employment to six or seven thousand men when at full capacity, a company hospital is also located, which Dr. Lorenz, of Vienna, has pronounced to be the finest hospital in America. Here is established likewise, our normal and industrial school, in which an evening course in the elementary branches is conducted during the winter months, and a six weeks' normal course in the summer to instruct and train teachers and workers of the department in their peculiar duties. At the first term of the normal school sixty-seven teachers were in attendance from four States. Besides the regular normal course there were classes in sociology, domestic science and physical culture. This school greatly increased the efficiency of the camp teachers. The building is also used as a dormitory and social center for steel workers and others.

The instruction given the kindergarten teachers in cooking, sewing, and basketry has by them been imparted to the classes in the camps. Especially popular are the classes in sewing. The girls have learned to do fine stitching, hemming and embroidery, and this winter they are being taught to make skirts, shirt waists, and dresses.

The work of the Normal School was supplemented last summer by sending a party of our teachers to the St. Louis Exposition. The expenses of the teachers to St. Louis were paid by the company on condition that the teachers remained there at least two weeks; that they visit the educational exhibit at least three mornings each week, and that they submit to the Sociological Department before September 1st, a thesis upon some phase of the exhibit. Every morning throughout June some twenty teachers were busy in the Educational Building with note books and pencil. Their studies resulted in the production of about twenty essays, each upon a specific subject studied at the Exposition, which have been roughly bound and are now being circulated from camp to camp so that each teacher may have the benefit of the work of all the others.

The local surgeons stationed in each camp give semi-monthly lectures in the school houses for the benefit of pupils, teachers, and parents, and these lectures are often supplemented by the use of the stereopticon. These lectures are followed up by a series of monthly bulletins in the form of a leaflet of four pages devoted to such subjects as "Milk and Its Care," "Consumption," "Foods," "Liquor Problem," etc. Each bulletin contains practical information and useful suggestions upon vital life and health problems. Scientific names and unfamiliar terms are eliminated or avoided as far as expedient. These bulletins are free to all employees and the teachers explain their contents to their pupils and the local physicians do the same for the adults.

Dances and dramatic entertainments by home talent, under the direction of company officers, are popular forms of entertainment in several camps.

A circulating library is kept traveling between stations throughout the territory. This library is increasingly popular. In one camp a long line of children is always waiting when the time for exchanging books arrives. This library is contained in forty-five boxes, of which twenty-nine are devoted to English books for adults, twelve to juvenile works and four to works in Italian. There is also a circulating collection of art. This comprises thirty sets of twelve pictures each. The pictures are accompanied by a typewritten description or interpretation of their meaning, together with a brief survey of the artists, school or type. Several hundred dollars contributed by interested individuals have been expended for casts and framed pictures to adorn the interiors of school buildings.

At several of the larger mining communities we have erected recreation halls and club houses for the men containing card and game rooms, bar and hall for entertainments.

A new club house for men at Segundo contains reading, card and billiard rooms, a barber shop and bath room. No liquors are served. Another men's club contains a lounging room and well stocked bar in addition to the attractions mentioned above. The reading rooms are supplied with popular weekly and monthly magazines and daily papers, the latter in English, Italian and Slavonic. These rooms are easily accessible from the card rooms and furnish an attractive place of rest after enjoying the shower and tub baths in the basement. Once a month this club house is thrown open to the wives and daughters and visiting friends of members.

A "no treating" rule encourages temperance in the use of liquor, and all soft drinks are served at a nominal cost.

The plans for our Industrial Home are yet in their incipency and the experiments thus far made have not been successful. Mattress making has proven too heavy work and just the right occupations have not been hit upon.

Special attention is paid to the sanitary laying out of new camps; the construction of model dwellings; the renovation and improvement of old houses and general sanitary improvement, such as cleaning wells and cisterns and providing for the systematic disposal of refuse.

The new dwellings, usually from three to six room cottages, are comfortable and convenient. Many of

them are furnished with water and electric lights. The variety of architecture and color transforms an unattractive coal camp into a most picturesque and attractive village.

A fine new church has been erected at Primero at a cost of \$7,000. Its seating capacity is about three hundred, and under its bell tower, a gallery affords ample room for choir and pipe organ. A large chancel contains a robing room and vestry. In the basement is a hall designed for a club room, reading room and lodge room. In its free use the people can enjoy every privilege not inconsistent with the church work and the welfare of the community.

In the other camps the Sociological Halls and school houses are used for Sunday School, Christian Endeavor and church services.

At the Recreation Hall of our hospital at Pueblo, chapel services are held every Sunday morning for convalescents, nurses, doctors and visiting friends. Brief addresses by prominent speakers from various parts of the country and varied walks in life frequently add to the helpfulness of these services. It is planned shortly to add to the attractiveness of the service by the addition of a vested choir.

This winter it is planned to extend the bathing facilities afforded our men by erecting a series of showers, wash basins, and clothes lockers for the miners at Primero similar to the equipment for the coke pullers at Redstone, but on a much larger scale. As rapidly as possible this equipment will be extended to all the camps.

No account of the work of the Sociological Department would be complete without reference to the Company Hospital at Pueblo, but an entire article would be necessary to do it justice, for no complete hospital is to be found in this country. The Medical Department treated last year 63,141 cases at the hospital and camps.

The work of the Sociological Department has received pleasing recognition at the St. Louis Exposition, inasmuch as our Kindergarten work and Industrial class work were each awarded a gold medal and our system of workmen's dwellings received a silver medal.

WISE EMPLOYMENT OF LEISURE

By MARY E. HAMSON,

Welfare Superintendent in a Large Manufacturing Community.

A French writer has said: "Oh, if I could discover how best to employ the leisure of men! Labor in plenty there is sure to be, but where look for recreation? The daily work provides the daily bread, but laughter gives it savor."

MISS MARY E. HAMSON.

Only men are employed in our works. The company, after having provided for their welfare and comfort during working hours, decided to extend the welfare work into their leisure time and to include their wives and children, believing that what is done for a man's family is a help to the man.

Much of this outside welfare work centers in a commodious Guild House, to which is attached a Guild Hall, containing modern improvements, including electric lighting, a stage, equipped with all the accessories for amateur theatricals, dressing rooms, a coat room for men and a cloak room for women. The main floor of the assembly room in Guild Hall will seat six hundred, and a gallery at one end will accommodate an additional number of people. This auditorium is available to the employees, for social entertainments, concerts and so forth, at a nominal price.

On the first floor of the Guild House are parlors and sitting rooms used as class rooms; reading rooms; a circulating library; and a thoroughly equipped kitchen.

For the purpose of encouraging out-door sports among its employees and their children, the company enclosed a five-acre plot situated between the office building and the Guild House. This athletic field has tennis courts and a running track. A portion of the space is used for baseball or football, according to the season of the year.

This year, to meet the growth of the work, a thoroughly modern gymnasium has been constructed, a system of baths being included. Besides the salary of the Librarian, the company contributes \$25 a month toward the purchase of books. There are contributors from other sources. A separate building is being erected for library purposes, so great has been the appreciation of this side of the work.

The class work begins in October, and extends through May, making a working year of eight months.

On Monday afternoons there is an embroidery class for girls between eight and fourteen years of age. They may either buy their own material or be furnished with work, in which case the worker may buy the finished article at cost. Some one reads aloud while the girls work.

On Tuesday evening there is a class for the mothers

and older sisters. The instruction is free, and there is an annual December sale of embroidered articles.

An art class meets on Monday afternoons. This year they are doing water color sketching under a competent instructor. Each member of the class furnishes her own materials, and pays ten cents a lesson for the instruction.

A class in piano instruction has been started. The charge is twenty-five cents for a half hour lesson.

The senior cooking classes are attended by those whose age enables them to make a definite and immediate use of the learning acquired. Each class partakes of the results of its own modest labors, sitting down to a meal attractively served upon a carefully laid table, thus giving an opportunity for table setting and serving. The junior cooks take home part of their results for parental approval. A trained instructor is hired to teach these classes. The cost to each girl is twenty-five cents a month, payable in advance, for one lesson each week.

A class in bead work meets on Saturday afternoons. Each member pays the cost of the beads used.

The basket making clubs on Tuesday afternoons are for girls; Thursday afternoons for boys; and Saturday mornings for advanced workers, both boys and girls. The cost to each is the price of the material used. For home work, two or three cents' worth of material is sold to a child. In June comes a basket exhibit, at which the fathers and mothers are invited guests.

The sewing school, which meets on Friday afternoons, includes fifteen classes of twelve pupils each. These classes are taught by volunteers from among the wives of the officers and head men of the company. A carefully graded course is followed. The stitches learned are applied by each girl in the making of aprons and undergarments for herself. The work for the graduating year is the cutting, fitting and making of dresses. In the dressmaking department each girl furnishes the dress material used. An experienced teacher has charge of this work.

To relieve the tension for the younger girls part of the sewing time is devoted to instruction in housekeeping. The object of this is to teach the girls to work neatly and intelligently at home with the utensils and materials there provided.

On Friday nights there is a class for advanced pupils in dressmaking. Here a charge of twenty-five cents a month is made, payable in advance, one lesson each week.

One of the most popular events of the week is the Wednesday evening dancing class for younger children. Two instructors and a pianist are furnished. The charge is five cents a week, except for hops, when it is ten cents.

On Thursday nights, the older people have a weekly dance. The music is the piano and violin. The admission is ten cents for ladies and fifteen cents for men.

The social clubs on Monday nights and Tuesday afternoons are for girls; on Thursday and Friday nights for boys. Prompt and full attendance attests their enjoyment and appreciation. The members of each club confer weekly with a director who receives suggestions, makes suggestions, and helps them to carry out ideas for mutual enjoyment. At the close of the club year the girls entertain their brothers and cousins. The boys also have a special party once a year.

Each gymnastic class meets once a week. The cost of these classes includes the use of soap and towel for the bath. The yearly charge is \$3 for seniors; \$2.50 for intermediates, and \$2 for juniors. The instructor is on duty each night from five until nine. The girls and women are as enthusiastic and faithful in attendance as the boys and men.

The company is constantly extending its outside welfare work because its beneficial results are increasingly obvious.

GRATIFYING RESULTS ACCOMPLISHED.

By W. E. C. NAZRO, B. A. S., S. B.

Welfare Manager in a Large Manufacturing Community.

Sympathy between the employer and the employee is the keynote to industrial peace. In the early days it was very easy for the employer to keep in touch with his men and to prevent neglect of things necessary to their welfare. But to-day the larger area that our plants cover, together with the vast amount of work, makes it impossible for the heads of the business to keep close inspection over the property, the factory and the people. Such problems have brought about the position of Welfare Manager, a position, however, which can never be made a success unless the heads of the business are in thorough accord with the work, and unless, upon large fete days or other social entertainments, they attend and lend their personal interest to the occasion. It was through this perfect sympathy of the treasurer of a large manufacturing plant that I was engaged to fill the position of Welfare Manager.

My first tour of inspection brought to light many little things that required immediate attention, such as cleaning up rubbish about the mill and houses. The grounds about the houses especially required the use of the hoe and shovel.

Systems of collecting ashes and carrying away

garbage were inaugurated, also a system of visiting the houses every few months was carried on until all the little repairs and leaks had been attended to. A remark was made by one of the men a little while after I had taken up the work, "that it was really the first time that the people thought that the company cared how they lived, and that they appreciated the step that the company had taken in providing some one to listen to their wants."

Not only did we try to improve their home life but endeavored to make their daily life about the factory more wholesome, procuring for them the best sanitary appliances, ventilation, drinking water, and many minor betterments.

We then started upon a plan to improve the exterior of our plant. New roads were built, good drainage systems constructed, grass plots laid out and vines planted.

The development of this side of the problem was very interesting to watch, because we had expended this amount of money in the hope of showing our people how grounds should be kept up, or at least to give them an interest to try some of the methods upon their own places. I may say that we felt great gratification to learn that on the first Saturday afternoon after these improvements the employees took home the lesson that we had taught them, and began edging their walks, cutting their grass, etc. Thus it was that our first efforts to show the people how to better their surroundings had been eagerly accepted. It is with this proof in view that I am led to believe that the employees' environment has much to do with developing their character and increasing the happiness of their lives.

So this principle of showing by example has been carried through our different branches of welfare work in our library, dining hall, kindergarten, and other institutions, with the hope of encouraging our employees to strive toward higher ideals.

I was once asked, "Are you not getting your buildings a little too good for your men?" As they were not at all lavish, I did not think so then, and time has proven that I was right. If the buildings are better than they had been accustomed to, the men proved their capacity of self-development by their appreciation.

There are always a few men whose clear perception and other superior qualities have placed them in positions of power and responsibility. These captains of industry should now lend a helping hand to develop the power of perception and appreciation in those who are less fortunate and who are working with them to increase the output and to make the product of each the best of its kind in the market.

How are you to arouse this ambition in the workman to better his condition? The condition of the laborer at the end of his daily toil, which has taxed both body and brain, often is likely to be that of discontent with himself and his surroundings.

To stimulate the ambition of the laborer, there should be put in his way opportunity for physical recreation and mental rest through social enjoyment. It is for the employer to offer these opportunities, because the average wage earner can not make them unaided. Such opportunities will keep awake the universal instinctive desire to rise above discontent. There is special recreative pleasure for employees in sports that bring them in competition with their fellow men. There is also a stimulus to ambition in the pride of their home life. This pride in making their little homes attractive is most real and is not dissimilar to that of the employer in his own estate.

It has been said to me, "What is the use of providing them with better homes? Workingmen do not appreciate them." My experience disproves this assertion. I have seen many tenants move from old homes to new and better ones built by the company. The test of the reality of their pride came in whether or not they used the opportunity thus offered for improvement. In every case these tenants took better care of their lawns and flowers, and in a dozen details increased the cheerfulness and beauty of their homes. For instance, muslin curtains displaced shawls and ragged hangings in the windows. Why did not this neat and attractive condition exist before? Because the houses were of the old, old type with no lawns or gardens; their environment was not of the character to awaken pride. But with their new environment, where the houses were surrounded by grass plots, with a little garden attached and well made walks, their ambition was immediately aroused.

It has been said to me, "This voluntary improvement might appear in your community, but it would not occur with us." This inborn desire for better conditions is not confined to our community, but its awakening needs the encouragement of example. No employee who has worked all day in or about a factory surrounded with rubbish and tin cans can be expected

W. E. C. NAZRO.

to decorate his home or keep clean its surroundings. Then again, the employes may have neither the knowledge nor the time to seek out ways and means of improvement. This lack may be supplied by the employer through literature or talks on the subject, and through extending to the employes opportunities for better homes.

My contention is that employes will grasp the opportunity for physical and mental recreation and generally to improve the conditions of their family life, if only the chance is given. They will read, not always the best books, but better ones, because of guidance in their selection. Their children will be better clothed and the workmen will be more orderly and of a higher degree of intelligence than those without such opportunities.

One caution is necessary. These opportunities for the workingmen should be kept free from patronage. The self respect of the workmen must not be offended by causing them to feel under obligation. Employes feel more manly if they can pay a certain share of the cost of welfare work. For some things the employer must pay entirely, such as better ventilation, better sanitary conditions and a plentiful supply of wholesome drinking water. But such forms of welfare work as schools, baths, lunch rooms, reading rooms, gymnasiums, and clubs should be managed on business principles.

The activities under my direction include the construction of mills and houses; landscape gardening, employing draughtsmen; a library, with a librarian and assistant; a dining hall, with a manager and necessary help; a kindergarten, with two teachers; a store, with a manager, four men and three teams; a band; a baseball team; a drawing school, with two teachers; a sloyd school and a school of basketry, each with one teacher; a department of baths with two employes; an athletic club; a hospital, with two trained nurses, and the supervision of an annual fair and celebration on Labor Day.

The results of these efforts have clearly shown that the wage-earner aspires to become something more than a mere machine, that there is readiness to improve when the opportunities are offered. Therefore, it is not the duty of every captain of industry, who controls the lives of men, women and children, to find some method of work and education that can be applied to his community to educate his employes, to make better citizens of them and to inspire them toward higher standards?

The large industrial plants and enterprises throughout the United States, controlling as they do somewhat the lives of the people, contain, if properly fostered, the seed for one of the greatest educational processes the country has ever known. They reach a vast class of people that the public school and college systems never can. They can be made to implant in the younger generations a pure and high perception of American citizenship, American life and American ideals.

GREAT PROGRESS IN ONE YEAR.

By ANNA B. DOUGHTEN,

Welfare Manager, the Curtis Publishing Company, Philadelphia.

The welfare work of the Curtis Publishing Company has been in charge of a Welfare Manager for little more than a year. Before its supervision was entrusted to me there was a place where women employes could eat the cold lunches that they had brought from home and obtain, without charge, coffee, tea or milk. There were also a room for rest and reading for women, and a Saving Fund Society for both men and women, which now offers its members insurance in the form of an endowment policy at a low rate.

At the outset of my work a new and attractive lunch room for the women employes was opened, where hot lunches are sold at the lowest possible prices. It is expected to be self-supporting in time. I was engaged to manage this lunch room and to extend the welfare work as I should learn the needs of the employes.

As a starting point, the lunch room gave an opportunity of enlisting the interest of the employes without arousing their antagonism. Several months were required to gain the sympathy of the employes and the co-operation of the heads of departments. Until that is gained there can be little tangible work. An advisory committee on the lunch room has been of considerable help.

A Voluntary Mutual Benefit Society has just been formed. Other new efforts are a circulating library and a hospital room in connection with the girls' rest room. A men's lunch room is under consideration and a smoking room is being fitted up. The first steps in the formation of a woman's club have been taken, and we have started a system of suggestion boxes. We are also preparing to make our wash rooms and dressing rooms adequate.

There is ceaseless opportunity for work in gaining the confidence of employes, in helping them in illness and in need, in being ever ready to talk over their affairs and in sustaining constant interest in their welfare, thus making them realize that the firm takes a real interest in them as human beings. So many and varied

are these opportunities for usefulness that I feel that the days are not half long enough for what I wish to accomplish. My occupation has been one of continuous and progressive education in the work itself.

EXTENSIVE AND THOROUGH APPLICATION.

By C. T. FUGITT,

Welfare Director, National Cash Register Co., Dayton, Ohio.

The National Cash Register Company made its first move toward betterment of the working conditions of its employes in 1894. Prior to that year the employes of the company were subjected to the usual unpleasant surroundings found at most factories. It was believed, and correctly so, as developments proved, that in the betterment of the conditions surrounding the workers, mutual benefits would result both to the employer and to the employee. As our President, Mr. John H. Patterson, aptly expresses it: "We do welfare work because it is right, and because it pays."

C. T. FUGITT.

From a very modest beginning in 1894, when small gas stoves were provided in the women's departments for heating coffee, welfare work has become an important factor in the company's organization.

A Welfare Department has been created and maintained in the belief that those conditions which affect the working man and working woman in their daily routine should be given first consideration. In carrying out this idea we have devoted considerable time and money to the problems of light, heat and ventilation. We feel that we have solved them in a satisfactory manner. The buildings are well lighted, 140,000 panes of glass having been used in their construction. They are connected by bridges and tunnels. This facilitates trucking and avoids the necessity of employes undergoing a change in temperature in passing from one building to another. Much unpleasantness and some sickness is prevented in this manner. By means of an efficient ventilating system the air in the buildings is changed every fifteen minutes.

The small particles of brass found in most brass polishing rooms form a disagreeable feature which we have practically eliminated. The dust from each buffing wheel is carried away by a pipe to a building on the outside. This is effected by the use of a suction fan arrangement.

The molders have also received attention. Considering the character of their work they should be given much more consideration than is usually accorded them in some factories. The acid fumes, a very unhygienic feature of their work, are carried out by suction fans. The gas room has been provided with all possible safe-guards. The ventilation and light are all that could be expected.

Well equipped bathrooms have been installed in different parts of the factory. The company gives all employes twenty minutes a week in winter and forty minutes in summer for baths; and in addition furnishes soap and towels. This privilege is much appreciated. Many take advantage of it.

Rest rooms in charge of a trained nurse have been provided for the women. These rooms are furnished with easy chairs and couches and with the accessories necessary for giving simple treatments. Girls are permitted to retire to these rooms if indisposed or in case of fatigue. It is gratifying to be able to say that the privilege is rarely, if ever, abused.

Emergency rooms have been arranged for the different men's departments.

In all women's departments high back chairs and foot rests are in use. We find that by the use of these simple comforts the women are capable of much better work.

At 10 A. M., and at 3 P. M., they are given a ten minute recess. Part of this time usually is devoted to physical development exercises. A competent teacher has given them instructions in this work and in the correct manner of standing, sitting and walking. They arrive at the factory one hour earlier than the men and are permitted to leave ten minutes earlier at night. This was done not only to give them shorter hours but to facilitate their transportation to and from the plant.

Aprons and sleeves are furnished to the girls, and white suits to the janitors. The company launders these articles free of charge.

Another important branch of welfare work is our Domestic Economy Department which serves over a thousand warm meals each day. Separate dining rooms have been provided for the women and the office force, while the heads of departments with their assistants and the foremen meet for luncheon at the Officers' Club. These dining rooms afford an opportunity to discuss matters pertaining to the factory and of general interest. They also enable employes to hear addresses made by many of the prominent visitors to the factory. Meals are furnished at cost. When employes are requested to work overtime,

lunches are furnished at the expense of the company.

The N. C. R. Library contains volumes on fiction, history, science, mechanics, and many other books of an educational character. These are supplemented by the leading newspapers of the country and most of the magazines. Portable libraries are being used for the conveyance of books to the respective buildings. We found that the men in the making departments would not take the time to go to the library, so books are taken to them. One cent a week is charged for books taken home.

Great interest is centered in our factory classes for employes. This year instruction is being given in English, cooking, dancing, physical development, sewing, first aid, health and Bible study.

Many of our employes go to and from work on bicycles. Sheds have been provided in which their wheels may be kept during the day. Provision is also made for inflating the bicycle tires.

At the N. C. R. factory Saturday is a half holiday the year around. This affords an opportunity for any shopping the employes may wish to do.

Welfare work has had a beneficial effect on those living in the vicinity. This has been evinced by the formation of clubs for betterment work. The results accompanying their efforts toward neighborhood betterment have been most encouraging.

A plot of land is set aside for boys' gardens. All the neighborhood boys are given an opportunity of caring for a small garden. Prizes are given each year for the best garden and for the best products raised. The boys show their appreciation of this opportunity by their faithful work.

Two independent clubs have been formed by the employes—The Men's Welfare Work League and the Women's Century Club. The women's club was organized in 1896 with 205 members. To-day it has an enrollment of 625. This club has been an important factor in promoting the principle of co-operation here. Its object is to aid in the betterment of those conditions which surround most working women.

The men's league is composed exclusively of the men employes of the N. C. R. Company. Although scarcely a year old the results already accomplished would do credit to much older organizations. It has fostered the spirit of welfare and good-fellowship among its members. It is active in the support of all matters educational. By the successful management of picnics and athletic sports and by monthly dues funds are procured for carrying on its work.

SECRETARY OF THE WELFARE DEPARTMENT.

Miss Gertrude Beeks, Secretary of the Welfare Department of the National Civic Federation, has had long preparation for welfare work and wide experience in the new profession. Her previous activity in business,

MISS GERTRUDE BEEKS.

in organizing business luncheon clubs and in the earliest sociological work of the Civic Federation, involving much personal investigation, prepared her for the formation of the Welfare Department of the McCormick Harvesting Machine Company in Chicago, employing 500 women and 6,000 men. She was in charge of this Department during several years. Later, after studying the plant and the needs of its employes, also numbering about seven thousand, she outlined a plan for the welfare work of another division of the International Harvester Company, to cover matters requiring the greatest attention, and which would need time to develop completely. Some of these recommendations have already been put into effect. She has traveled extensively in this country, visiting plants and studying the causes of the notable failures and successes of welfare work. In her capacity as Secretary of the Welfare Department of the National Civic Federation, Miss Beeks is frequently called into consultation by employers as to the application of welfare work, both in large industrial establishments and communities, and in more limited concerns.

RAILWAY PROVIDENT INSTITUTIONS.

Their Development and Application Upon the Pennsylvania Railroad System.

By MAX RIEBENACK, *Comptroller of the Pennsylvania Railroad Company.*

[The following is the closing instalment of Mr. Riebenack's paper upon "Railway Provident Institutions," read at a conference of the Welfare Department in New York City in November. The first instalment was published in the November number of THE CIVIC FEDERATION REVIEW. The author of this paper, the Comptroller of the Pennsylvania Railroad Company, is qualified to write as an expert upon this subject. In his official capacities he has been largely instrumental in maturing and promoting the provident undertakings of that railway system. Mr. Riebenack was selected to

report upon "Railway Provident Institutions" to the seventh session of the International Railway Congress, composed of the highest officials of the leading railways of the world, to be held in Washington, D. C., next May. —EDITOR'S NOTE.]

I may be pardoned for speaking directly on the efforts made and the plans adopted by the Pennsylvania Railroad Company in its endeavor to further the welfare of its employees, for the reason that I am more familiar with its plans and operations and practical workings, also on the ground that the policy pursued in the conduct of its provident undertakings has been largely followed by other American roads. Its status in this relation may therefore be taken as a fair indication of the drift of sentiment on the part of the railroads of the country toward providing institutions and measures for the benefit of their employees.

For operative and administrative purposes the System is divided into two distinctive organizations, one styled the "Pennsylvania System East of Pittsburgh and Erie," including the lines east of those points, and representing 5,852.44 miles of roadway with 117,928 employees, of which the roads associated in the administration of the Relief and Pension Departments represent an aggregate mileage of 5,209.87 miles of roadway and 110,502 employees, respectively; and the other the "Pennsylvania System West of Pittsburgh and Erie," embracing the lines west of those points, and representing 5,061.45 miles of roadway with 49,202 employees.

The provident institutions and undertakings now conducted comprise well-defined plans, and their relative importance warrants the following grouping:

Relief Fund and Superannuation Feature;
Pension Fund;
Saving Fund;
Hospital Service;
Libraries and Reading Rooms;
Young Men's Christian Association Branches.

Both parts of the System employ very similar methods for the benefit of their employees, but as those operated on the lines east come more directly under my observation, detailed remarks will be confined to that territory.

RELIEF DEPARTMENT.

The subject of providing some manner of aid for employees in case of disablement or death was first brought to the attention of the management of the Pennsylvania Railroad Company in 1874. An exhaustive canvass of the field culminated in the establishment of the present "Pennsylvania Railroad Voluntary Relief Department," in February, 1886. While many of the features of the original Baltimore and Ohio Railroad Relief Association, in operation at that time, were given full consideration and served as guides in preliminary work, the Pennsylvania Railroad Relief Department represents a purely distinctive organization, built up on the basis of the ascertained requirements of the employees.

The affairs of the Department are under the control of an Advisory Committee, consisting of the General Manager of the Railroad Company, as member *ex-officio* and chairman, and fourteen members, seven of whom are elected by the contributing members, the other seven being appointed by the several interested Boards of Directors. Each member serves for a period of three years, the elections and appointments being made triennially, in different years, and in such manner as to provide for there always being on the committee a majority of members who have served thereon for a period of time sufficient to afford them practical familiarity with the workings of the Fund.

Employees not over forty-five years of age may be enrolled upon making proper application and passing a satisfactory physical examination. Membership contributions, payable monthly in advance and collected by deduction from wages on payrolls, are made in accordance with a graduated scale, based on wages earned, and are, respectively, beginning with the first class, 75 cents, \$1.50, \$2.25, \$3.00 and \$3.75 per month for the five classes.

The benefits of the first class are: For sickness, after the first three days of disablement, 40 cents per day for a period of 52 weeks, and 20 cents per day thereafter; during continuance of sickness; for accident, 50 cents per day for 52 weeks, and 25 cents per day thereafter while disabled. Other class benefits are proportionately higher. The death benefits are, respectively, beginning with the first class, \$250, \$500, \$750, \$1,000 and \$1,250. Additional death benefits may be secured by payment of fixed monthly rates over and above regular contributions, the limit of such benefits being governed by class membership; the highest amount being for the fifth class, members of which may take five additional death benefits, with \$250 as the benefit unit, or a total of death benefits, including that of their class, amounting to \$2,500. The monthly rates of contribution are, for each additional death benefit of the first class (\$250), when taken at age not over forty-five years, 30 cents, when over age forty-five and not over sixty years, 45 cents, and over sixty years, 60 cents.

The Company gives the Department free use of its offices and other facilities; defrays all expenses of operation and administration, including the salaries of the two officers in charge, the eighty-nine medical examiners, and ninety-six other employees directly identified with the conduct of the Department; agreed at the outset to

make good any deficiency that should arise in any period of three years, which assumption of responsibility was subsequently made a part of the Fund regulations; and also arranged that any surplus arising during any triennial period should be set aside as the foundation for a Superannuation and Pension Fund.

A summarization of eighteen years' operation of the Fund, for the period ending December 31, 1903, presents the following results:

RECEIPTS.

Contributed by members.....	\$11,672,717.39
From company.....	2,544,348.11
From other sources.....	422,027.04
Total	\$14,639,092.54

DISBURSEMENTS.

Superannuation allowances.....	\$148,662.15
Operating expenses.....	1,815,641.54
For sickness.....	4,455,618.80
For accident.....	2,246,454.10
Death from natural causes.....	3,527,818.27
Death from accident.....	1,323,616.61
Total.....	\$13,517,811.47

During these eighteen years benefits were paid for 469,000 cases of disablement, for periods ranging from one day to seventeen years, while 8,531 families of deceased members received death benefits varying in amount, from \$250 to \$2,500, according to class membership. The membership as of December 31, 1886, was 19,952, while at the close of 1903 it numbered 76,507, or about sixty-nine per centum of the total number of employees, and included nearly all those who, by reason of age and physical condition, were eligible to membership.

The value of the protection provided by the Fund may be better understood when it is stated, that members may draw for disablement in 52 weeks as much as their contributions would aggregate in about sixteen years, and that the death benefit, which may become payable at any moment, is equal to the contributions of twenty-eight years.

SUPERANNUATION FUND.

The formation of the Superannuation Fund (which became operative January 1, 1900, simultaneously with the inauguration of the Pension Fund) was brought about by the establishment of the pension feature, when it was decided that members of the Relief Fund, upon retirement from active service, should receive monthly a proportion of the surplus on the basis of their relative contributions. This basis is one cent per month per class for each month of membership.

The Company's liberal policy in meeting all expenses growing out of the operations of the Relief Fund, as well as making up deficiencies at the close of any three-year period, made possible the accumulation of a Surplus Fund of \$751,256.25.

The original plan of payment of superannuation allowances involved that the interest accrued upon investments should be used for the purpose. After four years' operation under this plan, it was found that the interest returns were inadequate to meet the demand, whereupon the Company, preferably to making a reduction in the basis of payment, caused the Relief Department regulations to be amended, as of January 1, 1904, to provide that, in addition to the interest derived from the investment of the Surplus Fund, at the end of each three-year period the money not required to discharge the liabilities of former periods shall be applied directly to the payment of superannuation allowances instead of being transferred to and becoming a part of the Surplus Fund; if, however, at the end of the next ensuing three-year period there shall be a balance in the Superannuation Fund, it is to be transferred to and become a part of the Surplus Fund. On the other hand, the Company holds itself responsible to pay any deficiencies in superannuation allowances up to January 1, 1907.

Retired employees receiving superannuation are permitted, upon paying the proper rates of contribution, to retain title to death benefits in the Relief Fund.

PENSION FUND.

The pension plan was started January 1, 1900, and, as finally approved by the Company's stockholders, provides that the Company shall contribute all money necessary for the payment of pension allowances, and for the operation of the Department; also that the maximum amount disbursed for pension allowances under existing regulations shall not exceed in any one year the sum of \$390,000. Department operations are controlled by a Board of Officers, consisting of the following officers of the Railroad Company—namely, the Vice-Presidents, the General Manager and the Comptroller, vested with full power to make and enforce Department rules and regulations.

All officers and employees upon attaining the age of 70 years are retired and placed upon the pension payroll, while those of ages between 65 and 70 years, after 30 years' service, are retired and pensioned, either at their own request or upon the recommendation of the proper employing officer, if found to be permanently incapacitated by a Board of Company Physicians. Retirement is based on age, and pension allowance on service

and pay; that is, for each year of service one per centum of the average monthly pay for the ten years immediately preceding retirement.

During four years' operations, ending December 31, 1903, there was paid in pension allowances the sum of \$1,224,087.59, the expense of operation for the same period having been \$20,134.78.

Up to the end of 1903 there had been retired and granted pension allowances to 2,126 employees, while 527 pensioners had died. Of the total number retired, 456 were between ages 65 and 70, and 348 of these were relieved at their own request with the approval of the proper employing officer, which indicates that the number of requests to be relieved originating with the employees themselves was in the proportion of three to every one emanating from the employing officers.

RELATION OF AGE LIMIT TO PENSION FUND.

Provision is made that persons beyond the age of 35 years will not be admitted into the Company's service (the exceptions being in cases of former employees, whom the Company may desire to re-engage within a period of three years from the time they were last in the service, or of professional men or specialists). Employment in the service is generally understood to be permanent, and the Company, so viewing the matter, made provision accordingly in the organization of the Pension Department, by limiting the age to 35 years.

The motive for establishing this age restriction was to provide a basis of Department operation under which employees in the future, after the starting period, would be retired from the service and carried on the pension roll at age 65, with thirty years' service. In other words, under the present workings of the Fund it will be merely a matter of a few years when the application of this age limitation feature will bring about a condition under which all pension beneficiaries will have been in the Company's service for not less than thirty years previous to their retirement on pension allowances; and will, in consequence, receive not less than thirty per centum of their average wages for the ten years next preceding such retirement.

SAVING FUND.

Mature deliberation, growing out of appeals made by employees identified with the service of the various divisions and branches of the Company for saving fund advantages, resulted in the creation of the "Pennsylvania Railroad Employees' Saving Fund," as of January 2, 1888. The Fund is conducted as a separate department, in charge of a Superintendent, under the supervision of a Board of Trustees, three in number, the members of which are directors or officers of the Railroad Company. Custodianship of all moneys and securities of the Fund is vested in the Company, which assumes responsibility for the proper return of all securities in which the Fund surplus may be invested, also the return of membership deposits, together with a fixed rate of interest thereon, which at the present time is three and one-half per centum per annum. Fund regulations provide that no change shall be made in the rate of interest allowance on deposits without six months' previous notice to depositors, thus insuring against sudden fluctuations in the earning power of savings.

Employees whose regular monthly wage compensation does not exceed \$300 may become depositors, upon making due application at any of the depositories. No employee is, however, permitted to carry a balance in excess of \$5,000, nor deposit more than \$100 in any one month. Report of Fund operations for the year ending December 31, 1903, shows 9,494 depositors; deposits, \$1,260,229.50; withdrawals, \$796,204.22; interest allowed depositors at three and one-half per centum, \$127,587.09, and balance of \$4,010,116.88, equivalent to an average per capita credit balance of \$420. On the date named there were 1,102 depositories, located at station agencies most accessible to the employees, and of which the general clearing house is the Company's Treasury Department.

Statistics for the period since establishment of the Fund to the end of 1903 furnish the following results:

Deposits	\$9,334,945.08
Withdrawals	6,400,892.71
Interest allowed depositors	1,058,676.97
Number of applications for deposit books.....	20,133

Fully ninety-five per centum of the total amount on deposit is invested in first-class securities averaging an annual return of three and one-half per centum.

HOSPITAL SERVICE.

The Railroad Company does not conduct a Hospital Department, there being no absolute necessity therefor, owing to the fact that it is conveniently and reasonably enabled to avail itself of the numerous public and private institutions of this character located in the different cities and towns along its lines. There is, however, a well established corps of surgeons, the members of which are assigned to points on the road where they can be reached by quick summons, also the corps of medical examiners allied to the Relief Department, the members of which are assigned to special territorial districts, with offices at vantage points where they are ever ready to give in emergencies needed medical advice or attendance to employees, regardless of Relief Fund membership.

To render prompt assistance to those who may meet with accident or are seized with sudden illness on its lines, the Company has numerous devices, the foremost being the "Hospital Car," which is especially constructed to meet all requirements, and thoroughly equipped with necessary paraphernalia for emergency use.

FIRST AID TO INJURED.

For some years the Company had under consideration the establishment of a system of "First Aid to the Injured," but the actual inauguration of the plan was deferred pending the development of Relief Fund operations to a stage at which adequate equipment and working machinery could be commanded. The plan was launched on October 1, of this year, since which date the medical examiners have been giving lectures to employees selected to perform this work. The arrangement comprises the following features: The "First Aid Packet," containing small packets in a tin box, hermetically sealed, which, in turn, is enclosed in a sealed wooden box, these boxes being placed in every engine and caboose, and at principal stations, and the "First Aid Emergency Box," which is placed at large stations and agencies, with full instructions as to the use of contents, which, in a general way, include medicines, bandages and plasters, and surgical instruments. The Company also has in operation a systematic arrangement for supplying stretchers to all baggage, wrecking and maintenance-of-way cars. General orders have been issued requiring the giving of instructions to all trainmen and others concerned, on extending first aid to the injured.

LIBRARIES AND READING ROOMS.

Germane to the work of the Young Men's Christian Association Railroad Departments, and in many instances going hand in hand with it, is the plan of providing libraries and reading rooms at various points on the lines of road at which trainmen and others are required to collect in the discharge of their duties.

Numerous reading rooms are located on the lines of the Pennsylvania System East of Pittsburgh and Erie, at various division terminals; also at other points, where trainmen begin and end runs. These rooms are currently furnished with daily papers, magazines, periodicals and miscellaneous reading matter, the literature supplied being of such character as to be entertaining and instructive, thus enabling advantageous employment of enforced time off duty. Permanent libraries are scattered throughout the System, with a large clientele of employees. The growth of the library system has been steady, and at the end of 1903 it comprised 62,973 volumes.

Y. M. C. A. RAILROAD BRANCHES.

The Pennsylvania Railroad Company was among the first of the large trunk lines to realize the practicability of embracing a plan which would place before its employees of all classes broader and higher educational opportunities and advantages, and at different times during the preliminary consideration of the question endeavored to pave the way for the introduction of a permanent branch of the Association. Efforts in this direction did not meet with what might be termed signal success until the completion of the railroad branch located at West Philadelphia, Pa. This branch was finally organized November 18, 1886, although originally undertaken May 1, 1876; it was fully housed in 1893, when approximately \$140,000 had been raised and disbursed through the combined efforts of nearly 6,000 railroad men and their friends, together with the substantial co-operation of the Railroad Company.

The Pennsylvania Railroad Department Young Men's Christian Association of Philadelphia is the largest on the Pennsylvania System of Lines, and also holds the enviable distinction of being the largest railroad branch in the world in point of membership (which on December 31, 1903, numbered about 2,500), equipment, and variety and extent of work.

The demonstrated benefits accruing to employees enjoying membership in these branches have enlisted the enthusiastic and continuous support of the Company and its principal officers.

President A. J. Cassatt made the statement:

"I am in full sympathy and accord with the work which is being so successfully carried on by the Railroad Department of the Young Men's Christian Association. From observation I am satisfied that excellent results, from the standpoint of the employees as well as of the Company, are being accomplished through this agency."

At the close of 1903 there were thirty-one Association branches, with a total membership of 12,732 on the lines of the Pennsylvania System East and West of Pittsburgh, to which the Railroad Company extended financial support. Some of these branches own the buildings they occupy, but the larger number are located in buildings belonging to the Company.

SUMMARY OF EXPENDITURE DURING YEAR 1903.

The details of the annual expenditure for the various provident features of the two parts of the System, during the year ending December 31, 1903, show a total of \$943,618.23, as follows:

	Lines East.	Lines West.
Relief	\$262,777.37	\$91,614.09
Pension	363,629.29	130,381.81
Hospital	18,370.00	2,197.50
Saving Fund....	8,417.93	4,537.76
Y. M. C. A. and Libraries and Reading Rooms	53,351.36	8,341.12
Total	\$706,545.95	\$237,072.28

REMARKS ON PROVIDENT FUNDS.

A few remarks may be appropriately made on certain prominent characteristics of railway relief and pension funds as conducted in the United States.

The real consummation that has grown out of efforts made by the Pennsylvania Railroad Company in the provident fields of sickness, accident and pension, may be summed up in the statement, that all employees of the Company are, at the present time, given ample opportunity to provide for themselves in case of sickness or accident, and for designated or proper beneficiaries in the event of death, through the instrumentality of the funds—a co-partnership maintained jointly by the members and the Company, and later, when the prescribed time for retirement from active service is attained, either on the ground of old age or permanent incapacitation, the Company, absolutely from its own revenues and without any contributions or other form of support from the employees, grants to all employees entitled thereto, liberal pension allowances, while these monetary provisions are still further increased by a supplemental payment from the Relief Fund, in the form of superannuation allowances, on a fixed basis in proportion to the amount of contributions during Fund membership.

COMPULSORY MEMBERSHIP ILLEGAL.

Relief Funds may be properly styled "mutual benefit associations," as under their operations each member practically contributes for the joint welfare of himself and fellow members, and with company co-operation the duration of mutual assistance is unlimited. Membership is purely voluntary. As a matter of fact "compulsory" membership is prohibited by the United States Arbitration Act of June 1, 1898. It is sometimes held that membership is nominally voluntary but practically compulsory. This view undoubtedly arises from the circumstance that the companies, in accordance with the principle observed by all large business undertakings requiring the constant employment of large numbers of men, exercise the generally conceded right to decide upon the physical fitness and general qualifications of applicants for positions in their service. In carrying out this principle the discriminations made between applicants may appear to the uninformed to indicate a disposition to enforce "compulsory" membership, but this is an entirely erroneous conclusion, as such a course is of paramount importance with railroads for safeguarding the interests of the public as well as their own.

The question of joining the Fund is laid before new employees without the slightest pressure one way or another, and there are no cases on record to my knowledge where an employee has been dismissed from service simply because he refused to become a member of the relief fund, or rejected for employment on account of his declining, if employed, to become a member of the organization. It is entirely optional with the employee after he has become a member of the Relief Fund to resign from it at any time he may see fit, and his status with the company as an employee is not affected by such action on his part.

The stability of relief departments is based altogether on the extent to which the railroad companies assume responsibility for their operations and are willing to guarantee their financial obligations. The members are thus doubly protected, first by their own contributions and next by the promise and ability of the companies to make up any deficiency which may occur. There is, therefore, a direct mutual interest between the members and the companies. There is no encroachment on other plans of relief or insurance which may have enlisted the support of employees.

Contributions are intended primarily for the purpose of assuring sick or disabled members of a designated monthly income at a time when most needed, and in providing this income promptly.

The payment of death benefits is an incidental feature of the plan, whose presence stands for a logical constituent of the chief factors—sickness and accident, from the fact that it insures deceased members respectable burial, and intervenes to prevent the possible immediate impoverishment of their families.

No provision is made for the return to members of the Relief Fund, leaving either the service or the Fund, of any proportion of their contributions, for the reason that during their connection with the Fund they have been protected against sickness and accident at a minimum cost, and to make repayments would necessitate an increase in rates, which would mean an added expense to all the members. It is also a fact that the laws of some States prohibit the continuance of fund death benefits after employees leave the service of the corporation, as being an infringement upon State Insurance statutory enactments.

ADVANTAGES OF RELIEF FUND MEMBERSHIP.

The advantages of membership in the Relief Funds may be thus recited:

(a) Indemnity in case of disablement from accident or sickness, and death from accidental or natural causes, at a minimum cost; the protection extended for death being particularly advantageous to employees occupying hazardous positions, as many of the regular-line insurance companies will not insure them, and those that do demand largely increased premiums over the ordinary risk.

(b) Free surgical attendance in case of disablement from accident while in the performance of duty; also the furnishing of artificial limbs and other appliances.

(c) No payment for membership or medical examiners' fees.

(d) No special dues or taxes, and no extra assessments.

(e) Exemption from contribution during disablement, after that made for the month in which the disablement originates.

(f) Protection against possibility of forfeiting title to benefits for non-payment of dues; the practice of collecting contributions on the pay-rolls obviating this so long as members are on duty.

(g) No assessments for administration, all expenses being defrayed by the associated companies.

(h) Benefits are not susceptible to hypothecation, and death benefits cannot be diverted for any purpose, being confined exclusively to payment to designated beneficiaries, who must be members of the family.

(i) Relief from making contributions to their fellow-employees or their families in destitute circumstances; solicitations in this direction were of common occurrence before the funds were established.

LEGAL RIGHTS OF MEMBERS.

An important point in connection with the operation of relief funds is the question of a member's right to have recourse to action at law against the interested railroad companies in lieu of accepting accident benefits extended by the funds. To understand this point it must be borne in mind, primarily, that the applicant for fund membership enters into an agreement with the fund to accept, in the event of sustaining disablement injury while in the service and in the performance of service duties, the accident benefits specifically prescribed in fund regulations. This is a distinct agreement, with a good and valid consideration, made between proper contracting parties, and, therefore, invested with due legal status. By becoming voluntarily a party to the agreement the applicant should live up to its terms, any overt or serious violation of which should, and does, result in relinquishment by the violating party of the benefits that would otherwise have accrued to him thereunder. The companies by reason of guaranteeing that all obligations of the funds will be met, also paying their deficiencies, and contributing the entire amount necessary in the conduct of their operations, clearly assume responsibilities which warrant them in asking employee applicants to enter into the agreement referred to. By entering into such contract the member is invested with a fixed and certain rate of compensation, while the companies are always in position to determine the extent of their financial obligation, and accord each case prompt and systematic treatment. The object contemplated by the agreement is the safeguarding of both the funds and the associated or interested railroad companies, by the introduction of provisions that are plainly set forth and as well serve equally the best interests of both parties to the contract. This manner of fund agreement does not deprive the member from instituting legal proceedings instead of taking the rate of compensation offered by the fund. It does provide, however, that where the member disregards his plain obligations under its terms, he thereupon forfeits his rights to fund benefits, and the question of company compensation will then depend wholly upon the merits of the case from a purely legal standpoint.

REASONS FOR AGE LIMIT.

The establishment by the railroad companies of an age limit for admission into the service was for the purpose of making it possible, when the retirement age is reached, for employees to receive a return for services rendered an allowance equivalent to a fair proportion of their average pay.

The adoption of this provision does not, however, preclude the re-employment of former employees, who are over the age of 35 years, for the reason that this privilege is accorded to them, provided they have not been out of the service for more than three years and that the companies have positions in which they could be employed. This period is deemed sufficient for employees to decide whether or not they desire re-employment, and at the same time such absence from the service does not destroy the feature of the employees at the retiring age, having been in the service such a number of years as to give them the benefit of a fair pension allowance.

MOTIVES AND RESULTS.

Too much praise cannot be accorded the railway officials of the United States for their broad-minded and liberal treatment of the subject of conferring pension allowances upon employees. In providing for extension

(Concluded on page 20.)

THE VOICE OF THE PRESS DECLARES FOR INDUSTRIAL PEACE.

THE AIMS AND METHODS OF THE NATIONAL CIVIC FEDERATION WARMLY APPROVED BY EDITORS THROUGHOUT THE COUNTRY.

THE following four pages are filled with extracts, some of them reproduced photographically, from the publications, daily and periodical, lay, professional, technical, economic and religious, that have been stirred to comment upon the proceedings at the fourth annual meeting and dinner of the National Civic Federation. Comparatively few of these comments are reprinted here, but their publication will be continued. They have been selected at random, and without regard to their favorable or questioning tone. They serve to show that the progress of the Federation is critically scrutinized by millions of observers, and thus will impress those in sympathy with the promotion of right relations between employers and employed with the vast public responsibility that is involved in their joint and individual efforts for industrial peace. They afford convincing evidence that this movement has won that general support throughout the country which warrants its vigorous prosecution and wider expansion:

GOOD ACCOMPLISHED BEYOND EXPECTATION.

Locomotive Engineers' Journal.

The National Civic Federation has expanded equal to the fondest hopes of its principal promoter, the late Senator M. A. Hanna, and the scope of good it has accomplished has exceeded the most sanguine expectations of all interested in it; and now is reaching out by adding a new department of Industrial Economics, composed of prominent educators, heads of departments of political economy in universities, representatives of the pulpit, editors of the daily press, politico-social magazines, trade and technical papers, whose readers include all the great employing interests, among whom are those most antagonistic to organized labor, and more than twenty editors of papers and magazines which are read by millions of wage-earners.

We believe the organization of the new department will be specially beneficial to the latter class, for it gives opportunity to present the attitude of labor organizations, causes that make them necessary and the good they are doing, not only for those who are members, but that the bettered conditions they bring are not only not injurious to the public, as Parry and many others say, but are decidedly beneficial.

About one hundred editors were invited to join, and nearly all accepted and attended a meeting of the National Civic Federation on December 15, and we believe every one felt that in bringing together every class of interest, so they could get better acquainted, enter into the discussions of the various phases of this greatest subject now before the American public, it would be of great benefit to all concerned, correcting many erroneous opinions and modifying extreme views, and we believe these associations, with their attending education influences, will eventually leave very small space in public opinion for such men as Parry and his association, organized for the purpose of destroying organized labor.

The permanent organization of this department will be effected at the next meeting, when the *Journal* will give space to the subjects which come before this body, and a synopsis of the discussion, and point out with such ability as we possess the direction of the influence exercised by it.

HARMONY PREDICTED IN THE PIANO TRADE.

Music Trades.

It will be well if employers of labor, and particularly those who have large manufacturing plants, will take the trouble to read carefully the account in this issue of the *Music Trades* of the convention of the National Civic Federation, which was held in this city on Thursday of last week.

The eminence of those engaged in this work, and the absorbing interest of the speeches made by the heads of great corporations, as well as by the great labor leaders, should be sufficient to warrant a careful perusal of the proceedings; but there is a further and greater reason why the men engaged in these industries should take a deep interest in the work of the Civic Federation. In the event of there being labor troubles in this trade, and especially in the piano industry, the Civic Federation stands prepared to use its best efforts to bring the contending parties together, and as these efforts are put forth by conciliation committees, composed of men of the highest standing in the world of labor, as well as in the world of capital, it can be readily seen that a force will be brought to bear to bring about an adjustment of differences on a reasonable and fair basis that cannot well be resisted.

With the Civic Federation in the field, represented by men to whom industrial peace is a labor of love, who leave their vast interests to serve the public without hope of even that reward which comes from publicity, it is not likely that this trade will ever again be disturbed by labor troubles as it has been in the past.

GREAT STRIDES TOWARD CONCILIATION.

Locomotive Firemen's Magazine.

At the banquet, which was held after the adjournment of the meeting, Mr. Samuel Gompers acted as toastmaster. In his opening remarks he referred to the growth of the Civic Federation and said that as new problems are continually arising, and as the Federation solved them one by one, it puts itself in a position for the more ready and able solution of the next to come. He said that labor had discovered, through the instrumentality of the Federation, that employers are not the "modern monsters" which they were regarded as being in the past, and that he welcomed, advisedly, for labor which he represented, the organizations of employers.

The name of the late Senator Hanna was greeted with cheers when mentioned by the speaker, as was also the name of Mr. Andrew Carnegie, when Mr. Gompers, stating that in disposition kept him from attending, wished for his speedy recovery. Mr. Gompers then introduced Mr. Ralph Easley, Secretary of the Federation, who read Mr. Carnegie's address. Mr. Carnegie, as is well known, is an extensive employer of labor, and speaking as the result of a life's experience in that capacity, he sets forth in his address very clearly the great disadvantages resulting to corporations engaging in disputes with their men which culminate in strikes, and the advisability of their seeking, by every fair and honorable means, to avoid all such contention. Mr. Carnegie's address clearly set forth the provocations and trials experienced by workmen who, in a just cause, are

compelled to stand by and witness low, degraded, unprincipled and incompetent loafers usurp their places—fellows who, under normal conditions, are idle the better part of their time through lack of merit on their own part, and who seek work only when specially lucrative opportunities are offered through open warfare between capital and labor. He showed what a hardship it was for honest, competent wage-earners to see the work in which they had always taken such a pride being botched by such incompetents, and they themselves, deprived of the revenues resulting from its performance, whereby they had been enabled to support those dearer to them than life itself. An acknowledgment of this kind from such a source is a striking indication of the efficacy of the great work of the Civic Federation. The vivid portrayal by Mr. Carnegie of the feelings of the striking wage-earner, and the public expression of his opinion that employers, partly out of consideration for the men who create their wealth, and partly with a view to the protection of their own best interests, ought "never to employ new men in case of any strike, but to wait patiently for the old men," is, in itself, evidence of the great strides that have been made in recent years in the work of conciliating labor and capital through the influence of that vigorous, sane and healthy sentiment being developed through the instrumentality of such agencies as that powerful organization.

BROAD AND ENLIGHTENED VIEWS.

American Machinist, New York.

It has been Mr. Belmont's habit to recognize the rights of the men who work under his administration and the completion of the new subways in New York within the time in which it was accomplished is credited largely to what is described as his broad-minded and fair methods of dealing with labor questions. At any rate, few could ask for a more liberal or more enlightened expression of views than he gave in his address, and it is altogether probable that his promise to give the affairs of the Federation his best efforts means very much. And certainly the fact that a man of such large wealth, one who is so busy and possesses such a large measure of administrative ability is willing to devote his time and talents to such work is of itself significant. Another significant point in connection with it is that the many prominent labor leaders who are members of the Federation and who were present at the meeting and banquet very heartily endorsed Mr. Belmont's nomination and election.

Besides the letter from President Roosevelt, expressing the most hearty sympathy with the objects of the Federation, there was an address by Andrew Carnegie, the most notable feature of which was a declaration of his belief that where differences arise between an employer and his employees it ought to be announced by the employer that no effort would be made to get a new body of employees, but that operations would simply await the reasonable settlement of the difficulties.

John Mitchell made a manly and clean-cut address, in which he said:

"I hope the time will never come when men will surrender their right to strike or employers give up their right to close their mines or their mills, and I hope to live long enough to see the day when lock-outs, strikes and boycotts will be unnecessary, and when the American Civic Federation will be the recognized tribunal of peace in the industrial affairs of America."

Mr. Belmont's declaration to the effect that he had found face-to-face conferences the best, and, in fact, a practical and satisfactory means of avoiding or settling labor difficulties was heartily endorsed by others, notably by Mr. James Kilbourne, of Columbus, Ohio, a manufacturer who seems to have been able to remain upon entirely friendly terms with his employees throughout the troublous recent period and who, in his address, gave the most emphatic testimony as to their faithfulness and fairness when approached in the right spirit, and treated with the consideration to which he claimed American citizens are entitled.

A GATHERING OF "FELLOW-AMERICANS."

The Christian at Work, New York.

That was a notable gathering last week when the Civic Federation met for the first time since the death of its former head, Senator Hanna, and elected Mr. August Belmont president. The Federation, representing men equally prominent in the world of Finance and the world of Labor, is a movement prompted in the interest of both the great parties, to secure, if possible, a common working basis with a view of preventing strikes, and, when they do occur, of reaching a common agreement. So far no iron-clad rules of procedure have been adopted, if indeed, such rules are possible. The effect of the meetings of the Federation so far has been to bring the parties together for conference, with the result that by this means some strikes have been averted and others adjusted. Not only capital and labor, in the generally accepted meaning of the term, were represented among the 300 diners, but art and education, all had standard bearers there. So vast and diverse were the interests which mingled at the tables that Samuel Gompers, the first vice-president of the Federation, who acted as chairman, could think of no more specific term in which to address his audience than "fellow-Americans."

FOR INDUSTRIAL PEACE.

The Dry Goods Economist, New York.

The National Civic Federation, which held its fourth annual meeting Thursday in this city, is probably the most important organization in the world that has for its object the lessening, and ultimately perhaps the extinction, of industrial strife through education and conciliation. The importance of the organization is attested by its steady growth, by the character and caliber of the men who stand foremost in its councils, and by the work already accomplished along the line of its avowed aims.

It is a hardship upon the Federation that the details, and even the outlines, of its most successful achievements cannot be made public for the reason that the parties to impending contests usually stipulate, before meeting under the conciliatory auspices of the Federation, that the facts of such meeting shall remain a secret. Of what the institution has done, however, enough is already known to increase the general respect and confidence it has inspired, and to make it apparent that the National Civic Federation is to be a permanent, or semi-permanent, factor in the great work of bringing peace into the American industrial field.

A novel and significant spectacle was the array of capitalists, employers, labor leaders and representatives of the professions and the great institutions of learning, who sat promiscuously about the tables at the banquet.

When such men as Andrew Carnegie, John Mitchell, Henry Phipps, August Belmont, President Charles W. Eliot, of Har-

vard University; Oscar S. Straus, Samuel Gompers, Archbishop Ireland, James O'Connell, of the machinists; P. H. Morrissey, of the trainmen; Franklin MacVeagh, St. Clair McKelway, of the Brooklyn *Eagle*; Warren S. Stone, of the Brotherhood of Locomotive Engineers; H. H. Vreeland, president of the Metropolitan Traction Company; Professors Taussig of Harvard, and Seligman, of Columbia, and literally hundreds of others of similar prominence in the mental and physical activities of the country—when such men, we say, come together, not perfunctorily, but with a serious and sympathetic purpose, good results to labor, capital and to the public will surely follow.

In handling the complicated problems, social, financial and industrial, involved in what is called the "labor question," at least two important factors must always co-operate; first, the personal equation—the skill, tact and persuasiveness of the men who draw together and finally conciliate opposing forces—and second, the knowledge of actual facts and principles relative to the subject, which furnishes a basis for conciliation and agreement.

The Federation has already shown in a satisfactory measure its possession of the first of these requisites. It now proposes to provide the second by the formation of a Department of Industrial Economics, the organization of which was completed on Thursday, with President Eliot, of Harvard, at its head. As now equipped, and with August Belmont as successor to the late Senator Hanna in the president's chair, the National Civic Federation enters upon its new year with bright prospects of rendering illustrious service not only to labor and capital, but to the entire community.

A TRIBUTE TO PERSONAL WORTH.

Harper's Weekly, New York.

During the recent political campaign the person most frequently referred to as "a Wall Street man" was August Belmont. The term is usually meant by those who use it to be opprobrious, but we question whether Mr. Belmont himself would so regard it. He really is a Wall Street man in the sense that his office is in that vicinity, as was that of his distinguished father before him. In those days an honorable banker was considered to be as reputable as any other citizen. Times have changed somewhat in this respect, but a pleasing indication that they have not gone wholly awry was afforded last week by the unanimous election of Mr. Belmont to succeed the late Senator Hanna as president of the National Civic Federation. He not only did not seek the position, but was naturally very reluctant to accept it, and would not have done so but for one fact, in which lies the significance of his selection, viz., that the suggestion came from the representatives of labor in the Federation. That it was a meritorious choice is well known to everybody familiar with the admirable manner in which Mr. Belmont has sustained the reputation of an honored name, but that it should have been made by the courageous spokesmen of an element supposed to regard the Wall Street man with horror is clearly indicative of growing breadth and tolerance on the part of both labor and capital. The personal tribute to Mr. Belmont is surpassed only by the credit won for themselves by Mr. Mitchell, Mr. Gompers and their associates.

APPRECIATED BY ORGANIZED LABOR.

The Independent, New York.

Last week Mr. August Belmont was elected to the presidency of the National Civic Federation, to succeed the late Senator Hanna. Mr. Belmont has yet to prove his ability in this position, but his modest speech in accepting the office would seem to show that he realizes the responsibility conferred upon him and the high order of work required. It is no small honor for a great Wall Street financier to have the confidence of the leaders of organized labor, as was evidenced by the unanimous vote cast for Mr. Belmont. Even Mr. Carnegie, who declined the presidency before it was offered to Mr. Belmont, admitted that it was the greatest honor that had ever come to him, especially in view of his supposed connection with the Homestead affair. The National Civic Federation in its four years of existence has amply justified itself. Leaving radical and Utopian solutions of the capital and labor problem to others, it confines itself to the immediate difficulties between employers and employed, and uses its good offices to settle these difficulties in the most practical manner possible. As such it has done more than any other agency to bring about peace in the industrial world. No wonder it is bitterly hated by the uncompromising Socialists on the one hand and by the so-called "Parryites" on the other. At the annual dinner last year one of the representatives of the employees brought down the house by asking what the people whom he represented could expect from an organization harboring two such eminent politicians in its membership as Senator Hanna and Grover Cleveland. The labor element, however, has found that it pays to work and confer with the representatives of the other classes, and we believe that there is not a labor leader of any importance in the country who does not now acknowledge the value to organized labor of the work of the Federation.

A PECULIARLY FIT CHOICE.

Pueblo (Col.) Chieftain.

Universal satisfaction is expressed over the election of Mr. August Belmont to the presidency of the National Civic Federation. Mr. Belmont is peculiarly fitted in many respects for the position, and there is little doubt that there could have been no wiser selection for Mr. Hanna's successor. Mr. Belmont is an authority in the financial and political world and in the management of his vast interests he has had ample opportunity to acquire the knowledge that will prove useful to him in directing the affairs of the Federation. In his relations with his army of employees he has shown himself ready at all times to hear the other side, and by his sense of justice complications have been avoided that might have been most disastrous in their results. He has earned the confidence and respect of the men under him, and in his election the representation of all the elements was united and enthusiastically harmonious.

PRESIDENT BELMONT AND TRADE AGREEMENTS.

Ironton (O.) Register.

It is to be hoped that Mr. Belmont will not only be able to prove himself a good president but that he will be able in some real measure to carry out the large purposes of good and industrial peace which the former president thought so much of.

In his speech of acceptance he spoke of the work of the Federation as being for the good of all society, and that it must accomplish its end by teaching "good faith and honest dealings as the basic principles upon which trade agreements may rest." If agreements once entered into are faithfully carried out there will not be the trouble of making agreements what they should be for each side concerned.

PRESIDENT ROOSEVELT'S LETTER TIMELY.

Review of Reviews, New York.

In certain trades there has been a marked disposition on the part of the labor unions to carry their methods to the extreme of tyranny and dictation, while, on the other hand, there has been a disposition on the part of certain capitalists, working through employers' associations, to do everything in their power to crush out labor organizations altogether. As between these opposing tendencies, the wiser and more experienced labor leaders on the one hand and the more thoughtful and public-spirited employers on the other have found themselves during the past year subjected to a sharp cross-fire. It was therefore a particularly timely supplemental utterance of President Roosevelt that appeared in the form of a letter to be read at the annual meeting of the Civic Federation in New York, on the 15th of December. The National Civic Federation is an important body in which labor, capital, and the general public are equally represented. Its great practical mission is to bring men together in close relations and to promote industrial peace by conference, with conciliation and arbitration in the background. There are extreme labor leaders who oppose the Civic Federation in all its views and methods. There are organizations of employers which are even more bitterly opposed to the good work of the Civic Federation, for the Federation gives the fullest credit to the value of labor organization, and believes in a general way, that not only the best interests of the workers themselves, but also those of American citizenship at large, are advanced by a union of men in various callings for the improvement of their conditions.

The form in which the Civic Federation has found that industrial peace can best be conserved in this country is the form known as the "trade agreement," under which employers and employed meet directly through their accredited representatives and make their relative proposals, try to understand one another's point of view, learn to recognize one another's fundamental rights, and then settle by "give and take" those practical questions which are matters of bargaining rather than of conscience or conviction. As Mr. John Mitchell says, it is better for employer and employed to get together and talk a week than for them to fight by means of strike or lockout for a year. This is what the Civic Federation stands for, and it is most cheering to see how heartily the leaders of labor and the representatives of capital, meeting in this public-spirited organization, have come to esteem and respect one another. At the annual dinner of the Federation in New York, where President Roosevelt's wise and sympathetic letter was read, Mr. Samuel Gompers ably presided as the head of the American Federation of Labor, while among the speakers whom Mr. Gompers presented to a great company of representative men were capitalists and employers like Mr. Henry Phipps, Mr. August Belmont, Colonel Kilbourne, of Ohio, and Mr. Robbins, of Pittsburgh. Among the scores of talented leaders belonging to the ranks of labor besides Mr. Gompers himself, were such speakers as Mr. John Mitchell, of the United Mine Workers, and Mr. Morrissey, of the Railway Trainmen, and as representing the general public were President Eliot, of Harvard, Archbishop Ireland, and Mr. Oscar S. Straus. Mr. Andrew Carnegie had been with the Federation through the day, and was represented at the banquet by a paper read for him by Mr. Ralph Easley, the organizer and executive officer of the body. The vacancy in the office of the president caused by the death of the late Senator Hanna was filled by the election of Mr. August Belmont, the New York banker and capitalist, who is also at the head of the New York Underground Railway, and in that and other capacities has come into relationship with organized labor. Last fall, questions and disputes of various importance relating to the hours, wages, and other conditions of men employed in the Subway were finally settled by direct conference, in which Mr. Belmont himself took a leading part. His remarks at the Federation dinner were mainly ~~and to the point~~, and he promised in brief language, but with evident sincerity, to use his best efforts for the success of the work of the Civic Federation and for the promotion of these principles for which it stands.

The great doctrine for which Mr. Roosevelt in many an utterance has made a strong plea, and which he set forth again in an address to the members of his own church, Grace Dutch Reformed, of Washington, on December 15, is the doctrine of brotherhood. While it is perfectly true that lofty generalizations alone will not settle the hard workaday problems that men meet in the carrying on of their business affairs—and while it is doubtless true, as John Mitchell holds, that for the present, in matters industrial, the best safeguard for peace may lie in the ability to fight—the man who does not see how valuable it is to establish kindly personal relations, and to cultivate a love for justice and a sense of mutual regard, is a man not only of low conscience, hut of narrow and meager mental development. There remain some heads of great corporations and some large employers of labor in this country who regard with distrust, and even with abhorrence, the leaders of organized labor; yet no impartial judge at the Civic Federation dinner would have assigned to the labor leaders any lower rank either in character or capacity than the capitalists and financiers who sat at the same table with them, or the numerous representatives of the press, the church, and the university. Undoubtedly, in directness and in force, the labor leaders were better public speakers than any of the other elements that made up the body.

AN AID TO ORGANIZED LABOR.

United Mine Workers' Journal.

Every man possessed of a lucid mind and whose thoughts are not gangrened with saturnine political bias hails the work of the Civic Federation with emotions of delight, and knows that the cause of organized labor is stronger, far better equipped to present its case favorably to a hostile or indifferent public when backed by such force as met that night. The Civic Federation will not hesitate in its glorious career simply because Messrs. Hayes, Parry, Berger and Kirby do not approve. The Civic Federation stands for industrial peace. It would disarm hostile forces, it would bring distrustful employer and employer together, and have them get acquainted, free their minds from mutual aversion and upon the grounds of justice arrive at an amicable solution of their contentions. It would substitute arbitration for the strike, conciliation for the lock-out, the hand-clasp for blacklist, friendship for the boycott. In a word, it would remove the causes for the present industrial strife and bitterness and use common sense and equity in their settlement. That would bring industrial peace. But "Comrades" Hayes and Parry do not want peace. "Comrade" Hayes wants strikes, riots, bloodshed; he wants to embitter the hearts and minds of working men against their employers. He preaches Christ and practices Satan. "Comrade" Hayes' great desire for industrial turmoil arises from the fact that through some devious mode of reasoning he comes to the conclusion that the bitterness necessarily arising will swell the ranks of his political cult. "Comrade" Parry desires the same thing, but for a different purpose. He would have these belligerent exhibitions so that the armed forces of the State could be summoned to strangle organized labor, and thus crush out the last hope save revolution. It is quite evident that "Comrade" Hayes never was personally concerned in a strike. He evidently knows nothing of its appalling results upon the women and children. It was a noticeable fact that those labor leaders of whom "Comrade" Hayes speaks so slightly—Mitchell, Mahon, Keefe, Moffitt, Tobin, O'Keefe et al.—have led the greatest and fiercest industrial wars of a generation. When these warriors who know what such things mean, have seen them, been in them, led them, gladly welcome a course which will prevent their recurrence, it is not of the slightest import what figurative warriors such as Hayes and Parry think or say about

them. Was "Comrade" Hayes ever in a strike? Was he ever blacklisted? Were his thoughts ever haunted by day and his dreams at night of a wife and little brood desolate, perhaps dead? Did he suffer an eviction, face the winter's storms, hungry, ill-clad, a stranger in a strange town? Did he ever face a Pinkerton, a servile sheriff or an angry militiaman? It is prima facie evidence that he never did any or all of those things, else he would not so glibly advocate their continuance.

The Civic Federation, despite the sneers of the Hayes-Parry cults, have prevented more strikes, which would have involved more men than the aggregate of membership in both cults. And it is going to go on in its grand mission, will be successful, will give peace and dignity to employee and employer. The twin-cults will doubtless assail Mr. Belmont, the new President, just as they caricatured, lampooned and vilified the first President with equally fruitless results.

A PLATFORM FOR EXCHANGING VIEWS.

The Outlook, New York.

The National Civic Federation held its annual meeting in this city last week. The large and representative attendance of members and guests, the interest displayed in its department conferences and committee meetings, and the significant quality of the speeches at the successful social dinner which closed the three days' gathering, seem to indicate that the Federation is a sound organization and is likely to have a permanent usefulness. It was established about four years ago, for the purpose of dealing in a large and fundamental way with the labor question. Its aim is to bring together in counsel the three parties of every labor conflict—the employer, the employee, and the public. In accomplishing this aim the officers of the Federation have been surprisingly successful, for the list of those actively interested in its conferences and work includes the names of some of the most distinguished capitalists, labor leaders, and public men in the country. The late Senator Hanna was its president from 1902 until his death, and it has seemed to *The Outlook* that perhaps he performed the very best work of his public career in its organization and direction. The Federation has done something more than to collect and publish facts regarding the labor question, or to hold conferences, or to furnish a platform for the expression of opinion; it maintains a Department of Welfare, which concerns itself with the physical and social conditions of working men and women; and through its Department of Conciliation it has been able to settle some labor disputes which have never come to the knowledge of the public, and which, without such a settlement, might have developed into disastrous labor wars. Admirable as this practical work is, *The Outlook* is inclined to think that not the least important function of the Federation is, after all, to provide a platform upon which men with vital interest in the labor problem, hut with varying and often radically antagonistic opinions about it, may meet one another and exchange views. The annual dinner was a picturesque illustration of what may be done in this direction. August Belmont a great railroad capitalist and operator, and P. H. Morrissey, a railroad brakeman, now Grand Master of his union; Henry Phipps, a great steel master and employer of an army of steel workers and coal miners, and John Mitchell, a coal miner himself and a master-mind of trades-unionism; President Eliot, of Harvard University, and Samuel Gompers, originally a cigar maker and now a national leader of organized labor—all these sat at the same table, ate together and talked together, without in the slightest degree sacrificing their own independent views, but entirely respecting one another's personality and opinions. As Mr. Mitchell said in his after-dinner speech, "It is better to talk a week than to strike a year." A very large proportion of labor conflicts spring in the first instance from personal misunderstandings and their consequent irritation and friction. When men are willing to try to understand one another, such controversies can very often be adjusted by a little patient discussion.

IN A PEACEFUL WAY.

Staats Zeitung, New York.

An undertaking as represented by the National Civic Federation is, of course, utterly impossible in Germany, where only a few years ago an official representative of a manufacturers' association in the course of a discussion of reform propositions, said that the "captains of industry" would never consent to meet the workmen on an equal basis. It must be acknowledged that the association rests upon the fundamental principle of social equality of employees and employers, and thereby has already removed from its sphere of activity contrasts existing in other places and has made to a great extent compromises superfluous.

The solution in a peaceful way of the existing questions in dispute between the two economic parties is thereby really being put into practice. What has been stated at the banquet, which followed the annual meeting, shows how the association—by means of the aid of that fundamental principle of equality—has been productive of much good in many directions. Having contemplated at the beginning only the paving of the way for a mutual understanding and appreciation, as the principal aim of its activity, the object of the association has been, meanwhile, enlarged. Credit is due for this, partly to the committees, who have made efforts to solve practical questions in practical ways, and to remove dissensions wherever they appear. This activity of mediation is supplemented by an educational one carried on by speeches and writings, and the agitative activity resting on the establishment of sound conditions of agreements between employers' associations and trades-unions, as well as on suitable changes of existing laws, seeks to prevent the breaking out of differences, and especially the disadvantages of economic struggles.

ONLY POSSIBLE IN A DEMOCRACY.

The Western Laborer, Omaha.

We have received the National Civic Federation MONTHLY REVIEW, containing a full report of the meeting, banquet, business transacted and addresses delivered after the dinner in New York. In this age of sharp practices, commercialism and fierce struggles between the contending forces of capital and labor, it is a pleasure and hegeta hopefulness for industrial peace in the minds of those interested enough to note the progress being made by the National Civic Federation.

The meeting was such an assembly (as was tersely remarked by Samuel Gompers, August Belmont, Archbishop Ireland and others) as could not be gathered together in any other nation or under any other flag in the world. Such a meeting is only possible in a democracy and under such institutions as ours. The members of that gathering were all "men of affairs," embracing in their representative character capital, labor, letters, science, bar, press, platform and church, and through the whole deliberation of the meetings there was an atmosphere of earnestness, honesty of purpose and a sincere desire to arrive at a basis whereby the disturbances which affect our industrial life so disastrously from time to time could be lessened and our social life amended for the benefit of all our people.

President's Roosevelt's duties prevented his being present, but he sent a letter of regret in which he voiced his hearty accord, sympathy and hopes for the practical success and full recognition of the principles for which the federation is earnestly working.

A letter from Andrew Carnegie on the objects, aims and plans of the organization was also read, in which that hard-headed Scotchman gave utterance to more honest truths than have ever been credited to him before: the letter being replete with sound advice acquired by stern and costly experience.

Take the meeting for all in all it was a parliament of the

world, as its work will affect the world beyond the seas and become an agent for international peace abroad as well as industrial peace at home.

When this organization was proposed it was pooh-poohed by the great dailies, the subsidized organs of corporate monopolies, but the time is not far distant when it will crystallize more public sentiment in a given direction than all the big newspapers in the United States, hearing full tribute to the genius of the late M. A. Hanna, who conceived and founded it. This is one of the instances where the genius of the dead lives on to work for the living and his country. These meetings were addressed by men of all classes, making no special pleas for their class; they met on a plane of perfect equality, a perfect democracy, where the capitalist, Belmont, listened to the coal miner, Mitchell; where the archbishop, Ireland, and the Protestant bishop, Potter, paid respectful and earnest attention to the arguments of the longshoremen, the street-car men, the printer, bricklayer, etc., and where all these many classes of our industrial life in perfect good faith listened to the views of the builder, the banker, the college professor, the editor, the churchman, and all the other classes in our social life represented there; where no "class consciousness" was to be seen or felt anywhere, and where a common mutual confidence and honesty of purpose pervaded the entire atmosphere.

MR. AUGUST BELMONT IN A NEW ROLE.

New York Times.

The unanimous and even enthusiastic election of Mr. August Belmont to the presidency of the National Civic Federation, an office made vacant by the death of Senator Marcus A. Hanna, is a gratifying indication that the work of that body commends itself to the approval of men of affairs who are much too busy to have leisure for dilettante trifling with economic and social problems. That his nomination was so obviously acceptable to the labor men who took part in the election shows that they are outliving class prejudice, and that the possession and management of great wealth does not disqualify a man for their respect and confidence.

In this instance there is no reason why it should. Mr. Belmont is a workman of great industry. The wage-earner who had to carry a tithe of the cares and responsibilities of this organizer and manager of great enterprises would feel himself burdened beyond his strength. Mr. Belmont's sympathy with honest toil may be assumed from the fact that he earns his rest, when he has it, by the most systematic devotion to business. As one of the largest employers of labor in New York he has had intimate contact with the problems it constantly offers for wise and intelligent solution. His success in averting troubles threatened from time to time in the operation of the railways for which he is responsible shows that he does not lack patience or discretion. Finally, his willingness to undertake the duties of the presidency of the Civic Federation and to promise their faithful performance shows an unselfish and broadly humanitarian purpose to make his activities and his experience of benefit to others.

We wish him satisfactory success in every effort to promote industrial peace. That he will not be a figurehead, leaving to others the work for which he assumes responsibility, those who know him are assured.

APPROVED BY LABOR AND EMPLOYERS.

Indianapolis Sentinel.

Among the labor organizations of the East, as well as in the councils of the most level-headed and conservative employers of the industrial centers, great satisfaction is expressed over the elevation of August Belmont to the head of the National Civic Federation, the great organization in which employer and employee are so well represented.

The action of the national organization at its annual meeting and banquet at the Park Avenue Hotel, on Thursday evening, is looked upon as the forerunner of a better order of things and a step toward the great work of bringing about more amicable relations between capital and labor. In the presidency of the organization, which was so well filled by the late Senator Marcus A. Hanna, August Belmont, it is believed, will do all in his power to bring both great factions in the industrial life of the nation toward that goal when each will give due recognition to the rights of the other, while carefully safeguarding its own. In no uncertain manner Mr. Belmont has announced his views on the labor problem. He declared plainly in his address to the body that elected him its president, that he is "a believer in organization," and that he sees hope for the settlement of all American labor troubles through the medium of conference between representatives of organized employees and organized employers.

This conviction on the part of a man who is head of one of the greatest financial firms in the world, and who is himself a director in no less than thirty-five great corporations employing thousands of men, is regarded as a rebuke to those extremists among the employers of the country, who believe that "organized labor ought to be given no quarter."

MR. CARNEGIE'S TRUTHFUL ANALYSIS.

Boston Herald.

It is an interesting point that Mr. Carnegie makes in his communication to the Civic Federation, calling attention to the fact that while labor disturbances break out at frequent intervals in the manufacturing and mechanical occupations, nothing of the kind ever occurs in agriculture, which employs more than ten millions of workers. Mr. Carnegie accounts for this by saying that the relations of the farmers and the farm hands are always personally pleasant. They become interested in each other, and mutual esteem, often ripening to affection, insures not only peace, but good will. There's a lot of truth in this analysis.

RAILWAY PROVIDENT INSTITUTIONS.

(Concluded from page 16.)

of the allowances absolutely without cost to the employee and wholly from the revenues of the roads concerned, no distinction has been drawn as to rank or condition of employment. All employees, from the chief executive down to the man holding the humblest position in the service, are, one and all, amenable to the governing provisions. Generally there has been no distinctive classification of employees into "salaried officers" and "wage-earners," as is the practice in other countries, but, instead, all share alike, in accordance with their service status, in the benefits growing out of Fund operation.

These provisions for sick, injured and aged employees, and designated beneficiaries in the event of their death, in conjunction with the various opportunities for mental, physical and spiritual betterment, are actuated by truly humane and benevolent purposes and in their continuous development are bringing about a reciprocal feeling of mutual regard and respect between capital and labor. Conditions are being improved and at the same time energy is being vitalized and ambition stimulated among the rank and file of railway employees.

The National Civic Federation Review

Vol. I. No. 12

NEW YORK, MARCH, 1905

TEN CENTS

LABOR WRESTS VICTORY FROM DEFEAT.

NATIONAL LABOR CHIEFS CHAMPION THE SANCTITY OF CONTRACTS AND INSIST UPON THEIR PRESERVATION BY SUBORDINATE BODIES.

"THERE will be no strike," said Grand Chief Warren S. Stone, of the Brotherhood of Locomotive Engineers, to August Belmont, President of the Interborough Rapid Transit Company, two weeks before the strike. "You need not hesitate to go away on your vacation. If any disagreement arises between the management of the road and our local committee, it will be referred to you and me. If we cannot agree, we will refer the dispute to an arbitration committee of six, each selecting three." To this Mr. Belmont replied: "All right, Mr. Stone, and if we get to that point you can name all six of them."

This colloquy closed an interview between Mr. Belmont, Mr. Stone and a local member of his organization concerning the negotiations then pending between General Manager Hedley of the Interborough and representatives of its employees, over a new schedule and other questions. Mr. Belmont had said that he was anxious to make his annual trip South, which he had already delayed two weeks, but that he did not wish to go away if there was to be any trouble between the company and its employees.

That Mr. Belmont had ample cause for asking whether he could go away on his vacation without feeling that there was danger of interruption to the public service of the corporation of which he was the responsible head must have been clear to any observer of incidents prior to that interview. As long ago as January 24 there had been loud talk of a strike, unless certain concessions were made. A conference was brought about between Vice-President Bryan, General Manager Hedley and the employees' grievance committee. This committee included Messrs. Jencks, Pinney and Pepper, the heads, respectively, of the local branches of the Engineers' and Firemen's Brotherhoods and of the Amalgamated Association of Street and Electric Railway Employees of America. The demands presented were for the re-employment of a subway motorman, who had been dismissed after his train had crashed into another at the Worth Street Station; for the re-employment of three other discharged motormen; for automatic signals on local tracks; for a new schedule, and for various changes

in the methods of employing men. This conference adjourned for two days, Mr. Hedley announcing that everything had been discussed amicably, although nothing had yet been settled. When told of this

and he will find it out at the conference next Thursday. Our grievances will have to be settled. The unions will stand by several motormen who have been discharged." The conference was resumed on January 26. At its conclusion,

it was announced that the cases of the discharged motormen had been adjusted satisfactorily, and that a new train schedule was to be made. Messrs. Pepper, Pinney and Jencks all said that they were "satisfied," and naturally were in high glee at what they considered a victory over the management of the road. "All our demands were granted, down to the right of seniority in appointments and the fifteen minutes' rest after every trip," proclaimed Jencks.

Several days of quiet ensued. But suddenly more trouble arose. The new schedule was put into effect, but it did not please the men. Under its contract with the city, the Interborough Company was required to run trains at a speed of thirty miles an hour. This speed could not be attained until its men had learned thoroughly the handling of the trains. It was intended to increase the speed gradually until it should reach the required maximum. As the three years' contract with the motormen named no number of miles to be run within the specified ten-hours' work-day, General Manager Hedley in his new schedule added one run a day for each train, by increasing the speed. This schedule had been in effect only a few hours, when Mr. Pepper called up Superintendent Merritt on the telephone and in a peremptory manner demanded: "What does this extra trip mean? This is inhuman. It increases our runs to 160 miles a day. Unless that schedule is taken down there will be something doing. The men won't stand for it." Mr. Pepper was told that he would have to see General Manager Hedley, as the Superintendent had no authority to change schedules.

Accordingly, the next day a committee representing the Interborough employees demanded of General Manager Hedley that the new schedule be taken down. Mr. Jencks declaring publicly, before the conference: "Unless the officials change their schedule to-day, there will be a

statement, Mr. Jencks said testily to the reporters: "Mr. Hedley gave you a sweet talk, and he may think that everything is all right. But I tell you that things are much more serious than he would have you think,

Jencks declaring publicly, before the conference: "Unless the officials change their schedule to-day, there will be a

AN ECONOMIC EXHORTATION TO ORGANIZED LABOR.

EMPLOYEES SHOULD INCREASE EARNINGS BY UNRESTRICTED INDIVIDUAL OUTPUT, SEEKING STEADY WORK AND STUDYING CONDITIONS OF THEIR PARTICULAR INDUSTRY.

An address by LOUIS D. BRANDEIS to the Boston Central Labor Union.

TRAD unionism has made great advances within the last three years. The growth in membership has been large, but the change in the attitude toward unions both on the part of the employer and of the community marks even greater progress. To this result the anthracite coal strike, so wisely led by John Mitchell, has largely contributed. That struggle compelled public attention to the trades-union problem in a degree unprecedented in this country.

The arbitrary attitude of the presidents of the coal and railroad companies was an object lesson which made clear to many employers the unreasonableness of the position that an employer "must be free to run his own business in his own way."

From this warning example many employers learned also that one may deal with employees otherwise than directly or individually, and that the representatives of unions may be recognized without impairment of usual business honor. Since then it has become far more common for enlightened employers, whether their shops be union or open, to discuss labor problems with the representatives of the unions as freely as they would discuss other problems with other business connections.

The people at large who had no special interest in contests between employers and employees learned also through the coal strike much about unions. Sympathy was generally with the men as against the coal trust. Even among employers there were many who realized that their interests lay with the workingmen as against the great aggregations of capital.

IN THE MAIN COMMENDABLE.

Sympathetic attention being drawn to the unions, many people realized that the aim of the unions was in the main commendable, even if particular measures of unions or acts of individual unionists deserved condemnation—for who could deny that the work of the unions in seeking to improve the conditions and to shorten the hours of labor, to raise wages—to protect children and women—made for good citizenship and the general welfare of the community? The attitude of the American Federation of Labor in opposing socialism is also gaining for the unions support from the most conservative classes.

A substantial advance has thus been made by the unions in the estimation of working men, of employers and of the public.

The achievements of the unions in improving the lot of the laborer are not to be measured solely by conditions in the union shop or even in the non-discriminating open shop.

Unions may well point, as their greatest triumphs to certain establishments where no unionist is to be found, but where the conditions of labor are far in advance of the standard ordinarily prevailing. Those are instances where wise, far-seeing employers have acted upon the spirit or hint of union demands.

These steps in advance have been taken often for the purpose of preventing trades unionism from finding a lodgement, often unconsciously as a result merely of the enlightenment that comes with the necessary thinking that trade-union agitation compels.

So the unions have already achieved much, both directly and indirectly, in shortening the hours and in improving the conditions under which labor is performed, and in raising wages.

How far can this increase in wages be carried, and how shall it be accomplished?

LABOR'S RIGHTFUL SHARE.

First—The unions should strive to secure for the workingmen all the earnings of a business except that part which is required to get for it the necessary capital and managing ability.

Into most businesses three elements enter:

- 1—The capital.
- 2—The ordinary labor.
- 3—The special labor, usually called the "management."

The owners of capital are comparatively few in number; the possessors of the special ability to manage business still less in number; men competent to perform the ordinary labor very numerous.

Obviously in our country we should strive to conduct our industries as we do our government; that is, to secure the greatest good for the greatest number. The employees being the greatest number, should get of the fruits of the business as much as possible. This is clear. The question is merely, What are the limits now possible, and how can those limits be extended?

It is absolutely essential upon any scheme of division of the fruits of industry among employer, capi-

talist and employee that the business should be profitable. By "profitable" I mean not merely that the business shall not be run at a loss, but that the business shall be run under such conditions that the owner of the capital on the one hand is willing to risk his capital in the business, and the possessor of that special ability which is required to organize and conduct a successful business will be led to use his greatest efforts in that direction.

Unless the profits of businesses are such as to tempt capitalists to risk their money, the money will seek, not participation in business, which necessarily involves great risks, but will be put into classes of investment where there is supposed to be no risk whatever.

Unless men of exceptional business ability have the promise or possibility of large rewards they will not be led to develop or use those special talents or capacities which we find in the leaders of great businesses—the men who have made or managed them.

What the exact amount of profit is which is necessary to make men risk their money in business, and how great the rewards must be in order to develop the leaders of industry are, of course, matters which cannot be decided by any general rule.

STRIVE TO INCREASE EARNINGS.

Second—The employees should strive to make the earnings of any business as large as possible.

There can be no greater mistake for the workingman than to restrict the output of the individual.

LOUIS D. BRANDEIS,
Lawyer and Publicist, Boston.

You must make the total earnings of the business in which you are engaged the largest possible. By earnings in this connection I mean the aggregate fund available for paying workingmen, capitalists and managers. Make that aggregate large and there will be plenty for all among whom it is to be divided.

The most potent factor in securing large profits is the avoidance of waste, and the greatest source of waste in the industrial world is unused, undeveloped or misdirected human effort. To the correction of that evil trade unions should direct their attention.

Let every one engaged in the business work with the greatest possible efficiency and diligence consistent with maintaining himself in good condition to work thereafter, and leaving himself the leisure necessary to the performance of his duties to his family, to his state and for his own development and pleasure.

The hours of labor should be reasonably short; but during working hours each individual should work hard and earnestly, and under conditions leading to the greatest possible efficiency.

Any restriction upon the output of the individual reduces the fund of profits available for distribution, besides demoralizing the man who is so restricted.

It follows also that differences in efficiency between different individuals must be recognized and rewarded; and that those who can work faster and better than others must not be retarded by the less efficient. The industrial superiority of America is largely due to the absence of restriction upon individual effort; to the encouragement of the individual by giving him the fruits of his efforts.

Your federation opposes socialism, but to ignore

the difference between individuals would lend strength to socialism and communism.

LIMITATION IS WASTE.

A limitation of the production of the individual is pure waste. The business is merely rendered less profitable, and the man whose production is restricted is injured also.

Nor does the restriction of the output of the individual make more work for others. The amount of work to be done is, in a country like ours, in no sense fixed; for the amount of goods or service men buy is not fixed. The amount bought is as a rule limited only by the ability to buy.

If you waste human effort you make the product cost more. If you raise prices without increasing incomes you have simply limited the amount that will be bought. You have not made work for more people. You have merely given people less for their money.

Another great factor of waste in most businesses is the cost of inspectors, foremen and assistant foremen—men whose services are in large part required only because so many employees work, not as hard or as well as is possible but only hard enough or well enough to pass the inspector or foreman.

Every man should look out for himself, should do the work without inspector or foreman watching him like a policeman. The dishonor and the expense of unnecessary inspectors and foremen should be avoided.

Trade unions have already done much for the manhood of the workingman. They should teach him that it is a disgrace to manhood to require watching.

WORK SHOULD BE STEADY.

Third—The unions should demand for the workingman steady work.

In order that the pay of the individual may be large it is necessary not merely that the business as a whole be profitable, but also that the individual be given full opportunity to work for his share of the profit.

Most controversies between employers and employees have arisen upon claims for what is called higher wages; that is, for a higher rate per day or per piece. But the rate per day or per piece is only one of the factors which go to make up wages.

The important question is not how much a man is paid per day nor how much per piece, but how much can he earn in a year. He may have high wages and an opportunity of working only half the year.

For instance, it appeared in the anthracite coal strike inquiry that the men worked only about 181 days in the year. Speaking roughly, men should work 300 days in the year.

Lack of earnings is only a small part of the evil which results from irregularity of employment. It is the uncertainty as to a job which produces a large part of the care of a workingman's life, and the days of enforced idleness which lead to most of the bad habits.

Every man should have the opportunity of working every day in the year excepting Sundays and holidays and such time as he properly wishes for a vacation. In some trades this is impossible, but in many trades where the irregularity of work is accepted as a necessity, it would be found that if the effort were duly made the amount of slack time could be greatly reduced.

Where men are engaged in trades which on account of the physical conditions can be followed only during a part of the year, there ought to be found for them work at some other trade for the remainder of the year.

PROVIDE AGAINST IRREGULARITY.

No industrial condition can be satisfactory which does not tend to remove the thing called "day labor," which does not seek to make the work of the workingman as steady as that of the clerk or salesman.

No adequate effort to provide against irregularity of work has been made. If the unions once formulate demands for steady work and co-operate with employers to secure it, an immense improvement on these lines will undoubtedly result.

Steadiness of work is nearly as important to the employer as to the employee. For instance, the great aim of the manufacturer must be to run his factory full all the time. Many factories can earn their profit only if they do. If the factory runs all of the time, and the employees work all of the time, it is obvious that the owner can be satisfied with a much smaller rate of profit and the men can be satisfied with a smaller rate per day or per piece than they would

(Concluded on page 11.)

GREAT CAPTAINS OF INDUSTRY AND OF LABOR IN JOINT CONFERENCE.

OFFICIALS OF A GREAT RAILWAY CORPORATION CO-OPERATE IN ADJUSTING JURISDICTIONAL CONFLICT BETWEEN TWO POWERFUL LABOR ORGANIZATIONS.

IT IS a pleasure to record another triumph for the method of direct conference between the representatives of a great employing corporation and of its organized employes, in preventing industrial strife and public inconvenience. The value of this method found signal illustration in the avoidance of the threatened strike on the New York, New Haven and Hartford Railroad. The danger of this strike arose not from any dispute about hours, wages or conditions of work between the company and the employes. The question at issue was a dispute between two highly organized bodies of employes, each of them entirely friendly toward the company, but contending with each other over their representation before company officials in cases of discipline. The two organizations thus opposing each other were the Brotherhoods of Locomotive Firemen and Locomotive Engineers, and the dispute between them threatened to extend from the New Haven to every other important railway in the country.

This absence of a direct issue between the company and the employes makes all the more striking the patience and care which the company exercised in treating with the firemen and the engineers. It makes peculiarly significant the fact that a man of such large affairs and intense daily occupation in business as J. Pierpont Morgan, together with the other members of a directors' committee, Charles F. Brooker of Ansonia, Professor George J. Brush of Yale, and William Skinner of Holyoke, should willingly upon two different occasions spend several hours in conference with representatives of the firemen. It makes more conspicuous, also, the long period during which the officials of the company exhausted every effort to bring about an adjustment of the dispute between two organizations which officially and theoretically were not recognized by the company.

The trouble arose out of the claim that members of the Brotherhood of Locomotive Firemen who had been promoted to be engineers, but who retained their membership in the firemen's brotherhood, were neglected in cases of appeal by the engineers' adjustment committee. In other words, the firemen claimed that the engineers' adjustment committee was not taking up with the management cases of engineers who desired to appeal unless those engineers were members of the engineers' brotherhood. Therefore, the firemen's committee claimed that it should be permitted to represent before the officers of the road the engineers who were members of the firemen's brotherhood. This complaint was made to the general manager of the company as long ago as June, 1904. The claim being denied by the general manager, the firemen's committee appealed successively to the first vice-president and to President Mellen. Mr. Mellen, after earnest consideration, confirmed the preceding decisions, and pointed out that should the Brotherhood of Locomotive Firemen at any time have in its organization a majority of the engineers employed by the company, the question would undoubtedly settle itself.

Mr. Mellen explained: "The company has no objection to labor organizations, and is absolutely indifferent as to whether an employe belongs to a labor organization or not. The employes of different classes meet the officers of the company for purposes of making agree-

ments, settling disputes, etc., through committees selected by them from among their own number. Thus there exists an engineers' adjustment committee. Naturally, if the members of the Brotherhood of Locomotive Engineers are in the majority among the engineers, the adjustment committee is likely to be composed of brotherhood men. If the non-union engineers (of whom the road employs about 150) were in the majority, they would presumably control the committee, and if most of the engineers belonged to the firemen's brotherhood it would be probable that the committee would be composed of men of that brotherhood. This, however, is an internal matter, with which the company

men's brotherhood, stated: "The firemen are asking for nothing more than their rights. They have in their membership many engine drivers who have retained their allegiance to the firemen's organization after becoming drivers. These men believe they have some rights. We had an agreement with Mr. Hall, formerly president of the company, which lasted one year and three months. Recently the drivers have made an agreement with the company which gives them alone the right to negotiate for the drivers. This leaves those drivers in the Firemen's Brotherhood out in the cold."

In reply to this, President Mellen said: "The first vice-president, on investigation, was not only positively assured by the engineers' general committee of adjustment that it had and would in the future take up before the officers the cases of all engineers, irrespective of their union affiliations, if the cases were proper, but also produced evidence to show that all proper cases had so been taken up. The first vice-president furthermore communicated with former President Hall, who stated that in March, 1903, at the urgent request of the firemen, he had heard their committee in an individual case, that of Engineer Fox, but denied emphatically that he had made any such agreement for the future or in any other case."

Conference after conference followed, and time after time the same ground was patiently gone over without reaching an agreement. The question of a strike was submitted to a referendum vote of all the firemen, union and non-union, employed on the system, and the resulting vote was strongly in the affirmative. From First Vice-Grand Master Shea, of the firemen's brotherhood, came the suggestion of the appointment of a second adjustment committee of engineers, to be composed of members of the firemen's brotherhood. This plan was declined by the company as impracticable, because it would be in violation of its agreement with all its engineers, and because the plan would require the appointment of a third adjustment committee to represent the non-union engineers, and would compel the road to distinguish between its employes in the same class of work, but belonging to different organizations.

The subject was then brought by the firemen's general committee before a directors' committee of five, of which Mr. Morgan was chairman. This action, constituting an appeal from the chief executive of the corporation virtually to its directorate, was itself a most extraordinary proceeding.

The receiving of this appeal and its careful consideration illustrate the willingness of these representatives of large interests to exert every effort to treat labor conditions with the utmost desire to attain justice; and they are an example, also, of the diligence of directors who really direct.

The conferences of the directors' and firemen's committees resulted in sustaining the president's decision. After this decision, Grand Master Hannahan and Grand Chief Warren S. Stone, of the Brotherhoods of Locomotive Firemen and Engineers reached an agreement which is expected to heal a breach between these two organizations that was widening throughout the country.

J. PIERPONT MORGAN,
Financier.

CHARLES S. MELLEN,
President, N. Y., N. H. & H. R. R.

WARREN S. STONE,
Grand Chief, Brotherhood Locomotive Engineers.

Grand Master, Brotherhood Locomotive Firemen.

has nothing to do." After further conference with Grand Master J. J. Hannahan, of the Brotherhood of Locomotive Firemen, and A. P. Kelly, chairman of the firemen's general adjustment committee, President Mellen again reviewed the subject carefully with the general committee of adjustment of the engineers, asking that committee if it could not possibly assent to the demands of the firemen's committee, thus releasing the company from that particular phase of its agreement with the engineers. The engineers' committee could not see its way clear to assenting to this suggestion. The committee of engineers was agreeable to arbitration, but this was declined by the firemen's committee on January 13 and 16 last.

First Vice-Grand Master Timothy Shea, of the fire-

COMPREHENSIVE AIMS OF TRADE UNIONISM IN GREAT BRITAIN.

MARKED PROGRESS IN THE COLLECTIVE CONTRACT, CONFERENCE AND CONCILIATION, AND IN ORGANIZING, HOUSING AND EDUCATING UNSKILLED WAGE-EARNERS.

By JAMES WIGNALL, of Swansea, Wales, General Organizer of Dockers' Union; Fraternal Delegate to the American Federation of Labor.

THE main difference that I observe between the development of trade unions in our country and the United States is that the movement in England has for its broad aim the accomplishment of all things that are for the benefit of all the people. Thus, while higher wages, shorter hours and better conditions of labor are primary objects, the English trade movement also concerns itself with the social life and with the education of the workers and with everything, in short, that its constituents believe will contribute to the prosperity of the country. The movement endeavors to cultivate among the masses self-respect, and to teach constantly the lesson that any individual good must come from self-exertion.

There has been among British employers much antagonism against trade unions. Some employers have looked upon the movement as an unmitigated evil; some other employers have become reconciled and have thought it something to be conciliated temporarily, that in time would pass away; other employers and, I am glad to say, a large majority of them, have now come to realize the right of labor to the collective bargain, the right of labor to sell its commodity, through combination, at the best price that can be obtained. This change has grown progressively, and chiefly during the last ten years. During that period both sides have learned much. There have in the past been too many strikes and too many lock-outs, because both parties have been anxious for industrial strife rather than industrial peace. But experience has gradually taught that it is far better to resort to conciliation than to the bitter arbitrament of strikes or lock-outs. Thus there has been evolved a large number of courts or boards of arbitration. The result is that now about 70 per cent. of all the disputes between employers and employed in England are thus adjusted without trouble. For example, in the mining industry, there is a Board of Conciliation, composed of an equal number of representatives of the mine workers and of the mine owners. If this Board fails to agree, there is an independent chairman, to whom the case is referred. He hears the arguments on both sides, and his decision is always accepted. This method has averted trouble in the mining industry for several years.

The tin plate industry—once nearly ruined by the American tariff, but now, through the recovery of markets in other parts of the world, in a better condition than ever before—was formerly notorious for its labor troubles. But five years ago a Board of Conciliation was created, composed of representatives of both sides. This Board has made yearly agreements. Its agreements are now in their sixth year and during that time the industry has had only one slight dispute, which was settled by arbitration.

Another example is the agreement in Bristol between the dock-workers and the merchants. Under this agreement, each side deposits £600 with two elected trustees. This deposit is a security that each party shall carry out the agreement. Upon only two occasions has there been any dispute, which, in each case, was decided by an umpire, the decision including the amount of the deposit to be paid as damages. In one of these cases the agreement was violated by the men, and in the other by the employers. There is every probability of an indefinite continuance of peace under this agreement.

The question that I have observed as uppermost here—that of the open shop—has also troubled us during the past ten years, although under a different name. With us the open shop means the "Free Labor Association." Out of the efforts of that organization have grown great suffering, dislocation of trade and loss of money. I have seen its efforts supported at the point of the bayonet, when soldiers and police were protecting non-union men at work. But in every case the struggle, after two or three months, has collapsed and amounted to nothing. The "Free Labor Association" has upon the whole not resulted in a gain for the employers, but rather in a loss. For every shilling in labor cost that they have saved, they have spent a pound in trying to carry out, and without avail, their program.

Our general attitude is this: We recognize that the employers have a right to employ the cheapest labor they can find in the market. We ask the same right, to get the best price that we can exact for our labor. We find it the best plan to bring these two rights into harmony by sitting around a table and winning the battle one way or the other by the force of argument and reason instead of resorting to physical strife.

Previous to the last fifteen years there was practically no organization in England among the unskilled workers, such, for example, as the dock-workers and the general laborers; but after the London

dock strike of 1889, a great wave of organization of unskilled labor swept all over England. The success of this movement has been wonderful. In my own town of Swansea, fifteen years ago, the dock laborers were hanging around all hours of the day and night waiting for work. Rarely did they see the merchant with whom this work originated. It was passed down from him through one middleman after another until it reached the dock foreman. This dock foreman invariably kept a saloon. Only the man who would drink at his saloon could get a job. The man who could hold the most, who had the longest string of check marks behind the door, could get the best job. When the man was paid at the end of the week he would be paid in a saloon. One pathetic result of this system was the spectacle on every Saturday night in the market street of Swansea. There you would see scores of women waiting about hour after hour with their baskets. A stranger would ask in wonder what were these shivering, half-clad creatures doing. The explanation was that their husbands were all in the public houses, waiting for their pay. The saloon keeper and foreman would be busy serving his customers and he would delay paying the men as late as possible. He would even keep them waiting until the legal hour of closing. Then many of them were often

JAMES WIGNALL,
General Organizer, British Dockers' Union.

turned out without a cent to give their wives for food, and in debt for the coming week.

When the dock-workers organized it was resolved to bring this system to an end. Before they asked for higher wages, or shorter hours, or better conditions, they first made one demand. This was that the workmen should be employed directly by the principal; that no saloon keeper should be an employer; that no workman should be paid from a saloon, and that no worker should be kept out of his money after Saturday midnight. The result of granting this demand has been that the wages of the dockworkers have increased, on the average, 100 per cent. over fifteen years ago, and at the same time the cost of labor to the merchant is not a cent more, because of the elimination of the middleman.

The next step of our union was to begin to teach the men, many of whom could not even read or write, in the evening classes. Gradually the workers began to understand that they were real human beings quite like others, and that their children were like the children of others. The result of this discovery was a change in their lives that seems incredible. They had emerged from degradation. In our town alone, the Dockworkers' Union has had one mayor, one alderman, seven members of the City Council, two members of the Harbor Board, fourteen members of Boards of Guardians, and one auditor. These changed conditions in Swansea only illustrate an equal change in many other towns and cities in England.

Meantime our trades unions undertook a war against slumdom in many cities. We argued that if you wish to have good people it is necessary to give them good surroundings. We discovered that the wretched quarters in slumdom were returning enormous profits to the owners. The conditions in the alleys and tenements were such that their inhabitants were practically living in the saloons, which were bright and warm. We held meetings, appointed investigating committees, and secured tabulated state-

ments. In this way we caused existing laws to be enforced. Then we secured the passage of a law authorizing city councils, in cases where the towns owned suburban land, to build houses in the country and to run cars for workmen for a through fare of one penny between the hours of 5 and 8 A. M. and 5 and 8 P. M. Many cities have done this, and now have in the beautiful country workmen's cottages containing six rooms and a bathroom. When it was first proposed to put bathrooms in the workmen's cottages there was a great outcry: "Bathrooms for dockers! How absurd! They won't use them." But we said, "Only try them and see." The result is that now hundreds of families, born and reared in slumdom, own beautiful, bright homes in the country. The infinite good that this has done and is doing to the rising generation is one of the boasts of our trades unions. It is producing a better type of manhood and womanhood, and has infused great communities with a better spirit. All this has been accomplished in the last fifteen years.

The English trades unions have fought everywhere for good schools, furnished with the best teachers and the most beautiful and complete equipment. It frequently happens that the most beautiful school is situated in the poorest district of the city. Our Trades Union Congress is fighting persistently to increase the school age. This we have raised to fourteen years, and hope to increase it in another year to fifteen. Our Trades Union Congress discusses all social economic questions, and promotes such legislation as it believes will be for the benefit of the entire community. Our labor representation committee is an offspring of our Trades Union Congress. It aims to secure labor representation in all municipal boards and in Parliament. Each member of the organizations represented in the Trades Union Congress contributes one shilling per annum toward the expenses of representation in the House of Commons. In that body we now have fourteen members, and we have forty candidates ready to go to the country whenever Parliament is dissolved. In this way we have created a labor party in Parliament distinct from either of the other parties, which is constantly working to secure legislation for the good of the whole country.

As a further step we have brought about the Workmen's Compensation Act. This legislation was necessary because of defects in the former Employers' Liability Act, which caused the non-suiting of ninety-nine out of every one hundred actions, on the ground of "common employment," or of contributory negligence. Under the new law any injured employee may receive during life not over £1 a week, or, in case of death, from £150 to £300 to go to his dependents. This money is welcome enough to those injured, or to the heirs of those killed. But of far more value than the money is the effect of the law in causing the employers to take every precaution against accidents. The act has proved efficient in preventing accidents, and has reduced immensely the number of working people killed or injured in the course of the year.

NEWSPAPERS POINT THE WAY TO PEACE.

(Concluded from page 5.)

then the president of the International Typographical Union guarantees the subscribing publisher against strikes, boycotts, and any concerted interference with the peaceful operation of his office.

"In very many cases this contract has operated to prevent serious labor disturbances, and, conversely, to prevent the granting of unreasonable demands for the increase of wages. Therefore, there is every desire to continue the contract in force at least until its expiration, May 1, 1907.

"A similar agreement with the International Printing Pressmen's and Assistants' Union dates from 1902. We have had no friction in carrying out this agreement. In nearly every case expiring individual contracts have been renewed by conciliation, while in only one case has it been found necessary to resort to arbitration.

"As the printing trades are more thoroughly organized than almost any other in the country, the skilled men in those trades, outside of the union, are to say the least not plentiful. Therefore, as to the question of the open shop, it is a condition and not a theory that confronts us. The scarcity of non-union printers practically compels the publisher to deal with the unions. Before the existence of these contracts the question asked by the unions was 'How much wages can the employer be forced to pay?' The rule of arbitration now decides what it is reasonable to pay in each case under all the circumstances."

GREAT AMERICAN NEWSPAPERS POINT THE WAY TO INDUSTRIAL PEACE.

THE OPERATION OF THE LONG-TERM CONTRACTS BETWEEN THE AMERICAN NEWSPAPER PUBLISHERS' ASSOCIATION AND THE TYPOGRAPHICAL AND PRESSMEN'S UNIONS.

THE nineteenth annual convention of the American Newspaper Publishers' Association, which closed its proceedings in New York City with a dinner on the evening of February 24, was notable for the harmonious celerity with which it dispatched a large volume of business. The following addresses were delivered: "The Newspaper Man," Postmaster William R. Willcox; "The Newspaper," Colonel George Harvey; "The Newspaper in Politics," D. Cady Herrick; "The Man Upstairs," William H. McElroy; "The New Member," Lafayette Young, and "Breaking Into the Business," William McM. Speer.

These officers were elected: President, S. S. Rogers, *Chicago Daily News*; vice-president, W. L. McLean, *Philadelphia Bulletin*; treasurer, E. P. Call, the *New York Commercial*; executive committee, W. P. Weston, *Seattle Post-Intelligencer*; C. H. Taylor, Jr., *Boston Globe*; Colonel Cabiness, *Augusta Chronicle*, and C. H. Herrick, *San Francisco*.

The harmonious nature of this convention of an employers' association was chiefly due to the existence of a trade agreement with two corresponding organizations of employees, the International Typographical Union and the International Pressmen's and Assistants' Union of North America. Before the existence of these contracts, a large proportion of the annual meetings of the publishers was devoted to the discussion of labor troubles. But with the smooth operation of the local and national machinery of conciliation, conference and arbitration which these trade agreements provide, the business of publishing the great dailies of the country progresses with regularity as assured as the almost human-like operation of type-setting machines and lightning presses. More than \$40,000,000 of capital is represented in this publishers' association, while the membership of the unions with which it deals numbers hundreds of thousands.

These contracts rank among the other most conspicuous and important trade agreements in the United States, such as those between the interstate organizations of bituminous operators and the United Mine Workers of America; between the anthracite operators and miners, under the award of the Anthracite Strike Commission; between the Lake Carriers' Association and the International Longshoremen. These are the agreements involving the greatest amount of capital, the largest number of wage earners and that have exhibited the highest degree of success in adjusting differences through conferences, with a resort to arbitration in the background. The agreements between the Newspaper Publishers' Association and the two unions of employees are most elaborate in their provisions for arbitration. The agreement with the International Typographical Union, as does that with the Pressmen's Union, combines three features designed to make secure the result of arbitration. These are a pledge by both parties to accept the decision as final and binding; a pledge that there shall be no strike or lockout pending the decision; and a penalty for refusal to abide by the decision.

These agreements provide for a graded system of appeals from local boards to a national board of arbitration. The typographical national board consists of the

President of the International Typographical Union and the Commissioner of the American Newspaper Publishers' Association, or their proxies. In the event of failure to agree, these select a third member in each dispute, who acts as chairman of the board. The finding of the majority is final, and must be accepted as such by both parties to the dispute. When the two original members of the National Board differ as to the interpretation of the trade agreement, the difference is referred to a Joint Conference consisting of the three members of the executive council of the unions and the three members of the special standing committee of the publishers' association. If these disagree, to quote the code of procedure: "The

the daily press, exert a combined influence in the decision.

The argument most frequently advanced against the trade agreement as a method of industrial peace is that the trade union cannot be held legally responsible for the fulfillment of its part of a collective contract. But in addition to its pledges against strikes or lockouts, and to accept the result of arbitration as final, the typographical agreement provides that, "in the event of either party to the dispute refusing to accept or comply with the decision of the National Board of Arbitration, all aid and support to the firm or employer or local union refusing acceptance or compliance shall be withdrawn by both parties to this agreement. The acts of such recalcitrant employer or union shall be publicly disavowed, and the aggrieved party to this agreement shall be furnished with an official document to that end." Although the form for local contracts does not contain this provision, it does pledge the International Union to protect the employer in case of violation of the agreement of the local union. This is a strong re-enforcement of the other features to ensure acceptance of the result of arbitration namely, the mutual pledge in advance to abide by the decision, and the abstinence from rupture during the settlement of a controversy.

One outcome of the typographical contract is that a representative of the International Typographical Union usually attends, by invitation, the annual meeting of the publishers' association, and, conversely, a representative of the publishers is usually present at the annual convention of the union. This interchange of courtesies tends to promote mutual confidence between the two organizations in their respective good will and intention of fair dealing. The task of representing the publishers at the conventions of the union, and in all matters relating to questions of labor and the formation and interpretation of local contracts rests with Frederick Driscoll, who has been commissioner of the publishers' association since its formation of the standing committee on labor in 1900.

Commissioner Driscoll says of the history and operation of these contracts: "The association created at its annual meeting in 1900, after some severe experiences with strikes and labor troubles, a special standing committee to establish a bureau of labor. At that time about 80 per cent. of our publishers had trade relations with local unions. It became evident at once that it was necessary to make our arrangements with the International Union, which alone had power to regulate the locals and keep them in

check. Accordingly a plan of arbitration with the International Typographical Union, covering the composing room, stereotype, mailing, and photo-engraving departments, was ratified by the publishers' association and also by the International Typographical Union. After a year's satisfactory experience with this plan, it was mutually agreed that it should be extended for five years from May 1, 1902, and that its scope should be enlarged so as to cover arbitration of wages and hours.

"It is important to observe that the plan of arbitration provides that whenever any one of the publishers agrees by individual contract with the International Typographical Union, that he will arbitrate all labor differences,

(Concluded on page 4.)

S. S. ROGERS,
President, American Newspaper Publishers' Association.

CHARLES H. TAYLOR, JR.,
Ex-President, American Newspaper Publishers' Association.

JAMES M. LYNCH,
President, International Typographical Union.

MARTIN P. HIGGINS,
President, International Pressmen's Union.

selection of the seventh member shall be referred to the National Civic Federation. The decision of the arbitrator shall be final and binding upon the Joint Conference and upon the members of the National Board of Arbitration."

Thus there is established a system of appeals up to the highest body of national conference, with a further provision for the settlement of any dispute, akin in judicial procedure to a pure question of law to be determined only by the Supreme Court, to still another body, with provision for a final arbiter to be selected by an outside disinterested body, itself composed of representatives of employers, of wage earners, and of the general public. In the last resort all the elements of the community, which as a whole is interested in the uninterrupted output of

A NEW ENGLAND CONFERENCE OF EMPLOYERS UPON WELFARE WORK.

ITS VARIOUS PHASES DISCUSSED AND ITS APPLICATION ILLUSTRATED BY PRACTICAL EMPLOYERS AND WELFARE WORKERS.

Boston Herald, Feb. 28.

THE Welfare Department of the National Civic Federation held a notable local conference to discuss welfare work, at Young's Hotel last evening. H. H. Vreeland, President of the New York City Railway Company, and Chairman of the Department, who presided, although he arrived late on account of a railroad accident, spoke on "How to Make Good Foremen—The Labor Department." "Men's Clubs" was considered by Rev. James E. Freeman, Chairman of the Board of Directors, Hollywood Inn Club, Yonkers, N. Y.; "Welfare Work in a Mill Town," by W. E. C. Nazro, Welfare Manager, Plymouth Cordage Company, North Plymouth, Mass.; "Should Manufacturers Attempt Welfare Work for the Benefit of their Employees?" by C. W. Hubbard of

human beings organized under him as a mere machine out of which he is to express so much finished product for a given stint of wage. If ambition tempt him to ignore moral obligations, trouble is bound to ensue, because there is little toleration among workingmen of a system that tends to merge them into mass for treatment. This resentment to being individually obliterated, Mr. Vreeland said, he knew to be strong among workingmen, despite all the unionizing tendencies of labor.

He emphasized the importance of broadening the view of foremen as the means of communication between the great mass of laborers and executive heads, and he pleaded for greater intimacy and sympathy between foremen and laborers. In this, more than in any other way, could the frequent causes of misunder-

enterprise without the full consent of his board. In one year he had fully demonstrated the wisdom and commercial value of his proposition."

W. E. C. Nazro, of the Plymouth Cordage Company, said:

"Health and physical comfort are cardinal considerations for the welfare of the great number of employes in our large factories. Under the division of physical comfort, in our works, we have established modern systems of ventilation, light and heat, sanitary work rooms, wholesome drinking water, wash rooms, fire protection, seats for women, rest rooms, hospital and resident nurses, and lunch rooms. Under the division of recreation, we have established the social hall, athletics of different kinds, field day contests, lectures, private theatricals, and bath department. For

NEW ENGLAND WELFARE CONFERENCE DINNER, YOUNG'S HOTEL, BOSTON.

Boston; and "Loyalty and Fair Dealing," by Frederick P. Fish, of Boston, President of the American Telephone & Telegraph Company.

Miss Gertrude Beeks, the Secretary, gave an interesting talk on the work of the Welfare Department, illustrated by the stereopticon. This department embraces a large number of employers who are voluntarily giving especial consideration to the physical, mental and moral welfare of their employes.

In the course of his remarks Mr. Vreeland declared that one of the most regrettable results of great industrial combinations was the disappearance of sympathetic association between the operatives and administrators of these giant concerns. This altered relationship, considered historically, seemed to be a natural outcome of modern industrialism wherein, with its high organization and specializing tendency, an executive has little opportunity, however humane he may be, to consider his operatives except as a single unit. This necessity of dealing with labor as a unit has developed the importance of the foreman both economically and morally to a point where his task is greater even than that of the chief executive. In his keeping, to a very large degree, is the welfare of those whom he represents before the executive. If he is merely commercial he comes to regard the mass of

standing be diminished. The modern foreman's delicate duty is to truly present the point of view of the operative to the executive, and then, no simple task, he has to explain the point of view of the executive to his men. He stands in a sort of judicial and paternal relation between these two. Only moral inspiration will give him the courage and the ingenuity to correct a growing and deplorable tendency in the development of great industrial concerns.

Rev. James E. Freeman, of Yonkers, who had twelve years' experience with Cornelius Vanderbilt, which brought him into close contact with the men along the New York Central Railroad, said in part:

"We need something that at least hints at heaven here and now, and there is no place where this needs to be so largely emphasized as where for six days men and women are toiling for their bread. What is needed to render our operatives immune from that most corrupting curse, the saloon, is a kind of club environment that will give the men a place for necessary and legitimate recreation. The head of a large industry in a Southern State told me that the presentation of such a club scheme to his fellow directors was received by them at the outset as an indication of his own mental derangement. My friend was so determined to make the test that he undertook the

education, the first monument was that of the Loring reading room, while there followed classes in cooking, sloyd, basketry and cane-sewing, lectures, kindergarten, and a periodical issued by the company. Prizes are awarded for gardens, house surroundings, poultry, and other products, at our Labor Day exhibit. In the division of housing, modern houses have been built, with open and sanitary plumbing, with attractive grounds for the development of lawns, walks, etc. Under a miscellaneous head is improved environment of the mills by the planting of shrubbery and road building."

C. W. Hubbard, Treasurer of the Ludlow Manufacturing Associates, after pointing out that both duty and self-interest demand that large employers of labor do welfare work among their employes, said:

"It seems to me that there is too little thought of the harm of giving too much publicity to welfare work. It is not wise for the beneficiaries of welfare work to find themselves exploited in the public press. It would be well if the public could be interested in the general subject, leaving the details for quiet study by those intending to practice them."

"The need and difficulty of this work are greater in America than in England or in France, where one has to deal with a permanent community of one nation and one

language. We ask the public to recognize this need and to demand of our large employers that they also recognize it, and that they use their brains and their money in some organized effort to improve the lives of our laboring population. We also ask the public to remember that we have before us one of the toughest problems of the race—that of forming character. We ask the public to be slow in passing judgment, and to be charitable, if in our efforts we make mistakes."

Frederick P. Fish traced welfare work to the natural spirit of co-operation and of friendship that always exists wherever men are associated together for a common purpose and in a common work, with all the inequalities of position inevitably involved. This spirit, which he said permeated the army, the crews of ships, bands of explorers, the founders of governments, and the industrial associates, was not philanthropic, though containing an element of philanthropy; not charity, but primarily loyalty to the work and to the men associated in the work. "The man above expects and exacts loyalty from those below; the men below expect and exact loyalty from those above. Herein is the root of the movement represented here to-night. The purpose is to find a way, through organization and through method, to disclose to employes this feeling of loyalty on the part of employers." Mr. Fish continued:

"There are many ways in which this can be done. One is by the spirit of fairness, which the chairman has expressed as one of his cardinal principles of doing business. If there is a spirit of fairness at the top, it permeates the whole organization and is known to the man at the bottom, and he appreciates it and instinctively reciprocates it. Another is to make the conditions of the work just as favorable as they can be. Another is to see that the wages are on the right basis. They cannot be excessive, or enterprise would be ruined. But they can be meager and inadequate, and where they are, the employer is absolutely failing in this fundamental duty of loyalty and friendship to the men who work for him.

"Now, we in this welfare work, as I understand it, are endeavoring so to shape our organization, so to regulate our affairs, and so to establish our relations in an enormous aggregation of men, as to permeate the whole system with this spirit of fairness, frankness and co-operation.

"The interesting exhibits of applied welfare work that we have seen on the screen to-night illustrate methods of showing the employed that employers have thought for their comfort and welfare. Furthermore, they tend to create a standard for which the wage-earner should work in other relations and ultimately will bring up the standard of living in the community. For when we consider the cheapness of such sanitary appliances, the day will undoubtedly dawn when every artisan will demand them in his own home because he has them in his factory.

"All movements for social betterment are equally significant. What is the purpose of annual fairs in industrial communities? It is not merely for casual amusement, but to give the working people to understand that employers regard them as attached by the tie of a common enterprise and a common purpose.

"Take the business in which I am engaged. All through this country I have occasion to go into telephone exchanges from Maine to California, and wherever I go it delights my soul to find that the exchange manager shows me with more pride the retiring room for the girl operators, the bath facilities, the racks for their clothes, the hospital beds, the lunch counter, the cooking apparatus, than anything else in his whole establishment; and he feels that pride because he recognizes that therein he is carrying out, not the philanthropy nor the charity, but the spirit of friendship and loyalty which employers and employes naturally feel toward each other, unless their relations become artificial and strained, as is too apt to be the case under modern conditions.

"I personally believe that the importance of this welfare work cannot be exaggerated, because it is almost the only obvious and tangible expression that is open to us under modern conditions of the feeling on the part of employers, which should be and must be cultivated to the greatest possible extent, that they are the friends, the loyal friends, closely interested in the affairs of their employes."

Those present at the dinner were:

H. H. Vreeland, President New York City Railway Co., New York City.
James E. Freeman, President Hollywood Inn Club, Yonkers, N. Y.
Augustus P. Loring, President Plymouth Cordage Co., Boston, Mass.
Jamea Logan, Chairman Executive Committee, United States Envelope Co., Worcester, Mass.
Frederick P. Fish, President American Telephone and Telegraph Co., Boston.
Frederic S. Clark, Treasurer Talbot Mills, North Billerica, Mass.
Charles Dana Palmer, State Board of Conciliation and Arbitration, Boston.
W. E. C. Nazro, Welfare Manager Plymouth Cordage Works, North Plymouth, Mass.
George W. Brown, Treasurer United Shoe Machinery Co., Boston.
G. E. Emmons, Manager Schenectady Works, General Electric Co., Schenectady, N. Y.
Charles S. Dennison, Treasurer Dennison Mfg. Co., Boston.
Thomas G. Plant, President Thomas G. Plant Co., Boston.

Charles E. Hall, Dennison Manufacturing Co., Boston.

WAGES ADJUSTED TO PRICES.

[The following extract from an address by James F. Williams, of Streator, Ill., was published by the *Industrial Independent*, official organ of the Citizens' Industrial Association, with its approval and the advice that we present to our readers Mr. Williams' "sound common sense." We are happy to comply.—EDITOR'S NOTE.]

Let me say that there are just three ways in which a man may increase his wages, three possible sources out of which an advance may come. I will summarize them briefly:

1. It may come out of the pocket of his employer; that is, wages may be increased at the expense of profits.
2. It may come out of the pocket of the consumer; that is, wages may be increased by raising the price of the product either by artificial combination or otherwise, and charging it up to the buyer.
3. It may not come out of anyone's pocket; in other words, wages may be increased by enhanced skill and efficiency in production, by which the sum total of the goods produced may be increased and thus more wealth created, which can be divided as wages or profits.

Corresponding to these three ways of increasing wages there are three stages of trades-unionism. In the first stage the workman thinks his wages come out of the pocket of the employer and he is all the time fighting to get more. He does not realize that the employer is only a middleman who stands between him and the market, and that even if he could compel him to give up all his margin it would not make him rich. He does not remember that the margin of the employer is made up of small profit on the work of many men; so that if he can make ten cents on the labor of a thousand men it will give him a profit of a hundred dollars a day; and yet so small is the profit on any one man that if the laborer could get all of it, it would not make the difference between comfort and poverty. As long as the laborer is in this stage of unionism he will always be fighting the employer and trying to take his profit away from him; and we shall have local strikes, lock-

outs and all manner of industrial strife as the outcome. Mind, I am not saying that the employer may not be claiming an excessive profit, and that he may not be even less enlightened than the men but, be that as it may, there is no hope that this stage of unionism will ever bring permanent peace. It will always be a primitive and barbarous stage in which attack on the one hand and reprisal on the other will be the rule, and the law of the highwayman, "That he may take who has the power, and he may keep who can."

Men pass out of the first stage into the second stage of unionism by enlarging their combination and by changing the point of attack. Instead of attacking the employer, they attack the market—that is to say, the consumer. In this way they make the employer a friend of unionism instead of an enemy, and together they present a united front against the common foe—who is the man who buys the goods. In order to make this co-operation possible, the union must be so extended as to include every competitor in a given industry. It must be made co-extensive with the competitive area; otherwise, it will fail, and the union will return to the first stage, where it fights the employer and not the consumer.

This point is well illustrated by the experience of the miners of Illinois, who, prior to their national organization, were spending their energy fighting their employers and impoverishing both themselves and the community. If the glass blowers, the coal miners, or the clay workers of Streator, were to confine their union to this town alone, the result is so obvious it would be a waste of time to discuss it. They would be at the mercy of a competitive market and would have to accept such wages as the market allowed or go out of business. The same thing is true of any workmen, skilled or unskilled. If they do not organize on a large enough scale to control the market, the competition of non-union producers will soon drive them to the wall. In this connection the situation of unskilled labor, with its unlimited and uncontrolled supply, presents a difficult problem. Speaking quite frankly, it seems to me the most promising plan of organization for common labor is to unite itself with the skilled labor in the same trade, and to be enabled to take part in making a uniform scale that shall be binding on everybody in that industry. So doing, they will get on a common ground with the employer and present a common front to the enemy; who is, in this case, the innocent and often unconscious consumer. They will thus pass from the first to the second stage of unionism, from chronic war to comparative peace. For in the second stage the friction between employer and workman is greatly reduced, joint agreements take the place of strikes—and the millennium is one step nearer.

But we are not yet at the goal of unionism. There is a third stage, which is as far in advance of the second as the second is ahead of the first. It is the stage in which the laborer refuses to use his power to plunder either the employer or the consumer. I was discussing the relation of the union to the consumer with an intelligent Northumberland miner this summer, and he put it with such clearness that I can not do better than reproduce his argument.

"Who is the consumer?" said he; "the consumer is my fellow-workman. If I can force up the price of a ton of coal by combining with my fellow-miners, who pays for it? Why, even the mason, hod-carrier, the factory girl, even the poor widow who is struggling to bring up her fatherless children."

"But," I suggested, "suppose all men and all women in every trade were unionized."

"Then," he replied, "we would all be just where we were before. For suppose there were 25 per cent. added to the wages of every worker in England. What would be the result? Why every one of us would have to buy, and we would be no better off. It's like traveling in a circle; you get no further ahead." * * *

No union that hopes to increase wages by lessening production or by appropriating some other person's earnings can hope to ultimately succeed. You cannot create wealth by refusing to produce it; you cannot increase wages by diminishing the source from which they must be paid. Restriction is folly. Seamp work cheats nobody as much as the laborer. * * * A catchpenny motive is just as sordid in a union as in a capitalist; and a mean, grasping spirit is the more contemptible, in so far as the union professes to occupy a higher plane and to appeal to higher motives. You cannot rear a broad structure on a narrow foundation. Nothing less than industrial peace, social solidarity, the subordination of selfish and class interests to the rule of ethical and economical law, can be the ultimate aim of unionism. Only such an aim can arouse or justify social enthusiasm or hope to make a permanent contribution to the solution of the labor question.

The Northumberland Miners organized two bodies with legislative and judicial powers, that might roughly be compared to our upper and lower houses of Congress. They called one the "Board of Conciliation," and the other the "Joint Committee," and they gave them jurisdiction over any dispute that might arise, and invested them with power to enforce any decision they might arrive at.

They agree on a wage basis that should bear a certain relation to the market price of coal, and they made

Charles H. Taylor, Jr., ex-President American Newspaper Publishers' Association, Boston.
Dan R. Hanna, of M. A. Hanna & Co., Cleveland.
Marcus M. Marks, President National Association of Clothing Manufacturers, New York City.
Otto M. Elditz, Chairman Board of Governors, Building Trades Employers' Association, New York City.
William H. Pfahler, former President National Founders' Association, Philadelphia.

On the Part of Wage Earners.

Samuel Gompers, President American Federation of Labor, Washington.
John Mitchell, President United Mine Workers of America, Indianapolis.
E. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' National Union, Washington.
Daniel J. Keefe, President International Longshoremen, Marine and Transportworkers' Association, Detroit, Mich.
Warren S. Stone, Grand Chief International Brotherhood of Locomotive Engineers.
P. H. Morrissey, Grand Master Brotherhood Railroad Trainmen, Cleveland.
William D. Mahon, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
Theodore J. Shaffer, President Amalgamated Association of Iron, Steel and Tin Workers, Pittsburgh.
J. J. Hannahan, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
James O'Connell, President International Association of Machinists, Washington.
John Tobin, General President Boot and Shoe Workers' Union, Boston.
Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.
William Huber, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.

LESSONS OF THE INTERBOROUGH STRIKE.

"Labor organizations must keep their part of agreements if they expect success."

"No labor organization can break its contracts or aid others to break theirs and live."

In those two sentences, Warren S. Stone, Grand Chief of the Brotherhood of Locomotive Engineers, and William D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees of America, summarized the greatest lesson of the needless, unwarranted strike on the lines of the Interborough Rapid Transit Company. All that labor has gained, all that labor expects to gain, in wages, hours and conditions of work, is the result of the organization being stronger than the individual. If, then, the results of this greater strength through organization are to be retained, and if such further gains are to be made as the business conditions of industry may warrant, the collective contract must be held by labor in as high respect as is the contract between individuals. This is the doctrine that the chief leaders of organized labor, as well as its disinterested friends and advisers, have been constantly preaching to the mass. Now this doctrine has been driven home by a concrete object lesson so impressive that it will reach every local union from Maine to California. It should also impress every employer in the country with a new sense of the responsibility and conservatism of the national leaders of organized labor, whom some employers habitually denounce. To take its charter away from a local union for violation of a contract seems a drastic measure; but be it said to the credit of the organization of which Mr. Stone is the head, he would himself have been called to account at its annual convention, and his own head would have fallen had he failed in this instance to enforce its laws. The promotion of trade agreements between employers and wage earners is one of the primary purposes of the National Civic Federation. But work to this end would be futile indeed, had organized labor upheld the precipitate action and unreasonable conduct of the local leaders of the three organizations involved. The heroic action in this case of the national chiefs of organized labor gives renewed hope to all who are interested in promoting industrial peace.

The second great lesson of this conflict is that labor organizations must vest the decision of vital issues in their national officers. This principle has been recognized by many of the unions and is embodied in the constitutions or by-laws of many national labor organizations; but in New York City some local organizations have too long been permitted to treat this principle as a dead letter. In fact, they have frequently and openly defied the national authority on the pretext that metropolitan conditions made them a law unto themselves. Some such action as that of Messrs. Stone and Mahon was necessary to bring these locals to their senses. A great deal of trouble in the building trades has arisen from this disposition on the part of the New York unions to ignore or openly defy the authority of their national bodies.

The enforcement of this national authority in labor organizations is of the utmost importance to employers and to the general public, and should receive their cordial approval. The establishment of such large and responsible authority makes for all the approved methods of attaining industrial peace, including trade agreements and arbitration. Equally important with the establishment of this authority to wage earners everywhere is it to awaken their rank and file to the necessity of electing sane, responsible and honorable men to positions of local leadership.

These lessons were forcibly put by Samuel Gompers, President of the American Federation of Labor, in a speech which he delivered at Baltimore, the day following the end of the Interborough strike, to an audience of labor men, who heartily applauded his remarks:

"The most important object in the labor organizations to-day is the honor of agreement between employer and employee. The strike in New York involved the violation of agreements, and if the leaders of the New York unions had considered the agreements the strike could have been prevented. It was a simple case of the members of the local unions flying off half-cocked and not taking the advice of the men who have made the

labor organizations in the United States what they are to-day. I want to impress upon you, fellow unionists, the importance of living up to your agreements and contracts."

William H. Farley, of the Tilelayers, one of the most experienced of the local leaders in the building trade said:

"The labor men of New York feel that this strike and the stand that the national officers took has done more for the labor movement than anything that has happened within the last ten years. It has proved to large employers that the national leaders intend to hold trade agreements sacred, and local leaders in the future will not be so quick to get into fights of this kind without first consulting their national officers. The possibility of strikes will be reduced to a minimum, and instead of strikes we will have arbitration. The members of organized labor will then lose no time during the arbitration, and employers of labor will be willing to arbitrate as long as they know that the national leaders will be able to hold the local unions in line.

"After one conference during the strike, one of the representatives of the Amalgamated Association, who had been in the labor movement less than two years, said that he learned more of that movement in an hour's talk with Thomas I. Kidd, Vice-President of the American Federation of Labor, and William D. Mahon, President of the Amalgamated Association, and with some of the local leaders, than he ever knew before. This goes to prove the value of education of local unions as a preventive of strikes. The result of this strike is a lesson to union men everywhere, and especially to building trades men who seem to ignore their national officers and have caused many strikes that should never have been ordered."

The conclusion of the Interborough strike thus presents an interesting paradox: While many arguments in favor of the trade agreement by its advocates were nullified in this instance by the headstrong local leaders, the upholding before all the country of the responsibility of labor for its contracts is a lesson so valuable in itself and so beneficial to the cause of industrial peace as to make the outcome of defeat in reality a victory. This lesson is well worth all its cost.

WAGES ADJUSTED TO PRICES.

(Concluded from page 7.)

it the business of the Board of Conciliation to adjust the scale every three months. They made it the function of the Joint Committee to sit on all internal questions that might arise in the daily operations of the mines, and settle them forthwith. This body is in almost constant session, and like the Board of Conciliation, is composed of an equal number of miners and owners, and presided over by an outside chairman or umpire. Both associations maintain a staff of salaried officers, who are experts on all matters pertaining to the coal trade. * * *

Wages go up and down with the market; there is no maximum and no minimum. During the great depression the price went so low that the scale was abandoned in some of the poorer mines, and men were allowed to work for whatever the mine would yield; and during a spell of very high prices the miners once volunteered to accept a reduction to check the upward tendency and to save the industry from the effort of a reduction.

LABOR WRESTS VICTORY FROM DEFEAT.

(Concluded from page 16.)

not only of my good offices, but also those of President Gompers, of the American Federation of Labor; President Mitchell, of the United Mine Workers of America; Vice-President Kidd, of the American Federation of Labor, and President Healey, of the International Brotherhood of Stationary Firemen, were inconspicuously rejected.

"Nothing now remains for me to do but to declare that the present strike is neither authorized nor approved by the Amalgamated Association of Street and Electric Railway Employees of America, and I therefore advise all our loyal members to report for duty at once. To maintain their organization, which has done so much for the betterment of their material and moral conditions, and by the result of their present experience avoid such errors in the future; in that effort I shall be glad to assist to the fullest."

LABOR WRESTS VICTORY FROM DEFEAT.

(Continued from page 1.)

strike, to go into effect Saturday morning at the rush hour. Every train in the Subway will come to a standstill, and there will not be a wheel turning on the Elevated. This order is final."

Mr. Pepper also announced: "Unless Hedley rescinds his schedule I will tie up the whole road."

When Mr. Pepper was asked whether, before striking, it would not be necessary for him to get the consent of President Mahon of his national organization (the Amalgamated Association), he defiantly replied: "We don't need any teaching from Mr. Mahon. We can strike when we like, and when we do, we won't waste any time."

Another member of the employees' committee was quoted as saying, after the conference: "The situation was so tense during the conference that several members of the committee were in favor of granting the Interborough officials just fifteen minutes to grant their demands."

In vain did Mr. Hedley explain to the men that the new schedule had not received a fair trial, because it had been subject to the sudden increase of traffic in the Subway caused by the severest storm in New York in twenty years, which had almost paralyzed travel on the elevated and surface roads. He asked that the schedule be allowed to stand for a week, in order to allow it to be tested under normal conditions. This request the committee peremptorily refused. He asked the men to appoint a sub-committee of three to join with him in making a schedule. But the men would listen to no proposition whatever, and issued an ultimatum that unless the new schedule were taken down by 11 o'clock the next day, they would tie up both the Elevated and Subway. This demand was carried to President Belmont, who ordered the schedule taken down.

Mr. Pepper's exultant remark was: "The men have obtained all they ask. We'll get all the rest we want."

Mr. Jencks declared: "We got everything we went after."

Thus ended the preliminary encounter. The local chiefs had threatened and blustered to their hearts' content. The company's officials, in order to avoid a rupture, had humbly accepted the orders of Messrs. Pepper, Jencks and Pinney, and gone back to the former schedule, with the understanding that a new schedule was to be arranged before March 1. The company thus had every intimation that could be conveyed by abusive language and an intolerable spirit of dictation that the local leaders were plotting trouble. It was evident that if the men continued in this spirit a clash was inevitable, for no quasi public corporation under heavy obligations to furnish safe and rapid transit for the millions of people of a great city could long endure such a situation.

The New York Civic Federation at this juncture appointed a special committee of fifteen to tender its good offices if need for them should develop. This committee was composed of the following:

Representing the Public:—Oscar S. Straus, Rt. Rev. H. C. Potter, Albert Shaw, Roland Phillips, Thomas F. Woodlock.

Representing Employers:—Charles A. Moore, Frederick D. Underwood, Emerson McMillin, Louis B. Schram, Marcus M. Marks.

Representing Wage Earners:—Samuel B. Donnelly, Edward A. Moffett, A. J. Boulton, Herman Robinson, James P. Archibald.

Both the Interborough officials and the employees' committee were apprised of the appointment of this committee and its willingness to aid in every possible way in preventing a rupture. While the ill-natured talk of the local leaders of the three unions involved had given notice to the Interborough officials of what they might expect on the 1st of March, it gave warning also to the national officers of these unions that there was need of a restraining hand to be placed on the local leaders. The national officers took hold at once with such apparent success that Chief Stone felt safe in making the statement to Mr. Belmont appearing at the beginning of this article.

The Civic Federation committee also quietly sounded the situation and was assured by the local leaders that prior to March 1, when the Amalgamated contract on the Elevated road would expire, they would send a committee to the Interborough offices and present a schedule calling for increases in the wages of a number of the trainmen, some of whom were getting as low as \$1.40 a day. They said that while there was a handful of radicals who wanted an eight-hour day, the executive committee knew that this was impracticable and would not ask for it. They promised, however, in the event of a disagreement with the local management, to take the matter up with the Civic Federation committee along the lines of conciliation and arbitration.

The Civic Federation committee in the meantime sounded the Interborough Company far enough to feel assured that there would be no hitch over the wage question, as the demands were not regarded as unreasonable. It seems, however, that the operating department of the company, after its experience in the conferences in February, was determined to take no

more chances of being held up at the last moment by impossible demands, and took precautionary measures.

As late as February 27, Grand Chiefs Stone and Hannahan, respectively of the engineers and the firemen, being in conference with Civic Federation members on another controversy, gave the information that everything seemed to be going along all right on the Interborough, they having received such information from their local organizations.

Even on Saturday, March 4, both Messrs. Pepper and Jencks announced in the papers that the people of New York need not worry; that there would be no strike, but that if any differences arose they would be dealt with in a businesslike manner; that if they could not come to an agreement with Mr. Hedley, they would go to Mr. Bryan, and if they could not agree with Mr. Bryan they would go to Mr. Belmont.

On Monday, March 6, however, it seemed as if this conciliatory talk had been largely for public consumption. The local leaders had instructed the men to vote on Monday on authorizing the committee to call a strike in case their demands were not granted.

Up to this time the engineers and firemen had publicly kept out of this last controversy, rightfully stating that their organizations had three-year contracts and no grievances that could not be taken care of in a regular manner. But at 3 o'clock that day, when the Amalgamated committee appeared at the Interborough offices for an answer to their demands, the engineers and firemen joined it, and at this time the engineers renewed all the demands they had not secured in their three-years' contract last September, utterly repudiating that document.

Manager Hedley stated that these new demands contained propositions that he had no power to grant, and urged the employees' committee to take their demands above his head to the proper authority—first, Vice-President Bryan, and then, if necessary, President Belmont, who, although in Florida, could be reached on the telephone at any time.

This idea the men refused to consider, saying, in effect: "You are the General Manager and it is your business to have all the power necessary to grant our demands or else get it from somebody who has. We are here to get action, not delay."

Together with their written demands, the men presented another paper containing the name and home address of each member of the committee. "There are our demands, and there are our addresses, where you must send your answer, yes or no, before 11 o'clock to-night," they said as they departed.

The spirit of reckless irresponsibility of the local leaders was glaringly exhibited that afternoon in other ways. "Let us talk to him ten minutes and no longer," said Mr. Jencks to Mr. Pepper, as they approached Mr. Hedley's office. "If they want to throw down the gauntlet, we'll pick it up," Mr. Pepper responded. Again Mr. Pepper was asked whether he could order a strike without the consent of the national officers of his organization, particularly of William D. Mahon, President of the Amalgamated Association.

"That's my business," replied Mr. Pepper, amid the laughter of the local committeemen surrounding him. After the conference in Mr. Hedley's office, which lasted half an hour Mr. Pepper stated: "We made our demands. They are final. We are to get an answer, yes or no, by 11 o'clock to-night, and then something will happen."

Meantime a sub-committee of the Civic Federation committee, consisting of Messrs. Schram, McMillin, Marks, Moffett and Donnelly, undertook to intercept the employees' committee as they left the Interborough offices at 4 o'clock, but failed to reach them. The members of the employees' committee scattered to their respective headquarters, with the exception of the Amalgamated members, who, with local President Pepper at their head, went to the Clarendon Hotel to have a talk with their National President, W. D. Mahon, who had reached the city during the day. Mr. Mahon pleaded with them to abandon their rash plan, and stated that the national officers were ready to take up any grievances they had and were satisfied that they could secure a fair adjustment. He pointed out to them further that under the by-laws of the national organization they could not have the support of that organization without having first submitted the questions at issue to the national executive committee and obtaining its approval; and that the by-laws of the organization provided that arbitration should be offered by the employees and refused by the company, before a strike should occur. But this all fell upon deaf ears. In so many words they notified their national officers to keep their hands off, and to the statement that arbitration must first be offered, they replied: "We will strike first and arbitrate afterwards."

Messrs. Donnelly and Moffett, as a sub-committee of the Civic Federation committee, visited the headquarters of the Amalgamated local, where the vote was being taken, and tried to prevail upon the local officers either to extend the time twenty-four hours, or to offer, as a last resort, a proposition looking to arbitration. They practically guaranteed that if either were done the Civic Federation committee could bring about an amicable adjustment and save the New York public the great inconvenience that would follow a strike and at the same time protect the contracts between the Interborough and the unions.

But the local leaders rejected all peaceful overtures. In the first place, they were absolutely certain that before 11 o'clock that night, "Hedley would be on his knees to them," and that if by any possibility he did not grant all their demands and risked a fight they would "bring him to his knees by noon the next day." They utterly disregarded National President Mahon's official warning that he would not sanction the strike.

In the meantime, Grand Chief Stone, of the engineers, who had been notified of the part his local organization was taking, at once wired Mr. Jencks that if the motormen went out on strike without following the by-laws of the national organization, they would find themselves outside the brotherhood; and as he had an important engagement elsewhere he telegraphed Assistant Chief E. W. Hurley, who was at New Haven, Conn., to take charge of the situation. Mr. Hurley reached New York at 11.30 that night, and at once sent for Mr. Jencks. Mr. Hurley used every argument to have the local leader retrace his steps; he threatened Mr. Jencks with expulsion from the order; pointed out to him the sad facts that many of the men were too old ever to get back on another railroad; that they would lose their insurance and bring disgrace upon their organization. To all of these entreaties Mr. Jencks replied that the men had voted to go out, and that he could not recall them. Assistant Chief Hurley then wanted Jencks to issue an order authorizing him to use Mr. Hurley's name instead of his own, recalling the men, but Mr. Jencks declared that it was too late.

Thus, despite all efforts, the strike was on.

The next duty of the Civic Federation committee, under the by-laws of its organization, was to endeavor to bring about peace between the company and the strikers. The committee was called together, Chairman Straus presiding.

It was clearly perceived that the local unions were in open rebellion against their national officers, and as the local officers were declaring that they would "accept nothing but a complete surrender of the company," which was impossible, the first move decided upon was to bring the local and national leaders into working relations. In this task it was evident that only the labor members of the committee could be of any practical value, and until there was an occasion for opening negotiations with the Interborough Company, the main work of the committee would devolve upon them.

A sub-committee consisting of Edward A. Moffett of the Bricklayers, A. J. Boulton of the Stereotypers, William H. Farley of the Tilelayers, Herman Robinson, General Organizer of the American Federation of Labor, Robert Neidig of the Housesmiths, Edwin Gould of the Teamsters, Frederick Lemon of the Elevator Constructors, and James P. Archibald of the Painters, was appointed to call upon President Mahon of the Amalgamated Association at the Clarendon Hotel, and Vice-Grand Master E. W. Hurley of the Brotherhood of Engineers, at the Grand Union Hotel, and tender their services, which were accepted. A sub-committee consisting of Wm. H. Farley, A. J. Boulton and Frederick Lemon then called on the joint executive committee of the strikers to invite them to a conference with their national officers. This effort was but partly successful, as only the Amalgamated members would accept. President Pepper appointed a committee of three, Messrs. Madden, May and McCormick, to attend the conference. In addition to the full local committee named, the conference included President Mahon, Vice-Grand Master Hurley, Thomas I. Kidd, Vice-President of the American Federation of Labor; James Hatch, of the Upholsterers, and President of the Central Federated Union, of New York, and Timothy Healey, National President of the Brotherhood of Stationary Firemen.

This conference lasted four hours. One reason advanced by the strikers' committee for precipitate action was that the Interborough Company had been collecting strike breakers in New York from other cities, and that every hour's delay tended to make a strike ineffective. In reply to this, it was pointed out that it was only a question of two or three days at any time for the company to collect strike breakers; that from that standpoint, it would be good tactics to let the company go on accumulating strike breakers; that so long as the men kept at work, the company was put to the expense of maintaining an army in idleness, and that this very factor would soon become a potential influence with the company for peace. This argument was not one of theory, but was drawn from experience.

This conference broke up at 10 o'clock Wednesday night, the sub-committee appointed by Mr. Pepper being thoroughly convinced that they had made a mistake in calling a strike without the sanction of the national officers. They thought they could convince the whole executive committee of the strikers of their error by 11.30 o'clock and bring about a full conference at midnight. They reported at 12 o'clock, however, that they had not been successful, but thought they would be able to report favorably by 10 o'clock the next morning.

In the meantime the sub-committee of labor members of the Civic Federation had called upon Grand

(Continued on page 16.)

VITAL QUESTIONS AT ISSUE BETWEEN EMPLOYERS AND WAGE-EARNERS.

HOPEFUL INDICATIONS THAT THEIR RIGHTFUL RELATIONS CAN BE ATTAINED THROUGH SANE METHODS OF PROVED SUCCESS IN THE GREATEST INDUSTRIES.

By RALPH M. EASLEY. Reprinted by permission from *The Bankers' Magazine*.

ONE of the subsequent assets, if it may be so expressed, of the great anthracite coal strike has been the general awakening of interest in the industrial question. The "empty coal-bin" carried it home to practically every citizen. Prior to that strike, the view of the labor problem taken by the public was more or less academic and generally colored by local conditions. The rapid development of industry during the past fifty years has so revolutionized methods of production and distribution that innumerable and most intricate problems have arisen which only some such tremendous jolt would bring to public view. The great coal strike turned the inquiring mind of the public toward the questions lying back of industrial disturbances, such as "fair wages," "arbitration," "shorter hours," "the open shop," "boycotts," "black lists," "piecework," "restriction of output," "opposition to machinery," "minimum wage," "apprentices," "sympathetic strikes," "recognition of the union," "trade agreements," "integrity of contracts," "jurisdictional quarrels between unions," etc. These it found to be not only burning practical questions with every employer and employee, but also interesting from a general sociological and scientific point of view.

THE PIECEWORK SYSTEM.

Take the simple question of piecework, which has caused so many strikes, and which is a potential cause of more. The public hardly knew what the question meant. A most scholarly and eminent citizen wrote it "peace-work." But in the manufacturing world they would never think of spelling it that way! The Machinists' and Boiler Workers' Unions oppose piecework, while the Hatters' and Glove Makers' Unions will fight for it. The International Association of Machinists is so pronounced in its hostility to piecework that one of its annual conventions voted to refuse to work by that system after July 1, 1904, although a contest was afterward postponed by a referendum vote. The Industrial Commission gave a list of twenty-eight national labor organizations that prefer piecework and twenty-two that forbid it. In England there have been more strikes to secure piecework than to prevent it. Similar difference of opinion exists among employers, some being willing to order a lockout, if necessary, to force piecework in their establishments, while others insist upon day labor, believing that system to yield a better quality of work. Back of each of these positions there is an apparently good reason. The bitter hostility of some unions to the piecework system springs from the fact that after fixing a scale of prices for work by the piece, employers, when not checked by a union, often arbitrarily reduce the scale of prices for work upon finding that some of the men are making what they consider too high wages. Here the union comes in and says in effect to the swiftest workers, "You must slacken your speed. By employing all your energy you do not help yourself, for you are reduced at once by your employer, while you are forcing those less speedy to a starvation basis or to over-exertion that destroys their health."

This tendency of the employer thus arbitrarily and selfishly to reduce the scale of wages is so pronounced and recognized by employers themselves that a new plan is being introduced by some manufacturers called the "premium system," which undertakes to remove all cause for the fears of the workingman, and at the same time secure to the employer the benefits held out by the piecework system.

THE OPEN SHOP.

The open versus the closed shop is another question that has especially come into prominence the past year; and from the fiery speeches made by the leaders of the opposing sides, one would judge that there is no way out short of the utter annihilation of the unions, if the open shop should prevail, or the extinction of the non-union man, if the closed shop should be adopted. As both Mr. Gompers and Mr. Parry state the matter, there seems to be an "irrepressible conflict;" but, while theoretically the open or closed shop problem seems to be impossible of solution, practically it is being worked out every day. There are closed shops which are working satisfactorily and they are not criminal conspiracies against the public; and there are open shops operating successfully, and the unions accepting such have not gone to pieces, but are stronger to-day than they ever were.

Is there not a great deal of fustian put out on both sides of this question? We are told with ponderous eloquence that it is "unconstitutional," "un-American" and "infamous" for an employer to agree to employ only union men. We are told on the other side that an employer who should discriminate against union men would be violating every principle of justice and

equity, and in some States the penal code. Is it not possible that both are overstating the case just a little? For instance, many employers insist on emphasizing vigorously the liberty and rights of the non-union man, and those rights should be fully protected; but are there not also some rights, and some liberty of action, due the employer? For example, if he wanted a hundred men to perform a certain piece of work, and thought he could secure better service by employing only non-union men, or only union men, only Germans, only Irish, only Catholics, or only Methodists, would it not be his right to so discriminate? And would it be anybody's else business? This, of course, does not apply to labor employed by the Government—City, State or National—but to an individual employer.

Is there not a great deal of human nature in this open shop question? When a union leader goes to an employer and says, "If you don't discharge that 'scab' in an hour, we will tie you up," or "If you employ any non-union men, we will call a strike and put you out of business," the old Adam at once arises in Mr. Employer and he frequently responds by kicking Mr. Agent out of the office. But suppose this same agent should go in and say: "Mr. Employer, we want to make a contract with you to do your work. You want your work performed in a good workmanlike manner, under such conditions and at such rates as we may mutually agree upon. Now, we don't object to working with non-union men, but if you will make an exclusive contract with us, it will put us in a position to discipline and control our men so that we can enforce our contracts, and we can guarantee you better and altogether more satisfactory work." In other words, does not that place the proposal on a business basis? What freedom of contract, or what liberty of action, would be violated by such an agreement? What essential difference is there between that proposition and the common everyday agreement made in the mercantile world between manufacturers and dealers wherein the manufacturer says to the dealer, "If you will handle our goods exclusively, we will make you a discount;" or, as testified to by a manufacturer in a case recently, "If you will make the statement every ninety days that you have sold no goods made by our competitors, we will allow you a discount of ten per cent."

When Smith lets a contract for a house, the contractor, of course, hires all the men. Smith may never see them, nor does he know whether they are all Catholics, Protestants, Germans, Irish, union or non-union men; and in fact he has nothing to do with it, and cares nothing about it. In the case of the Longshoremens and the Great Lake carrying companies, the union contracts with the employer in just about this manner.

A good illustration of the human nature that crops out in this question came under my notice recently when a conciliation committee, which had worked for a week to settle a strike involving several thousand men, finally secured an agreement upon everything except the disposition of five non-union men. They had been taken in during the strike. The employer said that under no circumstances would he discharge those men at the command of the union. The union emphatically said it would not go back to work until the "scabs" were discharged. Consultation developed the fact that these particular five men were incompetent and undesirable in every respect, but the employer stood on the principle involved and justly refused to "throw them down," as he put it. The committee prevailed upon the union to give up its contention and go back to work with these men. When the union finally yielded, the leader called up the manufacturer and said, "Well, we will go back to work to-morrow morning." The answer, delivered in a tone as snarling and bitter as it could be made, was: "Well, you will have to work with those non-union men if you do." "All right," was the leader's reply, in his best "Sunday voice," "there won't be any trouble about that." On reaching the shops the next morning they found that the employer had discharged every non-union man.

When an employer makes a demand for an open shop on the public pretense of securing liberty for the non-union man, but privately announces that with the open shop he will "smash" the union, it can hardly be expected that the union will submit. If, as some employers claim, the open shop means the death of the union, one certainly cannot blame the union for fighting for its life. On the other hand, if a closed shop means the absolute control of all the business of the shop by the union, leaving the employer only to pay the bills Saturday night, then the employer cannot be blamed for wanting to "smash" the union. However, these extreme positions, I believe, are both

unnecessary evils, which patience, tact and forbearance will remove in time.

While I believe the employer has the absolute right to make an exclusive contract with the union, I have just as strong a conviction as to the legal rights of the non-union man to determine for himself, without coercion, whether he shall belong to a union, or not, and to work without molestation wherever employed. There is no legal conflict between these two rights.

The bitter feeling toward the non-union man in this country is marveled at by the trades-union leaders of England. In many of their contracts there is a clause stipulating that they work with non-union men; but this state of affairs did not always exist. The English unions passed through the bitter stage several generations ago, and doubtless the broader spirit will eventually control in our unions. It is hard to believe, when one now sees the tolerance and fraternizing of the various religious denominations, that at one time they were burning one another at the stake on account of differing views.

THE RESTRICTION OF OUTPUT.

The question of "restriction of output" is one that has called forth strong denunciations of unions and has been the cause of much friction. Many of the union leaders indignantly deny the charge, but they speak from their own craft experience only. There are unions that deliberately place a limitation on work and do it openly in their by-laws, and, generally speaking, all the union rules and methods, whether governing membership, apprenticeships, working with non-unionists, the minimum wage, piecework, machinery or output, are in some form a restriction upon the employer, and have come into vogue to protect the members at some point where they feel that competition will be destructive. But this natural desire to prevent destructive competition is so universal that it is not fair to stop the inquiry with the labor union. It is common to capitalists, farmers, the professional classes, and merchants as well.

The merchant who cuts prices is just as reprehensible in the eyes of the other merchants as is the non-unionist who cuts wages in the eyes of the unionist. The tactics employed in the mercantile and in the labor worlds to deal with the common enemy, the price or wage cutter, are almost identical. Purchasers of holiday books will doubtless remember finding a printed slip in each one containing the following:

In accordance with the agreement of the American Publishers' Association, which went into effect May 1, 1901, this book must be sold at retail at the published price without discount.

Now, back of that simple little statement there is a history of a combination between 95 per cent. of the publishers of all kinds of books and magazines in the United States, and about 90 per cent. of the wholesale and retail booksellers. The publishers made an iron-clad agreement among themselves that they would refuse to sell books to any booksellers who cut prices. This combination between the publishers and the booksellers was so advantageous that the sellers helped to compel the independent publishers (the "scabs") to join the publishers' organization. As these organizations have existed only four years and include practically all the old-established publishing houses in the United States, I will quote verbatim from the official circulars produced in court:

By special agreement entered into with the Organization Committee of the American Publishers' Association, the members of our association are bound not to buy, not to put in stock, nor to offer for sale the books of any publisher who shall finally decline to co-operate with us in the maintenance of the net price system by joining the American Publishers' Association and issuing books under the net price system. Inasmuch as the publishers have carried out their part of the agreement upon which our contract was conditioned, it now becomes necessary for us to preserve our part of the agreement. We had sincerely hoped that you would be pleased to join the American Publishers' Association and co-operate with us through it in the maintenance of the net price system; and if you will take the matter into consideration at the present time, we are confident that you will now join the Publishers' Association and not compel us to take final action in this matter. We inclose a copy of the last issue of the Booksellers' Bulletin. By referring to page 6 of the Bulletin you will see that one publisher has already been cut off by the members of our association. We sincerely hope it will not be necessary to extend the list. Very truly yours,
AMERICAN BOOKSELLERS' ASSOCIATION.

The resolution on which the above notice was based is as follows, adopted by the American Booksellers' Association June 17, 1902:

WHEREAS, All publishers of trade books still remaining outside of the Publishers' Association have been repeatedly invited by us to join the organization and through it co-operate with us in the maintenance of the net price system; and,

WHEREAS, Such publishers of general trade books as still remain outside of the Publishers' Association are continuing to sell their publications to the few persistent price-cutters, and thus encouraging them to continue their opposition to the net price system; therefore,

Be it Resolved, That we, the American Booksellers' Association, in convention assembled, do hereby instruct our secretary to give final notice to such publishers that it is our intention to

apply Reform Resolution No. 1 unless they immediately join the American Publishers' Association and co-operate through it with us in the maintenance of the net price system; and therefore,

Be it Resolved, That should any such publisher on receiving such notice decline to co-operate with us by failing to make application to the American Publishers' Association after receiving final notice, the secretary shall promptly issue notice to all members that Reform Resolution No. 1 is thereafter to be applied to such publisher, and all members shall discontinue handling the books of such publishers, as provided by Reform Resolution No. 1, until further notice.

As a further illustration of the methods adopted and the success with which they were carried out, the following extracts are given from a circular letter sent out by one of the publishers:

Several things have already been demonstrated of interest to the entire trade in connection with the "no cut rate" movement.

1. The substantial loyalty to the association of all dealers. In only one case (up to date of this letter) has there been any cutting of price—one large department store in New York City.

2. The vigor and promptness of the association to punish those who violate its regulations. The association immediately took steps to assure itself that the cut in price was deliberate and intentional. The entire wholesale publishing trade was at once notified not to sell a book of any kind published by members of the American Publishers' Association to the offending concern. There is every indication that this order will be loyally carried out by all publishers and wholesalers.

The two organizations above referred to claim they took the only course open to prevent the "demoralization of the trade" by department stores, "home library" and "mail order" agencies, but the methods are strikingly similar to those of the labor unions.

Everyone is familiar with the bitter warfare that has gone on for years between the "cut price" drug stores and the wholesale dealers and manufacturers of proprietary remedies. In fact, the whole commercial world is honeycombed with definite organized efforts to prevent what each trade would term destructive competition, and, in conducting the various fights on these propositions, the boycott, spies, and, in some cases, physical attacks, have been employed. Even the recent disgraceful conduct of the livery drivers in Chicago, where burial of the dead was interfered with, finds its parallel but not justification in the conduct of the "coffin combination," which in many cities has carried its fights against the independent coffin companies to the same disgraceful limit. In one Western city, the fight became so bitter that attachments were taken out for the corpses by the rival companies, and, in another, because a man had had an undertaker who handled independent coffins, he could not secure a hearse nor a public conveyance and had to take the body to the cemetery in a grocery wagon.

While the limitations and restrictions by unions have caused wholesale condemnation, little or no attention is paid to the regular meetings of manufacturers and dealers at which they openly discuss and agree upon prices and limitations of output. The New York *Commercial* of January 2, 1904, contained the following statement, which is certainly to the point:

The power of the Steel Corporation has been demonstrated by its ability to maintain high prices for its finished material in the face of a falling off of something like 60 per cent. in the demand for steel, and reductions ranging from 40 to 50 per cent. in the price of pig iron. This has been accomplished through the various pools which have been formed for the purpose of regulating prices and output. Practically all the pools met last December and decided to maintain the 1903 schedule. The iron and steel industry is now controlled by various associations, among them the billet manufacturers, steel rail manufacturers, structural manufacturers, steel plate manufacturers, tin manufacturers, and pig iron manufacturers.

In fact, when one strikes the iron and hardware world, it is difficult to find anything that is not in a pool or combination of some description, where prices are arbitrarily fixed and in some instances output prorated. I do not claim that these pools and combinations are not necessary to maintain stability in the market and, therefore, stability in employment; but I simply desire to call attention to the fact that what is accepted as an every-day matter of necessity on one side ought not to be too harshly condemned on the other. When a union man observes how readily the public acquiesces in the demand of all railroad corporations that their "fixed charges" be provided for beyond any peradventure, he wonders why the union man's "fixed charges," that is, his cost of living, should not be as surely provided for by the employer. Thus the "minimum wage" demand is nothing more or less than what the unionists claim to be their "fixed charges."

Limited space forbids reference, even by name, to the hundreds of combinations one may find upon investigation that restrict prices or limit output. In fact, it can be said that there is scarcely an industry that is entirely free from combinations of capital or combinations of labor in some form. There is an infinite variety in the methods of these different combinations, but there is a general similarity in their efforts to regulate competition and bring pressure to bear on persistent "competitors," "price cutters" and "non-unionists." It may well be asked, in view of the universality of this effort, What is to be the outcome? and, What should be the policy of the general public toward combinations? We may ask, Shall all combinations be suppressed and all industries be compelled to submit to the unregulated competition of individualism? Or, shall these combinations continue to grow and competition be entirely eliminated in the "ideal state" of socialism? If neither of these extremes should be followed, what shall be the middle ground where competition may continue without being destructive and where the public shall not be exploited

by monopoly of capital or monopoly of labor? Shall these combinations be left to work out their purposes, or shall the courts and legislatures be called upon to deal with them?

CONFERENCES AND TRADE AGREEMENTS.

Whatever the destructive forces that are finally brought to bear on this phase of the situation, there are some constructive forces whose great potentiality gives us hope that progress is being made, not the least being the trade agreement. While here and there these joint trade agreements between small bodies of employers and employees in a given craft have resulted in conspiracies against the public, now being dealt with by the courts, the great majority of them have proven of immense value in preserving the stability of industry. Such employers' organizations exist in over one hundred different industries, like the Stove Manufacturers' Association, the American Publishers' Association, and the Bituminous Coal Operators' Association, which meet annually in joint conference with the Iron Molders' Union of North America, International Typographical Union, and the United Mine Workers, respectively, and consider in a businesslike way the conditions of the trade, conditions of labor, and all matters pertaining to the special industry as well as the position of the general public.

The elevating effect of the joint trade agreement system upon the intelligence and character of the union leaders is clearly shown in a statement by Mr. Francis L. Robbins, President of the Pittsburgh Coal Company, referring to the sixth annual joint convention of the operators and mine workers of the interstate bituminous field, held at Indianapolis, in February, 1903. He says:

Looking back over the recent convention, and comparing it with the conventions held at the inception of the movement, one is struck by the change in the *personnel* of the miners' delegates. Instead of seeing flannel shirts, hob-nail shoes, no vests and often no coats, you meet a body of men as well dressed as any body of men gathered from the middle class in any Eastern city. There has been a corresponding change in the intelligence, as shown in the faces of the delegates, and particularly perceptible to those who have argued scale questions before these meetings for the past fifteen years. It is a critical audience of practical workmen, who are quick to detect sophistry or misleading statements.

Mr. Robbins did not so state, but it is equally true that the tone and breadth of view of the operators who met these men correspondingly improved. Page after page of testimony could be recited showing that the educational side of these joint conferences is important. Recently the Amalgamated Association of Iron, Steel and Tin Workers, the organization which deals with all the large iron and steel companies, met in special conference with the employers to consider abandoning certain artificial restrictions which had grown up in the trade and had become "vested rights." After a week's discussion the union leaders recommended that the restrictions be abolished; a referendum vote was taken by the organization, and the recommendation was accepted. At the same time, the organization of its own volition, in consideration of the trade conditions, offered a cut of 10 per cent. in the wages of its men notwithstanding the fact that the organization had a contract which still had months to run.

EMPLOYERS WHO DESIRE TO DESTROY THE UNIONS.

But there is another class of employers, which, under the banner of "law and order," "free labor," "individual liberty," etc., is organized primarily to "smash the unions." These employers refuse to consider the history, purpose and benefits of trades unions and see only the coercive, brutal and lawless methods which have too frequently been indulged in by the newer and cruder unions. Some of these same employers' associations had no sooner become organized than they adopted identical methods of warfare. It is openly boasted by one organization of employers in a city of something over 100,000 inhabitants that they compelled every employer to become a member; and that where they found any employer reluctant, they got the banks to shut off his credit and the wholesale houses to refuse supplies.

The attitude of this extreme class of employers and employers' associations is quite similar to that of the extreme wing of the labor movement—the Socialists. Socialists denounce the unions and the leaders of the unions for entering into agreements with employers, just as extremists among employers denounce all movements looking toward dealing with unions. The Socialists affirm that the class struggle is irrepressible, and that the workingmen must fight their employers to the bitter end and make no compromise. There are also a few labor organizations controlled by the Socialists which take similar ground respecting employers. The community of sentiment between the Socialists and this class of employers' association appeared plainly in an editorial in the *Socialists' Daily People* (New York, April 7, 1903,) commenting upon the annual address of the president of the National Manufacturers' Association. The Socialist editor says that the president is correct in holding that an "equitable arrangement" cannot be effected by the "artificial" method of conciliation or arbitration. An "equitable arrangement," he says, "can only be effected by allowing the class struggle full scope; and as a means to this end nothing is so much to be welcomed as the straight-out tactics" of that association. "Socialism," the editor concludes, "will triumph as a result."

If these two extreme wings of irreconcilables had their way, the outcome would be either arbitrary control by labor or arbitrary control by capital. If all employers stood for intolerance and bigotry, or if all unions stood for tyrannical and unreasonable methods, the end would necessarily be a revolution. But the American people, as a whole, are not willing to enter upon such a permanent warfare of "capital" and "labor." They have enough practical sense to recognize conditions as they exist, and they have the courage and patience to deal with them.

I believe that rightful relations between employers and employees will eventually be worked out in this country, in spite of the Socialists in the wage-earners' camp and the anarchists in the employers' camp.

AN ECONOMIC EXHORTATION TO ORGANIZED LABOR.

(Concluded from page 2.)

have to get if the factory and the employees were idle part of the time.

The manufacturer and the men will get less per piece, but more in the aggregate, and if you can keep the price low the demand for the article, whatever it may be, will be increased.

That is, if you can get your goods cheaper and yet have the men who make them earn in the aggregate as much as when the price of the goods was higher, you are increasing the amount of work, not diminishing it. In other words, it is by increasing the output per man, not by restricting it, that you give work to more men.

And therefore every bit of efficiency that you can add to the ability of an individual, and every bit of waste that you can avoid and thus enable the goods to be turned out cheaper, will increase the number of consumers, and increase the number of men employed, and increase your own means of comfort and improvement.

STUDY THE CONDITIONS.

Fourth—The unions should adapt their demands to the conditions of a particular business.

In order to determine how large a part of these earnings of any business you can properly demand, it is essential that your representatives should understand the conditions of the business.

It is not sufficient that you should make a demand and have that demand assented to or refused. Your representatives must be able to understand the needs and the possibilities of the business you are engaged in.

John Mitchell was successful in the anthracite strike because he understood the conditions of the businesses of the employers and they did not understand the workingman's side of the question.

Your representatives must understand not merely the general line of the business, but the possibilities and the necessities of the particular business in which your demands are to be applied. Concerns engaged in the same line of business in one part of the country and in another, or even in the same community, have varying possibilities and necessities, and your demands must be tempered by those possibilities and necessities.

The possibilities of employers' businesses vary like the employees' capacities. If you attempt to apply rigidly a uniform rule to all you may kill the goose that lays the egg; and except in extreme cases the goose must be kept alive whether the egg be golden or not.

Don't assume that the interests of employer and employee are necessarily hostile—that what is good for one is necessarily bad for the other. The opposite is more apt to be the case. While they have different interests, they are likely to prosper or to suffer together. Like in the case of dealer and customer, co-operation and a mutual regard for the other's rights are essential to continued success.

This is the lesson unions should teach.

There is no trade union that has a higher average of intelligence or whose management is marked by a higher degree of business sagacity and forethought than the typographical. It never forgets that prosperity in the printing business can only be assured by conditions that justify good wages. In the matter of contracts, a typographical union keeps faith with the employing party. The rules are carefully drawn to prevent hasty and ill-considered strikes. The Socialist element is kept in safe subordination.—*Washington Post*.

Armies are necessary evils, but for my part I prefer a procession of trades-unionists to the marching by of armed regiments and the simple and homely garb of a worker to the tawdry trappings of men of war. I respect a man who honorably fulfills his calling as a soldier, but he is no better in my eyes than the man who honestly labors in other and more peaceful vocations.—*London Truth*.

A review of the past twenty years goes to show that the labor problem, like the poor, is always with us. It is a chronic condition. It is the result of the eternal struggle of man to better his condition.—*Wall Street Journal*.

J. H. Williams, Vice-President J. H. Williams & Co., Brooklyn, N. Y.
Miss Gertrude Beeks, Secretary.

PROFIT-SHARING, INSURANCE, PENSIONS.

The Working of a Successful Plan to Promote Thrift and Relieve Distress Explained for the Information of Employers.

IN the article that follows, Francis L. Robbins, President of the Pittsburgh Coal Company, the largest corporation of its kind in the world, describes and explains the plan of profit-sharing, insurance and pensions, as carried out through its Employees' Association. Mr. Robbins presents this plan for the information of other employers, after the experience of more than four years has demonstrated its practical success from the points of view of both the company and the wage-earners. His treatment of the subject reflects the aid that a willing employer may receive from the suggestions of an assistant especially devoted to the development of such a plan.

J. B. L. Hornberger, Comptroller of the company, and president of the Employees' Association, to whom President Robbins gives credit for originating and extending the plan, contributes these interesting observations:

"Our plan had in part its origin in the knowledge that the average wage-earner does not think it worth while to save, because he cannot save much; but we made it as simple and easy as possible for him to save. We organized our work with a view to encouraging even the earners of the lowest wages to save something. The plan operates exactly like a building association, only in our case the investment of the money is altogether in the Pittsburgh Coal Company's preferred stock. 'The Employees' Association has a double purpose:

To encourage the men to save money, and that might be called the humane side of it; and to get them to become stockholders of the company, and that might be termed the practical side, since when they serve the interests of the company, as stockholders, they serve themselves.

"Many of the wage-earners have taken stock. They are as yet a comparatively small percentage of the whole; but at this time there are nearly 2,000 out of about 50,000 employees who are becoming stockholders. Since September there has been a very marked increase in the purchase of the stock.

"A large percentage of the employees are foreigners, cannot speak English, and are suspicious of the company, and these do not understand our methods and fail to appreciate the spirit of the organization that is intending to help them. They are very prone to give their earnings to some agent of a foreign bank, or to some self-styled banker, such as a grocer, who takes their money and promises them a good rate of interest. In many cases they make good, and in many cases they make away with the deposits. These defaults have made the men suspicious, and have made it more difficult for us to gain their confidence. Some of them carry their money on their persons. I remember one man who took off a belt he had been wearing next his skin, and he had \$800. His wages probably averaged \$500 or \$600 a year.

"We had, also, to encounter the suspicion caused by the business failure in the past of some small employers, causing the loss of savings entrusted to them by wage-earners. But we were aided here by the size and solidity of our corporation."

PLAN FOR SELF-HELP AMONG EMPLOYEES.

By FRANCIS L. ROBBINS,

President of the Pittsburgh Coal Company.

The plan of profit-sharing, benefits and pensions that is carried out through the Pittsburgh Coal Company Employees' Association is in harmony with a wide recognition of the necessity of adjusting social relations to new conditions created by modern industrial development. This plan represents a broad spirit of comradeship

FRANCIS L. ROBBINS,
President, Pittsburgh Coal Company.

ship and affects many thousands of employees. It is also noteworthy, because after four years it has long passed beyond the experimental stage, and is a thoroughly demonstrated practical success. This demonstrated success is important to students of industrial providence, since the company is the largest producer of coal in the United States. The employees of all kinds number 50,000, and are to be found from the mouth of the Mississippi to every port on the Great Lakes and in the mines of many intervening States.

The Pittsburgh Coal Company is an example of the present tendency to concentrate business under the control and management of large corporations. Its plan of profit-sharing, employees' accident insurance and benefits, has proved a practical and satisfactory solution of a serious problem that arises out of the tendency to concentration. In the new order of things, the percentage of managers and operatives, whose capital, as well as their brains and hands, is employed in a given business, is largely reduced; and there is a greater increase in the percentage of those whose only interest in the business is the daily, weekly, or monthly wage earnings. The new order, without some such factor as our Employees' Association, means eventually a wider separation between the employer and the employee, and a corresponding indifference on the part of the employee to the interests of the employer, while the latter may lose that paternal interest in the welfare of the wage-earner that existed under

the old regime, when individual contact was common. It was with the purpose of preserving this interest and to encourage the employees in habits of sobriety and thrift, as well as of assisting them in emergencies and old age, and of perpetuating under the new order the incalculable benefits of service by loyal and disinterested employees, that the plan here described was put into operation in the latter part of 1900. I have found this plan most available to put into practical operation a broad and generous policy toward the great body of the company's employees. It is my hope to see its beneficial results, if not its exact form of operation, extended to the yet larger number of employers and employed that are represented in the Joint Interstate Convention of miners and operators, which annually works out and agrees upon the wage scale and the conditions under which more than half a million mine workers and others dig and ship the bituminous output of Western Pennsylvania, Ohio, Indiana, and Illinois.

The plan is in accordance with the injunction of the greatest of all leaders of men: "Whatsoever ye would that men should do to you, do ye even so to them."

The operation of the Association proceeds under two heads—first, investment; second, insurance and pensions.

The Pittsburgh Coal Company Employees' Association makes contracts with employees to sell them preferred stock of the company at cost, the stock being bought on the open market by the officers at such times as the funds of the Association and the condition of the market may warrant. Employees pay for this stock at the rate of \$1.00 per month per share. They have the privilege of withdrawing from their contracts at any time upon thirty days' notice, and when such withdrawals are made employees receive back the full amount of their payments, together with interest at the rate of 5 per cent. per annum. A new series of stock purchase contracts begins at the first of each month.

Since December 1, 1900, therefore, there have been some fifty series of contracts, the first nine of which matured at intervals of one month beginning on May 1, 1904. The dividends paid on stock held by the Association to fill its contracts with employees are divided pro rata among the several series. The net earnings thus accumulated by the Association amounted, up to Jan. 31st, 1905, to \$129,240.20; and the portion of these earnings falling to the series which have matured was sufficient to net a return to the employees holding those series, based upon the market value of the preferred stock, of more than 20 per cent. per annum on their monthly payments. The Association has purchased a sufficient quantity of stock at the low prices then prevailing to enable it to close out the next ten or twelve series of contracts on about the same basis as those which have already matured. The first nine series of contracts embrace 2,460 shares, leaving in force 2,280 contracts, covering 17,222 shares.

While it is true that a large percentage of the Association's contracts are with heads of departments, superintendents, clerks and the more intelligent class of employees in the general offices, at the mines and the various docks and selling agencies of the company on the Great Lakes in the West and Northwest, and in the Hocking district of Ohio, yet it is a significant and encouraging fact that the percentage of purchasers among the miners and day laborers at the company's mines and shops is steadily increasing. Not a few of these latter, who never before accumulated any savings, are now taking upon themselves the dignity and bearing of men who have a financial interest in the company's operation; an element of conservatism and fairness, and a disposition to repress radicalism and lawlessness, are becoming more and more manifest among the men.

The great fall in stock values which began last year and affected Pittsburgh Coal Company stocks along with others, together with the general business depression of the first months of the year 1904, which resulted in closing down a number of the company's mines and curtailing very materially the company's gross output, checked the growth of the Association. With the great improvement in the company's business, however, incident to the opening of lake navigation and the general resumption of operations at the mines early in June, the number of stock purchase contracts began to increase and is increasing daily. It is confidently expected that the operations of the Employees' Association will eventually place a large portion of the company's preferred stock in the hands of the people who are digging, handling and selling the company's coal, building its tipples, cars and docks, and keeping its accounts.

Up to this time the company's insurance and pension benefits accrue only to workers in its mines. These benefits are conducted through branch lodges of the Employees' Association. These lodges are organized at practically all mines of the main company, and their organization is rapidly extending to mines of the subsidiary companies, such as the Monongahela River Consolidated Coal & Coke Company, the New York and Cleveland Gas Coal Company, Mansfield Coal & Coke Company, and the New Pittsburgh Coal Company, operating in the Hocking district of Ohio. The organization of a lodge is voluntary at each mine, but no lodge is organized until the majority of the operatives at the mine agree to be governed by the general by-laws adopted at a convention of the employees, at which each of the company's mines was represented by a dele-

gate selected by the men. One of the features of these by-laws is that every employe at the mine is to be protected by the benefits and pay dues. Each lodge is governed by an executive committee of three, selected by the men, and this committee passes upon all claims for benefits and issues all warrants. The treasurer of the Pittsburgh Coal Company Employees' Association, under the by-laws, is elected treasurer of each of the lodges; all disbursements, therefore, are made from the company's general offices by the treasurer of the Employees' Association.

INSURANCE DUES AND BENEFITS.

The dues paid by the men are at the rate of 40 cents per month per man; the benefits are graded into seven classes: First, for a fatal accident while at work, \$150, of which the company directly contributes one-half; second, death of an employe through natural causes, \$100, paid altogether by the men; third, death of an employe's wife or father or mother, if the employe is the sole support in such cases, funeral fund of \$75, paid altogether by the men; fourth, death of an employe's child over two and under twelve years, a funeral fund of \$25, paid altogether by the men; fifth, non-fatal accident of a serious nature, benefits \$10 per week, one-half paid directly by the company; sixth, non-fatal accident of a less serious nature, benefits \$7.50 per week, one-third paid directly by the company; seventh, minor accidents, benefits \$5 per week, paid altogether by the men.

The conduct of the relief department employs a manager (J. E. McDonald, secretary and treasurer of the Association), one staff surgeon, one adjuster of claims, three bookkeepers, one stenographer, and clerical service, and includes payment for postage, etc., etc., at all mines, shops and agencies.

It should be specially noted that all expenses of the Employees' Association are paid by the company.

START AND GROWTH OF PENSION FUND.

The pension fund had its start in a contribution of \$10,000 by the company. Its growth and maintenance are provided for by monthly portions of 2 cents per man of the 40 cents dues paid by the men, to which is added 1 cent per month per man paid by the company. This accumulating fund is invested in the preferred stock of the company and under the by-laws is to remain intact and grow for a period of ten years; at the end of that time the principal and earnings of the fund in excess of \$100,000 may be used in the payment of pensions to operatives of the company who have paid into the fund continuously for a period of ten years, and who, through old age, accident or sickness, are not able to earn a livelihood.

MANY THOUSANDS PROTECTED AND AIDED.

There are at this time about 20,000 employes paying dues into the various lodges of the Association. A large percentage of these are married men with families. If an average of two is allowed for each man (a wife and one child, a father and mother and sister), it will be seen that 60,000 people in the Pittsburgh district are protected and helped in emergencies by the relief department of the Employees' Association. The benefits paid up to and including January 31st, 1905, were \$188,891.54, and there had been accumulated in the pension fund on the same date \$32,671.87.

APPROVAL SUCCEEDS LOCAL OPPOSITION.

The organization of these lodges met with resistance at first from radical elements in certain communities, but this opposition has all melted away and evidences are not wanting of a growing appreciation of the wise and beneficent measures taken by the company to minister to the welfare of its employes.

The *United Mine Workers' Journal*, the official paper of the largest body of organized labor in the world, after analyzing the last annual report of the Employees' Association, said editorially:

These figures tell clearer than words what Messrs. Robbins, Hornberger and Jones are doing to relieve the "labor question" of its rancor and turmoil. Read the report, consider the purpose and intent of the Pittsburgh Association, and you can clearly see the pitiable meanness, the whole grotesque humbug lurking under the term Parryism. There is a great corporation, the largest of its kind in the world, officered by men who, in the multitude of perplexing duties, have hearts and minds for the men who toil for them. The sordid side of wealth has not appealed to these great business men. The merciless struggle for dividends has not deadened their manhood or their sense of equity and justice. These shares are not froth and bubbles on an ocean of watered stock. Behind them stands \$75,000,000 of tangible property, managed by men of brains and integrity, whose fortunes are linked with the miner-shareholder. Then behold the Death and Accident Association, in all of its beneficence, its mercies and goodness. The 19,250 men who contribute to its funds have an anchor against the surges of trouble's seas. Hurt in the mines? You are not left to the mercies of charity. You do not have to grovel and cringe for necessities or medical attention. Why? Because the Pittsburgh Coal Company inaugurated a system backed it with its dollars, officered it with men of commanding ability, and helped you erect a barrier against want and woe in the time of death or disaster. It is such things as these that rob the anarchists and the Parryites of their power to poison the minds of workmen against their employers and cause them to stand as a bulwark against the assaults of the demagogues.

It also teaches, practically, how by thrift and industry the workmen themselves may easily work for themselves instead of others rather than by chasing rainbows and chimeras. It is a wholesome object lesson against the ravings and industrial insanities far too prevalent at present.

It is obvious, of course, that the benefits of the com-

pany are indirect at the best, but, nevertheless, the management is thoroughly of the opinion that the plan has a definite value for the company, and this is understood clearly by the men.

Patrick Dolan, President, and William Dodds, Secretary and Treasurer of District No. 5, United Mine Workers of America, have both heartily approved the plan from the standpoint of the employes. That they were not particularly favorable to the plan at its inception makes their commendation of especial interest and effectiveness. Secretary Dodds, who was associated with John Mitchell, President of the United Mine Workers of America, in attending several international meetings of labor representatives in Europe last year, authorizes this statement:

In my opinion the Pittsburgh Coal Company, through the opportunity for their employes to become partners in the business and share in the profits, is to be commended to all large corporations in the United States, and there is no doubt in my mind that in the future the employes of this country will better understand the interests that can best be served by the co-operative policy embodied in the profit-sharing through the stock held by the employes.

The fund which the Pittsburgh Coal Company has established amongst their employes, to take care of them and their families in case of sickness or accident, is certainly to be commended and encouraged, and employers would do well to put themselves in touch with the Pittsburgh Coal Company and secure information through the by-laws and have similar institutions established in their different industries, and I certainly appreciate the efforts of the officers of the company who have been instrumental in giving opportunities and protection to their employes, who are in a large measure unable to take care of themselves in case of accident and death.

It is important to note that, in the face of original opposition by some of the men at the mines to this plan of profit-sharing, benefits and pensions, the management of the company persevered. Other employers who undertake welfare work of this description may also encounter at the beginning suspicion and even aspersion of their motives. I would advise them also to persevere. Any sincere effort for good will bear fruit somewhere, sometime. Sooner or later the persistent showing of humane, sympathetic interest will evoke a response that will promote industrial peace and prove for the mutual advantage of both employers and employes.

WHY EMPLOYEES OBJECT TO RAILROAD RELIEF DEPARTMENTS.

By E. E. CLARK.

Grand Chief Conductor, Order of Railway Conductors.

In his paper, "Railway Provident Institutions," which appeared in your issues of November, 1904, and February, 1905, Mr. M. Riebenack presents comprehensively the "provident effort in which the railways of the United States are interested on account of their employes."

All large employers of men have, and should have, an interest in the health, welfare and contentment of their employes. It is not too much to say that the railways are in the front rank of employers in this regard. I am not one of those who are unable to see anything good in what the employer does or wants. Human nature is human nature, however, and whether or not it be the impelling motive there is a strong motive of self interest in or behind every move made by an employing corporation which involves the expenditure of the corporation's funds.

It is unfortunate that improvidence is so general a trait of human nature. Scarcely the average person believes in literally applying the scriptural injunction to give no thought to the morrow. There are altogether too many men who are content, if left to their own inclinations, to continue in most hazardous employment and to grow old knowing, if they ever think of it, that it is merely a question of time when they or their families, or both, will be dependent upon charity. And so, influences and education which encourage and teach reasonable thrift and providence must work good to present and future generations.

Self respecting, steady, reliable and thrifty employes are greatly to be desired by a railway company. The man who spends his hours off duty in procuring full amount of necessary sleep and in reputable amusements and reading is a more reliable and efficient and valuable employe than if his habits were of a more questionable nature. He is less apt to make mistakes; is less likely to antagonize patrons; less apt to be injured himself and he sets a good example for his fellows. It is, therefore, a good investment from a purely business standpoint for the employing company to assist in affording opportunity for employes to so occupy their time by contributing to reading rooms, libraries, etc. The services of an intelligent employe are always of more value and prove most economical in the long run.

The railway employes are quasi public servants. Those employed on trains face dangers more appalling than the average person dreams of. A President of the United States, in recommending to Congress legislation intended to afford them more safety in their employment, called attention to the fact that the men in service on the freight trains of the country were in greater danger of being killed or injured in the discharge of their duties than were the average sol-

diers in time of war. The latest official records show that in the year ending June 30, 1903, one in every 123 of them was killed and one in every 10 was injured, and this record is not materially different from the average of the ten years preceding it.

I do not wish to belittle or underestimate the spirit which has led some railway companies to provide pensions for employes who have worn themselves out in their service. No occupation is so exacting as railroading. No workmen have such irregular hours and none, with the possible exception of sailors, are obliged to expose themselves to the extremes of weather to the same degree. If a man lives to be sixty-five or seventy years old in such work and has been a faithful employe, as he must have been, he has certainly earned a pension and it should be viewed more in the light of according something which is his due than as granting him some special consideration in the form of a gratuity. And when we consider the public character of the corporation and the growing interest in its affairs by the general government it does not require a very wild stretch of imagination to imagine a time when such care of worn out employes as is given through pension funds will be imposed by legislative requirement.

Any reasonable assistance which the employing company can render or any fair inducement which it may offer in the direction of thrift and saving on part of employes is good work in a good cause.

Hospital departments have been maintained, to the support of which employes have been required to contribute, with benefit to both employes and employing companies. This has been especially true in the less thickly populated regions of the far West. Except in isolated cases where someone charged with management failed to inspire or to hold the confidence of the employes, they have contributed to this department willingly and cheerfully.

Stock-sharing plans have behind them the theory and belief that if an employe owns even a small interest in the property he will be a better and more valuable employe who will take greater interest and care in the discharge of his duties. This is a rational theory and it would be a splendid thing if the employes of every railway owned enough of its stock to insure against having the property managed and operated with an eye principally to the stock market.

Mr. Riebenack says that there are nine "roads" which conduct purely Relief Departments, representing 31,000 miles of railway. I wish he had named the "roads" to which he referred. Systems of railway are made up of several "roads," each having a corporate name, but when we speak of the Pennsylvania railway the average person understands that we speak of the system. It is well known that the Pennsylvania, the Baltimore and Ohio and the Burlington systems conduct relief departments. The mileage of the Pennsylvania system, covered by the relief department, as given by Mr. Riebenack, is 10,271 miles. The mileage of the Baltimore and Ohio system, taken from official guide, is 4,410 miles, and that of the Burlington system, taken from the same authority, is 8,442 miles. We, therefore, have 23,123 of the 31,000 miles accounted for in these three systems, and it would hardly be fair in discussing such a subject to bewilder the average reader with distinctions in technical names of roads which for all purposes in which the public are interested lost their identity when they became part of the system.

In a little further analysis of Mr. Riebenack's figures we find that he gives the total number of the employes of the "nine roads" as 318,000, and that 159,704 of them, or just about half, are on the Pennsylvania system.

Information is not at hand as to the date upon which the Baltimore and Ohio relief department was established. It was, however, at a considerably earlier date than that on which the Pennsylvania system instituted its relief department, viz., February, 1886. The Burlington relief department was organized about 1887. It will thus be seen that the establishment of such departments is not appreciably on the increase and that they are not maintained by many railway systems. It is well known that in some instances railway companies have proposed to their employes the institution of such departments and that the employes have promptly and emphatically negated the proposal. It should be here remarked that in many others of the lines of provident effort referred to by Mr. Riebenack railway companies are receiving cordial support from their employes in their general and increasing interest and efforts in those directions.

OBJECTIONS RAISED BY EMPLOYEES.

And now we come to the question of why the employes object to relief departments. There are two principal objections. One is that, despite the fact that the word "voluntary" is included in the official name of the department; despite the fact that it is emphasized and italicized; despite the fact that a United States statute prohibits compulsory membership on part of employes, or discrimination against applicants for employment, because of their unwillingness to join such department, the employes of the companies which conduct such departments in speaking where they are

not afraid to speak plainly generally express the conviction that in so far as an employee who is a member of the department is concerned, he feels that if he should withdraw from it he would incur the displeasure of his employers, and that, when the opportunity offered, a fellow employee who retained membership in the department would be given preference over him, and that so far as applicants for employment are concerned, the man who is not ready and willing to join the relief department, is not needed and does not secure employment. In reply to inquiry as to how the practice followed affected applicants for employment, an old and reliable employee of one of these companies recently said: "An applicant for employment is required to fill out an application for membership in the relief department. He then goes to the examining physician, who is also the physician for the relief department, and if he is accepted as an employee he at the same time becomes a member of the relief department." It would be interesting to know how many men who did not become members of the relief department have been given employment within the past five years by the several important systems of road that conduct such departments.

If membership in the relief department carried with it nothing more than the requirement that certain reasonable sums be paid periodically as a condition of being entitled to certain specified sick, disability or death benefits, the objections entertained by the employees would not be so strong or so well founded. If that were all that the department undertook to do the men would feel that in paying their contributions they were providing for their fellows as well as for themselves and were removing the necessity for circulation of subscription papers for the purpose of relieving or burying unfortunate fellow employees.

If the relief department simply undertook to require men, through mutual or co-operative means, to provide some financial assistance for themselves and their families in the hour of sickness or injury or death and did not attach conditions to the acceptance of the benefit, for which the employee has, in fact, paid full or practically full value, which conditions operate wholly in the interests of the employing company and against the injured employee, there would not be such general distrust of, and opposition to, them on part of the employees. Neither would there be such broad and justifiable ground for criticism of the relief departments as now presents itself.

The applicant for membership in a relief department is required to execute a contract that, in the event of his being injured in the performance of his duties and of his accepting the benefits provided in the department for such cases, he thereby releases the employing corporation from all liability under the statutory or common law. This means that if a member of the department is injured through neglect of the company or of its agents and, believing that no permanent disability is to ensue, he accepts the first month's benefits provided by the relief department and tendered by the company, and, later, finds that he is disabled for life or his death ensues, all efforts to recover damages from the company are frustrated by the company pleading the contract which the employee signed when becoming a member of the relief department.

Instances of this kind have not been rare and a sufficient number of them, accompanied by distressing conditions and surrounded by facts which clearly demonstrated the injustice involved, occurred in the State of Iowa to lead the Legislature to place upon the statute books of that State a law which specifically provides that such contract is and shall be null and void.

The fact that the company insists upon such a contract is sufficient evidence that the relief thus afforded to it from legal liability is one of the strongest reasons for its interest in the relief department. The fact that the department is thus made a shield against liability which would otherwise attach to the company leads one's thoughts away from the idea that the company's interest is purely philanthropic.

Mr. Riebenack furnishes figures which show that in the eighteen years of the existence of the Pennsylvania system's relief department the company has contributed to it the sum of \$2,544,348.11, and that the cost of management has been \$1,815,641.54. The company has, therefore, contributed \$728,706.57 more than the cost of management. And the cost of management is entirely within the control of the company.

But if we dismiss from consideration the cost of management we find that in eighteen years the Pennsylvania system, containing 10,271 miles of railway covered by its relief department, on which are employed 159,704 men, has paid as its contribution to this fund—and this includes the purchase of relief from legal liability as above mentioned—\$2,544,348.11, or a fraction over \$15.93 for each employee. Considerably less than one dollar per year per employee. I quote figures for the Pennsylvania system because they are the ones at hand, having been furnished by Mr. Riebenack.

Mr. Riebenack argues that the contract under discussion is a legal and voluntary agreement. Its legal-

ity is not here questioned. It has been sustained by numerous courts. It was found necessary in Iowa to enact legislation clearly making it illegal. The contract is voluntary in this: That the employee and the seeker for employment sign the agreement believing that if they do not do so they will have to go elsewhere for employment.

All men who work for railways are not fully informed as to their legal rights. Most railway employees find it difficult to lay up much against the rainy day and hence find it almost absolutely necessary to accept the assistance which the relief department provides. The railway employees of the country generally object strongly to relief departments being made agencies through which the corporations evade liabilities which the law places upon them and which they should not be permitted to thus escape.

THE HOMESTEAD STRIKE RECALLED.

Some Inside History Showing Andrew Carnegie's Favorable Attitude Toward Conference.

THE memorable address of Andrew Carnegie at the annual dinner of the National Civic Federation, having revived an interest in the Homestead strike, our attention has recently been called to an article written by Edward W. Bemis, at one time Professor of Political Economy in the University of Chicago and now head of the Water Department in Cleveland, in the administration of Mayor Tom Johnson. This article appeared in the *Journal of Political Economy*, published by the University of Chicago, for June, 1894, and dealt with the causes leading up to the Homestead strike, and the history of its conduct and conclusion, based upon a thorough personal investigation by Professor Bemis. The extract from that article which follows recalls a chapter of the strike not generally understood:

Only once in twenty-six years of personal management has Mr. Carnegie, in a single one of his works, had any stoppage from strike or lock-out, but when difficulties were likely to arise, he had shown a disposition to "sit down and wait" till an agreement could be reached rather than to call in new men.¹

¹ Note—In 1886, he wrote in the *Forum*: "I would have the public give due consideration to the terrible temptation to which the workman on a strike is sometimes subjected. To expect that one dependent on his daily wage for the necessities of life will stand by peacefully and see a new man employed in his stead, is to expect much. This poor man may have a wife and children dependent upon his labor. Whether medicine for a sick child, or even nourishing food for a delicate wife, is procurable, depends upon his steady employment. In all but a very few departments of labor, it is unnecessary and, I think, improper to subject men to such an ordeal. In the case of railways, and a few other employments, it is, of course, essential for the public wants that no interruption occur, and in such case, substitutes must be employed; but the employer of labor will find it much more to his interest, wherever possible, to allow his works to remain idle, and await the result of a dispute, than to employ the class of men that can be induced to take the place of other men who have stopped work. Neither the best men as men, nor the best men as workers, are thus to be obtained. There is an unwritten law among the best workmen, 'Thou shalt not take thy neighbor's job.' No wise employer will lightly lose his old employees. Length of service counts for much in many ways. Calling upon strange men should be the last resort."

* * * In this connection there are certain hitherto unpublished facts to be taken into account. On the first Sunday (July 17th) following the arrival of the militia at Homestead, two gentlemen, prominent in labor circles, came to Homestead and urged Mr. O'Donnell, chairman of the Advisory Committee, to go to New York and secure, if possible, the intercession of some prominent man, for the purpose of inducing Mr. Carnegie to order Mr. Frick to re-open conference with the men. On the unanimous vote of the Advisory Committee, Mr. O'Donnell set out. On reaching New York and consulting with a few labor leaders it was decided to approach Mr. Whitelaw Reid, who, as candidate for the vice-presidency on the Republican ticket, was assumed to be interested in maintaining peace in a tariff-aided industry. In the office of one of the editors of the *New York Tribune* the letter given in the note below was dictated by Mr. O'Donnell, but dated from Homestead and dated back a couple of days.²

² Note. Hon. Whitelaw Reid, New York N. Y.

Dear Sir: I address you in behalf of the 12,000 inhabitants of Homestead, Pennsylvania. In their name I ask that you interest yourself in the unfortunate controversy still pending between them and the Carnegie Steel Company by whom the majority of the adult population of the town is employed.

In presenting this matter to you I have no desire to dwell upon the merits or demerits of the conflict. I am looking toward the future, not the past. With the past I assume you are fairly well informed; sufficiently well, at all events, to make it unnecessary for me to supplement your knowledge at this time. It would be foreign to my purpose to do so. I simply therefore lay before you the situation as it exists to-day.

A thorough, not only one of the most prosperous in Pennsylvania, but in the entire Union, whose population represents to the highest degree the thrift, industry, intelligence and morality—in short, the best tendencies of the American people, is at present practically under martial law. The entire State

militia, numbering 8,000 or more, are in control of the place at an expense to the commonwealth of \$22,000 a day. The spirit of peace and progress has been supplanted by one of intense bitterness and discontent. It is in the interests of no one that this state of affairs should continue; that it should not, there is but one, and only one, course to pursue. I say only one, and I speak advisedly. That course is an honorable settlement on the lines that I shall presently indicate.

But before submitting my proposition permit me to say a word in reference to the course of procedure which appears to be in the minds of the Carnegie Company. I mean their express determination to put non-union men at work in the places of our people by the aid of the State authorities. I am not going to discuss the question of the right of the company to do so. I simply want to point out the practical effect of that action, which in my judgment may be briefly summed up in the statement that it will precipitate an unending internecine strife at Homestead. It must be borne in mind that a majority of the present employees own their own homes. All their interests center there; and they will never surrender them without the most determined effort, and one that will be made regardless of all that can be said or done to the contrary. In brief, owing to the peculiar conditions of this strike which I have indicated here, the trouble will, in my judgment, only begin in earnest when the mills are set going by the men who will take the places of the old employees.

I am sure that you agree with me in saying that it is not desirable to have this come to pass. It is not desirable that the present situation should continue, nor is it desirable that the men who have by years of patient toil acquired a little homestead should be cut off from their employment if it can be prevented in any honorable way. It can be prevented easily and without the sacrifice of honor or dignity upon either side. How shall it be done? Simply let the Carnegie Company recognize the Amalgamated Association by re-opening the conference doors, and I have no hesitation in saying that when that is done the end of the strife is at hand. I am warranted in saying that there is no disposition on the part of the employees to stand upon a question of scale, or wages, or hours, or anything else. The spirit that dominates them is conciliatory in the extreme, for they deplore the recent sad occurrence as much as any other class of people in the whole country. I assure you that they will do all in their power to bring about a re-establishment of harmonious relations.

I ask you to interest yourself in this matter because I believe you are in a position to render more effective service than, perhaps, any other man in this country. I do not think that it is necessary for me to dwell upon this point, nor state the reasons why this is true. That it is true is sufficiently clear to my mind to cause me to ask you to do what you can in every honorable way to bring about an amicable settlement.

My appeal is not in the name of any political party, nor in the name of organized labor, but for the sake of the men, women and little children that make up our present distressed community.

Sincerely and respectfully yours,
HUGH O'DONNELL.

Mr. O'Donnell states, as did President Weihe, on July 6th, that there was "no disposition on the part of his employees to stand upon a question of scale, or wages, or hours, or anything else." All that was wanted was a "re-opening of the conference doors."³

³ Note—The information here given on this point is derived not only from Mr. O'Donnell, but also from very high and absolutely reliable authority, entirely disconnected with the Carnegie Company or with organized labor. Inquiries addressed to the Carnegie Company have brought no reply.

Mr. O'Donnell, having been charged by the Carnegie officials with murder in connection with the events of July 6th, hastened back to Homestead on the promise that Mr. Reid would cable Mr. Carnegie. Mr. O'Donnell surrendered to the authorities and was held in prison five days. Then (July 25th) he was released on \$10,000 bail. Meantime Mr. Reid, in response to Mr. O'Donnell's letter cited above, had applied to Mr. Frick for Mr. Carnegie's address in order to telegraph him—Mr. Carnegie being at that time absent in Scotland and his address not being known to any one in this country except his business associates. Mr. Frick refused to give the address; whereupon Mr. Reid obtained it from our Consul General in London, John C. New, and then cabled Mr. Carnegie, urging a speedy and amicable settlement. An answer was received by cable from Mr. Carnegie in which he accepted the terms proposed by Mr. O'Donnell and urged that Mr. Frick be seen immediately with a view to effecting the settlement.⁴

⁴ Note—Copies of these cablegrams cannot now be obtained.

By this time the New York anarchist, Alexander Berkman, without the knowledge or recognition of the strikers, had made his attempt on Mr. Frick's life (July 23), so that when the gentleman who undertook the mission of reconciliation reached Mr. Frick he found him confined to his bed with the injuries he had sustained. My informant (whose name is withheld) goes on to say: "Mr. Frick was obdurate. He refused to consider the matter at all, denounced the strikers as assassins and declared that if Carnegie came in person, in company with President Harrison and the entire cabinet, he would not settle the strike."⁵

⁵ Note—My informant adds: "There is a well-defined rumor that since Mr. Carnegie's return he has written Mr. Reid, expressing regret that Mr. Frick did not agree to O'Donnell's proposition as forwarded to Mr. Reid."

Mr. O'Donnell writes: "Thus it would seem that the bullet from Berkman's pistol, failing in its foul intent, went straight through the heart of the Homestead strike." Disclaiming the idea of having intended to make political capital out of the New York trip, he asserts the purity of his motives.⁷

⁶ Note—Mr. Frick's previous refusal, July 7th, to confer with President Weihe and the strikers, as well as his refusal to give Mr. Carnegie's address to the editors of the *New York Tribune*, throws some doubt on the probability of Mr. Carnegie's order being followed, even if Berkman had not made his attempt.

⁷ Note—He says, in a letter written in February, 1894: "Believe me, I was actuated with but one desire, and that was the banishment of our troubles, and to have restored to our own prosperous little borough a peace and repose that had formerly blessed its humble homes. Mine has been the sacrifice. To-day, in reward for my efforts, I am misunderstood and maligned by the unthinking crowd—a modern Ishmael doomed to wander in the desert of ingratitude."

THE VOICE OF THE PRESS DECLARES FOR INDUSTRIAL PEACE.

EDITORIAL APPROVAL OF THE AIMS AND WORK OF THE NATIONAL CIVIC FEDERATION FROM MANY VARIED SOURCES.

A METHODIST EDITOR'S COMMENDATION.

Rev. Dr. James M. Buckley, in the Christian Advocate.

Mr. Gompers presided and made an appropriate speech. He is a very slow speaker, but clear and forcible. Mr. Carnegie was present in the afternoon and was to have been present in the evening, but found himself too weary to attend. But he sent a most pertinent address, in which he stated that industrial peace reigns in six-sevenths of the industrial world. He recommended employers to keep their old men; declared that when the employer succeeds in running the works with new men his victory is really a defeat. He believes employers should make it an invariable rule never to employ new men in case of a strike, but to wait patiently for the old men.

After Mr. Carnegie's address Archbishop Ireland was called upon. We had long desired to have an opportunity of hearing the archbishop, as his reputation for fervid oratory is world-wide. Long ago in France he delivered an address in the French language so interesting as to be rapturously applauded, not alone for what he said, but for the admirable French in which he spoke it. As we sat near him the opportunity was afforded of asking him something of how he acquired his mastery of the French tongue. He responded that he spent eight years of his youthful life in that country. In conversation he is very attractive and animated. His address was a genuine oration of the old type, built upon two pillars—fellow Americans and fellow workers. All the problems could be solved by intelligence and sympathy for one another. One passage was directed against those who endeavor to break down the social structure.

Next came August Belmont, who testified to the efficacy of face-to-face conferences with honorable employees. He affirmed that it is a practical method of reaching a common understanding, and from his own experience testified that conferences over controverted points were followed by a better understanding and an harmonious agreement in the conduct of a great public service corporation. John Mitchell made a pleasing speech, in which he declared that he had not promoted strikes for the sake of strikes, and never would. James Kilbourne, of Ohio, read a very carefully prepared address. Mr. P. H. Morrissey, of the Railroad Trainmen, had only a little previous notice, but he made such a rational, calm, and well expressed speech as to secure universal applause. Mr. Oscar S. Straus gave a full statement of the number of labor disputes which had been settled by the Federation during the past year.

The National Civic Federation seems to us an admirable institution, for it tends to substitute calm discussion for acrimonious controversy. We are also convinced that the only thing in the way of "industrial peace with honor and liberty" is the attempt to prevent non-union men from working, which is equivalent to preventing employers from securing work unless labor unions consent to it. One of the speakers admitted that his union went upon the principle of making no trouble with non-union men who worked for union wages. We had framed a favorable estimate of the motives of those who established the National Civic Federation, and have appreciated everything good that we could trace to it in the struggles of the last few years. Our estimate of it was greatly enhanced by the proceedings at this dinner.

BRIDGING THE CHASM.

Address by John T. Wilson, Grand President International Brotherhood of Maintenance of Way Employees.

A potent factor in the partial elimination of strikes and lockouts during the past few years has been the National Civic Federation, which is endeavoring to substitute conciliation and arbitration in lieu of the wasteful and barbarous strike and lockout so frequently resorted to in the recent past as a result of disputes between employers and employees. The Federation is composed in equal numbers of representatives of employers of labor, representatives of employees and representatives of that large public interest which unjustly bears the brunt of each industrial conflict. Especially worthy of mention in this connection is the efforts made by the MONTHLY REVIEW of the National Civic Federation to bridge the chasm which divides the classes by giving each interest an impartial hearing through the columns of the REVIEW, thus allowing the public to judge of the reasonableness of each contention from the facts and the arguments submitted, rather than by appealing to class prejudices and arousing class hatreds, and thus widening the gulf between the representatives of capital and the representatives of labor.

AN INDUSTRIOUS EXECUTIVE.

Boston Herald.

Mr. August Belmont is getting some very handsome compliments, apropos of his unanimous and enthusiastic election to the head of the National Civic Federation. The New York Times, for instance, calls him a workman of great industry, adding that the wage earner who had to carry a tithe of the cares and responsibilities of this organizer and manager of great enterprises would feel himself burdened beyond his strength. Mr. Belmont's sympathy with honest toil may be assumed from the fact that he earns his rest, when he has it, by the most systematic devotion to business. He is now one of the largest employers of labor in New York, and he gets on amicably with all his employees.

GOOD WILL THE WAY TO CONCORD.

Chicago Record-Herald.

Strikes and lockouts are costly, uneconomic, wasteful, and American capital and labor are too sensible and practical to prefer them to the pleasant ways of confidence and peace. Hence, as President Roosevelt said in his letter to Mr. Gompers, "The highest aim of all should be the establishment on an ever closer basis of mutual respect and friendship of the relations between employers and workmen."

Where the proper disposition is wanting, where distrust and suspicion and bitterness prevail, no mere machinery of arbitration will insure industrial tranquility. Where there is what a great philosopher has called the highest product of human development, a good will, no obstacles can long obstruct the way to concord and understanding. The essential condition is that each side should not only place itself on a basis of reason and fairness, but should believe the other side to be equally willing to reach a settlement conceived in reason and fairness. The Civic Federation, in reporting encouraging progress in all the departments of its work, demonstrates the efficiency of friendly discussion, conciliation and arbitration as cures for industrial ills.

A HIGH STANDARD OF LEADERSHIP.

Boston Transcript.

The National Civic Federation has come to stay. That at least seems assured by the enthusiasm, increased definiteness of purpose and notably representative character of the fourth annual meeting of this unique institution just held in New York. From the beginning the Federation has been subject to

superficial criticism from those who were not, and from an outside standpoint could not be, aware of the solid, practical work that has lain behind the more general aspects in which from time to time it has come into public notice. The annual meeting with the numerous conferences, the sessions of the executive council, and the detailed reports on the various phases of practical work during the past year, conciliation, trade agreements, "welfare institutions," etc., furnish probably the best reply to unfriendly criticism that could be offered. The movement has passed the experimental stage.

The gravity of the issues the Federation is called upon to face demands a high standard of broad-gauged, tolerant, sagacious leadership. That it had in Senator Hanna; and in his associates, whose active co-operation will be given now to Mr. Belmont, the new president. Mr. Belmont's election seems to have been the result, largely, of the somewhat new light in which he came before the public in the important conferences which prevented the threatened strike on New York transportation lines last summer. As the fruit of that experience, he is decidedly persona grata to large labor interests, and presumably will not need any intervention to get a respectful hearing among the captains of industry and finance. It is to be hoped that the experience of the coming year will justify in even increased measure President Roosevelt's estimate of the Federation, in his letter read Thursday night, that it is "a movement so praiseworthy and so thoroughly American in conception that it should as a matter of course receive the earnest support of all good citizens who are awake to the vital needs of our nation."

LIVE AND LET LIVE.

New York Mail.

All that was said at the banquet of the National Civic Federation, and all that was implied by the fellowshiping of employers and employees over the mahogany, was in a sense an amplification of the text given by President Roosevelt in a lay sermon at Washington the same evening: "The one all-important necessity of our social, industrial and political life is the necessity of the realization of what brotherhood means." It means that each man must "recognize in his fellow man his brother whose interest he must have at heart."

Men must live and let live; that is the principle of industrial peace. The extreme men on both sides are being relegated; that is the cheering sign under which both sides move to a better understanding.

GOOD INFLUENCE EXTENDING.

San Francisco Chronicle.

The main source of the influence of the Civic Federation is the great prominence of all prominently concerned with it. They are among our most eminent men. The late Senator Hanna was president, and the vacancy caused by his death has been filled by the election of August Belmont. The first vice president is Samuel Gompers. That the body is of recognized national importance is shown by the fact that the President of the United States deems it proper to address a sympathetic letter to the annual meeting, sent, by the way, through the hands of Vice President Gompers. The influence of the body is great and is extending. Federations on similar lines are forming in other countries. The entire work of the association is to assure industrial peace by promoting industrial friendship. Friends will not fight each other.

CONFIDENCE IN HANNA AND BELMONT.

Buffalo News.

August Belmont's election to the presidency of the National Civic Federation meets with general approval. Mr. Belmont is a man of great ability and ambition and will undoubtedly make a creditable figure in his new role. The office to which Mr. Belmont is chosen is the one left vacant by the death of Senator Hanna. That men of wealth like Hanna and Belmont should have proved acceptable to the labor men of the Civic Federation is in itself a gratifying fact, tending to show that while there may be classes in this country there are no class barriers. Workingmen gave Hanna and Belmont their confidence, and rightly, too, for Hanna knew and Belmont knows industrial conditions and the lot of the toiler.

BELMONT AND GOMPERS.

Los Angeles Express.

"Belmont and Gompers." This is a legend which, without further explanation, might serve as caption for a stirring story of encounter between capital and labor, but in these mild days when amity seems to be a universal watchword it merely conveys the intelligence that the New York banker, sportsman and representative of Rothschild and the leader of America's greatest industrial army are in friendly association as president and vice-president, respectively, of the National Civic Federation. Much good must be predicted from this harnessing of Belmont and Gompers, even if they find occasional difficulty in trotting in unison. Such action tends to lessen apparent extremes, and often it is successful in proving that real differences are non-existent.

MR. CARNEGIE'S SYMPATHETIC STUDY.

Baltimore Herald.

The ablest labor leaders are stateamen, recognizing the force of public opinion and guarding against the handicap of a decision by the Civic Federation against them. The letter addressed by Mr. Carnegie to the meeting can only promote a better feeling all around. It is a plea for a better understanding between the men and the employer, for patience in dealing with the difference between them, for a regard by both sides for each other's good points. His paper discloses the man with vast experience in employing labor who has studied the question with a large sympathy.

WAIT FOR THE OLD EMPLOYEES.

Milwaukee Sentinel.

It amounts to commendation of Mr. Carnegie's thoughtful address read at the meeting of the Civic Federation to say that extremists like D. M. Parry, who are at odds with the spirit and methods of the Federation, will find in it little to approve. To illustrate, the great ironmaster made the at first view rather startling assertion that a large corporation makes a mistake when it adopts or even considers the policy of employing new men when its old employees are on strike. Mr. Carnegie qualified his statement by adding that, of course, in special branches, as street and other railways, where unbroken continuance of a public service is imperative, hire rule could not apply. But his general principle is that large employers will best serve their own interests by waiting patiently for the old men to return in case of a strike, though the rule must have its exceptions.

It is not difficult to deduce from Mr. Carnegie's view an argument for the organization of labor where employed in large masses. The physical difficulties in the way of direct personal contact between employers and workmen under such conditions are obvious. But indirect contact and thereby a degree of mutual acquaintanceship, so necessary to mutual reasonableness and sympathy, can be obtained by resort to the representative principle. But even such contact is impossible between large employers and a host of unorganized and therefore unrepresented workmen. The only medium of contact possible is the representative body created as a result of labor organization. Unionism should make for industrial peace and equity—if only the men selected to lead and represent are well and wisely chosen and are really and honestly representative of the collective interests they are supposed to stand for.

A WELL DESERVED HONOR.

Buffalo Times.

Hon. August Belmont of New York, has been elected president of the National Civic Federation to succeed the late Senator Mark A. Hanna, and the honor is well deserved. Mr. Belmont employs a large number of men and he has always taken a deep interest in the affairs of the Federation, believing it to be an organization through which great good may be accomplished in the mutual interests of capital and labor. In the construction of the New York subway Mr. Belmont won the friendship of the employees by his eminent fairness and justice in dealing with them. As president of the Federation he will have an opportunity to do much toward solving the problems involving capital and labor, and that he will improve it, all who know him are confident.

INDUSTRIAL WAR USUALLY AVOIDABLE.

Philadelphia Inquirer.

So far Mr. Belmont has never figured in any of the labor troubles of the country, although he is financially interested in many corporations. He is a quiet, unassuming man of much force of character and his selection, while a surprise, may prove to be one of the happiest possible. It is certain that the Federation is constantly achieving much, not only in the settlement of actual disputes, but in preventing strikes and in a larger way educating the people up to the knowledge that such industrial wars are usually disastrous to all concerned, and usually avoidable. The career of the new president will be watched with the greatest interest.

MR. CARNEGIE'S INDUSTRIAL DIPLOMACY.

Detroit Tribune.

A new school of industrial diplomacy is being fostered by Andrew Carnegie, whose address at the dinner of the National Civic Federation in New York was characterized by its good sense. He approaches the problem in much the same manner as he has approached the question of international war, the more portentous threats of which have been time and again averted by the offices of diplomats. "A corporation engaged in a dispute with its men makes a great mistake if it adopts a policy of running its works with new men," Mr. Carnegie has here become responsible for a bit of genuine wisdom. The idea is possibly wholly selfish, born of bitter experience and advanced for a motive that cannot dissociate itself from material gain, nevertheless it is an attitude that can be borrowed with profit to everyone. In the body of industrial strikers there are skilled men with whom those on the list of idle, and thus available, labor cannot compete. Each new man is as much a potential striker as the old. A strike is a difference to which there is a possible agreement, rather than a revengeful warfare.

MR. CARNEGIE AGAINST STRIKE BREAKERS.

Detroit Times.

Andrew Carnegie, in his speech at the National Civic Federation, an organization conspicuously in contrast with the convention of Parryites, which met in New York recently, declared that a victory over labor, won by the employment of new men, is a defeat in reality. He declared the method unjust to the men and their families and disastrous for the employer because of the necessary inferiority of men employed in time of labor trouble to take the place of old employees. Mr. Carnegie did not mention labor unions in his speech, but his words apply so perfectly to those situations where union men are opposed by strike breakers that their meaning loses no force from that fact. As a criticism of employers' associations and a support of the contention of unions that the men opposed to them in the ranks of labor are inferior workmen, no higher testimony could be adduced.

MR. CARNEGIE DEPLORES INTOLERANCE.

Pittsburg Press.

Mr. Carnegie has been until recently one of the largest employers of labor in America. It is, therefore, significant that he believes thoroughly in the mission of industrial reconciliation, rather than in the efficacy of the spirit of violence. This, we take it, Mr. Carnegie deprecates, whether it be manifested by lawlessness on the part of strikers or intolerance on the part of employers (such for instance, as the employers' association, represented by D. M. Parry, whose motto appears to be "War to the knife, and the knife to the hilt"). In addition to the Carnegie letter, the Federation listened to a letter from President Roosevelt, who made it plain that industrial conciliators have his entire sympathy. The Federation has already done a great deal to promote industrial peace. Representative American citizens could find no worthier work. August Belmont, who was elected, to succeed the late Senator Hanna as president, has not been known to the country as a special friend of the cause, but he has the ability and the influence to fill the position acceptably.

A GREAT OPPORTUNITY AND RESPONSIBILITY.

Saratoga Springs Saratogian.

August Belmont has taken part in many works of great public moment and in many ways his career has been a good example of what men of brains and wealth may accomplish toward the world's good. But never before has there been shifted to his shoulders a greater opportunity or a larger responsibility than has come with the headship of the Civic Federation bestowed by the ballots of his fellow members. The work of that organization toward a closer fellowship and understanding between capital and labor was one of the great moving forces in Senator Hanna's life. How dearly he cherished the plan and how hopeful he was of the results to follow, only his intimate associates knew. But he left much of his inspiring faith behind and it is to be hoped that Mr. Belmont will feel its influence and will seek to carry forward the same ends with the same high and unselfish purpose that prompted his dead predecessor in the past.

LABOR WRESTS VICTORY FROM DEFEAT.

(Continued from page 9.)

Chief Stone, of the Engineers; Samuel Gompers, President of the American Federation of Labor; and John Mitchell, President of the United Mine Workers of America, for assistance, and they were on the ground Thursday morning. At 10 o'clock that morning, no answer having been received from the joint executive committee of the strikers, Chiefs Stone and Hurley, of the Engineers; President Mahon, of the Amalgamated; President Samuel Gompers, President John Mitchell, and Herman Robinson, met in conference to decide on the course of action. At 12 o'clock there was still no answer from the strikers' committee and President Mahon telephoned the local Amalgamated officers that unless he had an answer by 2 o'clock in person he would issue a statement repudiating the strike. Chief Stone meantime drafted his statement to the public, but agreed to hold it back out of courtesy to the committees that had been trying to bring about a conference. At 3 o'clock the sub-committee of the Amalgamated Association appeared at the Clarendon Hotel and reported to Mr. Mahon that while the Amalgamated members of the joint executive committee were willing to call in the national officers, the engineers and firemen had outvoted them and therefore none of them could accept.

Chief Stone then read his letter to the committee and it was heartily approved and given out to the public. It is as follows:

"The Brotherhood of Engineers have no differences between their organization and the Interborough

Company at the present time that could not have been adjusted at the present time in a proper manner.

"The present strike now going on by men claiming to represent the Brotherhood of Engineers is in direct violation of our orders. It is not recognized, nor will it be supported by our organization. The contract entered into in September, 1904, between the Interborough Company and the Brotherhood of Locomotive Engineers we recognize to be as binding to-day as it was when signed, and loyal members of the Brotherhood of Engineers are instructed to at once report for duty to comply with the requirements of the agreement. Members refusing to do so will be expelled from membership in our organization. It has been reported to me that many of our members have been misled by statements that the grand officers have given consent to this strike. This is not correct. No request was made or granted, nor were the officers of the Brotherhood of Engineers consulted in the present situation. This is the first time in the history of the Brotherhood of Engineers that our members have repudiated their agreement with any railroad. Labor organizations must keep their part of the agreement inviolate if they expect success. Had our laws been complied with conditions as they now appear could not exist on the line of the Interborough Rapid Transit Company."

Mr. Mahon's statement soon followed and was:

"The present strike of Local Division No. 332, of the Amalgamated Association of Street and Electric Railway Employees, was undertaken without consulting the responsible officers of the general organization, without their consent or approval.

"Last Saturday a telegram was received at my Detroit office stating that 'the situation in New York

City is critical,' and my presence was essential at once. I reached this city on Monday morning and was astonished to learn that the request for my presence here was made on personal responsibility and not at the instance of the local division.

"A copy of the demands to be presented to the Interborough Railway Company on Monday afternoon was shown me, and I strongly advised against their presentation, for, in addition to the demands for better conditions, the document contained the endorsement of the local division of engineers (motormen) which violated the agreement that organization had with the company.

"I had reason to believe there would have been little or no difficulty in obtaining from the company better conditions, but our organization is strongly committed to the maintenance of its own agreements with employers, and was in honor bound not to encourage the violation of an agreement which another organization had with the employer of its members.

"Under our laws our local unions have no right to strike in violation of any agreement they have with the employers, and surely then they can have no right to strike to support another organization to do an act which they themselves have no right to do.

"It seemed to me that without resorting to drastic measures I might yet give whatever assistance my experience and position offered to advise a way out of the difficult and questionable position in which our men and our local division were placed, to try and bring about an honorable adjustment in the establishment of better relations between the men, the organization, and the company; however, the repeated tender

IS COMPULSORY ARBITRATION PRACTICABLE?

SHOULD CORPORATIONS RENDERING PUBLIC SERVICE BE REQUIRED TO ARBITRATE ALL DIFFERENCES WITH EMPLOYEES?

COMPULSORY Arbitration, with special reference to the practicability of its application to quasi public corporations, was the special topic discussed at the second annual meeting of the Civic Federation of New York and Vicinity on April 4. This subject was directly suggested by the recent strike on the lines of the Interborough Rapid Transit Company, which presented a number of problems, both interesting and difficult, bearing upon the relations between similar corporations and wage-earners. Compulsory Arbitration, as a method of ensuring to the public uninterrupted service, was favored by the Hon. Seth Low, ex-Mayor of New York City, and as in accordance with existing legal institutions, by Everett P. Wheeler; while an argument against Compulsory Arbitration was presented by James P. Archibald, President of the New York Brotherhood of Painters and Decorators. Bishop Potter, in an informal interchange of views, suggested the creation of a commission to examine this and kindred topics concerning the relations between employer and employee.

This discussion, of which a verbatim report follows, is but the introduction to other symposiums upon the same subject, to be presented in future issues of THE REVIEW.

The Hon. Oscar S. Straus, member of The Hague Tribunal and versed upon the subject of international arbitration, who acted as chairman, in bringing the topic before the meeting, said:

The subject of compulsory arbitration, as you know, has had probably the longest trial in Australia and New Zealand. The results are disputed by both sides. Some assert that it has proved disadvantageous to the cause of industrial progress; others look upon it more hopefully. The question has projected itself upon the attention of many in this country, and is receiving serious consideration by students, scholars and men of practical experience in the relations between capital and labor. The chairman refrains from expressing any opinion upon this subject, but wishes rather to throw out suggestions as to the lines of thought that doubtless will enter into the discussion here to-day.

In the beginning of the development of law, if one

individual injured another, it was regarded as an individual affair, and the individual injured was remitted in a very inchoate way to his right for redress. As law developed, a new theory also developed upon

takes up the question; and the public prosecutor assumes the power of the state in order to correct the injury that the public has received.

Now, analogously, we may say, that if a difference arises between a public service corporation and its employees, it is no longer a question solely between the public service corporation and the employees; but it is the larger interests of the general public that are trespassed upon. The question arises, What rights have the general public and how can those rights be best conserved? Under the theory of the law, in public service corporations, the state is a silent partner, and as such has a right to insist upon the most efficacious means to prevent interruption of its service and to impose compulsory arbitration. Others say that compulsory arbitration infringes on a still more fundamental right, individual liberty. I suppose largely around these two questions the whole subject will naturally be considered. Certainly all sides are looking for light, not only from a theoretical standpoint, but light from a concrete and practical point of view; and we are fortunate to-day in having with us men who have studied this problem both theoretically and concretely.

I will ask ex-Mayor Low to open the subject of compulsory arbitration. I need not introduce him to you. You all know him. (Applause.)

Mr. Low:

Mr. Chairman and Gentlemen: The recent strike in New York upon the Subway and Elevated roads was not so much a labor trouble as a social tragedy. Probably a million people, more or less, suffered "in mind, body and estate" while the strike lasted; and many of those who struck, if deprived permanently of their places, may feel the consequences to their dying day. It is amazing that society should be subject to such a disaster because of the unwisdom and the obstinacy of a few men. It is pitiable that the victims of such a blunder should suffer so severely for a mistake in judgment, even if wilful. It would be appalling if such

a thing could happen and nothing be learned from it. No one is able to suggest any way out of such difficulties except through arbitration; and when compulsory arbitration is spoken of in the interest of the com-

which to-day the whole law of crime is based—namely, that if one man injures another the most serious infraction is that which results in disturbing public peace. It is upon that theory of law that the public

munity, it is apt to be challenged by both sides. The capitalist says: "Compulsory arbitration is unfair, because labor is not responsible;" and labor says: "Men are not slaves: they cannot be compelled to work against their will."

I venture to submit, however, that at one point capital and labor stand in precisely the same position before the law; and that, at this point, if it is desirable, compulsory arbitration may be insisted upon, and may be made practicable. Without the privileges given by statute, neither capital nor labor, as illustrated in corporations and trade unions, can lawfully combine. In the eye of the common law, such combinations as a corporation and a labor union were both conspiracies. In other words, in order to combine at all, in such forms, both capital and labor have to ask the same privilege at the hands of the State.

The State can certainly say, if it will: "Yes, you may combine, but only upon the condition that all disputes between you shall be arbitrated." And the State can as certainly, secure the acceptance by both parties of the award of an arbitration, by providing that a failure to arbitrate, or to abide by the award of the arbitration, shall work a forfeiture of the privilege of combining. In the case of a corporation, it would, in that event, lose its charter; and in the case of a trade union, which is an association of individuals, each individual would become amenable to the criminal law against conspiracy. Such a provision would probably be equally effective as to both labor and capital; and it would be equally fair to both, because it would apply to both equally for the same cause; that is to say, because of a failure to observe the conditions upon which the statutory privilege of combining had been granted.

Of course, in this paper, I am not attempting to deal with the details of legislation. It would be altogether possible, I believe, instead of depriving a company of its charter, to deprive the responsible officers and directors for a term of months or of years, as the statute might provide, of the privilege of being officers or directors in any corporation within the State; and, similarly, if a trade union were at fault, only the officers or the men responsible for the fault need be deprived, as in the other case, for a term of months or of years, as the statutes might provide, of the privilege of belonging to any trade unions within the State.

The community, then, is not helpless. The question rather is, why should it not insist upon such legislation, limited, if you please, in the first instance, to public service corporations, where the evils felt by the community are greatest.

It may throw some light upon the problem to try to show the philosophy of the present situation. For many centuries the best men of the race, the world over, have been struggling to secure for the individual man equality before the law and freedom of opportunity. In this country, and at this time, these results have been achieved more generally than ever before. On the other hand, as we observe what is going on about us in the field of industry and commerce, it seems as if the individual capitalist was disappearing in the corporation, and the corporation itself in the trust; while the individual laborer is disappearing in the trade union, and the trade union itself in the brotherhood or federation. What does all this signify? Does it mean that, in this large field of human activity, the loss of individuality is threatened by the force of combination? I think not. It means, on the contrary, as I conceive, that we have reached, in human society, the era of combination simply because we have first succeeded in individualizing each man as to his legal rights and as to his social privileges. In other words, what has happened in society may be illustrated by the art of printing. Until each type had come to represent a single letter only, the era of limitless combinations of types did not appear, and there could be no art of printing. When every type had been individualized, then, and then only, the era of limitless combination was attained and the art of printing was born. This, I think, is what has happened in our day in human society. Men combine at will, because they are free to combine, and because they perceive that in combination they can accomplish what before was impossible. Combination does not threaten individuality: it is rather founded upon it. This proposition, I submit, goes to the very root of so-called labor troubles.

One sometimes hears it said, for instance, that labor combines because capital combines, as if combination on the part of labor was simply an act of self-defense. I think that a very partial and inadequate explanation of the combination either of capital or labor. Men combine, in our day, because they are free to do so, and because they perceive the advantage of doing so, and they do it in obedience to a social law as irresistible as the force of gravity. If capital and labor seem often to be in conflict, through their different forms of organization, it is, as I conceive, because this universal social law affects the two precisely as the law of gravity affects us and our antipodes. The same force is felt by both, and if, in affecting both in precisely the same way, it seems to draw them into conflict with each other, that is because they start from opposite positions. If, then, this is a true philosophy

of our times, the inference from it is important. Nobody thinks of antagonizing the force of gravity. Everybody simply takes it for granted, and adjusts his actions to it. Just as soon as, in a free community, the movement towards combination on the part of both labor and capital is recognized as a movement in response to a law as universal as the law of gravity, the bitterness of antagonism between capital and labor will tend to moderate. Each will take for granted the position of the other, and each will strive, as wise men always strive, so to adjust themselves to universal law as to get from it the greatest possible advantage. Then the effort to destroy the trade union, on the one hand, and the trust on the other, will give place to the wiser effort to regulate both so as to do away with the abuses of which each is capable.

This power of combination in industry and business, while of slow growth, in its recent manifestations is almost like the discovery of a new force. It has taken more than a century since the steam engine was invented for men to learn how to make the use of steam as effective and as safe as it is now; and yet, even now, from time to time, boilers explode and loss of life takes place. No one should be surprised, therefore, and no one need lose heart, if progress in learning the limits of safety in the use of the power of combination, on the part of both capital and labor, is slow, and if, in the process of learning, much injury is done. It is only through experimentation that men learn what can be done and what cannot, when they are put into possession of a new power. Especially must this be the case when the same power is put at once into the hands of men who occupy competing relations as to its use. The first impulse of human nature, when given control of a new power, is to use it to its utmost; and it is only as experience shows what are the limitations of its usefulness, that such limitations are accepted. Capital, in combination, has sometimes imagined that it could do anything that it wished. Labor, in combination, has often yielded to the same idea. Both have found, when they have carried their ideas to the extreme, that forces exist in society with which they are obliged to reckon, and which put a limit upon what they are able to do. In the first stages of the struggle growing out of the efforts of both capital and labor, each to secure for itself, by combination, a larger proportion of the joint products of both, resort was almost uniformly had to main strength. The appeal to justice and the appeal to the community's sense of right seemed to be unnecessary when one side or the other apparently had power enough to have its own way, no matter what people thought. I think it may fairly be said, speaking broadly, that this stage of the matter has been passed in the so-called conflict between capital and labor nowadays. At the beginning of every such controversy, both sides now put forth a statement of their positions, in the endeavor to secure the favor and help of public sentiment. This they do because both have discovered that seldom, if ever, can either side win, in such a dispute, unless it has public opinion with it. From this I infer that the time is ripe to urge that no breach of relations between employer and employee should ever be allowed to take place without a resort to arbitration.

When arbitration is urged in any controversy, one side or the other is pretty certain to say, "There is nothing to arbitrate." This phrase always has one of two meanings. First, it often means, on the part of the employer, that he does not admit the right of his employees to any voice in the decision of the points under discussion; or, second, it may mean, either on the part of the employer or on the part of the employee, that he feels himself so strong that he does not want to arbitrate. Men often say, with a great deal of force, that the finding in almost every arbitration is a compromise. The weaker side is always ready to arbitrate, because it feels that, while it may not get everything that it wants, it is pretty sure to get something. The stronger side, for the same reason, is unwilling to arbitrate, because it feels that, while it may not have to give everything that is asked, it will have to grant something, and it does not want to grant anything.

These two attitudes deserve consideration. And first, that of the employer who thinks that his employees have no right to a voice as to any of the questions under dispute. Abundant experience has shown that, in these days, this attitude concerns not only the employer and his employee, but also it often exposes the community to breaches of the peace, and always, to very many serious and direct evils. This claim, when made, is sought to be justified by saying that it is one of the rights of private property. Can such an attitude toward organized labor be, in fact, so justified? In all ages the rights of private property have been modified in the public interest. Witness the abolition of mortmain and the use of real estate as affected by municipal ordinances. It appears that, as to all lines of business that depend upon public franchises, no such claim can be admitted; because, for such purposes, the private corporation is only the agent of the state; and it may properly be said that no agent of the public has a right so to conduct his business as to involve the community in disaster. As to all business carried on by corporations, the soundness of this position may again be questioned; because every cor-

poration receives from the State two very vital privileges—first, that of limited liability, and, second, that of indefinite life. The State may well demand of people who receive such privileges at its hand, that they also shall conduct their business in ways that are consistent with the public interest. Were it worth while, it might be shown that the argument in favor of arbitration, even as between the business firm, or individuals and their employees, is only less strong; but the amount of business likely to lead to labor disturbances, carried on under these forms in these days, is so small as practically to be negligible in this discussion. It may be said, therefore, that it is very seldom indeed, if ever, in our day that the capitalist is justified in saying that there is nothing to arbitrate, because he is unwilling to admit that his employees are entitled to a voice as to the conditions upon which they will work for him.

Turn now to the second sense in which that phrase is frequently used, "There is nothing to arbitrate;" that arbitration, after all, is merely a form of unwelcome compromise. Is it certain that this is an argument against it? I perceive that the round world is kept in place by an opposition of forces, and it may easily be that the best possible arrangement, as between employer and employee, is the arrangement, if they fail to agree, upon which a fair-minded arbitrator would decide. That is to say, the equilibrium between the demands of the opposing forces, so established, may be, upon the whole, the best possible adjustment for the time being. Such a practice would certainly tend to adjust the relations between employer and employee upon the basis of reason and good will, instead of by force and compulsion. Relations established with good will are not only likely to be more permanent, but also more mutually advantageous, for my business experience convinces me that no business relations are enduring that do not involve advantage to both sides.

There are certain lessons vital to this argument to be drawn from the recent strike in New York City upon the Subway and Elevated roads. From the moment that the breach occurred, and the public had read the statement of the two sides on the issues involved, there was never a moment's doubt that public opinion would be against the men, and that public sympathy would go to the railroad. For these two things were evident to the most casual reader: First, that there was no issue at stake that justified such immense injury to the public as was done by the strike; no issue, indeed, that could not have been easily adjusted by arbitration; and, second, that one section of the men, at any rate—the motormen—had gone out in flat violation of their agreement. Every friend of industrial progress through industrial peace, when he became aware of the facts of the situation, must have felt a sinking of heart, because it is perfectly evident that organized society cannot prosper when men will not keep their faith. Most happily, the day was saved by the good sense and the courage of the national labor officials, by promptly and publicly repudiating the locals who had broken faith. It is, therefore, now more clear than ever, that the more responsible labor leaders and the more responsible labor unions are to be trusted when they have once given their word. As long ago as when the Book of Psalms was written, the writer said that the just man was he who kept his faith, although he had sworn to his own hurt. It is only because the laws of nature are uniform that men can live in the world subject to those laws; and it is only because the great mass of men, in their individual relations, do keep faith that human society is possible. It is idle to consider the establishment of trade agreements, or arbitration, or anything else, with men who will not abide by their contracts. Therefore, if it was discouraging that so intelligent a body of men as the motormen involved in the recent strike should absolutely disregard their agreement, it was, on the other hand, highly encouraging that this action should be so promptly and vigorously repudiated by the officials of the National orders. I venture the opinion that no one thing is more unfriendly to the success of the cause of arbitration, and also to the cause of trade agreements, than the claim on the part of the employers that the men do not live up to their bargains. The Civic Federation, therefore, can do no better work than to exert its great influence in bringing home to the business community the highly encouraging significance of this unhappy episode. Let it be once made clear that the men will abide by agreements entered into in their name by the unions to which they belong, and the movement toward arbitration and the movement toward trade agreements will both have received an immense impulse; and the day may yet come when this force that makes for combination in human society, as it affects both labor and capital, will show itself as consistent with the peaceful and orderly development of industry, as the same principle, applied to the art of printing, has shown itself to be friendly to the unimaginable development of that art, which men fondly call "the art preservative." (Applause.)

The Chairman: I am going to ask Mr. Everett P. Wheeler, who has given the subject careful consideration, to address us upon compulsory arbitration. (Applause.)

Mr. Wheeler:

Mr. President and Gentlemen: You know there are two sorts of lawyers—one, the lawyers who make a specialty of seeing how not to do it and the other who make a specialty of seeing how things can be done.

I see here a portrait of a man who was one of the ablest of us all, Mr. Simon Sterne, whose specialty was to see how things could be done, and I believe, among all the members of the bar in his time, there was not one who was more successful or more suggestive in that direction. My endeavors have been to follow his example in that line, and I suppose it is for that reason that you, as an old friend, have appreciated that I am honored by being asked to speak.

Now, it does seem to me that compulsory arbitration is entirely practicable and that it might take this form: Let an act be passed by the Legislature making it unlawful for employers to lock out their workmen or for the workmen composing a union to strike until the subjects in difference between them have been previously submitted to the arbitration of a competent and impartial tribunal which would be provided by the law. That is all you need, as it seems to me, to accomplish the result. Practically I would say that such a law should apply, in the first place, to what we sometimes call public utility corporations—to common carriers especially—who perform a public function that in many states is performed by the state itself. In Europe most of the railroads are managed by the respective kingdoms or republics, and managed to the satisfaction of the public as well as to the advantage of the state itself. In this country, on the contrary, with the single temporary exception of the railroad across the Brooklyn Bridge, I am not aware that any city or state has undertaken to manage and direct a railroad. But it certainly is perfectly competent for the states of this Republic, or the cities under the authority of the state, to do it. We have thought it advisable up to this time in general that railroad corporations should be organized under the direction of the state. But certainly they are subject to the control of the state that creates them and vests them with a public franchise and function. There is not, I apprehend, any serious difficulty in compelling performance by a railroad of the award of such a tribunal. That is not seriously contested, and if it were, the experience which again I say Mr. Sterne so often had of procuring the appointment of a receiver of a delinquent railroad corporation, who very often managed the corporation quite as well as the board of directors did, would meet the difficulty and would show that the corporations were certainly amenable to such a tribunal.

All we ask is to establish another court. The present courts of justice in effect enforce compulsory arbitration. If my client has a contract, and the other party to it refuses to perform, there are many cases already under which the court will decree specific performance and will enforce it. There have been receivers appointed, not only of railroads but of newspapers, and of many other lines of business, who have carried on the business, whatever it was—and I don't say always carried it on well; sometimes carried it on very badly; but it has been carried on, and in many cases has been well carried on. So I think we may pass from the side of the corporation.

Let us look at the labor side. The objection is made that to compel the performance of an arbitration tribunal would be to create an involuntary condition of servitude. Let us look at that seriously from the practical and not from the theoretical side. Practically, what is it? One thousand men or ten thousand men make an agreement voluntarily. You don't compel them to do it. Nobody compelled the motormen, for example, or the trainmen, or any of them to enter into their agreement with the Interborough Rapid Transit Company. It was perfectly voluntary. There was no compulsory servitude there. Do you mean to tell me that it is compulsory servitude if a court obliges a man to keep his contract? In what book, in what decision of a court, can any authority be found for that proposition? Look it squarely in the face. It is said that it is involuntary servitude to compel a man to keep a contract he has voluntarily made. The objection is absurd.

What, after all, is it that leads the great majority of men to make contracts to do something—to do a piece of work, to manufacture a given article? Why, it is the necessity of life. It is the Lord Almighty that creates that condition of servitude—we must work or starve. There is sometimes accumulated capital; but that is the accumulation of the labor of some one. All capital, after all, when you look at it, is the accumulation of labor in the past and that labor was voluntary labor. And you get it in that concentrated form, as it were. So then we are under that necessity. We want to live. We want to have food and clothing and shelter, and to get that somebody certainly has had to work for it. That is the necessity. That necessity lasts and that necessity compels in itself the performance of the work.

Go a step further. What is it in effect that makes a strike? Why, it is the decision of the leaders. The men who are in the union elect certain leaders. It is those leaders as a rule that decide upon a strike.

The men follow them. We all know, and cannot help but admire, the loyalty of the men. The leaders are amenable to the process of the court. If they commit a crime they can be punished for it, and if it is a punishable offence to violate the judgment of an arbitration tribunal, why cannot the law punish the leaders for that offence as it would for other offences? And if they are punished, the strike of necessity goes to pieces. If there had been such a law as that, and the leaders of this late strike had sought to do what they did and had been arrested on the charge of violating the law, the strike would have gone to pieces from the first. It never had any life except from the action of the leaders and the loyalty of the men. If the state should interfere and say, "You must do this; it is as much an offence against the public to initiate such a strike without arbitration as it is to pick a man's pocket," and the state proceeds to punish that offence, that would be the end of the strike. And why should anybody complain that society compels members of it to perform contracts which are made for the public benefit? I confess I have tried very hard, Mr. Chairman and gentlemen, to see the objections to that proposition, and I fail to see them.

I would like to say this one thing in conclusion. We are, after all, a law abiding people. We are too much given to making laws, and many laws are made undoubtedly that are not enforced. I am willing to admit that. But when in your experience has a court, after a fair hearing, decided and rendered a judgment, that the judgment has not been obeyed? You may say you can appeal. Very well, you appeal. But when the final court has rendered its judgment, who can give an instance where that judgment has not been regarded? Take this notable case of the Northern Securities Company. There, the richest, most powerful persons in this country were involved. The interests were mighty. We all remember the struggle and the keen competition that resulted in that famous Northern Securities agreement. Those people have been obliged, by the law of the land, to submit this controversy to the judgment of the court, and the court has annulled their agreement. They had another controversy, as to how the result of all that combination should be divided, and the court has decided that. They are going to obey the decision. Is there anybody, from the greatest to the least, that was connected with that combination who is not going to submit peacefully, without a struggle, to the decision of the court? Will it be necessary to order out the marshal or the United States troops to enforce the decision? Not at all. That is ingrained in the American people. I think I can truthfully say—I am sometimes called an optimist—but I think I can truthfully say that the disposition of our people is to submit to the decision of the court when it has been rendered after a fair and impartial hearing. I don't believe you would need any compulsion. I don't believe, when such a tribunal has rendered its decision, there would be any occasion to put anybody in prison or take any method of enforcing that decision.

May I refer to my own experience in this connection? Every man's experience ought to be worth something to himself, and it is out of the combined experience of many individuals that we ought to learn something, at least, of a useful lesson for the conduct of life. I have been practicing law in this city for forty years. I can only remember three occasions in all the cases I have tried, and I have tried a great many, where it has been necessary to resort to the compulsion of the sheriff or marshal to enforce the orders of the court, and one of those cases was the case of a defaulting trustee. If even out of one thousand cases there were three where you had to call in compulsion, would that be a serious defect? I submit that such a law as I have suggested could be devised which would do justice to all parties, which would provide a fair and impartial court, the decision of which would be respected and would be greatly in the interest of the public, because it would prevent these social wars which we call strikes. (Applause.)

The Chairman: I shall now call upon a gentleman to speak on the other side, a representative labor leader, Mr. James P. Archibald, who I believe has given considerable thought to the other side of this question. (Applause.)

Mr. Archibald:

The general objections to compulsory arbitration, based upon political, social and economic grounds, apply to the specific phase of the question here under consideration, which would limit the application of compulsory arbitration to differences between employees and employing corporations chartered to perform service, essential or important, to the public convenience, comfort and welfare. Despite that limitation, it will be found that nearly all, if not every one, of the broad reasons that can be adduced against legislation to make industrial arbitration compulsory will hold good as against the proposition to employ compulsory arbitration only in differences between employers and employed engaged in quasi-public service. Furthermore, this is true even if we admit at the outset that the corporation engaged, for instance, in transportation, owes to the state a duty, more or less de-

fined and restricted, in requital for its charter, and that the employees of such a corporation are in a sense public servants who, in accepting employment, have incurred on their side the duty of exerting every effort to secure the safe and prompt conveyance of goods and passengers. Even to place thus in a category by themselves such a corporation and such employees, does not exempt them from the operation of universal principles.

The first of these broad objections to compulsory arbitration, to my mind, is that it must tend, in its practical operation, toward control of industry by the state; that is, toward Socialism. The very definition of arbitration, whether compulsory or voluntary, implies a surrender of control of any industry to which it is applied by either of the two parties whose co-operation is essential to its success and to their share in its prosperity. Arbitration is defined by the Industrial Commission as the authorized decision of an issue, as to which both parties concerned have failed to agree, by some person or persons other than those parties. That is, the decision thus reached may be unsatisfactory to either or to both of the parties. If each has agreed in advance to abide by the decision, whatever it may be, that agreement involves only a voluntary and temporary self-sacrifice by one or the other or by both. But if the state is empowered to compel obedience to the award, to which each party is enforced to submit, the outcome would be, in case the parties should refuse either to carry on the business or to work, that the state would assume the conduct of the industry; that is, if its continuance were essential or conducive to the public welfare. It is not necessary here to enter into a discussion of Socialism further than to say that opposition to Socialism thus implies opposition to compulsory arbitration, whose ultimate tendency toward Socialism is clear enough in theory and not to be measured by any experience.

The next broad objection to compulsory arbitration is that it is unnecessary. It is a general principle that legislation should be framed only to meet requirements. Needless laws cumber the statute books and are a burden to society. The maxim that the best government is that which governs least may be carried to an extreme, but it is certainly true that no one would seriously contemplate a large extension of our judicial machinery without a clear demonstration of its necessity. Now, in the regulation of industry there has been no such demonstration of the necessity of the creation of a court of arbitration, to which either party to a dispute could cite the other at will or caprice, and from whose decision, reached without reference to a jury, there could be no appeal. The advocates of compulsory arbitration are keenly aware of this vital objection. They usually preface their argument by statements designed to picture the United States as in an incessant ferment of industrial war, and at least one of them has gone so far as to apply the famous definition of war to the relations of capital and labor as a whole. But a calmer view will show that the normal and usual condition of industry is one of peace, and that war is the exception. So distinguished and experienced an observer as Andrew Carnegie recently remarked that "peace reigns in six-sevenths of the industrial world." Mr. Carnegie reached this conclusion by pointing out that out of 22,000,000 engaged in gainful pursuits only seven millions are in mechanical and manufacturing occupations. Outside of these, in agriculture and domestic service, peace reigns. Out of the seven millions engaged in mechanical and manufacturing pursuits, he estimates that not more than three millions, or those having relations with large employers, are often disturbed by industrial war.

The strikes, then, that do occur, nearly all involve directly less than one-seventh of the total wage earners of the country, and only a fraction of them at one time.

Official figures show that of the 22,783 strikes in the twenty years from 1880 to 1900, the industries most affected, in the order named, were the building trades with 4,440 strikes; the coal and coke industry, with 2,512; the metal and metallic goods industry, with 2,079; the clothing industry, with 1,536; the tobacco industry, with 1,509, and, least of the six, transportation, with 1,262. Of the total 22,783 strikes, 58.09 per cent. were in these six industries. In the number of establishments involved, transportation also takes lowest rank; few more than 5,000 establishments being involved in the twenty years, as against 41,910 in the building trades; 19,695 in the clothing industry and 14,473 in the coal and coke industry.

In this connection, it is to be noted that this lack of necessity for compulsory arbitration is progressively decreasing. The methods of conciliation, conference and voluntary arbitration are largely responsible for this decrease of industrial war. No one can fail to be impressed with the fact, of common knowledge, that there has been no strike of serious consequence upon any of the great railway systems since 1893, or for more than a decade. This, it has been pointed out, is due to the increase of organization among railway employees. Strikes upon such public service systems as gas or water works are so rare that they may be left out of account. There remain, then, only the strikes upon street railways in centers of population to be considered in relation to the necessity for compulsory arbitration, and as to them the necessity is yet to be demonstrated. In their case, it is not the capital or the number of employees involved that becomes important. It is the inconvenience of the public and the dislocation of the business of a community

that cause the outcry for a drastic remedy or an effective prevention. The gravity and the reality of these public grievances cannot be minimized or obscured. Yet it is none the less true that their occurrence is local, though intense; their endurance temporary, though acute; their effect limited in time, though accompanied by an appreciable increase in danger of operation. These are not adequate causes for introducing an innovation into our judicial machinery.

The organization of employees, accompanied by the organization of employers, is a constantly increasing cause of industrial peace, and a constantly increasing argument against the necessity of compulsory arbitration. If, then, we accept the organization of labor as socially and economically desirable, as tending to elevate the mass and increase its power of consumption, we must oppose compulsory arbitration as inimical to the development of unionism. A primary object of unionism is the negotiation of trade agreements, otherwise collective bargaining with employers, organized as corporations or associations. Nearly every labor organization in the country is opposed to compulsory arbitration because of the conviction, that is shared by many professional economists, that its adoption must, in the words of Carroll D. Wright, "inevitably result in the destruction of trade unions." A decision in a contest adverse to a union would render that union liable to whatever penalty would be contingent upon disobedience. A violation of the decree of the arbitration court by the union would probably be followed by the imposition of a money fine or the loss of its charter and its dissolution. The only alternative, obedience to the decree, if the decree were against the sense of justice and therefore against the sense of self-respect of the employees, would amount to working for specified wage under compulsion, or, in other words, to involuntary servitude, forbidden by the Thirteenth Amendment to the Constitution of the United States.

The ready answer to this is that the operation of compulsory arbitration in New Zealand has not there destroyed the trade unions, but has strengthened them, just as it has promoted unions of employers. That may be in part because the New Zealand system is accompanied by the preferential employment of union labor under the terms of an award, accompanied by the requirement that the unions admit all competent workers, without ballot and upon the payment of a nominal fee. But, aside from that explanation, which implies a national closed shop in all industries, as well as making dependents of workers incompetent to earn the minimum wage and yet able to earn their living if permitted, the conditions of life and labor in New Zealand are so radically different to those in the United States as to make inapplicable to this country the lessons of the experiment in New Zealand. That experiment, moreover, has not reached conclusive results even in its own territory and under its peculiar conditions. Its strongest adherents have confessed their inability to transfer it to this country. The report of the Anthracite Strike Commission said: "Apart from the apparent lack of constitutional power to enact laws providing for compulsory arbitration, our industries are too vast and too complicated for the practical application of such a system."

It is precisely the belief that the awards, or the bulk of awards, of a court of compulsory arbitration would be adverse to wage earners that impugns in advance the efficiency of this device. It is an essential precedent to voluntary arbitration that each disputant shall feel confident that his interests will receive the same consideration as those of his opponent. Each must have faith that the award will be guided by a spirit of perfect fairness. But when the element of compulsion is introduced, this essential element of confidence disappears. It is impossible, as men are constituted, to guarantee the fairness of a tribunal of arbitration clothed with power to compel the hearing of disputes and to enforce its conclusions. It is a condition that must be taken into account that the belief largely obtains among wage earners that state-created courts or boards are generally, if unconsciously, on the side of capital or invested interests as against the more indefinite influence of labor.

Another general objection to compulsory arbitration is that it involves a surrender of the right to strike and of the corresponding right to lock out. These are weapons that neither self-respecting capital nor self-respecting labor can afford to surrender. The abandonment of the power to fight would make for the peace of subjection, for the craven submission of one side or the other. The possession of the weapons of war makes for peace in industry as surely as it does in international affairs. The arguments for an effective military force as an insurance of national security against foreign offense and of foreign respect for the rights of a nation abroad are quite parallel to the arguments for retaining an inalienable right to refuse to work or to refuse to employ, reinforced by thorough organization. The mutual respect of employer and employed is essential to harmony. The abandonment of liberty to fight for conviction of right would impair and ultimately destroy that mutual respect. It would be a confession of inability to reconcile mutual respect with a manly compact of peace.

I have enumerated all these general objections to compulsory arbitration as applicable to the specific class of public service corporations and their employees. It is for the advocates of compulsory arbitration to prove that they are not so applicable. It is for them to show that the injury to the public convenience and safety or to the

conduct of business is so frequent, so serious, so important as to warrant an innovation that is repugnant to republican conceptions of liberty.

But, it is said, it may be possible to create a method of compulsory arbitration that will stop short of compelling either employers to continue a business or employees to continue to work. Let us see how any conceivable plan of non-compelling compulsory arbitration would work in practical application to a system of rapid transit in a great city.

The chief purpose of such a plan would be to prevent, under any and all circumstances, the interruption of service. The first essential, then, would be to forbid by law either strike or lockout on the railroad, pending the submission of a dispute to the court of arbitration. Assume that the corporation on the one side and the employees on the other have been deprived by law of this weapon. The decision of the court follows. It is regarded, we will say, as unjust by the employees, who then enter upon their deferred strike. Pending the decision of the court, would the corporation be in contempt if it gathered an army of strike breakers? The strike breaking remedy is not immediately effective in preventing delay and interruption to traffic, and it involves danger to the traffic. The only alternative would be for the state or municipality to operate the road with police or military. If there were to be no interruption nor danger to traffic, the members of these forces would have to be trained to render instant and efficient service as motor-men, trainmen, signal men and in all other capacities necessary to the continuous and safe operation of the road. Is the public prepared to include these accomplishments in the list of requirements for service in the police or army?

It has been suggested also that, as the final court of appeal in all industrial disputes is public opinion, a court might be created with power to compel the production of all testimony, persons and papers, and to render its decision. It is argued that under present conditions public opinion cannot learn the truth in industrial controversies; that it is bombarded with contradictory, *ex parte* statements and confusing and ill-informed reports in the press, and that the creation of a court empowered to ascertain and publish the truth would make conclusive and morally compulsory, because necessarily right, the verdict of that highest court of arbitration—public opinion. Strictly speaking, this proposition is not compulsory arbitration, but compulsory investigation, with submission of the finding to the verdict of the community.

This proposition is based upon the assumption that public opinion, if correctly informed as to facts, is infallible. But what basis is there for this assumption? As to the ascertainment of facts, the historic conundrum, "What is truth?" is persistently pertinent. Especially does it apply to an industrial inquiry as to which only experts, not laymen, would be qualified to arrive at a just decision, and even experts might disagree. A task difficult for such a select body would assuredly be confusing to the judgment of that vast, indeterminate jury known as the general public. Even in cases of litigation, carried to the highest courts of appeal, in the States and in the Federal Government, judicial decisions now divide the bench and fail to command by far the unanimous approval of public opinion. Yet those decisions are reached in accordance with procedure elaborated through centuries and with principles evolved through the teaching of all history. But judicial inquiry into industrial questions would explore unknown fields, would meet novel questions, involving both expediency and principle, would evolve new principles and in the absence of any body of industrial jurisprudence, would make of such a court in practice a legislative as well as a judicial agency.

Be it noted, the element of compulsion is still present. If there is to be a candid inquiry into the existing facts of an industry, the status quo must be preserved. If the industry be that of transportation, the employees must keep the trains running and the corporation must discharge none of its discontented employees, pending the inquiry. Each antagonist must appear in the judicial arena with hands tied. The contest must be reduced to statement and argument. It must be a battle of wittinesses and counsel.

The objection to this procedure is that it is against the normal processes of human progress. The race does not emerge from barbarism by argument, but by deeds. Valor, not eloquence, wins battles. In the long run, right, truth, justice must win, and they must be demonstrated. But they cannot stand unsupported against the ever powerful forces of wrong, untruth, injustice. It is only by fighting, or by the power to fight, that the weal of society is advanced through the adjustment of relations between its component parts. Remove this ability to fight by compelling peace while the issue is submitted to a tribunal, and that tribunal will inevitably and unconsciously be swayed by adherence to the old away from digression into the new. It must ever be kept in mind that the struggle of labor for betterment is not merely a question of here and now. It is eternally a question of the future, and not to be a combatant, at least potentially, would be for labor to turn its face backward.

There is a conspicuous illustration of these facts, which are facts of human nature, in the outcome of the anthracite coal strike. That was a struggle that in time came to affect the public convenience, comfort and health

as vitally as could the paralysis of any public service corporation. That struggle was brought to an end through adjudication by a tribunal of inquiry. Very well; but be it observed that the battle preceded the inquiry. Had there been in existence a tribunal empowered to pronounce a verdict upon the issues between the mine workers and the operators, it never would have made an award so favorable to the advance of civilization among the mass of inhabitants of the anthracite region as was made by the Anthracite Strike Commission, for the reason that there never would have been made the demonstration by the workers that they were so terribly in earnest in their conviction that their demands were just, that they were willing to go hungry and even to see their wives and children suffer, rather than work upon oppressive terms. There has existed for generations in Russia an office-holding class whose function was that of an industrial judiciary. Against industrial adjustment by this bureaucracy, it was a crime for workers to organize for appeal. The result was the evolution of industrial conditions so shocking as to be incredible to occidental minds and to cause a revolt in demand of rights that our civilization has grown to treat as axiomatic and to take for granted. Establish in the midst of our civilization such an industrial tribunal as proposed, and retrogression would ensue, perhaps slowly, but surely, toward the suppression of the toilers whose hands are tied.

The Chairman: Gentlemen, if there are any questions suggested by the discussion that any here wish to ask any of the three speakers, they are in order. Will Bishop Potter say a few words?

Bishop Potter: I would like to ask a question. I would like to ask my friend Dr. Low and my friend Mr. Wheeler how they propose to get this commission of compulsory arbitration appointed. Is it to be selected by the state or is it to be appointed by the two sides?

Mr. Low: I haven't attempted to work out the details of such a scheme, very largely because I don't believe myself entirely competent. The only thing that I presented was the reasonableness of such a method of settling disputes and the practicability of it. The point I endeavored to present for purposes of discussion was the reasonableness of settling disputes of this kind and its practicability if it was found to be desirable to do so. I assumed that if public sentiment desired, a law could be framed which would constitute such a tribunal in either of three ways—by permanent judges, by temporary judges appointed by authority, or, if voluntary arbitrations are carried out, by the choice of an arbitrator throughout the parties concerned.

Bishop Potter: Mr. Easley, how far would a board of arbitration created by the state be able to go?

Mr. Easley: There are boards of arbitration and mediation in several states. They have no power to do more in some states than to compel attendance of witnesses and the production of papers. They then make a report. They have no power to compel compliance with the report.

Bishop Potter: My friend Mr. Archibald's suggestion to you of the value of force and collision in settling industrial disputes emphasizes my difficulty in reconciling the terms "compulsory" and "arbitration," and while I desire to make my acknowledgment publicly of what has been said by Dr. Low and Mr. Wheeler, I am bound to say that they have neither of them made that point clear. The value of arbitration, as I understand it, is the voluntary note in it. The moment it loses that note it loses its value. And while I quite agree with Mr. Wheeler that we are a law abiding people and disposed to acquiesce in judicial decisions, yet what I should like information about would be, How are you going to make, for example, a body of men who are on strike in connection with a railway company, go back and take their places and do their work unless you invoke, as Mr. Archibald very admirably told us, the military element? And then I should like to inquire how you are to avoid the inevitable tendency of such a system of government as it applies to labor and to travel, and to all the labors of life that strikes involve—the tendency of such a system toward what we call militarism and are very properly afraid of?

I don't believe the ordinary misapprehensions that grow up between workingmen and the employers of workingmen are the result of deliberate misleading on the part of labor leaders, though I am bound to say that there is no greater opportunity for enlargement of intelligence and information which underlie the relation of employer and employed than at that particular point.

What I think we want to-day is not so much a law creating a board which shall apply to the labor classes compulsory arbitration, as a commission which shall interpret the terms on which the workingman and the employer of the workingman are related to one another. Dr. Low has stated the substance of the whole question when he has reminded us that it is impossible for such a relation to exist unless it is plainly mutually advantageous. What you want is when the workingman comes into collision with a condition, which is usually what happens to him, some such help as will translate to him the terms on which he works and shall translate to the employer the terms on which he pays, and I believe the solution of our labor difficulties, so far as they exist in America, is exactly that point—to get a commission—

(Continued on page 13.)

TRADE AND INDUSTRIAL SCHOOLS IN THE UNITED STATES.

AN EMPLOYER, AN EDUCATOR, AND TWO LABOR LEADERS DISCUSS THEIR NECESSITY AND ECONOMIC EFFECT.

THE following group of opinions upon the advisability of encouraging trade schools in the United States, and upon their relation to organized labor, has been collected as a result of the present agitation of the subject in Massachusetts. Governor Douglas, who officially recommended the creation of a State Commission to examine and report upon the subject, presents an argument in their favor. R. Fulton Cutting regards their necessity as following upon the disappearance of the apprentice system and cites the operation of the New York Trade school as an example of their practical usefulness. On behalf of wage-earners, Frank K. Foster, representing the Typographical Union and many other unions in Massachusetts, argues against them, but does not object to an inquiry by a commission on which labor shall be represented. John F. Tobin, President of the Boot & Shoe Makers' Union, favors their introduction in that industry.

TRADE SCHOOLS, COMPETITION, WAGES.

The following is the condensed argument of Governor William L. Douglas, of Massachusetts, advocating the establishment of trade schools:

In my official capacity I have called the attention of the General Court to the necessity of considering the advisability of establishing trade schools. I notice that there is some opposition to the project by the workers, on the ground that it would create a surplus of skilled labor, and that graduates from such schools would go to other parts of the country and lend their talent to the building up of competition. These reasons are not altogether well founded.

The object of the industrial and trade school is, first, to benefit the individual—the person who is compelled to earn his living by the work of his hands. It is intended by the establishment of these schools to teach the person not only how a thing is done, but why it is done, and to broaden his knowledge of the entire industry in which he is engaged so that when he has served a sufficient time he will be capable of purchasing the raw materials, converting them into a finished product and possess some knowledge of marketing them.

The second object of the trade school is to provide a sufficient amount of skilled labor to enable the manufacturing industries of the commonwealth to keep in the lead in its several lines of manufacturing. Thus could Massachusetts capital be employed to advantage in the manufacture of a large part of the goods now imported into this country, which in turn would mean the better employment of our work people and the prosperity of those communities in which the industries were located.

I have every reason to believe that the opposition to the movement will be less when the question is better understood. Our country is far behind other nations in the establishment of industrial and trade schools.

There has been urged upon the legislative committee on education the wisdom of reporting a bill authorizing the appointment of a representative commission to consider the whole matter and report to the General Court its findings and recommendations, together with some practical plan whereby the system of trade schools for all our industries may be established in the commonwealth. Surely there should be no opposition from any source to our endeavor to learn all we can about the subject.

To those who have given the subject but limited study it is apparent that the future of Massachusetts is dependent almost wholly upon the success of her manufacturing industries.

The method of conducting trade schools in Germany and the thoroughness of the education are the best in the world. Germany saw the need of such schools many years ago. Trade schools were organized, graduates sent out and the effect was so marked on the industrial situation that other countries were attracted by the progress made, and finally realized that Germany was distancing them in the excellence of her manufactured goods. Germany with her technical schools and army of educated workers has demonstrated the great economic principle that finer and better goods can be manufactured at a less cost than by uneducated and unskilled labor. Throughout the empire of the Kaiser trade schools are to be found in all the cities, towns and large villages. New factories are springing up everywhere, and Germany is increasing her export trade wonderfully.

I wish also to call your attention to the fact that in Berlin, as well as in most German cities, trade schools for shoemaking, tailors, carpenters, metal workers, masons, etc., are being conducted with friendly relations with the labor unions, and in many cases the boards of inspection have upon them members of the trade unions.

England, too, has schools teaching 66 trades. These

schools are in operation and doing good work in all the cities, towns and larger villages. France is making great strides in the trade school movement. Belgium, Italy and Switzerland are also endeavoring to teach their young men to become expert mechanics. In Geneva, where the best watches are made, a young man must serve a five years' apprenticeship in order to get his education. He must make five or six of the best watches, make every part and put the watch together before he can receive a diploma which certifies that he is a practical, skilled workman.

The schools of technology, the textile schools and nautical training school of Massachusetts are doing a great work.

The Boston School of Technology has turned out mining engineers who have revolutionized the business. Twenty-five years ago a mine that would not yield from \$20 to \$30 worth of gold to a ton of ore could not be worked, because it cost \$10 to get the gold out of it. Now, thanks to education, a ton of ore can be worked profitably that does not contain over \$2 worth of gold. Under the Elmore process a ton of ore can be worked and 98 per cent. of the gold extracted at a cost of 10 cents a ton. Twenty-five years ago only about 25 per cent. of the gold could be saved. This shows what education can and does accomplish in our own country.

WILLIAM L. DOUGLAS,
Governor of Massachusetts.

The shoe industry is greatly handicapped by a lack of expert workers, especially in the cutting departments. Forty per cent. of our cutters do not perform the amount of work they should, owing to the lack of training to use quick judgment in placing patterns on the leather. In a trade school such as is proposed a competent instructor would teach pupils how to place patterns to the best advantage. By this lack of proper training the manufacturer loses, because the shoes cost more to cut; he loses because the workman is not able to produce as much work as an expert in the same number of hours. He also loses because the unskilled workman does not always put the right piece of leather in its proper place in the shoe.

The shoe manufacturer is also handicapped because the skilled workman is levelled down to the unskilled workman in the quantity of work done. This method of levelling down in the last five years has largely increased to the manufacturer the cost of cutting shoes. The cost in sole leather rooms, owing to unskilled labor, has also been increased by this levelling down process, and these conditions are growing worse every day. If these handicaps are not remedied it practically builds a barrier against the worker, which will prevent him from bettering his condition or in wages. The method in vogue to-day prevents any possibility of a young man's advancement, takes away his ambition, and places him in a position where he can see no hope for the future.

The shoe manufacturer is also handicapped because of the men who run machines, not more than 25 per cent. know how to keep their machines in thorough working order to produce the best results. Men have to be hired to do this work for them. A large corps of sub-foremen have to be employed to see that the work is kept up to a proper standard to meet competition. All this makes it harder and harder every day to meet competition.

With a thorough system of technical education, where a man would serve an apprenticeship and learn all parts of the business, our goods would be produced at a less cost and the workman would receive higher wages. When a young man thoroughly learns a trade and receives a diploma from a trade school, he is sure to get employment.

When our young men are all taught a trade, the problem of the unemployed will be solved. Those who are out of employment to-day are men who have very little knowledge of the work to be performed in any of our industries.

There will also be an opportunity for girls to learn a trade. In the factories owned by my company 680 women are employed. Trade schools would furnish an opportunity for girls after leaving school, between 14 and 17 years of age, to prepare themselves for employment. There has already been established in Boston a school for the education of girls where they are taught dressmaking, millinery and how to operate machines. They secure employment immediately after they receive a diploma from the managers.

The apprenticeship idea cannot meet the requirements of the present factory system. It has been outgrown. We must find a broader, larger way to assist the young man who desires to learn. The school for the man who may learn at once must take the place of the master who formerly personally taught his apprentices.

In the last generation the position of Massachusetts as a manufacturing state has greatly changed. Skill in workmanship will decide the future of Massachusetts, and only by the use of the best skilled labor can we compete with the Germans, English and French.

The skilled labor necessary to Massachusetts industries should be furnished not by skilled labor imported from abroad and other states, but by the young men from 15 to 21 years of age who are to become citizens of this state. We take away their birthright when we refuse them the positions of skilled laborers which we give to others, and equally so when we refuse to assist them in obtaining the knowledge which will enable them to compete with other skilled labor in their own state.

THE NEW YORK TRADE SCHOOL.

By R. FULTON CUTTING, President of Trustees of the New York Trade School.

The Trade School is the scientific method of trade education. The old apprentice system, now extinct, while narrow and unfair in some particulars, possessed practical qualities. The contract between master and youth embodied a mutuality of interests that supplied the inducement for the observance of its provisions. The master, taking the apprentice into his home and family, could only compensate himself by making him efficient and of good behavior. The more rapidly he could teach the apprentice his trade, the sooner would he become remunerative; and he looked to the last three years of his seven years of apprenticeship to compensate him for the cost of the young man's board and lodging during the whole term. It was always to the interest of the apprentice to acquire the trade as early as possible, as opportunities of earning a little money for himself were frequently afforded during the last years of his apprenticeship. The principal objection to the system, and that which led to the repeal in 1814 of the Act of Elizabeth, which with few modifications had been the law for four hundred years, was its practical restriction of the number of apprentices. The long term of the indenture and the exclusive methods of master workmen kept down the supply. In the middle ages the collusion between great land owners and the trade guilds was a serious abuse—the former desiring always to maintain a large supply of unskilled labor that they could hire at a low wage during the harvest seasons, and the latter, jealous of the privileges of their organizations, found common interest in shutting the door of opportunity to the unskilled.

Since the disappearance of the true apprentice system, there has been nothing adequate to replace it, in this country at least. The pseudo apprentice of to-day learns as he can from the journeyman with whom he happens to work; he is really not taught at all. The journeyman, intent upon his own duties and under no obligation to the apprentice, makes what use he can of the latter, but gives nothing in return. Of course, in not a few individual instances, the kind heartedness of the journeyman induces him to give the apprentice occasional hints and opportunities; but however sympathetic may be his inclination, he has little opportunity to act as a teacher. Moreover he has, himself, learned his trade in the same "rule of thumb" school. He knows the "how" of his trade, but rarely the "why." Manual dexterity can, of course, be acquired, and the really ambitious student can learn much from books, but the stimulus to the

ordinary measure of ambition that comes from an intelligent apprehension of the scientific basis of trade is lacking.

The New York Trade School, in a course of four months and with sessions of seven or eight hours a day, can actually teach a trade. It is difficult to comprehend how thoroughly trades can be taught in a school until a study is made of the system of instruction which prevails at this institution. In all departments each student is required to follow a prescribed course, starting with the basic principles and advancing, as skill is acquired, until all details from simple to complicated work are mastered. The students are of the proper age to insure excellent results, the general average being between eighteen and twenty. They are sufficiently mature mentally to realize the value of a trade and old enough to determine along just what line their aptitude lies. They are full of zeal and determined to succeed, and it is an inspiring sight to see them at work in the school shops. As serving to illustrate the practical character of the instruction, an outline is here given of the course in house painting:

(1) Name and use of tools, care of brushes, manner of keeping pots clean; (2) Painting new wood, priming, puttying and sandpapering, second and third coats; (3) Burning off paint when advisable; (4) Painting brick work; (5) Treating plastered surfaces in both kalsomining and oil; (6) Mixing paint, materials required; (7) Use of various stainers; (8) Color mixing in oil; (9) Color mixing in kalsomine; (10) Contrast and harmony of colors; (11) Painting doors and sashes; (12) Painting in two and three shades; (13) Flattening and painting with a glass; (14) Stippling; (15) Staining; (16) Varnishing; (17) Treatment of hard wood; (18) Enameling; (19) Gilding; (20) Preparing stencils and cutting same; (21) Laying in panels; (22) Applying ornaments; (23) Bronzing; (24) Graining; (25) Marbling; (26) Paper hanging.

During the progress of the course lectures bearing on the scientific features of the trade are given to the class.

It is true that these young men need from six months' to two years' practice and experience to make them fully equipped journeymen, but when they have had this they possess not merely the manual dexterity, but the scientific knowledge of their calling. They will have passed an examination, in graduating from the Trade School, of a nature that would floor many journeymen of this city who have spent years at the trade. Of course this does not mean that they are already as efficient as such journeymen, but it does mean that they possess possibilities of development and growth such as the ordinary craftsman does not.

The trades unions object to the school. It threatens to increase the number of journeymen too rapidly. The economic loss involved in spending five years in learning a trade that can be acquired in two or three does not appeal to their reason. They have spent five years as apprentices and the coming generation should not expect easier conditions. Of course, limitation of the number engaged in any trade is the fundamental objection of the trades unions to what they regard as an artificial method of increasing the supply, and one must remember that the journeyman who is no longer young does not wish to accelerate a movement that threatens to diminish his prospects of employment. The union fears its scale of wages cannot be kept up with an increased supply of skilled labor. But one factor in this question of supply and demand does not receive adequate attention by the American journeyman. Every spring hundreds of tradesmen flock to this country from various parts of Europe. They are usually very competent workmen—most of them have learned in European trade schools and technical institutions. They belong to the unions—they take advantage promptly of the demand for skilled labor which in good times exists all over the country during the season of pleasant weather. When the autumn arrives they sail back across the ocean, taking with them out of this country the earnings which should have gone to American tradesmen. This has been going on for years—the trade unionists of this country fighting against the education of their own children so that trade employment may be enjoyed by foreign craftsmen.

In the learned professions the tendency has been altogether the other way. It is true the general standard has been raised and it is necessary to acquire more learning to qualify, but the colleges and similar institutions have arranged their systems of study in such a way as to make it possible to acquire professional education under the most favorable conditions. That the professions have not suffered from this policy can readily be demonstrated. As far as efficiency is concerned, our professional men are second to none in the world. This is not the case with trade unionists. While the intelligence and energy of the American enables him to attain an excellence in the crafts that is astonishing when we remember his opportunities, yet in many trades the best men we have are foreign taught. They are the product of trade schools.

There can be no question but that trade schools tend to elevate the handicrafts by bringing into them men who are carefully and thoroughly taught, and who by reason of such training can undertake every branch of their trade. Proficiency and capability should be the passport into the ranks of journeymen and not simply the service of a stipulated term of years. The general run of apprentices under present conditions cannot become first class all round mechanics.

SOME OBJECTIONS OF WAGE-EARNERS.

The following are the views of Frank K. Foster, of the Typographical Union, as expressed to the Education Committee of the Massachusetts Legislature, upon the proposed commission to investigate trade schools:

"We are not lacking in gratitude to our friends, the professional educators, and other disinterested philanthropists, who desire to expedite the manufacture of

FRANK K. FOSTER,
Typographical Union, Boston.

craftsmen by state aid. We cheerfully assume that they have but the single purpose of the future welfare of the state in their propaganda for trade schools. We deem it but just, however, that the public shall be informed as to certain reasons why trades unionists cannot be expected to share this enthusiasm.

"The great economic fact confronting us, from the trade union standpoint, is that there are hundreds of thousands of wage earners in this state whose life capital is their knowledge of a craft. They have listened very patiently of late to the frequent accusation that Massachusetts workmen possess comparatively little of this knowledge. This may or may not be true—incidentally, we don't believe it is true—but whether it be true or not, it is not germane to the point under consideration.

"But here our friends will doubtless interject the plea of the mobility of labor—that if a man cannot do one thing he can another. Would that this were true in general, as it may be true in especial instances. But every practical craftsman knows that the average man loses 50 per cent. of his earning capacity when divorced from his trade. It takes years of adaptation, of ad-

JOHN F. TOBIN,
General President, Boot and Shoe Workers' Union.

justment of sight and touch, of the acquirement of those deft details which are essential to skilled workmanship, to make the expert mechanic. You may as well say to the manufacturer whom you crowd out of business by flooding the market with the commodities he manufactures: 'You can go into some other field of business. The general welfare demands it.'

"No, gentlemen, you must consider the craft and the craftsmen as a whole, for the craftsman must practically depend upon conditions in the craft in which he

has been bred. Here is a vested interest, so to speak, which legislators may not consistently disregard.

"I take it that it will quite generally be granted that the wage rate of Massachusetts mechanics is none too high, bearing in mind that these mechanics are taxed upon almost everything consumed by their families, assumedly for their own protection. What regulates this wage rate? How many times have we been taught and told that it is the law of supply and demand, i. e., that wages will go up when the supply is less than the demand, and down when the demand is less than the supply?

"Now, while the trade unionist would modify this teaching of the economist by the assertion that the causes which make the wage rate are complex, and may be modified by the will power of the labor seller himself, they yet recognize the truth of the general proposition that two employers hunting after one man give an upward tendency to the wage rate, and vice versa.

"If, then, you propose by this commission to recommend that the commonwealth shall increase the quantity of the supply of the commodity of craft skill in any given craft beyond the normal supply drawn in through competitive demand among employers, how can you expect the trade unionists to wax joyful over a course of action which, according to your own economics, will have a tendency to break down the rate of wages?

"May we be pardoned for insisting that public attention shall be called to this possibility, and that, if the associations of labor are to be dragged at the chariot wheels of a so-called educational and philanthropic movement, they shall not be compelled to profess ignorance as to just what kind of a performance they are going through?

"Despite all this, we are not in an attitude of hostility to the appointment of this commission, provided that the industrial class be given its equitable share of representation upon it, and that the conditions of service be such that these representatives can afford to serve upon it. We believe that the present resolve is defective in that it provides for but one representative from the large class most directly concerned, and that it provides for gratuitous service, which would bar out all wage earners from accepting positions on the commission.

"We are not opposed to industrial education, in its broad sense. We are opposed to the proposition of trade schools which would virtually place the state in the position of a recruiting agency for certain manufacturers, which the normal conditions of the labor market force to pay higher wages for skilled help than they desire to pay."

A LABOR LEADER'S APPROVAL.

John F. Tobin, General President of the Boot and Shoe Workers' Union, is a prominent labor leader who has declared unequivocally in favor of trade schools and unlimited apprentices in his industry. The following letter states his position:

Boston, Mass., March 8, 1905.

Editor *The Shoe Retailer*, Boston, Mass.:

As a result of the recommendation of Governor Douglas in his inaugural address, the subject of trade schools has become a live question in the State of Massachusetts.

I confess that when the subject was first approached I was very much opposed to the proposition, having in mind the barber schools, where they profess to turn out skilled barbers in a very few weeks, and which has resulted in the five cent barber shops, coupled with groans and scars sufficient to make trade schools of that kind decidedly unpopular.

Shoe manufacturers and other advocates of the trade school dwell at length upon the necessity of more skilled workers in the trade, if we are to develop a foreign market and hold it against countries where trade schools flourish.

They also dwell upon the necessity of men learning the various branches of the trade, so that they become not only skilled workmen, but have the necessary qualifications to make foremen and superintendents.

Germany is said to be a dangerous competitor because of the existence of trade schools, and I understand that in that country apprentices at the different trades are obliged to spend a certain portion of their time in attendance at the trade schools, and no person is eligible to attend the trade school unless they are employed at the craft which they seek to learn in the school.

I would, therefore, suggest that trade schools be established and that shoe manufacturers have unlimited scope in the number of apprentices they shall employ, who shall be indentured for a period of not less than three years, and they shall spend at least one-third of their working time in attendance at a trade school and two-thirds in the factory of their employer, thus acquiring a practical and technical knowledge of the craft in all its departments; the trade school to be maintained at the expense of the state, and the employer to be compensated for the time the apprentice spends at the trade school through his superior skill because of the technical training.

Respectfully yours,
JOHN F. TOBIN, General President.

CHURCH FEDERATION AND ITS RELATIONS TO CAPITAL AND LABOR.

A GREAT INTER-CHURCH CONFERENCE WILL EXPRESS ITS INTEREST IN INDUSTRIAL PROBLEMS
—MINISTERIAL DELEGATES TO LABOR UNIONS.

By E. B. SANFORD, D. D., *General Secretary of the National Federation of Churches and Christian Workers.*

AMONG the great movements of the present time one of the most hopeful and important is the drawing together, in closer fellowship and co-operation, of Christians of every name who hold to Christ as the Head of the Church.

It is significant that the basis upon which they find they can clasp hands and plan together in facing common difficulties and meeting common needs, is that of ministration and service. It is in the recognition of the great truth of the brotherhood of men, a truth that found its highest expression in the life and teachings of Jesus of Nazareth, that the fact is manifested that all Christians are one in Christ. In proportion as this fact is translated into terms of life, the Church is true to its mission and brings men to the recognition of their right relations to one another.

In the autumn of this year, for the first time in the history of the Protestant Churches in the United States, delegates appointed by the highest ecclesiastical assemblies or conferences of bodies, representing denominations whose aggregate membership is over seventeen millions, will meet in New York City for mutual counsel and federated action regarding matters of common interest.

This great Inter-Church Conference will directly and indirectly, represent a considerable proportion of the

of both. Never, until the Church shall lay the Golden Rule upon the conscience of capitalists and laborers, will the golden millennium of industrial peace be assured us.

"In all this contention it need hardly be said that the sympathy of the Church must to a large extent be with those, concerning whom Abraham Lincoln quaintly said, 'The Lord must like the common people, else He would not have made so many of them,' doubtless having in mind the fact that when Jesus was on earth 'the common people heard Him gladly.'

"In spite of all the blunders made by labor leaders, and the indefensible acts of their followers, philanthropic men must wish them success in every lawful effort to better their condition and secure their rights. But they must learn from their real friends that every act of violence hurts their cause and that law and order must be maintained at all hazards. We recognize as significant and hopeful the recent movement led by certain capitalists to settle by arbitration all disputes between labor and capital."

At the last session of the General Assembly of the Presbyterian Church held in Buffalo, May, 1904, the report of a committee of which the R. F. Coyle, D.D., of Denver, was chairman, was adopted that closed with these words:

"The Presbyterian Church has always believed and does now and most profoundly believe that the principles of the religion of Jesus Christ are the only basis upon which any true and lasting peace can be established between nations or between men in their industrial and other relations; and so believing the Church offers its earnest prayers and devotes its consecrated energies to the universal establishment of these principles, knowing that when the nations have received and adopted them they will learn war no more, and when men have embraced them they will dwell together as brethren: the employer, remembering that his employes are brethren, will treat them justly and righteously, and employes will remember that the employer has rights which must be respected; and while so believing, the Church rejoices in the efforts of all those who are laboring to apply these principles to specific cases and causes."

"Believing that the National Civic Federation and the Arbitration Council are working along the lines of these principles, and for high and righteous ends, we most heartily commend their efforts and offer our prayers for their success. Gladly will we hail the day when nations shall settle their differences and men their industrial contentions in the arena of calm, just council and arbitration."

The vigorous and thoughtful reports on capital and labor adopted by the General Convention of the Protestant Episcopal Church, and the National Council of the Congregational Churches have already been published in the pages of this "Review" (Nov., 1904).

In view of these utterances and those we have quoted we have reason to expect that at the Inter-Church Conference to be held this year a message and plea in the interest of brotherhood and industrial peace will be sent forth, the influence of which will be far-reaching and fruitful.

THE PRESBYTERIAN CHURCH AND LABOR.

The Practical Success of a General Movement in that Denomination to Establish Cordial Relations between the Pulpit and Unionism.

The Presbyterian Church has been fostering for more than two years a movement to bring about a more cordial relationship between the church and organized labor. Those especially interested in this effort agree in reporting that the thoughtful labor leaders welcome the movement and urge their followers to co-operate. The result is already evident in the fact that much opposition to the church formerly existing among workingmen has changed into a spirit which makes it possible to carry the idea of co-operation between the church and trade unions, in the movement to better the conditions of wage-earners, farther than would have been at all possible two years ago.

A practical manifestation of this movement, which has received the full sanction of the Presbyterian Church, is the exchange of fraternal delegates between Ministers' Associations and Central Labor Unions. This plan has been carried into operation in about a dozen cities, with such good results that a special effort is now being made to extend it in many more cities. Only last month the Brooklyn Central Labor Union admitted a representative of the Brooklyn Presbytery. As this plan has been devised and carried out by Rev. Charles Steltzle, the special representative of the church in the interest of workingmen, its first step is

to secure the interest of the President or the Secretary of a Central Labor Union. It has been found that this is easily accomplished, as soon as it is intimated that the delegate of the Ministers' Association is not bent upon preaching at the members of the Union, but that he wishes to learn, for his own benefit and that of the other ministers, something about what the organized labor movement in that city stands for.

The delegate minister does not ask for any of the privileges of regular members of the Union, but only for the privilege of the floor, when opportunity offers to make practical, helpful suggestions in the spirit of brotherhood.

It is regarded as important that the delegate minister should come to the union meetings unpledged to secrecy, the men trusting in his honor as a Christian gentlemen not to disclose matters that, for business reasons, it may be wise not to give to the general public. This understanding relieves the delegate minister of embarrassment, and makes a better impression upon the community. In turn, the delegate sent by the Union to the meetings of the Ministers' Association is also unpledged and trusted with equal confidence.

To employers in the church, the suggestion is made that it is quite as proper for a minister to be associated with an organized movement that embraces great masses

E. B. SANFORD, D.D.,
Gen. Sec. National Federation of Churches.

home and family life of our country and their religious affiliations. If the number of employes and those connected with labor unions, found in the membership of the churches represented in this Conference, could be correctly enumerated, it would be a surprise to many.

Its message touching the relation of capital and labor cannot fail, therefore, to interest the entire community. That it will hold up a high ideal of brotherhood and plead for the spirit of the Christ in solving the difficult questions that grow out of present industrial conditions, we cannot doubt.

These questions, in spite of all representations to the contrary, rest heavily upon the thought and heart of those who have official and ministerial leadership in the churches. This has been shown in the action of great denominational bodies in the past year. We quote first from the message signed by Bishops of the Methodist Episcopal Church, a communion having a membership of over three million.

This message which forms an important part in the record of the General Conference held at Los Angeles, California, in May last, says: "Assuredly one of the burning questions of to-day is the relation of employes and employed. It may smolder here or there for a time, but somewhere it breaks forth in volcanic eruption and now and then it shakes the whole social fabric like an earthquake. The workers with brain and the workers with hands are often in hostile camps between which sharp collisions are alarmingly frequent and disastrous.

"Situations leading to such enormous waste and so fomenting evil passions, cannot fail to command the intense attention of the Church of God, which was founded by Him who died to save all sorts of men from their sins, and from such frightful consequences of sin. The Church must come in between these vast contending forces, holding aloft the banner of the cross, to which both must bow, and offering to both the Sermon on the Mount as the charter of the rights and the duties

REV. CHARLES STELTZLE,
Labor Representative, Presbyterian Church.

of people as it is to be identified with associations or clubs composed almost exclusively of employers. This work is not primarily evangelical, but provision is made for meetings of that nature. Industrial problems are discussed at conferences between ministers and labor leaders. A considerable amount of literature is circulated upon topics connecting the church with labor, some of the suggestive titles being: "Jesus Christ and Rich Men," "Class Spirit in America," "Has the Minister a Closed Shop?" "The Relation of the Church to the Labor Movement," "Labor Leaders in the Church," "Not Missions but Churches for Workingmen."

This movement is opposed to Socialism, understanding that, while there may be Christian Socialists, Socialism is avowedly materialistic and that its leaders strive to make it a substitute for the church. But it concerns itself with the great host of workingmen who are not Socialists, and recognizes that the wage-earners of this country who are organized practically control the labor situation. The Rev. Mr. Steltzle says:

With the increasing struggle and influence of union labor, and the growing organizations of employers to defend their interests, America has before it the biggest social problem she has ever wrestled with. The Church cannot remain indifferent to this problem. There is rarely a strike or a lockout but the Church or its ministry are in some way involved. As a church, and as ministers, we must make our positions clear to the men who misunderstand us.

Rev. John Dixon, D. D., who in an official capacity is especially familiar with the prosecution of this work, says:

I have no doubt that the practical success with which this movement is meeting will have a visible influence upon the attitude toward the great questions involved in the relations between capital and labor of the representatives of the Presbyterian Church, in the great conference upon Church Federation to be held in New York City next November.

The Rev. Mr. Steltzle is a machinist by trade, having been employed for years in a large manufacturing establishment before entering the ministry, and he still carries his union card.

James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.

THE ORGANIZED AND THE UNORGANIZED.

Letters from both employers and wage-earners are frequently received at the headquarters of the National Civic Federation bearing upon its attitude toward organized and unorganized labor. Several employers have asked why the representatives of wage-earners in the organization include only members of labor organizations. Why, they ask, is there no representation of the great mass of non-union wage-earners?

The answer to this query is simple. There really is no way to select a representative of unorganized labor, even if desirable, because that is composed wholly of individuals, each worker representing solely himself in his relations with any employer. To this reply, one employer made the rejoinder that non-union labor should be formed into an organization and representation given it. The fallacy of this suggestion is, however, apparent; for as soon as any number of non-union workers are organized, they cease to be "non-union" men, and their representative would not be a representative of unorganized labor.

A contrasting inquiry frequently made in various forms by members of trade unions may be thus summarized: "Why does the National Civic Federation include in the employers' branch of its membership some who do not employ union men, or who do not recognize union labor? If the Civic Federation believes in the organization of labor, why doesn't it expel all such members?"

This question involves a misconception of the character and scope of the National Civic Federation. Its by-laws define its purpose "to be helpful in establishing rightful relations between employers and workers." That broad statement does not restrict its mission to association of either employers or of workers. Again, its by-laws express the belief "that at all times representatives of employers and workers, organized or unorganized, should confer for the adjustment of differences." This language does not confine conference to representatives of organizations.

This question arose when the National Civic Federation was formed. It arose again at the formation of each of its local branches. But in every instance the labor members reached the conclusion that it is wise to include such employers in the movement. The reason they gave is that it enlists the interest, good will and intelligence of even the anti-union employer in a cause continually educational to all of its advocates. In one city there was at first objection to an employer as a member of the local branch of the Civic Federation, because he was then actually on a union's "unfair list." But further consideration caused the labor men to say: "Why, this is the very man we want to meet. We do not want to know only our friends; we want to make converts by showing that the leaders of organized labor are not agitators and grafters, but are devoted to the objects of unionism because they believe that their attainment is essential to the welfare of the human race."

There was a spirit akin to this in the response made by one large employer to an invitation to join the Civic Federation: "If to join the Civic Federation," said he, "means that I endorse all the radical acts or theories of organized labor, I will not accept membership; but, if it means that I recognize the labor problem as the greatest of the age, requiring the best that is in us all to work toward its solution through interchange of thought and experience, instead of through fighting, then I will gladly join in the effort."

SOME ANTI-BOYCOTTERS' BOYCOTTS.

The boycott is rated high among the crimes and misdemeanors imputed to organized labor by the anti-union employers' associations. This fact lends peculiar interest to the quotation that follows from an address by the chairman of the executive committee of the Citizens' Industrial Association, and to two remarkable examples of employers' association boycotts against independent employers in San Francisco. The quotation is made more refreshing by its opening exhortation, to those who "bitterly abhor" the "tyranny" of the union labor movement, to be "consistent in all things":

"Be ye consistent in all things," is a charge worthy of the consideration of all men. But let us see how consistent men are in some things relating to the labor-union movement, the tyranny of which they bitterly abhor.

The American Federationist is the official organ of the Ameri-

can Federation of Labor. It is edited by Samuel Gompers, the President of that organization. Its issue for July, 1903, contained 125 advertisements; its September, 1903, Labor Day issue, 490; its July, 1904, issue, 102, and its September, 1904, Labor Day issue, 431 advertisements, representing manufacturing and mercantile concerns, transportation companies, etc., and why were they there? Simply for lack of moral courage to say No! or, worse yet, because of a desire, prompted by selfishness, to stand in with the unions.

Have we not had experience sufficient, and is it not time now, that men of common sense, men of honor, and men of ordinary patriotism, capable of reading the "handwriting on the wall," quit feeding their money into a cause which contemplates the destruction of an industrial and social system under which we, as a people, have prospered so well? If not, then when shall it be?

The Citizens' Alliance of San Francisco has threatened to boycott employers who do not join fight against the cooks, waiters and allied unions. This group of unions had agreements with the Restaurant Keepers' Association, fixing wages, hours and conditions of work. The Citizens' Alliance formed a new employers' organization, known as the Amalgamated Restaurant and Hotel Keepers' Association. When a committee of the allied unions attempted to renew the yearly agreement it encountered a flat refusal.

In the meantime, the President and Secretary of the Citizens' Alliance sent circulars to restaurant and hotel men urging them to join the new employers' association, which had declared "that no more contracts would be signed between its members and the unions." This was reinforced by the following formidable bit of literature:

OFFICE OF PRESIDENT.

THE CITIZENS' ALLIANCE OF SAN FRANCISCO.

HERBERT GEORGE, President.

'Phone—Main, 966.

My Dear Sir: Mr. A. W. J. Gibbs, General Manager of the Amalgamated Restaurant and Hotel Keepers' Association, reports to me that you (for some reason best known to yourself) think it best not to identify yourself with the Amalgamation. The Citizens' Alliance is deeply interested in making the movement a unanimous one so far as the hotel and restaurant keepers are concerned, to the end that it may be spared the cost of a long and expensive strike. I believe you are intelligent enough to realize that we live in an age of organization, and the only way for you to protect your business is to forget that there are big and little restaurants and accept the fact that everyone in your line of business has the Cooks' and Waiters' Union to deal with. We trust you will need no further hint than this one to ally yourself with the new Association that Mr. Gibbs represents, because this new Association is simply an auxiliary of the Citizens' Alliance, and the Citizens' Alliance is backing it. I suggested the plan, and I feel sure that every man who belongs to this new Amalgamation of hotel and restaurant keepers will realize before the end of the year that for every dollar he pays into it he will get \$10 back. We are not looking for trouble, and the only way to head off trouble is for all of us to get together and work in harmony. Above all things, I aim to avoid using the flour, meat, poultry, oyster and milk interests (which we have organized and now have in working shape) to coerce anybody. We are not in that sort of business and think the boycott is as un-American when practiced by our side as it is when practiced by the other side; but we are interested in the upbuilding of this new association for the protection of hotel and restaurant keepers, and it must succeed. The membership to-day is large and growing rapidly, but we want to make it absolutely complete to the end that its completeness will prevent the unions from breaking through our ranks.

We realize that many are hanging back believing they can get something for nothing by so doing. That is to say, they are perfectly willing that we should fight their battles with the unions while they stay outside and profit by the victory that follows. It is not our intention to let any man enjoy any such privilege. The membership is secret, and everyone must join and do his share. That is what the Citizens' Alliance is for. It is not fighting unions as much as it is fighting that class of people in its own ranks who refuse to do what they know is the right thing to do, believing that by hanging out they can play to both sides and thereby secure a little mean advantage over their neighbor. "A word to the wise is sufficient." You would greatly oblige me if you would call upon Mr. Gibbs and identify yourself at once.

Very truly yours,

HERBERT GEORGE, President.

As if this threat were not enough, another circular warned employers who were still reluctant to make war on the cooks and waiters that "We are now busy with the bakers, who are forming a strong organization"—thus adding bread to the other supplies that the association threatened to cut off from any hotel or restaurant persisting in dealing with the unions. This circular added the ominous information: "I have been compelled with the assistance of the Citizens' Alliance to commence suit against three restaurants for signing with the unions." To the threat of the boycott is thus added the vague terrors of the law for daring to make contracts with unions in defiance of the edict of the Citizens' Alliance!

Another employers' association in San Francisco, styled the Butchers' Exchange, places the union button under the ban and decrees the substitution of the "open shop card," enforcing its ukase with threatened penalties in the following circular:

SAN FRANCISCO BUTCHERS' EXCHANGE,

628 MONTGOMERY STREET.

Room 22, 3d Floor. Telephone—Bush, 131.

SAN FRANCISCO, March, 22, 1905.
The attention of the San Francisco Butchers' Exchange has been called to the fact that certain shops are taking advantage of trades union conditions to gain trade by the displaying of signs and the wearing of union buttons by employees; it has been therefore

Resolved, That no shop shall display cards or advertisements having any bearing on the labor question, or allow their employees to display union buttons while on duty, or any other insignia of unionism.

Any infraction of this rule will be punished by suspension, or fine, or by both.

The only sign or placards to be used shall be the regular *Open Shop Card*, which must be displayed in a prominent position.
L. B. WIELER, Secretary.
By W. A. SAMUEL, Assistant Secretary.

The *Labor Clarion* publishes a fac-simile of an official notice by the Butchers' Exchange that two butchers had been suspended, because they had refused to pay an assessment of the Butchers' Exchange, on the ground that they were not members. One of them tore up the open shop card. As a penalty, the *Clarion* states, these two butchers discovered the next day that they could buy meat from the Butchers' Exchange only by paying several cents a pound more than their competitors.

TWO CONSERVATIVES DISAGREE.

(From the *Iron Age*.)

While the management of the strike on the Interborough system in New York was admirable, one minor mistake was made, which we trust will not be repeated in any part of the country. An offer of employment was made to students at Columbia University, which was accepted, largely as a lark, by quite a number of the boys. Newspaper reports indicate that some of the professors of the university rather encouraged the students to enter employment which could at best be only temporary, since the boys are supposed to be engaged in preparing for a profession—a work which, as it is, suffers from only too many distractions. We do not blame the students when they seize upon an opportunity for excitement and for attracting public notice. But it was a serious mistake on the part of the college authorities to permit the boys to become strike breakers, because it fosters a class feeling, which should be studiously avoided. The pupils of an educational institution must not be placed in the position of participating in an industrial struggle. The day of learning the management of men must come to many of them when they enter upon their life work, but until they have left the university they should not be allowed to intervene as students, whatever they may do as individuals during their vacations. In the eyes of a very large proportion of our citizenship a certain odium attaches to every strike breaker, and our highest institutions of learning should not go out of their way to fasten that odium upon themselves.

We hold the belief, too, that the managers of the Interborough system made a tactical mistake when they invited engineering students to accept such employment, because it was obvious on the face of it that those who responded to the call could do so for only a very brief period. It gave strength to the conviction which the strikers themselves generally hold that strike breakers are employed for only a brief emergency and that few of them settle down as regular employees who permanently occupy at least some of the places of the strikers.

(From the *Wall Street Journal*.)

The organ of the American Federation of Labor comments with severity on the action of a number of Yale students in offering to take the place of strikers in case of a strike on the New Haven road. During the recent subway strike in this city a number of students offered their services as motormen, conductors and ticket sellers. The *American Federationist* does not think that the students are bad, or that they would knowingly injure the cause of organized labor, but says that "they must be misled by such attacks on trades unions as President Eliot, of Harvard, is in the habit of making." The spectacle of students taking the place of strikers is in its opinion "disgusting, shameful and dangerous."

This is laying down a rule that when a body of men give up their jobs in order to force a corporation to pay them higher wages or grant them shorter hours of labor, other men have no right to take their places. In other words, jobs are sacred to members of the American Federation of Labor, and nobody else has any right to them.

That is not the American idea. The spirit of this country is free labor for everybody. Let everybody have a chance to work, and if he does not want to work for the wages which are paid him, he has the liberty to stop working; he has the undoubted right to strike. But there is no moral or legal obligation on the part of other men to prevent them from taking the places of those who choose to strike.

The bulk of the young men who go into our colleges come from families possessed of moderate incomes. To put them through college means a hard financial struggle. It involves sacrifice of many pleasures and rigid self-denial. Many of our young men pay their way through colleges. They are glad, therefore, of the opportunity to find places where they may earn something that will enable them to continue their college course. That they should take the opportunity of a strike to secure remunerative employment, instead of being disgusting and shameful, is in the highest degree creditable to them. It shows that they are willing to work and work hard in order to get ahead in the world.

The American Federation of Labor cannot erect a fence around the jobs in the United States and put up a sign, "No Trespass." There can be no such a thing as monopoly in labor very long in this country, and we believe that the same thing is true of capital.

HON. SETH LOW ARBITRATES THE CLOSED SHOP.

THOROUGH MASTERY OF TECHNICALITIES RESULTS IN AN AWARD WITH WHICH BOTH SIDES EXPRESS SATISFACTION.

ONE objection urged against arbitration generally by employers is the danger of calling in as an umpire some high-minded representative of the public, who, not being able to grasp the technical complications involved in a controversy, may render a decision that will be satisfactory to nobody. Both employers and unions are generally agreed that there are certain questions of principle that are not arbitrable, such as the question of the closed shop. To each of these propositions a conspicuous exception is found in a decision rendered, as an arbitrator, by the Hon. Seth Low. He evinced a remarkable capacity for mastering the most intricate details of the highly skilled printing industry; rendered a decision that proved satisfactory to both parties, while the decision was peculiarly important in that it related to the question, usually excluded from arbitration, of the closed shop.

The fact that this decision was satisfactory led to a subsequent request for Mr. Low's services in another case in the same trade, in which the representatives of the Typothetae and of the Typographical Union joined in this expression:

"Your decisions in the settlement of the strike at Little's, though applying to only one office, have served as a precedent in every similar case that has arisen, and have been so accepted by both parties to the controversy, which can be said of but few arbitrations of individual cases; so that both committees are naturally very desirous that you should accept. We know that you are a very busy man and that we are crowding in on time already fully occupied, but we hope that you will see your way clear to oblige us."

The strike in the job rooms of J. J. Little & Co., in 1896, ordered by the Typographical Union and supported by the Pressmen's and Electrotypers' unions, threatened to involve the entire printing trade of New York. But the men returned to work under an agreement to refer the eight demands to a joint committee of ten, with Mr. Low as arbitrator. Five of these demands were adjusted by the committee. Of the three submitted to Mr. Low for decision, he found in one case in favor of the union and in the other in favor of the Typothetae.

The demand for a "closed shop" was in this form: "That book and job rooms shall be recognized as card offices." Mr. Low's decision, delivered at a time when the "closed shop" was not a subject of such acrimonious discussion as now, follows:

This is a question ordinarily decided by power. If the union is strong enough to carry its point, an office is made a card office. If the employer is strong enough to maintain his position, he declines to have his office made a card office. I have shrunk not a little from attempting to pass, as arbitrator, upon a question of this nature; but, upon reflection, I have thought that a fearless discussion of the question by one in a position to look at it with impartiality might prove of sufficient advantage to justify the attempt. In a word, I think the contention of the union has in it an element of right; but in its entirety it involves two points that I am unable to sustain.

As one detail of this question in its application to the office of J. J. Little & Company, it is urged by the union that Mr. Little at one time became a member of Typographical Union No. 6, and in so doing pledged himself to give preference in securing employment to union men. Mr. Little admits that he did join the union thirty years ago; but claims that the incident has no relation to the present question. As it bears upon the matter in arbitration, I am constrained to treat the incident as having no decisive weight.

A card office, in the meaning of the union, is an office in which only union men are employed, and which is organized into a chapel, so-called, presided over by a chairman on behalf of the union. It is clear that such a condition of affairs may exist in an office as matter of fact, without its being recognized as a matter of policy by the employer. The union claims, for example, that in the office of J. J. Little & Company the press department, the electrotypers' department, and the stereotypers' department are all card offices. J. J. Little & Company aver that they have never been recognized by the firm as such. It appears to be the case throughout the trade at large that more than a few offices are considered card offices by the union which are not so considered by the employers.

In support of its demand, the union alleges that it is unwelcome to union men to work in the same office with men who receive the benefit of the union scale and generally profit by the attitude of the union, but who decline to share with the union the burden of securing and maintaining these advantages; and that it is especially unwelcome to union men to work side by side with men who, having been at one time members of the union, have been expelled therefrom for one cause or another. The union deems, therefore, that for this reason, among others, it is justified in asking that Little's book and job rooms should be recognized as card offices, in view of the fact that most, if not all,

of the employees of the office in those rooms at the present time are union men. It further urges this conclusion in the interest of the compositors, in order that the compositors may be upon the same basis, as it claims, as the stereotypers, electrotypers, and the pressmen in the same employ. The union urges it also because such a condition, in its judgment, is absolutely necessary to the faithful carrying out of the provisions agreed upon in the present settlement, as well as of those to be determined by this arbitration.

The Typothetae object to the claim of the union that the book and job rooms of J. J. Little & Company be recognized as card offices, for a number of reasons, the most fundamental of which are:

1. That J. J. Little & Company have successfully withheld this recognition for many years, "particularly in 1887, when not only that office, but nearly every office in the city of New York successfully resisted such a demand, although enforced by strike;" and that, as matter of fact, the demand is to-day as obnoxious as ever to that firm.

2. Because they claim that "in the office of J. J. Little & Company no distinction is made as to union or non-union, Jew or Gentile, American or foreigner, black or white; qualification being the only test."

3. Because of the character of the control claimed by the Union in an office that is admittedly a card office.

It is apparent from this *resumé* that the questions at issue in this demand are very fundamental.

So far as the Typothetae hesitate to recognize the union as the representative of the union men in their employ, I think they are mistaken. I think they are justified, on the other hand, in objecting to certain incidents that would flow from the recognition of the book and job rooms of J. J. Little & Company as card offices. As I view it, an employer is at liberty, if he pleases, to employ none but union labor. He is at liberty, also, if he pleases, to employ only non-union men. There are, in fact, printing houses of both types in the city of New York, although, as I judge, many more of the former than the latter. In the book and job trade, I understand that most of the offices are what are known as "open offices;" that is to say, employment in them is open to union men and to non-union men alike. I understand the office of J. J. Little & Company, as to its book and job rooms, to be such an office at the present time. It does not follow, it seems to me, because an employer employs both union men and non-union men without discrimination, that he is therefore at liberty to disregard the connection of his union men with their union. When a man employs members of a union, knowing them to be union men, or having good reason to suppose that they are union men, he must take them, it seems to me, with all that their unionism implies. In other words, I think that J. J. Little & Company, having book and job offices which are composed largely, if not altogether, of union men, may reasonably be expected to recognize the union in all negotiations upon which it may enter in behalf of the union men in their employ. To this extent I think the union is right in its present demand.

There are two points involved, however, as matters now stand, in the recognition of an office as a card office, which, it seems to me, cannot be sustained by argument, however they may be enforced by power. No one can compel union men, without their own consent, to work with non-union men. But it is a different thing to demand that an employer shall not be free to employ any but union men, and that I understand to be involved in the demand under consideration. It is no more reasonable, I think, for the union to demand that J. J. Little & Company shall not be free to employ non-union men, than it would be for non-union men to demand that the firm should no longer be free to employ union men; or, than it would be for J. J. Little & Company to demand that the union should be deprived of its freedom to take in new members at its own discretion. Employer and union alike ought to be free to determine what is for their own advantage in such matters. No arbitrators, I think, could find that an employer should be constrained, against his will, to shut his office either to union men or to non-union men. The other point at which I stumble in the consideration of this demand is this. In a card office, under the regulations of the union, a dispute between the employer and his employees is determined by the Executive Committee of the union. The representatives of the union have urged with great force that this tribunal in Typographical Union No. 6 has shown itself in many cases to be an impartial tribunal; that it has, as matter of fact, decided in favor of the employer perhaps as often as in favor of the employee. This may be conceded; but it remains a fact, nevertheless, that it is a one-sided tribunal, and because it is a one-sided tribunal it does not afford such a provision for the settlement of disputes between employer and the employee as would

(Concluded on page 12.)

J. H. Williams, Vice-President J. H. Williams & Co., Brooklyn, N. Y.
Miss Gertrude Beeks, Secretary.

HOW THE AMERICAN TELEPHONE AND TELEGRAPH COMPANY PROVIDES FOR THE WELFARE OF ITS EMPLOYEES.

(From a Contributor.)

WHEN telephone central stations were first established, the work of attending to the wishes of the subscribers was done exclusively by young men, who stood while at their work, but it soon became evident that the needs of the service could best be fulfilled by women, and their transference to these positions took place rapidly. With these later conditions of help, active measures were initiated for furnishing them with the most beneficial means for their comfort. As it is to-day, so from the very first, every endeavor of the telephone company was concentrated upon methods whose sole purpose was to secure the permanency of the telephone service by housing the central apparatus as far as possible in fireproof buildings, equipped with every desirable safeguard, to make the construction of lines as stable as possible, and also to lay the wires in cities underground. While limiting conditions require varying means for the comfort of the operators, yet every effort has been made from the first to obtain the highest efficiency of the service by the use of the best apparatus at the time being, only to renew it, even if it be in good order, to substitute later improvements, which were rendered necessary by the destructive agency of inventions, and in order to secure the manipulation of this apparatus with the highest degree of efficiency, it was essential that the operators should be selected from intelligent young women, who could be well trained for their duties with environment which would conduce to health and contentment, for it is wholly desirable that good tele-

phone operators should be retained in the service as long as possible, without intermittent breaks in daily attendance.

The care for the welfare of the operators differs in various cities according to the facilities which it is feasible for the company to adopt. These are modified locally

ADJUSTABLE CHAIRS WITH FOOT RESTS, BOSTON.

by the space available for such purposes and by the distances of the operators' homes from the exchange. The amount of travel is minimized by assigning them to central offices as near to their homes as the requirements of the service permit. In snow storms so severe as to stop street car service the company has often provided quarters for the operators for the night at a nearby hotel under the chaperonage of the matron. In other cases the company has sent operators to their railway stations in carriages.

When one visits the telephone offices, which are generally in the top story of fireproof buildings, away from the noise of the city, one is at first struck with the quiet which prevails in the room where a babel might be expected; for an operator need speak but little and that in a low tone of voice in the performance of her duties.

LIGHT.

Such rooms are lighted during the day for the most part by monitor roofs, which divert the glare of the polarized rays which are so trying to the eyesight, and a system of curtains as elaborate as those of a photographer's studio provides for agreeable illumination during the day. At night the face of the switchboard is illuminated by incandescent lights, screened from direct vision by reflectors, which cast rays on the face of the board in such directions that the accuracy of the hand is never impaired by shadows.

VENTILATION.

Although there is necessarily a great concentration of occupancy of such rooms, health and comfort are secured by means of forced ventilation, and the temperature is frequently controlled by thermostatic appliances. The continuous use of an operating room requires far more efficient ventilation than does an office or a workshop occupied less than one-third of the twenty-four hours. Therefore great care is used in the ventilation. The air is drawn from a place either at the rear or on the roof of the building, as far as possible from direct contamination of the streets. Nevertheless, this method of forced ventilation would necessarily bring an excessive amount of dust into the room, were not this air filtered through tubular screens of cloth. An analysis of this dust, thus extracted in large quantities from the air, showed it to contain:

Moisture	20
Magnesia	2.18
Alkalies and other undetermined substances	8.95
Lime	12.82
Alumina	13.70
Silica	22.85
Carbon, organic matter, etc.....	39.30
Total	100.00

This material has also been found to contain a large amount of iron, evidently worn by attrition from horseshoes and wagon tires, although the inlet to the air supply was in the center of a large block. Microscopical examinations show that the material is mainly composed of particles of soot, scales of mineral matter,

spores of mould, shreds of wool and cotton, and bits of hair. The removal of such foreign and unwholesome material must contribute to the hygienic properties of the air as well as render the building cleaner.

In certain western cities, where the use of bituminous coal is universal, the air is actually scoured by sprays of water, and the excess of moisture is removed by subjecting it to a rapid rotary motion, which throws out the water as a centrifugal extractor separates the milk from cream. In winter, the air is humidified to an extent which renders it soft and equable, and has mitigated the throat difficulties which result from excessively dry air, which prevails under the usual conditions of artificial heating in northern temperatures.

These methods of sanitation were devised for the purpose by persons connected with the company, and the result has been so successful that they have been widely adopted elsewhere and also form the subjects of lectures in several medical schools.

SEATS FOR WOMEN.

The chairs provided for the operators are adjustable, both as to the height and the foot rests. Their shape was selected after careful experiments, in which those who were to occupy the chairs took a prominent part; and, before adoption, this type of chair received the approval of physicians whose services were secured for this purpose.

REST AND READING ROOM.

Connected with each telephone office is a retiring room, in which each operator has a ventilated locker, usually of enamelled iron, for outer garments and other paraphernalia. This room is also furnished with easy chairs, lounges and tables, and provided with books and papers. The care and management of reading matter is under a committee of the operators, and the expense is usually divided between the company and a payment by the operators of about 5 cents a week. In some instances books are circulated as in the case of a reading club, the last person receiving the book in alphabetical order of name retaining it as her own. The lounges in this room are of plaited bamboo and of a shape selected by the advice of physicians.

TOILET AND LOCKER ROOMS.

These retiring rooms are under the charge of a matron, who has a few simple remedies for cases of slight indisposition. If illness sufficiently serious occurs an arrangement is made with neighboring physicians to respond to any call for immediate attention.

Connected with the retiring room are toilet and bath rooms, as well as lavatories. There are clothes dryers heated by steam, so that damp garments and umbrellas may be thoroughly dried.

LUNCH ROOMS.

Telephone offices are equipped with lunch rooms, which are provided with steam tables for heating lunches and with refrigerators for cooling them. In many instances the telephone company supplies, without charge, coffee or chocolate to supplement the cold lunches brought by the operators; and in some places, at nominal cost, a light lunch, including soup, one or two cold meats, fruit, bread and butter, and tea, coffee or milk.

PRIZES.

In some cities where there is a large number of switchboards a record is kept in each office of the rate of answering calls, speed of answering, percentage of errors, number of complaints, and regularity of at-

REST AND READING ROOM, NEW YORK.

tendance of the operators. The office making the best record for the month receives as a prize a picture or other gift appropriate for the retiring room.

FIRE PROTECTION.

As in the case of schools or other places, where there is a dense occupancy, the tendency to panics, which otherwise would be inevitable on exposures to fires or smoke from other parts of the building, is reduced by fire drills, which are held at irregular intervals and without warning. There have been numerous instances where an operating room was filled with smoke from fire which threatened no actual physical hazard, yet was naturally alarming; but any destructive results which might have followed a panic among the operators were averted by the discipline of the drill.

CLASSES FOR INSTRUCTION.

The selection of an operator is attended with the utmost care. It involves the usual recommendation as to character, information as to general intelligence, and a medical examination by a woman physician—particularly as to the voice and hearing. Before taking permanent positions at the switchboard, they are under instruction, and also under pay, in a school where the operation of the telephone switchboard is explained and to a great extent its principles illustrated by means of models specially constructed for the purpose. The learners are also given practical experience in the operation of the switchboard.

One company employs a man to give talks to the operators, which are not merely technical, but treat of travel or topics of literary interest. The appreciation of these efforts on the part of telephone companies for the benefit of their operators is indicated by the fact that it is customary for them to come earlier than their duties require or remain later for the sake either of reading in these retiring rooms or attending to sewing or other feminine handiwork.

WORKING CONDITIONS.

Hearing is not impaired by the use of the telephone, but on the contrary, as is the case with musicians—particularly those playing the violin, or other instruments requiring tuning by the performer—the auditory sense is developed to a point of great acuteness. Operators use identical receivers and transmitters, and when one leaves her position at the board, after a period of not over three hours, her instrument is hung upon a numbered hook; a substitute in turn uses instruments which are reserved for her own use.

Women operators are directly under a woman supervisor, although in the large offices the whole operating room is under the supervision of a man. The service at the switchboard is broken up by recesses, and an operator can at any time obtain a temporary substitute by telephoning to the lady supervisor in the room.

In addition to the manipulation of the telephone service at the central station, there are in large business houses private branch exchanges in such numbers that, in large cities, such private branch exchange operators exceed the number of central operators. While the conditions surrounding these private branch exchange operators are like those of stenographers or other first-class office help, yet such positions are considered desirable because in most instances the hours are very short and the duties light, although requiring such a high order of experience and intelligence that these operators are usually selected from the most efficient of those in the central telephone offices.

The telephone company exercises especial efforts

SCHOOL FOR BEGINNERS, NEW YORK.

for the welfare of its men employees, who are obliged to face the exposure of weather and various hazards incident to their work. The duties of many linemen

being to a certain extent intermittent, some place or room is always provided for them when not on active outside duty.

There are many methods of insurance, varying in detail. One organization has a fund of \$10,000 accumulated from its annual balls; another insurance association has relatively large reserve funds. Gener-

CLOTHES DRIERS, HEATED BY STEAM, BOSTON.

ally a person's membership continues for a year after leaving the service of the company, and in some instances membership is retained as long as the annual dues are paid. These associations include benefits which award a larger amount for death by accident than by disease, as well as a larger weekly stipend in case of disability from accident than from illness. In all cases the telephone company adds large contributions to the monthly assessments paid by the men. Various meetings of a social and improving nature are held in connection with these insurance and benefit associations.

STATE INSURANCE IN GERMANY.

(Reprinted by permission from *Scribner's Magazine* for April.)

[The following is an extract from the fourth of a series of articles by Frank A. Vanderlip, appearing in *Scribner's Magazine*, under the general caption, "Political Problems of Europe." The subject of the April article in *Scribner's* is "Paternalism and Nationalism," and the extract here reproduced deals especially with State Insurance in Germany. The author's treatment of this subject makes a fitting climax to previous articles that have appeared

in THE CIVIC FEDERATION REVIEW upon allied topics, namely: by Max Riebnack, Comptroller of the Pennsylvania Railroad Company, upon "Railway Provident Institutions;" by E. E. Clark, Grand Chief Conductor of the Brotherhood of Railway Conductors, upon "Why Employees Object to Railroad Relief Departments;" and by Francis L. Robbins, President of the Pittsburg Coal Company, upon "Profit-sharing, Insurance and Pensions."—EDITOR'S NOTE.]

In any examination of European political and economic institutions, the attention of an American would at once be attracted to the subject of workingmen's insurance. He would find it a subject not only of vast importance in European political and social life, but one presenting to him novel considerations, because the institution is practically without parallel of any sort in this country. Nothing that I have seen in Europe has interested me more than the effect of workingmen's insurance. On the Continent one finds it, measured from any point of view, one of the most important subjects that is presented in the whole array of affairs. As a rule, I think Americans have little conception of the extent to which the system has developed, and of the marked effect which

it is producing upon national economy and upon social conditions.

Workingmen's insurance conducted as a government,

or semi-government institution, is confined to the Continent. In Great Britain there is no Government activity in this field, the development there being wholly within the ranks of the friendly societies, or else in the direction of the provisions which are made by the great railway corporations for retiring on part pay their superannuated servants. The weight of political sentiment in Great Britain is violently opposed to the adoption by the Government of any position which might lead to national responsibility for workingmen's pensions. On the other hand, in the ranks of the workingmen, and particularly in organized labor, there is a growing disposition to force the question upon the attention of Parliament.

It is on the Continent that we find the governments intimately related to the subject of workingmen's insurance. There has been an interesting development of semi-public semi-government insurance institutions in Germany, France, Italy, Austria-Hungary, Belgium, Sweden, and Denmark, and in all of those countries the movement has assumed proportions of political importance, and the workings of the systems have already produced marked sociological effect.

It is in Germany that there is to be found, by all odds, the highest evolution of workingmen's insurance. In that country a social experiment has been conducted on a vast scale, and I think the movement may fairly be said to mark the most interesting recent social legislation that is to be found anywhere in the world.

The significance of the movement in Germany will be better understood when it is noted that 17,000,000 German workmen are contributing to and enjoying the benefits of the pension system. That significance is emphasized when we learn that since the inception of the system, in 1885, the total receipts have reached \$1,750,000,000. At the present time the annual receipts are in excess of \$130,000,000, an amount sufficient to make us consider with much interest the economic consequences of the plan.

ADMINISTRATION OF INSURANCE FUNDS.

Especially is it noteworthy to find that this vast sum has been administered with absolute integrity. The administration of the insurance funds of Germany offers one of the best indications in the world to-day of the possibility of a successful state control of important institutions, even when enormous sums of money are involved. The demonstration, however, has more than integrity to its credit. The collection and disbursement of these great funds have been carried on with an economy which is admirable. In considering the cost of administration of the German insurance funds it should be remembered that collections are made from 17,000,000 individuals, as well as from the employers of those individuals, and that in making disbursements, particularly of the sick and accident funds, there is a care and intelligent supervision exercised which must make the cost of disbursement quite as great as the cost of collection. There are, therefore, reasons for a much higher ratio of expenses than would be essential in such a system of life insurance as we have in America. But as a matter of fact, the cost of administration of American insurance funds makes sorry comparison with the expense of administration in Germany. It is a monument to the economy of the German administration to find that less than eight and one-half per cent. of the total income is used up in the cost of administration, and that ninety-one and one-half per cent. is paid out in benefits to the insured. A showing like this, so greatly in favor, apparently, of the economy of government administration, would seem to raise the inquiry as to whether Germany has not found a better plan for the administration of insurance funds than we have evolved in this country.

Nothing like a full consideration of the subject of workingmen's insurance is to be given in the course of a magazine article. I believe it is a subject worthy of the deepest consideration. Certainly it is one that offers many difficulties before a clear conclusion can be reached as to its effect and advisability. There are arguments of great weight on both sides of the subject. I believe, however, that it is a subject which in due time will come before us in America for consideration and action.

Any exposition of even the German system of insurance alone is too complicated to be presented in a brief study of the subject. The system in Germany is an evolution, and in its present form probably none of its friends would suggest that it is an ideal system. Anything like a complete understanding of its provisions is complicated by the fact that there are three distinct forms of insurance—insurance against sickness, against accident, and insurance to provide old-age pensions. An explanation of the system is further complicated by the fact that the administration of these three distinct and separate insurance funds is in many different hands, although all are under the supervision of the general Government. The sick insurance fund is administered by more than 23,000 sick clubs. The accident insurance is administered by nearly five hundred managing boards, which represent various state and municipal communities and various trades and industries. The old-age pension system is in the hands of some thirty-one distinct insurance institutions. An understanding of the details of German insurance administration is, therefore, difficult; but some general considerations of its provisions

and effect are easily possible. All the insurance funds are contributed to in about equal proportion by employers and by the insured, and that total is augmented by a subsidy from the empire. Employers pay in about forty-seven per cent. of the total, the workmen less than forty-six per cent., while the subsidy from the Government provides between seven per cent. and eight per cent.

EFFECT OF DEEP SOCIOLOGICAL INTEREST.

The effect of the institution, as seen in Germany, is of far wider significance than are merely the admirable efforts in alleviating distress caused by sickness, by accident, or by poverty in old age. The results which have been attained in the accident insurance field, for example, are far broader than the mere indemnification in some measure for the suffering and loss which accidents have entailed, and it is likewise true in the other branches that the provision which has been made for the payment of pensions in lieu of wages lost in case of sickness has been only a part, and one might say almost a minor part, of what has been accomplished in that field.

The results of the German workmen's insurance embrace considerations of the deepest sociological consequences, on the one hand, and of a most significant effect on the national health and physique, on the other. The Germans have gone at the whole subject with their characteristic thoroughness, and the whole world will in time be forced to give attention to what is being accomplished.

ACCIDENT INSURANCE.

The German system of workmen's insurance is founded on a very general belief that the change which has been going on in Germany, transforming that country from an agricultural into an industrial state, and the evolution which has been proceeding in industry, resulting in a great specialization of work and the high development of the factory system, have made necessary an enunciation of some new principles in regard to the duty of the community toward the individual, principles which are fundamental in their character. The intricate and complicated modern system of industry has left the industrial population economically dependent, no matter how free it may be politically, the Germans argue, and the development of that system has brought the industrial population into a position where it is difficult for the individual to extricate himself from his misfortunes should he be overtaken by accident, sickness, or old age. In this new industrial order the liability to accident is greatly increased, and new means for meeting the condition which that fact has brought about are demanded.

Various nations have recognized the increased liability to accident which has come with the present-day development of industry, and have taken diverse means to meet the new condition. Germany offers the most notable example of a development of accident insurance. France, on the other hand, has undertaken to meet the demands which industrial workers make for some adequate provision for indemnity by passing most rigid and far-reaching legislation, fixing upon the employer the liability and making provision so that the injured workman may easily enforce that liability in the courts.

EMPLOYERS' LIABILITY LEGISLATION.

In America there not only has been little legislation passed on this subject, based on broad principles of humanity, such as have actuated the German legislation, but there has been little progress toward more definitely fixing the liability of the employer, and making it easy for the injured person to enforce a claim. Instead of that, there has arisen here a system of so-called employers' liability insurance, which is in effect organizations of strength with which to combat weakness, organizations the object of which is not to indemnify the worker for injuries, but rather to indemnify the employer for the cost of fighting in the courts the claims of the injured persons. The purpose of this system is not to put the insurance company in the position of a fair employer who will make payment of a just indemnity. Its purpose is accomplished rather by fighting each individual case with all the skill which its organization, made up of experienced adjusters and sharp attorneys, enables it to pit against the feeble efforts of an injured workman who is attempting to enforce even the inadequate legal rights that our legislation has thus far accorded him. If statistics were presented dividing the receipts of these insurance organizations so as to show what amount they expended in actually paying indemnity to injured persons, and what amount they used in fighting claims and paying dividends, the comparison which those figures would make with the humane institution of accident insurance as developed in Germany would be anything but to our credit.

Germany has accomplished most admirable results in the way of providing indemnity to persons injured in industrial occupations. The work accomplished by accident insurance however has been of far wider usefulness. Accident insurance as developed in Germany has really been an insurance against accident, not merely the providing of indemnity. There has been evolved there, as a result of the study which employers and employees who have been managing these insurance funds

have given to the subject, a system of laws and of regulations providing for safeguards which have gone far to reduce the number of accidents, and to remove the danger from industrial callings. In the last few years the effect of these safeguards has been to reduce one-half the frequency of accidents. Viewed from an economic standpoint alone the saving which has resulted to the national economy has been a vast sum. In the United States we seem as extravagant of life as of resources. There is no single line in our national statistics that is read in Europe with such startling surprise as the one which shows 60,000 fatalities and injuries on our railroads in a single year. In other industrial fields we are as careless of life. It seems to be regarded as more economical to fight damage suits than to provide safeguards, and dangers that do not interfere with dividends frequently receive little attention.

SAFEGUARDS AGAINST ACCIDENT INTRODUCED.

It is noteworthy that German employers have willingly accepted the burden they are charged with on account of workmen's insurance. That it is a very considerable burden there is no denying. The Krupp Steel Works alone, for example, contributed more than \$2,000,000 for the purposes of workmen's insurance within the period from 1885 to 1902. The amount which employers are paying, compared with the total wages paid, is showing increases as the operations are extended in the various fields of insurance. The actual contributions to the insurance fund have, too, been only part of the expenses that the administration of the insurance laws has charged the employers with, because they have been forced to spend great sums of money providing safeguards against accident, and putting their works in the best possible hygienic condition. The general disposition among employers, so far as I have ob-

FRANK A. VANDERLIP,
Vice-President, National City Bank.

served, however, is to regard these expenditures as having been made with good value received, because of the increased efficiency and better health of their workmen, and their contentment and fair attitude toward capital.

DISEASE PREVENTED AND STEADY EMPLOYMENT SECURED.

There have been almost as great indirect benefits connected with the administration of the sick insurance fund as has been the case in the field of accident insurance. Remarkable results have been attained in the prevention of the spread and in the cure of contagious diseases. The sick insurance administration has by no means stopped at the point of giving care and financial aid in cases of sickness. More and more its aim has been to seek, with the utmost energy, every means for avoiding the disturbance in the wage-earning capacity of the workmen which sickness entails. It has sought to ascertain the principal causes of sickness, and to combat with organized and scientific efforts the various enemies of public health. The organs of the workmen's insurance committees have done a great work in educating the people in hygiene, and particularly in reducing the scourge of pulmonary diseases. This has been done through prompt and effective measures of isolation and treatment, and in directing special attention to the question of the hygiene of workmen's dwellings. The administration of the sick insurance, instead of being confined to rendering assistance to the sick and the invalid, has sought to cure them, and make them fully capable again of earning their former livelihood. In the development of that work the Germans have characteristically gone to the very foundation of the question, and are doing as important service in effectively preventing sickness as they are in curing it or relieving the distress which follows from it.

The effect upon the general level of the national health has been enormous. In the field of hygiene, as in the field of education, the German Government seeks to

make of each individual the most effective economic unit it is possible to develop. In doing that, the aid which has been rendered by the direct and indirect results of workmen's insurance in improving the physical condition and increasing the power of resistance to diseases, and in promoting the recovery and full return to health of those who are ill, has been beyond all calculation.

HARMONIOUS RELATIONS BETWEEN EMPLOYERS AND EMPLOYEES.

There is one phase of the benefits which workmen's insurance in Germany has conferred that is not to be measured by statistics nor weighed with exactness by definite evidence, but it is, nevertheless, one of the most noteworthy of all the influences that have grown out of this great social experiment. There has been accomplished a service of the very first importance in the direction of bringing about more harmonious relations between employers and employees. There is growing to be a better and better mutual understanding between capital and labor, and the administration of these insurance funds has furnished a common ground upon which the two interests can meet and discuss those questions which affect both. The committees that have the administration of all the details of the collection and expenditure of these great funds are made up in part of employers and in part of workmen. In serving on these committees, employers are brought to a better understanding of and a closer sympathy with their employees, and workmen have been given a clearer comprehension of economic possibilities in the field of industry, and have come better to understand their employers' point of view. I do not mean to say that Germany has reached a millennium, and that there is complete harmony and understanding between capital and labor there, but I do feel that the labor situation offers some sharp contrasts to conditions in other countries, and that those contrasts are favorable to Germany. I have frequently spoken of the spirit which pervades so many of the institutions of Germany, the spirit of making each individual member of the commonwealth the most efficient of industrial and economic units.

HON. SETH LOW ARBITRATES.

(Concluded from page 9.)

commend it to the approval of disinterested men. A tribunal, to command such approval, ought to be composed of an equal number of representatives of both sides, with provision for arbitration in the event of inability to agree. Section 125 of the General Laws of the International Typographical Union appears to me to recognize this position. This section reads: "When disputes arise between subordinate unions and employers, which cannot be adjusted after conference between the parties at issue, the matter may be settled by arbitration." Indeed, the present proceeding, in my judgment, is a type of what ought to be the uniform method of procedure in cases of dispute between union men and their employers. My observation, founded upon an experience of ten years in business life, leads me to believe that all business arrangements, to be permanent, must involve the element of mutual advantage. A relation that permanently favors one party to a transaction at the expense of the other, is, in the nature of things, short-lived.

Accordingly, if my functions as arbitrator permit me to pass upon this demand only categorically, I am obliged to find that the demand that the book and job rooms of J. J. Little & Company be declared card offices should be denied. If, on the other hand, I am at liberty to say, with hope of its acceptance, what I think is fair in all the circumstances of the case, my finding would be this: That J. J. Little & Company recognize Typographical Union No. 6 as the accredited representative of the union men in their employ in their book and job rooms, and that permanent arrangements be made for the arbitration of all differences between the firm and the union upon the general lines of the present arbitration.

Such an agreement as I have in mind has been recently entered into between the Lithographers' Association of the Metropolitan District and the New York Subordinate Association of the International Lithographers', Artists' and Engravers' Insurance and Protective Association of the United States and Canada. This agreement is spread out at length in the history of the recent lithographers' strike, pages 27-30 inclusive. Another form of permanent arbitration, which has behind it the record of ten years of success, is to be found in the agreement between the Masons and Builders' Association and the Bricklayers' Union of the City of New York. The lithographers' agreement provides for a temporary board of arbitration to dispose of each dispute as it arises. The masons' agreement provides a permanent board of arbitration, and contemplates an agreement to be revised and renewed in all its details each year. It is naturally impossible for me to say which form of agreement is best adapted to the printing trade. In one form or the other, however, I wish to throw whatever authority or influence I have, as the arbitrator in this controversy, in favor of this method of settling all disputes hereafter in the book and job rooms of J. J. Little & Company.

IS COMPULSORY ARBITRATION PRACTICABLE?

(Continued from page 4.)

and I believe that commission would be of incomparably greater value if it were a voluntary commission and not a commission elected or appointed by the Legislature, but a commission representing trained minds like that of our friend, Mr. Carroll D. Wright and others, who have made a life long study of this enormous subject. That is the only word that I should like to leave before we adjourn, that while on the whole we have made during the last quarter of a century enormous progress in the betterment of the condition of the workingman and the betterment of the understanding of his relation to labor and capital, there are yet in that direction much land to be passed, many fogs to be cleared away, much illumination to be furnished, and with a commission of interpretation, if to-day we could create that everywhere to construe the contract, the relation, whatever it is, between the workingman and his employer—that would be of supreme value. (Applause.)

On the day following the above discussion, Mr. Wheeler addressed the following letter to Bishop Potter:

New York, April 5, 1905.

My dear Bishop Potter:

May I answer the question that you put to Mayor Low last night?

My proposition would be that the members of such an arbitration tribunal as I propose should be appointed by the President of the United States, and selected from among the judges and ex-judges of the Federal Courts, and that their jurisdiction should extend to all interstate commerce cases. A similar tribunal in this State I would have appointed by the Governor, and selected from the judges and ex-judges of the Supreme Court of the State.

It does seem to me that Mr. Archibald's objections are very like those that used to be taken a hundred years ago or more, to the giving up of duelling. This was a sort of private war, but experience has shown that we can do very well without it, and that questions, even of a very delicate and even sacred character, can be safely adjusted by the courts. I cannot see that the questions that arise between capital and labor are any more sacred or difficult than those which arise between husband and wife; and yet when all efforts at conciliation in the latter instance have failed, it is better to have a judicial tribunal to give some decision than to leave the decision to the contention of the two parties concerned.

At any rate this is the judgment which I have formed as the result of forty years' experience in court.

Yours faithfully,
EVERETT P. WHEELER.

INTERNATIONAL NON-ARBITRABLE QUESTIONS.

The following letter from the Professor of International Law in Columbia University, who is recognized as the highest authority in this country upon that subject, sheds light upon questions excluded from international arbitration:

Editor National Civic Federation Review:

Sir:—I have your letter of the 7th instant, in which you ask, "What questions, if any, arising between nations, are considered by common consent, or in international law, or usage, as essentially non-arbitrable?"

If we consult the history of international arbitrations during the past hundred years, we find that it is impossible definitely to answer this inquiry. By this I do not mean to convey the opinion that the use of force in the conduct of international affairs is likely soon to be abolished; but I do mean to say that phrases such as "national honor" and "national self-defense," which have been employed in describing supposed exceptions to the principle of arbitration, are of little value as indicating what questions may or may not be arbitrated. Questions of honor and of self-defense are, in international as in private relations, matter partly of circumstances and partly of opinion. When the United States, in 1863, first proposed that the differences that had arisen with Great Britain, as to the fitting out of the *Alabama* and other Confederate cruisers, should be submitted to arbitration, Earl Russell rejected the overture on the ground that the questions in controversy involved the honor of her Majesty's Government, of which that government was, he declared, "the sole guardian." Eight years later there was concluded at Washington the treaty under which the differences between the two governments were submitted to the judgment of the tribunal that met at Geneva. This remarkable example serves to show of how little value are mere descriptive phrases, when we are dealing with practical questions.

The extent to which international arbitration can be carried depends chiefly upon the dispositions of the parties to the dispute. A nation could not be expected to submit to arbitration the naked question of its own independence; and yet a dispute which in one form might appear to involve independence, in

another form might not appear to do so. In other words, the dispute might, by patient negotiation and mutual concession, springing from a desire to reach an amicable settlement, be reduced to a form in which the issues would be clearly arbitrable. I may observe that the project of an arbitration treaty adopted by the Pan-American Conference in 1890 provided that arbitration should be obligatory in all cases except those which, in the judgment of one of the parties to the controversy, might imperil its independence; and even in these cases it was provided that, while arbitration should for such nation be "optional," it should be "obligatory upon the adversary power." This treaty never became effective. Had it been put into operation it is altogether probable that the clauses which have just been quoted would, when they came to be applied, have given rise in some cases to a wide divergence of views; and this divergence would have furnished a proof of the correctness of the opinion that the limitations of arbitration cannot be precisely fixed by general restrictive phrases. Roughly speaking, it might perhaps be agreed that "vital interests" and "national independence" may properly be excepted from an international agreement of arbitration, where such agreement takes the form of a general and positive obligation. But we should still have to determine in each case whether the particular difference fell within or outside those categories.

Very truly yours,

JOHN BASSETT MOORE.

April 10, 1905.

SOME QUESTIONABLE ASSUMPTIONS.

(By the Editor.)

The discussion of compulsory arbitration of industrial disputes, as thus far developed, proceeds largely upon two assumptions: First, that all questions that may arise between employers and wage earners are arbitrable; second, that neither party to an industrial dispute can win without the support of public opinion, and that public opinion is infallible. It may clarify the further consideration of this subject if we examine these two assumptions and ascertain whether they are wholly warranted.

Disputes between nations arise as do disputes between employers and employed. Voluntary international arbitration has been applied successfully to the settlement of some disputes between nations. But the method of international arbitration provided in The Hague Convention, the most advanced product of the efforts of civilization to secure peace, clearly recognizes that there exist questions that no nation would consent to submit to the decision of an arbitral court. The most casual thought will make it apparent that among the disputes between nations that diplomacy may fail to adjust, there are some that, if they are to be settled at all, can be settled only by the stern arbitrament of arms. It is not conceivable that any question involving, or appearing to involve, the existence of a nation or the continuance of its form of government, or its honor, could be submitted to arbitration. The Hague Convention in express terms provides that "powers who accept arbitration will sign a special act, clearly defining the scope of the arbitrators." Not content with this limitation, the United States Government, in becoming a signatory to the treaty, made this declaration: "Nor shall anything contained in said convention be so construed as to require the relinquishment by the United States of America of its traditional attitude toward purely American questions."

Thus we see, in the concrete outcome of the Universal Peace Conference of 1899, the existence of non-arbitrable questions recognized both generally and specifically.

It could not have been possible for the first French Republic to have consented to arbitrate the effort of the Alliance to restore the Bourbon monarchy. Within our own time and in our own country, the impossibility will be recognized at once of arbitrating the issues of the "irrepressible conflict" that were settled by our civil war; or the Cuban question that, despite the most painstaking efforts of diplomacy, made inevitable our war with Spain; or any issue involving the Monroe Doctrine, or the exclusive right of the United States to construct the Panama Canal.

Similarly, in the industrial world there are questions which one side or the other could not consent to submit to arbitration, because they involve principles strikingly parallel to those that debar some issues from international arbitration. The right of a man to belong to a union or the right of an employer to hire a non-union man are questions that neither employee nor employer would consent to arbitrate, because there is involved what each side regards as an intolerable surrender of individual liberty.

When the Chicago Metal Trades Association (employers) proposed to the International Association of Machinists (employees) to arbitrate a dispute involving apprentices and handy-men, the answer was a refusal on the ground that the questions placed in jeopardy the very existence of the union, and a strike ensued.

When a union, through its organized efforts, has secured certain general conditions, such as an eight

hour day, it refuses to arbitrate a demand to return to a nine hour day, on the theory that it will not risk losing what it has already established.

The Building Trades Employers' Association of New York City (the largest organized body of building trades employers in the country), recognizing that the union would not arbitrate questions involving working with non-union men, or the lengthening of hours, excluded these two questions from arbitration in their celebrated compact.

John Mitchell has instanced the eight hour day, which has prevailed in the bituminous mining fields for years, as a subject never to be submitted to arbitration.

The International Association of Bridge and Structural Iron Workers, in its contracts with employers, stipulates: "None of the definite agreements of this contract shall be subject to arbitration."

This same idea is put in the most extreme form and made to apply to any use of arbitration in a recent speech by John Kirby, Jr., chairman of the Executive Committee of the Citizens' Industrial Alliance of America:

Arbitration has proven a failure over and over again. If I am held up for my belongings and I refuse to surrender them, why should I submit the question to arbitration and take my chances on having to surrender half of what I have. Then, on the next hold-up, surrender half of what I have left, and so on until everything I ever had is gone.

In fact, people who have had practical experience in arbitration in the industrial world are constantly running against exceptions until, in some cases, it seems that it is hardly possible to find anything that both sides are willing to arbitrate. For instance, in the controversy between the lithographic employers' association and the five allied national unions, representing 95 per cent. of the capital invested and the labor employed in that industry, the employers demanded a trade agreement that should bind the unions to submit all questions that might arise to arbitration. The unions contended that there were certain questions that they could not, with justice to themselves, so submit. These were the three great issues of wages, hours and the closed shop, which they maintained must be definitely established in any trade agreement, and arbitration employed only for any remaining questions. Conversely, the employers, while demanding wholesale arbitration and an absolute abandonment of strike or lock-out, contended that the ratio of apprentices should be made larger and should not be subject to arbitration.

In the operation of a public service corporation, such as an electric street railway, the corporation regards an entire class of subjects as impossible of arbitration, because they involve the safety of the traveling public. For instance, the motormen of the Interborough objected to a medical examination, claiming that what they called a "practical road test" would be just as effective in ensuring safe service. But it was pointed out that the medical examination was necessary to test the heart action, for its susceptibility to electric shock; the hearing and vision, for quick and accurate understanding of signals; and the respiration, to guard against the chance of unconsciousness while running a train at high speed. Questions of discipline in such a service are also regarded as non-arbitrable, because they also relate to the safety of the public; just as in marine transportation, the absolute authority of executive officers at sea is not to be arbitrated.

Sympathetic strikes present issues that are not arbitrable. The last great railway strike in this country, that of 1873, is an illustration. The original trouble was a strike in the manufacturing shops of Pullman Car Company. An effort was made to tie up every railroad in the country that hauled Pullman cars, out of sympathy. The railway companies were under contract with the Pullman Company to haul its cars. To the suggestion of arbitration, they replied: "We have nothing to arbitrate. We have done nothing to cause you to strike. We would be penalized if we broke our contracts with the Pullman Company. Your affair is with them, not with us."

On the other hand, a labor organization does not regard provisions of its constitution or by-laws as arbitrable. Thus the constitution of the American Federation of Musicians forbids its members to play with non-union musicians, fining them for the first and second offenses and expelling them for the third. Accordingly, last winter, the local union of musicians in New York declined to play with a lady harpist until she joined the union. This was not a question of gallantry, to be arbitrated by a commission expert in artistic etiquette; it was a question of the union's constitutional law, that left no ground for arbitration.

These examples might be multiplied indefinitely. They serve to show that there is a considerable range of questions, varying in different industries, that are regarded by either employers or wage-earners as outside the scope of arbitration.

The second assumption of the advocates of compulsory arbitration, that the verdict of the public is necessarily infallible, is not surprising. That assumption is extremely common and ancient, as is indicated by the saying, "Vox populi, vox dei." No one will deny that in a broad sense this is true, even though it is commonly said that all majorities have at

some time been wrong. All progress means emergence from darkness toward light, a growth out of error toward the truth. All progress, in its origin and growth, is a process of conversion of popular belief.

But this long process of historical evolution cannot be applied to the public opinion whose judgment, quickly, almost instantly, formed, may become the basis of action upon present issues.

A little reflection will show that the opinion of the public, even of its most intelligent portion, is subject to the influences of as much bias, prejudice and emotion as is the opinion of the individual, and is as discordant as are the opinions of parties to any dispute. Thus, in the long period of debate, both economic and passionate, that preceded our civil war, the church itself was rent asunder upon the moral aspect of slavery, while the bar was divided upon its legality and the Nation was torn over the constitutional right of secession. The bulk of the most learned opinion in England, after the growth of the factory system, stood aghast at the proposition to restrict the hours of labor, to require sanitary conditions, to regulate the employment of women and children. These, it was asserted, were invasions of individual liberty; while the economists gravely argued that unless the cost of labor were kept to the lowest point consistent with the existence of the laborers, foreign competition would ruin British industry. It required years for the minority demanding these industrial reforms to become the majority.

It is pertinent to recall the state of public opinion during the anthracite strike of 1902. The public was widely divided in opinion as to the right and wrong of the struggle between the mine workers and the operators. Public opinion was unanimous only upon two points: People wanted their coal bins filled, and they protested against the cost. These were points of agreement, because they touched the common need. Had public opinion been of a judicial cast it would have suffered cheerfully the deprivation, discomfort and expense, because these should be endured in the cause of right, either of the strikers or the mine workers.

Political contests afford the most familiar examples of the fallibility, not to say gullibility, of public opinion.

Large results sometimes hinge upon incidents, essentially trivial, but distorted and exaggerated for political effect. The "roorback" is a familiar weapon of the closing days of important campaigns.

The perspective of history illustrates vividly the changing public conception of the characters of men in political life. To-day, the American Nation reveres the name of the Father of His Country. But in his own time, a considerable portion of the citizens of the Thirteen States believed the denunciations of George Washington heaped upon him by his partisan opponents.

Was it not public opinion that forced Galileo to recant, under oath, his discovery that the earth moves around the sun? Andrew D. White answers that question by saying: "The supporters of what was called 'sound learning' declared his discoveries deceptions

and his announcements blasphemy." It was a century before modified opinion permitted the removal of his bones from a dishonored grave. Even nearer our own day, the same authority tells us, the great Cotton Mather published a book "thanking God" for the burning of witches at Salem; "and his book received the approbation of the Governor of the Province and the President of Harvard College." Even Christ was crucified in obedience to an outburst of public opinion.

But granting that public opinion is not infallible, the advocates of compulsory arbitration would provide a method for its education, through a commission of "high-minded, disinterested citizens" to investigate and report upon industrial disputes. The assumption here is that a body of such a character can always be trusted to arrive at the truth in any controversy. But do the conclusions already reached by the expert wisdom of the Bench wholly verify this assumption?

Civilization has evolved elaborate codes of law and systems of jurisprudence. Yet the highest court in the land renders decisions upon which the justices are almost evenly divided; the decisions are themselves subjects of popular debate.

The Dred Scott decision settled nothing and plunged the Nation into violent controversy. Nothing could show a more hopeless tangle of judicial intellects than the decision as to the Philippines; scarcely any two of the justices following similar lines of reasoning. Expediency, rather than conviction, favored its general acceptance.

Industrial disputes are essentially questions for prompt decision. But there exist no formulated principles of industrial ethics such as have been established, through centuries of experience, in legal jurisprudence.

Any tribunal would have to summon to its aid expert testimony relating to a tangle of confusing interests and peculiar conditions. The experts would contradict one another, as handwriting and medical experts do now in the courts. Is there any certainty that a conclusive result, carrying in its terms conviction of its justice, would be reached by such a process? And is there any assurance that subsequent public opinion would sustain the decision?

So strong has grown to be the distrust in the assured justice of the decision of a dispute by any outside judgment, whether of an umpire, a court, or ultimately of the general public, that many trade agreements, especially in England, now provide that disputes shall be referred to a joint committee, composed of an equal number of representatives of each side, and prohibit the employment of any umpire, as well as the rendering of any compromise verdict. The bricklayers and other organizations in this country have a similar provision in their by-laws. A provision for conference, instead of arbitration, with equal representation of each side, is an increasingly frequent feature of trade agreements.

There is a striking parallel to this resort to an evenly balanced conference committee in industrial disputes in preference to arbitration in the method by which the controversy over the Alaskan boundary was settled. In that instance, it was the effort of Great

Britain to make it appear that the boundary dispute was referred to "arbitration." But in fact, the word "arbitrate" was stricken from the treaty at the request of the United States, whose attitude was that its right to the Alaskan coast strip was too well established for arbitration. The treaty accordingly provided that the six members of the tribunal, three appointed by Canada and three by the United States, were to act as "impartial jurors." John W. Foster, ex-Secretary of State, thus defined the method of settling this international dispute: "The treaty does not entrust any American territory to the adjudication of arbitration, but creates a commission of three American and three British experts to determine where the line should be drawn between Alaska and British Columbia."

It is urged that the state may exact, as a condition of any corporate franchise, that the company bind itself to arbitrate any difference with its employees. One objection that employers instantly suggest is that such a requirement would amount to a standing invitation to the employees to seek or to invent or to exaggerate grievances, and to demand arbitration in the confidence that the award would not injure them, and might better them. The chance that the arbitrator might be an elective office-holder or other politician would tend to increase this temptation. Even more serious, employers claim, is the objection that this plan would be compulsory upon the corporation, but not upon the employees. No device has yet been contrived that would enforce compliance with an award by the employees. Neither bonding, nor incorporation of the unions seems practicable. But even if they both were, there exists no means to compel men to work effectively against their will. There was a recent impressive illustration of this fact in Italy, where the Kingdom operates the railways. But a dispatch from Rome describes the employees, during a period preceding a strike, as adopting a novel means of pressing their demands upon the authorities:

They observe the regulations in their minutest details, and lose as much time in the process as possible, with the result that the entire railroad system is disorganized, and the official time table has no relation to the running of trains. The method employed by the "obstructionists," as they are termed, instead of strikers, is as follows: When a passenger arrives in a railway station and asks an employee where the ticket office is, the man is as long as he can possibly be in giving the desired information. Arrived at the ticket office, the employee there scrupulously tests every coin handed him by the passenger before accepting it. The porter who handles the baggage saunters along the platform at a snail's pace, and with exaggerated care arranges the hand luggage in the compartment. The trunks are piled with mathematical exactness on the truck and leisurely conveyed to the baggage car. As the train is about to leave the station it is discovered that the engine is short of coal, or water, or that the wheels of the train have not been tested for hot boxes, and so on, until the passengers are exasperated beyond measure. In the beginning the men had the sympathy of the public, but this they have lost by their erratic proceedings.

At Milan some tourists fell upon the employees and beat them with their canes. The large number of English and American tourists who visit Italy at this season are the main sufferers from the present state of affairs, and many are leaving the country for other lands by the waterways.

Even under a monarchy and under state operation here is illustrated the power of recalcitrant employees to nullify the possible regulations established by an arbitral tribunal.

ANNUAL MEETING OF THE NEW YORK CIVIC FEDERATION.

INDUSTRIAL DIFFERENCES HARMONIZED THROUGH ITS CONCILIATION COMMITTEE—AUGUST BELMONT REAFFIRMS HIS FAITH IN TRADE AGREEMENTS.

THE second annual meeting of the Civic Federation of New York and vicinity made a special feature of its proceedings a discussion of Compulsory Arbitration as a method of preventing industrial disturbances, particularly in its application to public service corporations and their employees. The discussion of this topic, which was suggested by the recent strike on the lines of the Interborough Rapid Transit Company, is published in full upon preceding pages of this issue of THE REVIEW. The other business of the meeting, which was held in the rooms of the Board of Trade and Transportation on April 4, consisted of the receiving of reports and the election of a General Board, which will elect general officers.

In calling the meeting to order, Oscar S. Straus, Second Vice-President of the National Civic Federation, stated that he had been called to take the chair, in the absence of Charles A. Moore, President of the New York Civic Federation. Mr. Straus said:

"A great deal of the work that is done by the Civic Federation is of a confidential nature; often so confidential that even the Secretary's report refrains from touching upon it. However, there is considerable work of which many of you are more or less conversant which will be presented. When the Civic Federation was formed, it was the opinion of a great many that our main work would be arbitration. But it has proved that the Civic Federation, as such, has never arbitrated a single case. There have been here and there members of the Civic Federation who have been called on in their individual capacity as arbitrators; but the Civic Federation, as such, has never acted as an arbitration board. Its function

has been confined almost entirely to conciliation and to a method of adjustment that is even subsidiary—to bring together the disputants. We have often found that troubles have arisen between employers and employees which were not due to any fault on the part of either, but rather due to the lack of understanding among the employers. There were certain concessions which the employees demanded which the employers would have been glad to concede, but the employers, being all competitors, one with the other, and not on the most friendly relations, and by reason of severe competition, never came together; and the result was, while some of the employers would have been very glad to grant some concession, they were unable to grant it because their competitors would not grant the same concession. This happened in several important cases. The mere fact of bringing employers of a certain line together has in several instances contributed to an adjustment of serious differences that would have led to lockouts and to strikes." The Secretary, James P. Archibald, read the report of the Conciliation Committee of the New York Civic Federation for the past year, which was received and placed on file. The report follows:

"Much of the work of the Conciliation Committee of the New York Civic Federation, like that of the similar committee of the National Civic Federation, is of a confidential nature and cannot be disclosed to the public. Not that there is anything in the settlement of these disputes that would not bear the closest scrutiny and the widest publicity, but neither employers nor employees as a rule care to have their disputes or differences between themselves aired in the press. If our conciliation com-

mittee should give to the press every case it takes up, both employers and employees would feel that we were simply running a publicity bureau for the purpose of exploiting our own work. One of the great assets of our organization is the confidence both employers and employees repose in our good faith and disinterestedness in tendering our services. There has not been a week in the past year in which the officers of this body have not been asked by either employer or employee to bring them in touch with the other party.

"There are cases, however, where the parties in interest announce the connection of the Civic Federation with their work. It is only such cases that we feel free to refer to as illustrations of the work done by the committee.

"Just a year ago to-day there began a series of conferences brought about through the efforts of this organization between the employing body of lithographers known as the National Lithographers' Association and the five allied organizations representing the different crafts of employees. These conferences were continued for eight consecutive days, beginning at ten o'clock in the morning and lasting from six to ten at night. These conferences resulted in an agreement covering hours and wages for one year. As this contract is about to expire, the organizations are again in conference looking to the making of a contract for the ensuing year. With this present conference the Civic Federation has no connection, its services being entirely unnecessary. This very fact is a gratifying proof of the efficacy of the trade agreement as a basis for establishing negotiable relations between employing and wage earning organizations.

"This situation was attained in the lithographic industry only through the patient application, to a vexed and

complicated problem, of methods of conciliation. The negotiations between these two forces covered a period lasting from October, 1903, to the middle of April, 1904. They involved the exercise of the utmost tact and patience; a gradual process of education, each side learning much from the other; a constant avoidance of all appearance of interference from an outside source, coupled with persistent efforts to bring the contending parties face to face, and the necessity of creating mutual confidence in the good faith of both parties. Not only did these negotiations cover a long period; they also enlisted the time and energy of disinterested persons, as well as of the representatives of the employers' association and of the organized unions, to such an extent that several of the conferences were prolonged to the point of mental and physical exhaustion.

"A highly interesting and somewhat difficult case, in which the offices of the Civic Federation were enlisted, was that resulting first in the settlement of differences between the Association of Theatre Managers of Greater New York and the Theatrical Protective Union, composed of mechanical and other stage employees, and afterward in the agreement between the Managers' Association and the musicians' union of New York, known as 'Local 310.' This trade agreement, approved by the American Federation of Musicians, is national in effect, extending to every place of public amusement in the United States. The value of conference was signally illustrated in the highly satisfactory result of the very first meeting between the representatives of the managers and of the stage employees' union. Mutual explanations of grievances and demands resulted in an agreement that was subsequently commended by the national convention in Milwaukee of the Theatrical Protective Employees. This initial success led directly to the opening of negotiations between the Managers' Association and the musicians' union. Conference between the representatives of the managers and of the musicians' union extended over a period of several months, frequently resulting in no progress, but finally the members of the Conciliation Committee succeeded in bringing the two sides to an understanding which resulted in the introduction of the trade agreement into the new field of the production of grand opera, other musical entertainments and the drama. Here the value of frank and free discussion was disclosed by the fact that when the parties came together many of their grievances proved fanciful. For instance, the managers complained that at rehearsals and performances green substitutes frequently appeared in place of players familiar with their part. They were surprised to find that the union itself had provided in its by-laws against this evil. As they had never before conferred with the union leaders, the managers did not even know of the existence of these by-laws, which afforded them an instrument to correct the abuse. The special committee of the Civic Federation, which by invitation took part in these conferences, was composed of Messrs. Roland Phillips, chairman, V. Everit Macy, Samuel B. Donnelly, and James P. Archibald. The controversy between the musical union and the Marine and other governmental bands was brought to the attention of this organization by a threatened strike in Brooklyn. A sub-committee, with Roland Phillips as chairman, was appointed to take up the trouble. While the threatened rupture in Brooklyn did not materialize, the committee began an investigation of the whole subject involved in the controversy, which has been breaking out periodically for many years past. This report is not ready to-day, but will soon be presented. Suffice it to say that the committee did not find the subject such a simple one to deal with as had been anticipated. On the contrary, it involved some very serious problems.

"Mutual conferences, arranged through the efforts of the New York Civic Federation, succeeded last May in averting a strike of organized teamsters, that would have brought to a standstill every truck in New York, causing untold mid-summer inconvenience and distress throughout the city. Furthermore, out of these conferences was evolved a satisfactory trade agreement, the first one ever made between the organized New York truck owners and teamsters. At least one of the issues considered at these conferences was so delicate that only the earnest argument and tactful persuasion of the chairman of our special committee, Marcus M. Marks, reinforced by the efforts of Messrs. Donnelly and Archibald, secured their continuance and successful outcome. The month of July witnessed another avoidance of strife and the formation of a trade agreement, through the mediation of this committee, between the International Brotherhood of Teamsters and the Contractors' Protective Association of New York City.

"Our conciliation committee is frequently called upon in the adjustment of difficulties in towns up the State. It is at present working on a matter which was brought to its attention last December, involving directly not over a thousand men, but indirectly a very much larger number. The controversy had gone to such an extent that a strike vote had been taken and the men had almost unanimously decided to go out unless they could secure a hearing and a modification of certain alleged grievances. On account of the extreme sensitiveness of some of the parties in connection with the matter names cannot be here reported. Suffice it to say that after much effort a conference was finally brought about ten days ago, and two members of this body, one representing the employer and one representing the employee groups, were

invited to use their good offices in effecting a settlement. They have spent two days taking the statements of one side of the case and next week will hear the other side. They are quite confident that they will be entirely able to establish satisfactory relations.

"In February a jurisdictional controversy arose between the engineers and firemen on the New York, New Haven and Hartford R. R. While only the employees on that one line of railroad were directly involved, if a strike had occurred it would doubtless have involved other systems, as the dispute was one of long standing. The Civic Federation was asked to exercise its good offices by the officials of the Brotherhood of Firemen, after their committee had exhausted its own resources with the company, appealing first from the superintendent to the president and from the president to the executive board. Our committee held conferences first with the firemen and then with the engineers. Finally they were brought together and reached an agreement.

"The unfortunate strike of the employees of the Interborough Company, on March 7, 1905, in many ways was a severe disappointment to the friends of trade agreements and conciliation. In fact, some of our members felt on the morning of the strike that the general cause of industrial peace had encountered a serious check. Having been instrumental in bringing about the conference in 1902 that resulted in the first agreement ever made on that line between its officials and employees, and having followed that initial success with the pacific settlement of one or two subsequent controversies, our committee had every hope that it would be able to prevent the recent break. As the details of the work done before and during the strike have been published in our MONTHLY REVIEW, we will not take the time of the meeting in recounting them here. Suffice it to say that, despite the earlier apprehension of the committee, the outcome of the strike was in reality a victory for the principle of trade agreements and a demonstration of the respect for their inviolability which animates national organizations of labor. Many problems arose during the progress of this controversy, some of which will be discussed here this afternoon."

At the conclusion of the report, the chairman said:

Gentlemen, we have with us Mr. August Belmont, the President of the National Civic Federation, and perhaps he may have something to say upon the subject of the report, especially the portion of it referring to the recent strike on the Interborough lines and the inviolability of trade agreements:

Mr. Belmont: I feel somewhat embarrassed in being obliged to address you as President of the National organization. It will be impossible for me to speak upon the subject of the strike without alluding to it in a measure from the point of view of the organization which I represent; but I hope and trust that what I do say—and I will not go into much detail about it—will not be construed in any way as a bid for a decision for or against the position which the company assumed. I will simply refer to it as bearing upon my own position with respect to trade agreements as outlined at the time I had the honor of being elected President of the National Civic Federation and I wish to say that those remarks were prepared before I had any idea of assuming any official position in connection with this organization, and, therefore, they expressed at that time my personal position on that subject; and I have no reason, in the light of what has occurred, to change my views.

I stated then that I believed in the trade agreement but that it should be observed and kept inviolable by both capital and labor, and scrupulously so.

The agreements which were made with the Interborough Company were broken, as is proved by the attitude which the national labor officers assumed with relation to them, and I think it speaks well, as your secretary's report stated, for organized labor, that the position of these national officers was so promptly assumed on the side of what was right. The details of this controversy and the question of hours of labor and wages had no bearing upon the importance of the point at stake, which was the observance of the agreement between the company and its employees.

What has occurred was deplorable. But a public service corporation has no choice about the question of continuing in operation or ceasing in the same way that a manufacturing concern has. It is under contract to give service uninterruptedly. Any manufacturing concern follows its own interests in the matter. So that the Interborough Company was compelled, under its duty to the public, to be prepared for a disagreement, which, unfortunately, it had some reason to foresee, and which it was its duty to provide against. And it could not do it in a manner which would have involved simply a temporary operation of the road. It had to provide for its permanent operation in any case, and, therefore, the company, in turn, entered into an agreement with individual employees, whom it took into its service, that their positions should be secure as long as they should give proper service and satisfaction. So that, when it became possible for the company to take back some of its old employees, it could take only as many as it had vacancies for. It welcomed them. There was no antagonistic attitude on the part of the company toward the freedom of the men to affiliate with trade organizations. There was no question in regard to that. There was no interference with the freedom of labor

affiliation. The men who were taken back are employed on the same terms as they were before.

I state that, because there has been some misapprehension on the part of those who choose to interpret the attitude of the Interborough Company as unfriendly to organized labor. If that had been the case, in taking back any of its old employees it would have discriminated against organized labor, which it did not do.

In the course of a conversation with some of the representatives of the Central Federated Union, I find that it is stated that I expressed myself as in favor of compulsory arbitration. That must be qualified. The statement was based simply upon this: That I was asked the question, and I answered that that could not be possible unless both sides to the controversy could be held to the result of the arbitration. That was all I said, or intended to convey.

The following were elected members of the General Board:

ON THE PART OF THE PUBLIC:

Cornelius N. Bliss, Ex-Secretary of the Interior.
Nicholas Murray Butler, President Columbia University.
W. C. Douglas, Attorney at Law.
Ralph M. Easley, Chairman Executive Council, National Civic Federation.
Charles S. Fairchild, Ex-Secretary of the Treasury.
Rt. Rev. John M. Farley, Archbishop Roman Catholic Church.
Rt. Watson Gilder, Editor *Century Magazine*.
Hamilton Holt, Editor *New York Independent*.
Seth Low, Ex-Mayor of the City of New York.
V. Everit Macy, Capitalist.
Emerson McMillin, Banker.
John A. Schleicher, Editor *Leslie's Weekly*.
Walter H. Page, Editor *World's Work*.
Roland Phillips, Managing Editor *Harper's Weekly*.
Rt. Rev. Henry C. Potter, Bishop Protestant Episcopal Church.
C. T. Root, Editor *Dry Goods Economist*.
Albert Shaw, Editor *Review of Reviews*.
Oscar S. Straus, Member of the Court of Arbitration at The Hague.
H. C. Watson, Editor *Dun's Review*.
Thomas F. Woodlock, Editor *Wall Street Journal*.

ON THE PART OF EMPLOYERS:

Emil L. Boas, General Manager Hamburg-American Line.
John Cooper, The Cooper-Wigand-Cooke Company.
Otto M. Eidlitz, Ex-Chairman Board of Governors, Building Trades Employers' Association.
William Green, Chairman New York Typothetae.
J. Alexander Hayden, Chairman Association Interior Decorators and Cabinetmakers.
Henry C. Hunter, Commissioner New York Metal Trades Association.
Edgar L. Marston, Blair & Co.
Marcus M. Marks, President National Clothiers' Association.
Thomas F. McCarthy, President New York Truck Owners' Association.
Charles A. Moore, President The Shaw Electric Crane Company.
Hosmer B. Parsons, Vice-President Wells, Fargo & Co.
Walter L. Pierce, Lidgerwood Manufacturing Company.
Herman Ridder, Manager *Staats Zeitung*.
Charles A. Schieren, Charles A. Schieren & Co.
Louis B. Schram, Chairman Labor Committee, Associated Brewers.
A. Beverly Smith, U. S. Lithographers' Association.
C. W. Sweet, Sweet, Orr & Co.
Charles W. Terhune, Edwin C. Burt Co.
Benjamin D. Traitel, Traitel Bros. & Co.
Charles Wilhelm, President United States Lithographers' Association.

ON THE PART OF WAGE EARNERS:

James P. Archibald, Brotherhood Painters and Decorators.
A. J. Boulton, Stereotypers.
William O. Coakley, Lithographic Press Feeders.
James Daly, Dockbuilders.
Charles Delaney, Granite Cutters.
Samuel B. Donnelly, Typographical Union.
J. J. Flynn, Metal Polishers.
William Fyfe, Amalgamated Carpenters.
Edward Gould, Teamsters.
Timothy Healy, Eccentric Firemen.
James P. Holland, Stationary Firemen.
Jesse Larimer, Housecarpenters.
Philip Kelly, Theatrical Protective Union.
Fred Lemon, Elevator Constructors.
William Long, Lithographers.
Edward A. Moffett, Editor *Bricklayer and Mason*.
Robert E. Niedig, Housecarpenters.
John W. Parker, Poster Artists.

A LABOR LECTURE TO LABOR.

Here is what is sometimes found in the labor movement: Selfishness, greed, grafting; jealousy of the leaders, no real co-operation; neglect of the meeting, indifference as to the label, the button and the card, knocking, trivial differences magnified into open quarrels, disputes, cliques, who run the whole thing for personal ends, lack of cohesion, consequent failure of many strikes and generally slow progress toward the ultimate success of the movement. Here is what should prevail: Broad-minded consideration for each other—no selfishness; absolute integrity—no grafting; confidence in well selected leaders—no jealousy; every union to help every other union—no lack of co-operation; large and enthusiastic meetings—no neglect; a vigorous campaign for the label, the button and the card—no indifference; boosting—no knocking; conferences and arbitration—no quarrels; the referendum and action by the whole union—no cliques; concentration of aims and work—no lack of cohesion.—From the *Pattern Makers' Journal*, Official Organ of the Pattern Makers' League of North America.

At best restriction of output by a particular class of workmen is a most selfish principle and therefore cannot truly be a trade union principle. The aim of this restriction is to benefit those who adopt the principle at the expense of their fellow producers in other crafts and callings. So that besides being economically false it is morally bad.—*Labor World*, Pittsburg.

THE NEW ENGLAND CIVIC FEDERATION ESTABLISHES HEADQUARTERS.

ITS RELATION TO THE NATIONAL ORGANIZATION AND ITS SPECIAL FIELD OF ACTIVITY AND USEFULNESS.

(From Bulletin No. 1 of the Civic Federation of New England.)

HHEADQUARTERS for the newly-organized Civic Federation of New England have been opened on the tenth floor of the Paddock Building, 101 Tremont street, and with the much deliberated question as to who should be secretary settled by the selection of Hayes Robbins, for several years a writer on economics and labor questions, the Boston branch of the organization is now in a position to fulfill its mission of bringing about a better understanding between the wage earners, the employers and the public. The headquarters are not pretentious; they consist of an office for the secretary large enough for ordinary business conferences if desired, and an outer office for a stenographer. But the secretary's room will soon become a virtual library of labor publications, for Mr. Robbins is gathering the labor reports of all the New England States, and already receives most of the economic and labor periodicals of the country at large.

The New England organization can hardly be called a branch of the national body, after all. It is allied with the national organization in purposes and methods, but is independent in action and influence. It has now practically perfected its organization, its lists of officers are substantially complete, its by-laws are in print, and the secretary will issue a series of bulletins which will state the aims and objects of the organization in detail and serve as a medium of communication between the executive committee and the members or others interested in the Federation's work. This is the first bulletin.

The Federation is a voluntary association composed of three general groups, one representing employers, one representing wage earners, and one representing the general public not directly identified with either of the other bodies. These three groups are also represented equally in the executive committee of thirty, which directs the general policies and work of the organization. The condition of membership is acceptance of the general purposes and methods of the Federation as stated in the by-laws, and expressed willingness to support the work by personal influence and, if possible, active co-operation when necessary. There is no membership fee. The work is maintained entirely by voluntary contributions.

It is desired to remove any possible misunderstanding of the objects and practical work of this organization. It is not an "interference committee." It does not attempt to entangle petty shop disputes, nor, for that matter, to intervene in any industrial difficulty except by request or consent of both parties. It does not pretend to know more about the details of a disagreement or the peculiar problems and special point of view of each side than those engaged in it. Its chief work is not with strikes and lockouts, but with the preventable causes thereof. What the Civic Federation has accomplished for good on that line in the national field is well known, but it does not pretend to have any final and complete "solution of the labor problem." Neither is it organized to promote directly or indirectly any eccentric scheme of social or industrial reorganization. It has no political affiliations or interests. It does not concern itself with legislation, nor in any way antagonize or interfere with the work of state boards of arbitration. Being jointly controlled and directed by representatives of employers, wage earners and the general public, in equal numbers, it is not and cannot be at the service of any special interests to gain advantage over any other interests involved in a controversy.

But the Civic Federation does stand for positive ideas, positive principles, positive work. A movement is sometimes assumed to have no principles unless it is "anti" something, or takes sides on special or local issues. That may be principle, or it may be simply short-range partisanship. The Civic Federation is neither "anti" nor partisan. It stands squarely on the proposition that our present industrial system, based on individual enterprise and free labor, is inherently sound and full of promise, in spite of many defects and abuses; that it is not a failure because of industrial strife; on the contrary, that the discord and hardship are survivals, not new growths, and are diminishing instead of increasing; that they are incidents in the slow and painful upward movement of the race, and not the result of any crafty scheme of labor exploitation, supposed to render the lot of the wage earners hopeless except through social revolution.

The whole design of the Civic Federation rests on the principle that there is no "inevitable" conflict between the interests of labor and capital. That the two are not engaged in a hopeless struggle to divide a certain fixed product, but in a common effort to make nature yield a constantly increasing return; so that practically the whole issue between capital and labor is one of fair divi-

sion of a product which, with the progress of invention, skill and intelligence, may become larger for both.

The strife that does occur is not the fault of our industrial system as such; it is due very largely to preventable causes, to misunderstandings, lack of the spirit of fairness, hasty conclusions, poor organization, unwise leadership on one or both sides, lack of self-control in the use of power, arbitrary demands, arbitrary refusals to confer, lack of correct information, failure of one party to appreciate the special problems, view point, difficulties and motives of the other, lack of personal acquaintance and of frank businesslike relations between the representatives of the interests involved on both sides. Realizing these facts, broad-minded and far-seeing men directly concerned in the problem from the standpoint of employers and of wage earners, and indirectly from that of the general public, have sought to provide, in the Civic Federation, a common meeting ground where as much as possible of this needless misunderstanding may be cleared up, and the elements of friction and prejudice taken out of the situation.

Men who have occasion to know of the good results of personal acquaintance and a better understanding between employers and employees have often remarked: "If the Civic Federation did nothing more than promote just that, it would be many times worth while."

Various doctrines of social upheaval are represented throughout the country to-day by active organizations, zealously at work encouraging class antagonism, destroying faith in the general scheme of our institutions, and

HAYES ROBBINS,
Secretary New England Civic Federation.

building up sentiment for this or that radical social experiment, guaranteed to bring in the millennium. The insistent propaganda of these movements works its way into a surprisingly large variety of important groups—social, religious, philanthropic, labor, educational, political. Its results are constantly cropping out in quarters least expected, and supplying the advocates of these doctrines with fresh ammunition. Naturally, the most determined efforts are being made among wage earners; it is a little appreciated fact that the trade union movement, on the whole, is to-day bearing the brunt of the attack. Thus far, it has proved one of the strongest bulwarks of our industrial society at what has been generally thought of as its most exposed point.

One of the most telling arguments made use of in this crusade is the fact of industrial strife—the hardship, loss and suffering that go with it. It should not be necessary to argue the question, therefore, whether it is worth while to develop a practical method of lessening the strife, or to maintain an organized means of rallying, at the danger points, the enormous reserve of public sentiment which is all the time in favor—if only passively—of industrial peace under free democratic institutions, and believes in progress through evolution rather than revolution.

The general educational influence of such an institution is probably its most important service,—more important even than the sum total of specific labor troubles it succeeds in averting or settling. In the nature of the case, the value of the work can never be measured by any tabular record of the number of such disputes adjusted; it must be estimated chiefly by the general preventive influence it steadily exerts in the community, against industrial strife on the one hand and revolutionary movements on the other, and by its practical work in building up, little by little, the habit of resorting to

peaceful rather than violent methods of settling differences.

The general officers of the Civic Federation of New England are as follows: Lucius Tuttle, president; Frank H. McCarthy, first vice-president; Louis D. Brandeis, second vice-president and chairman conciliation committee; Charles H. Taylor, Jr., treasurer; Henry Abrahams, recording secretary; Warren A. Reed, vice-chairman conciliation committee; Hayes Robbins, secretary.

The following compose the executive committee, which directs the general affairs of the Federation in the New England States:

ON THE PART OF THE PUBLIC:

W. Murray Crane, United States Senator, Dalton, Mass.
Charles Francis Adams, Publicist, Boston.
Henry L. Higginson, of Lee, Higginson & Co., Boston.
Bishop William Lawrence, of the Protestant Episcopal Church, Boston.
Bishop William Stang, of the Roman Catholic Church, Fall River, Mass.
Charles S. Hamlin, Lawyer, Boston.
Louis D. Brandeis, Lawyer, Boston.
John Mason Little, former President Real Estate Exchange and of Associated Board of Trade, Boston.
Horace G. Wadlin, Librarian Public Library, former Chief of Bureau of Statistics of Labor, Boston.
Hayes Robbins, Secretary Civic Federation of New England, Boston.

ON THE PART OF EMPLOYERS:

Lucius Tuttle, President Boston & Maine R. R. Co., Boston.
Frederick P. Fish, President American Telephone and Telegraph Co., Boston.
Amory A. Lawrence, President Merchants' Association, Boston.
Arthur T. Lyman, Treasurer Boston Manufacturing Company, Boston.
Edgar Van Etten, Vice-President N. Y. C. & H. R. R. Co., Boston.
Charles H. Taylor, Jr., of the Boston Globe, Boston.
P. F. Sullivan, President Boston & Northern Street Railway Co., Boston.
W. C. Winslow, of the Metropolitan Coal Co., Boston.
Wallace L. Pierce, President Walworth Manufacturing Co., Boston.
James Logan, Chairman Executive Committee, U. S. Envelope Co., Worcester, Mass.

ON THE PART OF WAGE EARNERS:

Frank H. McCarthy, President Boston Central Labor Union, Boston.
Henry Abrahams, International Cigar Makers' Union, Boston.
Frank K. Foster, International Typographical Union, Boston.
Francis J. Clarke, President State Branch American Federation of Labor, Brockton, Mass.
Dennis D. Driscoll, Secretary-Treasurer State Branch American Federation of Labor, Boston.
Edmund F. Ward, Vice-President Boston Central Labor Union, Boston.
John J. Connolly, State Organizer International Association of Machinists, Boston.
P. F. Sheehan, President Street Railway Employees' Union, Brockton, Mass.
William H. Frazier, Secretary-Treasurer International Seamen's Union, Boston.
Peter W. Collins, International Brotherhood of Electrical Workers, Boston.

The conciliation committee was organized in part on March 13, 1905, with the following membership:

ON THE PART OF EMPLOYERS:

Lucius Tuttle, Boston.
Charles H. Taylor, Jr., Boston.
Simeon B. Chase, Treasurer King Philip Mills, Fall River, Mass.
Herbert T. Drake, Superintendent Douglas Shoe Company, Brockton, Mass.
James L. Bowlby, President Master Teamsters' Association, Boston.
Edward C. Mead, of Mead, Mason & Co., Building Contractors, Boston.

ON THE PART OF THE PUBLIC:

Louis D. Brandeis, Boston.
Hayes Robbins, Boston.
Judge Warren A. Reed, Brockton, Mass.
Rev. Denis T. O'Sullivan, Boston College.
Dr. Carroll D. Wright, President Clark College, Worcester, Mass.
Professor John Marshall Barker, Boston University.
Hon. Charles S. Hamlin, Boston.

ON THE PART OF WAGE EARNERS:

Frank H. McCarthy, President Boston Central Labor Union.
Henry Abrahams, International Cigar Makers' Union, Boston.
John F. Tohin, President Boot and Shoe Workers' Union, Boston.
Peter H. McNealy, President Joint Council Teamsters' Union, Boston.
James Tansey, President Textile Council, Fall River, Mass.
James Duncan, Secretary-Treasurer Granite Cutters' Union, Quincy, Mass.
William Shields, New England Organizer Brotherhood of Carpenters, Jamaica Plains, Mass.

The National Civic Federation carries on its work through six general departments: Trade agreements, conciliation and arbitration, welfare work, industrial economics, trade sections, and organization, and the New England organization will proceed in the same way. Under the head of industrial economics the educational work in this section will be promoted by public meetings, from time to time. The first of these is planned for April 26, when the organization hopes to get together representative men from all over New England. There will be a dinner, and some addresses by prominent Federation leaders.

Governed as we are by public opinion, the utmost care should be taken to preserve the purity of the public mind. Knowledge is power, and truth is knowledge; whoever, therefore, propagates a prejudice, will fully sap the foundation of his country's strength.

The National Civic Federation Review

VOL. II. No. 2

NEW YORK, MAY 15, 1905

TEN CENTS

PEACE WITH LIBERTY AND JUSTICE.

EMPLOYERS, WAGE-EARNERS AND PUBLICISTS DISCUSS RESTRAINTS UPON INDIVIDUAL LIBERTY
CAUSED BY ASSOCIATIONS OF CAPITAL AND OF LABOR.

EMPLOYERS, wage-earners and scholars were the participants in a discussion that marked the first general meeting of the Department of Industrial Economics of the National Civic Federation. The meeting was made the occasion of a dinner at the Park Avenue Hotel, New York City, on the evening of April 25. This meeting was the beginning of a series of similar gatherings, to be held for the purpose of bringing to bear upon specific topics connected with the relations between capital and labor the experience of men familiar with the interests of employers and of wage-earners, and the convictions of ripe scholars in economic science. The design is that these meetings shall cause a clearer understanding by the participants and by the general public of some of the questions that directly concern the industrial world and that are of general importance.

The question discussed at this first meeting was:

"How far does associated effort in industry involve the curtailment of individual liberty?" This question was the outgrowth of a spirited exchange between Charles W. Eliot, President of Harvard University, and Samuel Gompers, President of the American Federation of Labor, at the annual meeting of the National Civic Federation last December. Dr. Eliot then declared that what the country needs is "peace with liberty," which he held could not be attained with combinations of either capital or labor that aim at monopoly; while Mr. Gompers asserted that there could be no liberty for the workingman without his material prosperity, to which union is essential.

Those who took part in the discussion were August Belmont, President of the National Civic Federation, who acted as chairman; President Eliot, who opened, and President Gompers, who closed the debate; Edwin

R. A. Seligman, Professor of Political Economy in Columbia University; Frank K. Foster, representing the Typographical Union and other labor organizations in New England; Louis D. Brandeis, lawyer and economic author, of Boston; Francis L. Robbins, President of the Pittsburg Coal Company. A verbatim report of their addresses follows:

SCOPE OF THE NEW DEPARTMENT.

Chairman Belmont:—

Gentlemen: It is with pleasure I perform, this evening, an act of official duty, that of presiding at the first regular meeting of the Department of Industrial Economics. It is a new Department of the National Civic Federation—one that is natural and logical.

At the outset, the National Civic Federation was met by a very general misapprehension of its mission. It

THE FIRST DINNER OF THE DEPARTMENT OF INDUSTRIAL ECONOMICS

was commonly and erroneously believed that it was organized to avert or settle strikes and lockouts. Our position is now better understood. We strive for industrial peace and more rightful relations between employer and wage-earners. In doing this, we look beyond the strained relationships to the causes which induce them. Inquiry, discussion, education are important factors in the settlement of vexatious problems, which are sociological as well as industrial; and this new departure in the work of the organization admits of a broader conception of the possibilities and opportunities afforded by intelligent review, research and agitation. It is not my belief that any one man, at any one time, will be able to solve these vexed and ever changing problems; but it is my belief that a step in the right direction can only be taken after the most free, full and thorough discussion.

We must place ourselves in the attitude of students, of earnest seekers after Truth. We must examine the economic laws and understand their application in special localities. We have before us, from time to time, industrial agitations, and it is our duty to discover what sub-surface conditions produce them. Economic laws govern. It is for us to read them in the relations between employers and employees, in the scale of wages,

CHARLES W. ELIOT,
President Harvard University.

in prices, cost of living, in production and consumption, combinations of capital, limitation of apprentices, restriction of output, open and closed shop, piece work, the shorter work-day, regulation of child and woman labor, the requirement of sanitary conditions of work, the restriction or distribution of immigration.

We hear in all directions a cry for economic education. On the one hand, we cannot read the publications of associations of employers without encountering an incessant emphasis upon the necessity of education. The larger employers, in transportation and in the basic industries, have in some instances advanced beyond the preaching of education, and are making systematic efforts for its actual extension among the workers. On the other hand, organized labor perceives that education is essential to its own maintenance and advancement. The American Federation of Labor has undertaken to introduce regular instruction in social, economic and industrial topics throughout its 25,000 local unions. The trade union publications contain an increasing proportion of reading matter devoted to technical subjects, all designed to increase the efficiency and productive capacity of the individual worker.

The very life of democratic institutions will be profoundly affected by the character of the information that is to be disseminated throughout the mass of the body politic. It becomes, therefore, of immediate importance that economic science be presented with convincing force and attractive clearness. To this end is this new department formed, and I cannot conceive a more useful function or a work more patriotic.

The special subject to be discussed to-night was suggested by the short debate at the last meeting. It is one of vast interest: "How Far Does Associated Effort in Industry Involve the Curtailment of Industrial Liberty?" We will this evening hear the question debated; therefore, I will not detain you by further or extended remarks.

Gentlemen, I, being a Harvard man, must be permitted to state that we have here to-night the man who stands at the head of the greatest educational institution in the country (laughter and applause), and I will introduce, therefore, President Charles W. Eliot, of Harvard College. (Applause.)

INDUSTRIAL PEACE WITH LIBERTY.

President Eliot:—

Mr. President and Gentlemen: Before we enter on the discussion of the precise subject which has just been read by your president, it has seemed to me that it would be useful to make a brief statement concerning

the fundamental importance in industries, and productive industries, of this principle of individual liberty, the curtailment of which is threatened by industrial combinations, whether of capitalists on the one hand, or of laborers on the other.

For brevity's sake I have written out what I wish to say on that subject. It is, of course, a theoretical presentation, but it might be indefinitely illustrated by practical examples.

The foundation of American prosperity and progress is not cheap land, or fresh mines, or flowing oil wells, or virgin forests. The real foundation is the efficiency of the American at work. By different philosophers this efficiency is attributed to various causes—to strong food, to the stimulating climate, to a native alertness and eager energy, to an intense desire to possess, to a readiness to study and try things new, and doubtless these causes all contribute to American efficiency; but there is another cause, which Americans apparently think about but little, and of late often completely ignore—namely, American freedom for the individual, the freedom which feeds hope and ambition. This freedom of many kinds—all fruitful.

When the Pilgrims sought at Plymouth freedom to worship God they planted a great tap-root of American efficiency. Religious liberty not only makes accessible to every thoughtful soul its congenial nurture, but also prevents the wastes and destructions of religious strife, evils which history teaches have been both widespread and intense. Europe still wastes a deal of force on religious contentions.

American political liberty is another source of American efficiency; for it is founded on a broad suffrage which enlists the interest and effort of every citizen capable of making a choice between parties or policies, no matter whether the choice be determined by reasoning, or by inherited or acquired sympathies and feelings. It takes the voter out of the narrow round of his personal or family affairs, and makes him think of the larger interests of the commonwealth. In other words, it develops not only the intelligence but also the co-operative spirit of the masses of the people.

Another very precious source of efficiency is the free access for all competent children to a prolonged education. This is a characteristic American opportunity which has much to do with the efficiency of the population. It secures for the many children, born in humble stations, but endowed by nature with exceptional gifts, access to their most appropriate and productive life-work. In this way free education makes an immense contribution to American efficiency.

The setting free of women for a variety of productive employments has greatly increased the collective efficiency of the nation; and we have much yet to expect from this emancipation which has followed from comparatively recent improvements in the education of women.

The perfect liberty to travel or migrate, without government passport, permission, or even inquiry, also promotes collective efficiency; for it permits both capital and labor to go where they can earn most. Indeed, parts of the laboring population are too migratory; for the nomad makes no home.

Again, American social mobility promotes efficiency; since any improving and growing man or woman readily rises from the social level at which he was born to any higher level which his early education, his trained capacities, and his experience make congenial to him. This rise is a stimulating prize for efficiency—all the more effective because his children may share it.

The very evils which accompany the present day doings of unions and trusts are only abuses of precious liberties not yet two generations old—the liberty of association, and the liberty of incorporation with limited liability. To be sure, the potent agencies created through the exercise of these new liberties have practically become, in the keen pursuit of pecuniary and especially of monopolistic advantages, enemies to the liberty of the individual, the combinations by a fatal or inevitable development always trying to absorb or destroy independent outsiders. Nevertheless, it is great liberties given by legislation which are thus temporarily perverted to the restriction of individual liberty. Undisturbed by the adverse phenomena of the moment, let us ourselves see clearly, and declare as persuasively as we can, that the chief source of American efficiency is the personal liberty of the individual workman.

If I needed any confirmation of this doctrine I should find it in the history of American education, where a new liberty for the individual has been the chief source of progress, ever since Thomas Jefferson began to design the University of Virginia.

Now, in the industries of our country this principle of liberty for the individual ought to be the chief promoter of good-will and content in labor and therefore of efficiency. What prevents this natural felicity? The opposing interests of workmen and employers prevent, and the consequent organization of labor on the one hand and of capital on the other for attack and defense. Whenever large bodies of men organize to fight, individual liberty goes to the wall. For effective fighting implicit obedience to leaders, self-sacrifice, and passionate zeal for the common cause are indispensable, and individual interests must be subordinated. Every workman who joins a fighting union, and every capitalist who joins a fighting employers' association makes a sacrifice

of personal liberty, and both act thus with the same object in view—namely, to win in a fight. These fighting unions and associations all dislike and try to prevent competition. Unions and associations alike seek to establish and maintain controlling monopolies, and some of them succeed. Thus they strike another blow at industrial liberty by destroying free competition.

The only way to prevent these sacrifices of that individual liberty which is the mainspring of industrial efficiency is to stop the fighting and the monopoly-grabbing. This is not a job likely to be finished to-morrow or next year; but it is just what the National Civic Federation, and particularly this new department of the Federation, is trying to do. What are the recognized preventatives of fighting between nations, classes or individuals? Are they not better mutual acquaintance between opponents, frank discussion of differences, publicity for evils and wrongs on either side, and agreements to abide by the decisions of previously accepted tribunals? In all labor and capital contentions the ultimate tribunal is the public opinion of the great body of consumers. Sooner or later that public opinion will regulate these new monopolistic powers, the sudden rise of which has taken courts, legislatures, and consumers by surprise. But legisla-

SAMUEL GOMPERS,
President American Federation of Labor.

tion follows slowly after public opinion, and judicial interpretation follows legislation. For the enlightening and crystallizing of public opinion concerning the industrial strife which has often seriously embarrassed particular factories or trades and general business, and has even threatened to cut off the supply of absolute necessities of urban life, what better combination of forces can we imagine than that here assembled? This assemblage represents immense and various forces for promoting the better acquaintance of employers and employed, the discussion of industrial contentions, and the publicity which compels attention to evils before they cause war, and forms a public opinion capable of leading to beneficial legislation. The press as a whole is not likely to lose sight of the fact that the most fundamental and characteristic cause of American efficiency has been and still is American individual liberty. Industrial liberty is not to be lost; it is only impaired temporarily. Trades unions and associations of employers or capitalists are natural and useful products of democratic society, and any nation which harbors one of these forms of industrial combinations must harbor the other also. They will endure; but they will create great disturbances and do much harm until they give over the pursuit of monopoly, recognize that competition is indispensable to industrial and social progress, and see in liberty for the individual the mainspring of efficiency.

Therefore, I say again, as I said at the preliminary meeting of this department of the Civic Federation—what we want is industrial peace with liberty. (Applause.)

Chairman Belmont: Gentlemen:—We have with us Prof. E. R. A. Seligman, of Columbia University, who has made a special study of the questions which interest us most and part of which are to be discussed to-night, and it affords me much pleasure to now call on him. (Applause.)

AN ANALYSIS OF ECONOMIC LIBERTY.

Professor Seligman:—

Gentlemen: Individual liberty, as an economic concept, is the result of a slow evolution. The ordinary picture of the freedom of the untutored savage is as fanciful as the rest of the fairy tales of our youth. Primitive man lacked freedom in three ways—he was in abject dread of nature, of his stronger comrades, and of the social group. In his ignorance of natural phenomena he was subject to all kinds of fear and superstition, an easy victim of the sorcerer or medicine man. Living in a state based upon brute strength, he was at the mercy of the more stalwart savage. Dependent upon

the group or clan for existence he was hemmed in by social customs that could not be infringed and by group prohibitions which it would be folly to evade. Civilization and not primitive nature is the creator of liberty. Knowledge has emancipated man from superstition. Law and order have protected him from the oppressor. Social progress has evolved in every phase of life a sphere of liberty evermore secure from the encroachments of absolutism. Economic liberty, like political liberty; freedom of thought, like freedom of speech, is the product of a most advanced stage of society.

FREEDOM OF INDIVIDUAL ACTION.

As opposed to the theories of ancient and mediaeval absolutism, with its continual interference in the economic life of the individual, the modern doctrine is that a man can commonly be depended upon for utilizing his opportunities and turning his own energies to the best account; that an adult of sound mind usually knows what is most advantageous for him, and that in making the most effective use of his own abilities, he will ordinarily do the best for the community. It involves the substantial identity of private interest and public welfare, and it is to-day, almost everywhere in the civilized world, either an accomplished fact or a cherished ideal.

FRANCIS L. ROBBINS,
President Pittsburgh Coal Company.

If we look more closely, however, we shall find that liberty is more than the mere absence of restraint from interference. In contrast to this mere negative conception of liberty as adopted by the average man, we must put the positive conception as elaborated by recent thinkers. Economic freedom is not an attribute of primitive man, but has been hammered out by centuries of toilsome effort. Individual liberty is the product of social effort. If it is to be a constructive rather than a destructive force; if it is to minister to social progress rather than to social dissolution, it must be accompanied by two other conditions. Of these the first is equality.

ECONOMIC EQUALITY THREEFOLD.

By equality we do not mean absolute equality. A certain degree of inequality inheres in the nature of things. Men are born with an inequality of physical, mental and moral attributes which no amount of care can eradicate. As soon as private property develops, these natural inequalities inevitably produce their results in inequality of possessions. The real equality that is important for economic purposes is threefold:

First—Legal equality, or the certainty that one man is as good as another before the law, and that his economic rights will be protected.

Second—Equality of opportunity in the sense that no man is shut out by legislation or social prejudice from free access to any vocation or employment for which he deems himself fitted.

Third—Such a relative equality, at least in the conditions of bargaining, as not to put one party to the contract at the virtual mercy of the other.

Without such a threefold equality freedom becomes illusory, for liberty based on gross inequality means the liberty of the stronger and more unscrupulous to impose his force on the weak. Liberty without equality is the power of the one and the subjection of the other. The liberty to invest one's capital in slaves was stoutly defended by the ante-bellum Southerner, but his liberty involved others' slavery.

SOCIAL SOLIDARITY.

In addition to equality, the growth of competition and the complexity of modern economic life have brought into prominence the second condition of liberty. The enormous power exerted to-day by accumulations of capital as well as by combinations of labor is in the present stage of human development peculiarly susceptible of abuse. These abuses may be within the margin of the law and yet none the less socially reprehensible. Unless great power is tempered by responsibility it is apt to run wild. We are beginning to speak of the re-

sponsibilities of the rich, but the adage "Noblesse oblige" applies to all forms of economic power, whether represented by wealth or not. What is needed, and what is gradually being developed is the sense of social solidarity, the conviction that no one can really disassociate himself from his neighbors' welfare, and that his every action must be judged by its influence on society at large. It was this idea that found vague expression in the "fraternity" of the French Revolution. It is the same idea that is again more forcibly advanced to-day under other names. The application in the economic sphere is no less strong than in the others. Liberty without responsibility is license.

LIBERTY AS A POSITIVE CONCEPT.

Real economic liberty, therefore, is constructive. In that it implies not simply restraint, but such a complex of conditions resting on law and custom as to insure to the greatest possible numbers the opportunity of a full development of their faculties. Liberty when based on equality and responsibility means wealth for the individual and progress for society. Liberty without equality and responsibility may mean advance for the few and retrogression for the many. Liberty as a negative concept is disruptive. Liberty as a positive concept harmonizes society and the individual. The one is a menace, the other an aid to lasting economic progress.

Let us now apply these criteria to the various forms of economic freedom:

First:

FREEDOM OF MOVEMENT.

In the middle ages the right of internal migration was often restricted. Under the settlement laws of England, for instance, it was virtually impossible for a workman to leave his native parish. In modern times, the growth of freedom has brought the right not only of internal but of international migration. Restrictions on emigration still existing in Russia are a relic of mediaevalism. On the other hand, the prohibition of immigration which is sometimes found in modern countries must be judged in the right of liberty as a positive concept. Chinese immigration into the United States, for instance, is forbidden. Cheap Chinese labor would undoubtedly help in developing the resources of the Pacific slope, but the vital objection is the lasting inequality between the Chinese and the American workman. Immigration in general is to be welcomed because even though the standard of life of the immigrant may be lower than that of the native, he or his children will soon reach the American level. The Chinese, however, refuses to assimilate and will not adopt the American methods. He retains and perpetuates his lower standard, and will, if present in sufficient numbers, inevitably drag the American standard down to his own level. Freedom of immigration, which in this case means prosperity for the employer and comparative comfort for the immigrant, implies permanent degeneration for the American workman, that is, ultimate economic decay. It is a specious liberty because based on inequality. When, however, there is any prospect of speedy equality, interference with the freedom of immigration is uneconomic.

Second:

FREEDOM OF OCCUPATION.

The right of choosing one's profession was in former times hedged in by all manner of barriers. At its worst, the system of caste and custom prevented progress because it put men into vocations for which they were not fitted. Freedom of competition insures as far as possible the right man for the right place, and thus leads to enhanced production and better distribution. The only restrictions which modern society permits are the evidence of fitness in those occupations where incompetence would imply irresponsibility and involve injury to others as well as to one's self. The certificates required from doctors, dentists, engineers, plumbers, pilots, and the like, are not a hindrance but an aid to true liberty. The apprenticeship regulations of the trades unions, however, are sometimes good, sometimes bad. Where they are designed to secure good work or even to prevent the degradation of wages and the workers' standard of life through the irruption of large numbers of underpaid apprentices, there is much to be said for the practice. But where the object is simply to keep out competent workmen and erect a monopolistic close corporation, as in the older stages of the mediaeval guilds, the limitation is clearly indefensible.

Third:

THE FREEDOM OF ASSOCIATION.

The chief forms of association, for economic purposes, are combinations of labor and combinations of capital. In classic Rome as in modern Russia, where both political and economic aims were sought, we find a stern repression of labor associations. Even after the right of political and religious association had been secured, however, combinations of labor were prohibited. Under the modern factory system such combinations have assumed the form of trade unions. The legitimacy of trades unions, as such, is now accepted, because it is recognized that they tend to secure real freedom for the laborer. The individual workman in a large factory is at a clear disadvantage in dealing with the employer. The union restores equality by securing the right of collective bargaining.

In the same way, the right of free association by capital in the form of the corporation and other combina-

tions has been acquired only in the past half century. It is only when liberty of association results in restraint of trade or virtual monopoly inimical to the general interests, or when the enterprise is conducted without any sense of social responsibility, that the community is justified in curbing its excesses. The greatest care, however, must be observed in the analysis before the infringement of the right of association can be conceded. To abandon liberty because of mere apprehended, but imaginary, inequality would be to sacrifice both liberty and equality. A clear case must be made out before the law should be invoked against combinations of either labor or capital.

Fourth:

FREEDOM OF PRODUCTION.

This includes freedom of contract and enterprise.

Here again the emphasis has been shifted in modern times. The world has outgrown the time-worn conception of the citizens as the children of an all-wise and benevolent paternal government. It has been realized that governments are not always benevolent, and never all-wise, and that with the growth of capital and competition better results can be secured by the repeal of conflicting and even contradictory provisions, which thwart

FRANK K. FOSTER,
Member of the Typographical Union.

production and check individual initiative. It was this which the French manufacturers meant when they told the Minister, "*Laissez-nous faire*," and this paved the way for a celebrated phrase. There was indeed the necessary destructive process of pulling down the barriers which impeded progress, because they checked equal opportunity. It has been requisite, however, in recent times to modify both the theory and the practice of "*Laissez faire*" in order to safeguard the interests of the various classes of society. The complex requirements of modern life have necessitated a governmental regulation of many business enterprises in behalf of producers, consumers, investors and the general public. The difference between mediaeval and modern interference is to be found chiefly in the fact that the one sought to prevent competition while the other endeavors to enlarge its domain and to raise its level. Factory laws give the operatives a fair chance, railway regulation attempts to secure equal treatment of shippers, supervision of banks and corporations is intended to enforce financial responsibility. In all these cases, interference is justified only as leading to surer and greater general liberty. We have to deal with the positive, not the negative concept.

Fifth:

FREEDOM OF TRADE.

This is virtually included under the last head, since trade is a species of production; but it forms so important a part of the subject that it is generally treated separately. The modern age has seen the emancipation of internal trade from mediaeval restrictions on the part of governments. The great controversy to-day centers about international trade. Here, again, the general hypothesis must be in favor of freedom. But freedom is not necessarily and always beneficent. When the relative inequality of two countries in the production of a certain commodity is great, free trade may hinder, in the weaker country, the growth of an industry which might become comparatively profitable and even highly necessary. Under such conditions, protection, by building up the industry to the point where there will be a domestic competition, may help in creating that relative equality between the domestic and the foreign producers which will ultimately redound to the interests of the consumer as well. Such a policy is defensible, however, only when protection increases and not diminishes real productive efficiency, and when the undoubted intermediate economic loss does not outweigh the ultimate advantage. Only then is interference with freedom legitimate, because only then is it in the interest of a more real and beneficent ultimate freedom.

We see, then, that modern liberty does not mean absence of restraint. Absence of restraint is license, not liberty. All social progress is a result of a certain repression of liberty of some in the interests of all. These restrictions are imposed by custom, by voluntary association, or by law. Good manners and social usages which prevent men from doing what they like are a mark of civilization. Associations like the church, the club and the business union, lay down rules to which each member must conform. The government enacts many laws the wisdom of which is unquestioned, and obedience to which is compulsory. In every case there is necessarily an infraction of liberty in the crude sense.

Moreover, especially in industrial matters, the cry of individual liberty often becomes a mere shibboleth, invoked by individuals against others instead of themselves. The railway magnate restricts his own liberty by pooling arrangements, but objects to interference by the shipper. The manufacturer demands protection against his foreign competitor, but objects to factory laws. The cotton grower acclaims the rise of prices brought about by manipulation on the exchange, while the spinner decries the liberty of speculation. The employer joins the selling bureau which restricts output

EDWIN R. A. SELIGMAN,
Professor in Columbia University.

or fixes prices, but objects to the "tyranny" of the labor union. The labor union adopts provisions relating to apprenticeship, the open shop, and the boycott, but opposes lockouts and trusts. The lawyer refuses to consort with the "shyster," and the doctor with the "quack," because they wish to maintain the standard of their professions; but they sternly reprobate the effort of the trade unionist to prevent the "scab" from similarly reducing the level of his occupation.

Liberty, then, must be looked at from the social as well as from the individual point of view. The individual has become what he is largely through associated effort. This, however, implies a certain subjection of the individual to the group. The liberty that is compatible with social progress involves the readiness of the individual to work for a common end. If this readiness is not voluntary, it must be developed by persuasion or by force.

THE USE OF ASSOCIATION.

All association involves a certain sacrifice of independent action. The question, therefore, whether the sacrifice of independent action, which is involved in the idea of association, means a curtailment of that liberty which is really advantageous for society, depends on the use that is made of the association. If the association has for its object or incidental result the general welfare, we applaud it; if it has for its object only the advantage of the particular group at the expense of the rest of the community, we decry it. If capital is combined so as to save expenses and reduce costs, and if the advantages incidentally accrue to the community, in the shape of lower prices or better service, we cannot reasonably object to it. If the combination, on the other hand, becomes a monopoly and secures its high profits only through higher prices, we seek to restrict it. If a labor union endeavors to maintain monopoly advantages by shutting out intending members, if it unduly restricts output or unreasonably interferes within the shop, it inevitably increases cost, curtails production and raises prices. But if a labor union uses its power to prevent starvation wages, to raise by reasonable regulation the standard of life and to promote the real efficiency of the workman, the laborer may ultimately become, and has often in the past actually become, so much more efficient a workman that his higher money wages represent a lower real cost and therefore lead to lower prices for the community. In both cases, we have a sacrifice of one kind of independence to secure the economic liberty which rests on the possession of wealth; but in the one case it involves a disadvantage, and in

the other case an advantage, to society as a whole. In the one case, the enlarged opportunity of the group is purchased at the cost of the community; in the other, it goes hand in hand with the general interests of the community.

REAL ECONOMIC FREEDOM.

All liberty then is a balancing between the forces of anarchy and tyranny. The individual freedom that is oblivious of the rights of others, or of the best interests of the majority, leads to the destruction of real liberty. Group restriction that is forgetful of the possibilities of the individual leads to a tyranny that is equally destructive of real liberty. But associated action, which in helping the group also subserves the interests of general social progress, is none the less defensible because it implies a certain curtailment of the freedom to do as one likes. In a socially complex society, one must learn to like that which is best for society as a whole. From the economic point of view, only that is real freedom that is calculated to reconcile the greatest possible production in the group with the greatest possible consumption of every individual within or without the group. The liberty of one, therefore, must not endanger the economic progress of the others. Economic liberty implies at least economic opportunity, and economic opportunity depends on a certain degree of equality and responsibility. Economic liberty, in the last analysis, is the result of action, not of inaction. It is a social, not an individual, product.

Chairman Belmont: I have the pleasure of introducing as the next speaker the editor and proprietor of one of the leading labor organs and authorities, Mr. Frank K. Foster.

A LABOR VIEW OF LIBERTY.

Mr. Foster:—
Gentlemen: Those of us who speak for the philosophy of the shop are somewhat peculiarly placed in a discussion like this. Our argument springs not from an elastic and tenuous abstraction, but from the concrete fact. The work-a-day world, moved by instinct, guided by experience and driven by necessity, has sought liberty along the lines it has found good. In doing this it has disproven former economic postulates and disarranged old economic philosophies. The why and the wherefore has therefore been subordinated to the imperative *Is*.

The manual laborer has always possessed liberty to starve. His ambition, expressed through his craft association, is for liberty to live. Without this, nothing.

That the application of the principle of association, even upon voluntary lines, involves the surrender of more or less personal liberty, is conceded by all of those who have contributed to this discussion. But even the opponents of unionism have not the hardihood to assert that the social relationship itself could exist if this principle were eliminated. The real question in the industrial world is to find that happy medium which shall produce a maximum of good with a minimum of ill effects.

RESTRICTION OF COMPETITION.

There is no single, separate fact in the world of industry affecting prices and wages, whether on the side of capital or on the side of labor, that does not imply some degree, and often a large degree, of the surrender of individual liberty. That is the general principle to which the analysis of any such fact must surely lead. Let us take, for example, one such fact in the labor world—the demand for the limitation of apprentices, with which is involved the union objection to the trade school as a substitute for the training through apprenticeship. It will not profit us to observe exclusively this isolated fact. We must discover its cause, its motive. This restriction of apprentices and the associated opposition to trade schools spring from the underlying fear, warranted or not, that a craft may be overcrowded. In other words, these are efforts to prevent destructive competition between its wage earners in a given trade.

Thus we have advanced from the limitation of apprentices to the large question of excessive competition. Any of the other measures taken by organized labor to meet and overcome whatever retards or prevents their aims of higher wages, shorter hours and better conditions of work will be found to involve efforts to restrict competition. Thus the unions procure the aid of legislation to prevent wage reduction by woman or child labor. They seek by organizing the immigrant to prevent his becoming a wage reducer. The fight for the union shop is a fight to erect a barrier against nonunion labor or to force all labor in a given craft to become unionized so as to maintain a wage scale.

All of these efforts to restrict competition are efforts of association, and every one of them implies some sacrifice of individual liberty of action for a common purpose. But in competition, we have reached the cause of a vast range of phenomena, extending throughout the world of industry and manifested by capital as well as by labor.

EVILS OF EXCESSIVE COMPETITION.

Competition, it is said, is the life of trade. Yet every one recognizes, almost instinctively, that excessive competition in his own occupation spells ruin. Capitalists, farmers, professional men, all feel its danger, as well as wage earners. "Destructive," "ruinous," "unfair," "cut-

throat" are adjectives applied to excessive competition by all whom it affects. The rebate-giver, the discount shaver, the under-seller, the doctor who accepts fees below a standard, are as offensive in their roles as is the "scab," or the working wage reducer, to the trade union man. Excessive competition in the world of capital works the havoc of reduced dividends, depression of trade, long and risky credits, the vanishing of confidence, business demoralization, bankruptcy and panic. Excessive competition in the field of labor brings the dire evils of the sweat-shop, starvation wages, unsanitary factories, unprotected dangerous machinery, wretched homes, ignorance, poverty, despair and crime. These consequences are reciprocal; for the ruin of the employer means an increase in the unemployed, and the ruthless cutting of earnings following wage rivalry means the driving out of business of all but unscrupulous employers.

PARALLEL RESTRICTIVE DEVICES.

The devices to prevent excessive competition between organized capital and between organized wage earners are almost numberless, and are impressively similar in that they all restrict individual freedom. All of them involve agreement between the members of an organi-

LOUIS D. BRANDEIS,
Lawyer and Publicist, Boston.

zation not to sell transportation or manufactured articles or labor or the use of money, or any other commodity, below a minimum price. The arrangement between capitalists may be called an "association," a "gentlemen's agreement," a "pool," an "exchange," a professional society, a "corporation," or a "trust;" the arrangement between wage earners is known as a "brotherhood," an "amalgamated association," or a "union." Upon both sides these associations of capital and labor vary widely in their methods. But they all have the object of preventing ruinous competition; and they are all subject to the danger of carrying the regulation of competition to the extreme of monopoly, of exploiting the consumer of exacting unreasonable demands from the employer, of conspiracy against the public interest. Many are the attempts to regulate these combinations by legislation. Many and contradictory are the decisions of state and federal courts affecting them. With their moral aspect, this department need not concern itself. Its interest lies in the economic causes of their evolution and in the principles that should guide efforts to restrict competition, based upon the instinct of self-preservation, along lines that shall not run counter to industrial prosperity and the welfare of employers, wage earners and all consumers.

Throughout the commercial and manufacturing world we encounter these combinations, everywhere seeking to regulate prices, from the raw material to the finished product. The most familiar of these, the pool, affords a notable example of the surrender of individual liberty. The pool is an unincorporated association of manufacturers, who agree to maintain a schedule of prices and to limit production for that purpose. Each manufacturer is allowed to produce only a certain percentage of the whole output, proportioned to the capacity of his plant. To prevent violation of the agreement a money deposit is often required from each, forfeitable to the association. If one manufacturer sells more than his allotment, a fine is imposed, while members selling less than their share receive a bonus from the common fund.

EXAMPLES OF COMBINATIONS.

These pooling associations are most familiar in the iron and steel industry. Prices of ores are regulated as soon as they are dug. Price agreements among associated furnace men regulate the price of pig iron, of steel rails, and of all the immense variety of products resulting from successive treatments of the original raw material. As to competition in the larger of these prod-

(Continued on page 15.)

THE TRADE AGREEMENT ENTHUSIASTICALLY ENDORSED.

DISTINGUISHED SPEAKERS ADVOCATE COLLECTIVE CONTRACTS AS A METHOD OF INDUSTRIAL PEACE BEFORE THE NEW ENGLAND CIVIC FEDERATION.

THE first general meeting of the Civic Federation of New England, held at the Quincy House, Boston, on the evening of April 26, was devoted to a discussion of "Trade Agreements." A reception and banquet, attended by about 150 prominent business, professional and labor men and students of political and industrial economy, preceded the discussion. Among the speakers were Lucius Tuttle, President of the Civic Federation of New England, Boston; August Belmont, President of the National Civic Federation, New York; Samuel Gompers, President of the American Federation of Labor, Washington; Wm. H. Pfahler, former President of the National Founders' Association, Philadelphia, and John F. Tobin, General President of the Boot and Shoe Workers' Union, Boston. All of the speakers advocated the trade agreement as a practicable method of advancing toward industrial peace, but emphasized the importance of adherence to collective contracts between employers and employed by both parties.

The Boston *Globe* published the following report:

PRESIDENT TUTTLE'S ADDRESS.

Mr. Tuttle, in opening the discussion, said:

Gentlemen: I think we may all congratulate ourselves and each other and the Secretary of the New England Civic Federation upon the successful gathering of so many people to-night interested in the great subject which the National Civic Federation began to discuss and to educate itself upon some years since, and which the New England branch has recently undertaken to study and to help work out in this section of the country.

We have no panacea for what is called the labor problem, and I doubt very much if there is any labor problem as such. What is known commonly as the labor problem is a great economic question confined more or less to this social problem, which has been working itself out from the earliest dawn of written history down to the present day.

It has had in ancient and in modern times fluctuations upward and downward, and in acute stages there has been great excitement, many difficulties to overcome, and probably many people have looked upon the ques-

tion as insoluble and as presenting difficulties which were in the end perhaps to lead to a general break-up of society.

There are, it is true, many discouraging and troublesome questions in connection with this matter, as there are in connection with every other great economic problem; but I think those who have given the most thought to the subject have never at any time felt that there were any other dangers in it than those that might be overcome by a careful consideration of the whole problem as one having various conflicting elements in its nature.

BETTER MUTUAL UNDERSTANDING.

The Civic Federation has undertaken mainly, as I understand it, to get those who are called employers and those who are called employed to understand each other better.

I doubt if there has ever been a serious labor problem so called, or a serious outbreak of labor difficulties, unless there was a great lack of intelligence or understanding of the subject matter, either on one side or on both sides; and I think it is the purpose of the Civic Federation and all of its branches to endeavor as rapidly as possible (and with a full understanding that the movement must go slowly) to get each to understand the other side of the problem.

It is just as important from my point of view that the man who is called the employer should reason with the men who are called the employed and give them a complete and thorough knowledge of his side of the case as it is that those who are called the employed should be asked to develop the other side of the case.

I have studied somewhat this subject, and I feel that my knowledge of it is still very limited, and yet I have discovered this—that with practically all classes of the employed, or on the part of all classes of the employed, collectively and individually, there is a desire to be trusted; and I believe that one of the things which the Civic Federation is endeavoring to bring about is a willingness on the part of the employer to trust his employe with the facts of his business and to endeavor to procure a fair and satisfactory

division of the results produced by the joint effort of the employer and the employed.

There can be no prosperity in this world anywhere unless there is a fair division of results between all of those who produce the results; and it is my belief that whenever from the efforts of the Civic Federation or in any other way the men who work—and I think we all work—can get together over the problem, reason it all out, show all sides of it, show in the end that the division which the employer is willing to make with the employed is a fair and reasonable division of the results of both, I think you have gone a long way on the road toward the settlement of any difficulty that may arise.

CONFERENCE PRODUCES AGREEMENT.

If, on one hand, the employer says, "that is your part and this is mine, and there is a wall between us, and nothing can be done on either side of that wall except that I will do what I please on my side, and you may do what you please on yours," so long as that plan of dealing with the question lasts so long there will be trouble.

But when it can be understood that there is a common interest taken in every man who works, and that the employer may come up collectively, or through his committee, state his case and have it heard, and the employe can come to his committee and state his case and have it heard, I think you have begun to solve the labor trouble in that particular instance, and there will be little difficulty in reaching ultimately an agreement which will be reasonably satisfactory to both sides. (Applause.)

Now in a word that is the purpose of the Civic Federation everywhere. It does not intend or attempt to lay down for the employer any rules or for the employe any rules, but it undertakes to put in the hands of each the olive branch of peace and to say that peace is more valuable than strife. When that shall have been accomplished, there may not be anything more for the Civic Federation to do, but it can certainly retire with honor then and rest securely upon its laurels. (Applause.)

THE FIRST DINNER OF THE NEW ENGLAND CIVIC FEDERATION.

I now take great pleasure in introducing to you Mr. August Belmont, President of the National Civic Federation, in the first place, and incidentally of the little corporation known in New York as the Interborough Rapid Transit Company. (Applause.)

PRESIDENT BELMONT'S ADDRESS.

Mr. Belmont spoke as follows:

Mr. President and Gentlemen of the Civic Federation of New England: Your topic this evening is "Trade Agreements." I am requested to address you in my capacity as an employer, and that I will cheerfully undertake to do.

At the threshold of our inquiry I desire to impress upon you: First, that corporations face problems in relation to labor peculiar to their own special classification as industries; and, secondly, that public service corporations in their relation to labor widely differ from private corporations engaged in mining and manufacture. A public service corporation deals in a daily necessity. Its activity must be constant. It creates and supplies in the same instant. It has no reserve, no accumulation to draw upon.

In many industries, as mining and manufacture,

AUGUST BELMONT,
President National Civic Federation.

employers may decide to stop or continue as their judgment guides them; but no corporation chartered to render public service has such freedom of choice. The corporation derives its life from the state. Failure to perform its chartered duty or service works its forfeiture.

Referring to the distressing conditions attending the strike on the Interborough Company's lines, I want to say publicly to the honor of the men who went out, that among the twenty odd individuals now under indictment and facing conviction and imprisonment for forcibly interfering with the operation of the elevated and underground roads, not one was a striker; they were all outsiders, either sympathizers or hoodlums.

MR. CARNEGIE'S ADVICE.

Our respected and admired friend, Mr. Andrew Carnegie, to whom, in many things, we are willing to concede much, has recently given some advice, the wisdom of which I am compelled to question.

Mr. Carnegie advises when the employees "go out," to wait patiently for the old men to return to work, and not to fill the places with new men. This course of action may, to a limited extent, go beyond the manufacturing and iron industries, even to the steam railways, as freight trains may be delayed for a reasonable time without serious loss and inconvenience. But in a great city where the demand is for the transportation of human beings, I assert the advice would spell ruin.

The question of the open or closed shop which is involved in some trade agreements does not present itself in the operation of steam railroads. I have not encountered it in the railroad world as an employer. In the steam railroad industry what are virtually trade agreements with the brotherhoods exist. They permit members of the brotherhoods to work with non-union men, provided only all are accorded alike the conditions specified in the agreements with the brotherhoods. This question—that of the open or closed shop—did not enter at all into the former contract between the Interborough Rapid Transit Company and the Amalgamated Association of Electric Railway Employees.

The only difference before and after the strike, so far as the open shop was or is concerned, related to the proportion of union and non-union employees. At no time has the Interborough Company taken an antagonistic attitude toward the freedom of the men to affiliate with labor organizations. This I recently

stated at the meeting of the New York Civic Federation. I now desire to say that since the strike the men who have been taken back were re-employed without discrimination as to their membership in labor organizations.

At a time when I had no expectation of being honored as the President of the National Civic Federation I expressed myself, solely as an employer, in favor of trade agreement. I again declare for it. I maintain that trade agreements afford a practical method toward the establishment of industrial peace, whether in transportation, manufacturing, mining or other industries.

TRADE AGREEMENTS SHOULD BE INVIOLEABLE.

But such trade agreements must be held inviolable by both contracting parties. They are equally obligatory on the signers, both employer and employee. In all such contracts the officers of the corporation in behalf of an association of employers sign for one side, and the officers of the union in behalf of an association of employees sign for the other side. Such an agreement, cautiously and deliberately entered upon, becomes binding upon the honor of every individual affected, as well as upon each body, whether company or union, as a whole. The national organization, affected by the strike on the Interborough, by its officers gave convincing proof that such is its belief and its practice. Its action must be considered to the credit of organized labor.

We must bear in mind that the union labor movement is an evolution. Progress has been made slowly, but not with the assistance or sympathy of employers. Have we a right to demur because self-government in all of the 150 organized crafts has not become a perfected system? On the contrary, I claim that it is to the credit of organized labor that its faults are not more numerous.

In the matter of trade agreements every contest may develop new problems for our department to consider. For example, the recent deplorable strike on the Interborough lines in New York stimulated general discussion of such topics as compulsory arbitration; the incorporation of unions; the licensing of railway employees and other propositions more or less suggested by experiments in New Zealand and elsewhere, amid conditions vastly different from those in the United States, and which, even there, have yielded no conclusive results.

THE DISCIPLINE OF LABOR.

From the union standpoint there has developed the question involving the power of officers of national organizations to enforce contracts in the face of a rebellious and defiant local organization. What practical means can be devised to enforce the discipline of labor by labor? If the government of Italy cannot force its employees to work upon the railways, we should not expect the national officers of a labor organization to be able to compel several thousands of its local members to work against their will. Possibly the contract between the International Typographical Union and the American Publishers' Association may point the way to answer this question. That contract, I understand, is underwritten by the national officers of both those organizations. If it is violated by a local union, the national union at once fills the places of the strikers with other union men, expelling the offending local. The longshoremen, I understand, have such a proviso in their contract with the Great Lakes shipping interests, and they have exercised this discipline, going as far on one occasion as to fill the strikers' places with non-union men. I am glad to say that not only the national leaders, but the most representative local leaders of organized labor, are in favor of similarly drastic methods of compelling adherence to contracts.

I am not one of those who would cite an occasional broken contract, either by employers or by labor, as an argument against the Trade Agreement. Rather would I point to the encouraging record of honorable observances and successful operations as a vindication of the good faith and common sense of both employers and wage earners.

PRESIDENT GOMPERS' ADDRESS.

President Tuttle then introduced Samuel Gompers, who spoke as follows:

I am very much impressed with not only the work which the National Civic Federation has performed for, after all, the actual achievements are of less consequence than the lessons which it has inculcated upon the minds of all our people.

We may look the whole world over and fail to find anywhere an effort of this character. It is true that in Germany about half a century ago Mr. Schulz-Delitsch undertook to bring about what he declared to be harmony between capitalists and laborers. It was in another way, what we understood to be the Manchester school of concrete or perhaps speculative political economy.

AGREEMENT AND HARMONY.

I do not know that there is any considerable number of men in our country and our time who believe that it is possible in our day or even in the near future to bring about harmony between the employers and the employed. I am not satisfied that such a condition would be either right or even natural.

There has not been entire harmony in this world between the buyers and sellers of a given thing; and, after all, in the cold blooded consideration of the relations between the buyer and the seller of labor, it is a business proposition, when stripped, of course, of any element of humane feeling. And there has not always been, there is not now, and I doubt that the future will develop entire harmony between the buyers and the sellers of any particular thing.

There may be mutuality, there may be a common understanding that for the sake of convenience during a specified time there shall be agreement, there shall be understanding, there shall be a common effort to continue industry, transportation, the distribution of wealth, under the term commerce.

With the increased ability to produce the wealth of the world, due to all the pent-up genius of all the ages that have gone before; with the possibilities of the improvements in our day upon the conditions of the past the world of workers asks this question: Are we to be constantly in the condition of our forefathers or of the present day? Are we not entitled to be sharers in the great industrial advancement and development of our time?

LUCIUS TUTTLE,
President New England Civic Federation.

We ask whether it is fair, whether it is just, whether it is wise that the hours of daily toil which have prevailed in the past shall continue despite the fact that wealth is produced in our day a hundred fold to what it was half a century ago?

We ask that with the great material progress and mental advancement of all others in society, larger opportunities should be opened up to our children that they may be the better prepared to meet the problems and to bear the burden of modern industrial conditions.

THE DEMAND OF LABOR.

Labor makes a demand upon modern society for better conditions. It asks for more leisure, a shorter work-day that shall give men leisure to live, leisure to love, leisure to enjoy their freedom, leisure to develop the best that is in them and in their wives and in their children.

Of course those who take a position antagonistic to this demand that labor makes may fancy themselves in a security by that opposition. There have been instances in the history of the world where the possessors of wealth have lulled themselves into a fancied security against such demands, but they have never enjoyed either the safety of the security supposed to come from the effort to maintain that position. For, no matter whether the organizations of labor continue to exist, or whether they by any possible effort could be swept out of existence to-morrow, you could not destroy the yearnings in the human heart, or these aspirations in the human mind.

If the workingmen had continued in slavery as in bygone ages, if they had not been taught the alphabet and the three R's and something beyond them, you employers of labor might have continued to be masters of the situation. But owing to certain conditions that are not necessary to enumerate now, the workingmen have tasted freedom. They have learned the importance of the A, B and C, and the other letters of the alphabet. They have learned to conjure with those letters. They have learned that certain of the letters spell "liberty," and having learned that, it is neither wise, nor sane, nor economic to try to dispel that understanding and conception. (Applause.)

THE INTEREST OF EMPLOYERS.

I have every reason to believe, judging from the history of the people of our country, that there is not any problem which may confront us that we cannot solve. We have our organizations of labor; we have grown immensely in numbers; we have grown even in greater proportion in the feeling of fraternity among those who

are organized and even among the unorganized workmen there is the general concession that the hegemony and the progress and the interests of labor are represented by the organization of the labor movement.

Yet this growth that has taken place in numbers, in intelligence and in feeling has not been confined to our own ranks. It has aroused the intelligent consideration of the employers of our country to a very large extent.

And I say to you, gentlemen, that up to this year of grace it has not been possible until now to bring about an association such as exists in our country where the employers of labor can meet with the representatives of organized labor to discuss the relative interests and try to find a way out where the mutual interests of both may best be conserved. (Applause.)

What do we find as the result of the much vaunted individual agreement between individual workmen and employers? An agreement entered into between them is reached, where? Usually at the entrance of the factory, the workshop, the store, the mill or the mine or an office established for that purpose by some public service corporation. And what are the consequences? If there are fifty men who may be required, if there be ten men who may be required, what is the basis upon which wages and hours and other

WILLIAM H. PFAHLER,
Former President National Founders' Association.

conditions of labor shall be fixed? The man or the men in the group of applicants for that employment compete with each other for the positions. Those whose poverty is direst, whose needs are most immediate, are those who not only secure the employment, but by reason of their immediate necessities and their impoverished condition, set the wages, hours and other conditions of labor for themselves, and for others not so immediately driven.

The trade agreement transfers the employment and the determination of the conditions of the employment from the mouth of the mine, the door of the factory or shop, to where the conditions are to be determined, not by the direct necessity, but where, after discussion, the average intellect obtains and a committee stand between the employer and the employed to determine what is just and equitable under the conditions.

MR. PFAHLER'S ADDRESS.

William H. Pfahler, of Philadelphia, former President of the National Founders' Association, was introduced as the man who, with the late Mark Hanna, had been largely instrumental in founding the National Civic Federation.

He first commented on the progress which is being made from year to year in the settlement of labor problems, through a better and clearer understanding of their causes, and especially because of the fact that employers and employees were more and more willing to discuss their differences.

He then cited three examples of associations of employers which had been formed, in each of which the trade agreement had been found of distinct advantage for a time at least. One of these associations had each year for thirteen years made agreements with employees which had been respected and which had prevented strikes, while wages had been fixed each year according to the conditions of the trade. These agreements were successful, he thought, because in the case of this particular association the agreements dealt solely with wages.

The other two organizations had not been as successful as this first one, largely because they attempted to deal with too many problems. In the case of the National Founders Association the question of apprentices had for years been laid one side as a problem upon which agreement could not be had until within a few months when it was deemed expedient to take the matter up and settle it.

Mr. Pfahler felt that this was the spirit in which agreements should be made—go slowly and settle the

problems as they arise one at a time. He felt that the National Civic Federation and the subordinate bodies like the Civic Federation of New England, would do a great deal toward furthering the trade agreement idea and toward settling all disputes in a deliberate and at the same time effective manner.

MR. TOBIN'S ADDRESS.

John F. Tobin spoke of the best means of reaching trade agreements and making them effective. He said there was no doubt but there had been many violations of agreements by employers as well as by employees—the wonder, when all things were considered, was that there had not been more of the latter, but he thought the tendency was more and more every day to live up to these agreements.

In his own experience he had seen conferences for agreements broken up on trivial grounds too often, but he was glad to testify there was a growing disposition on both sides to forget bygones and act from the present necessities.

His observation had led him to believe that there was as large a percentage of employers unreasonable in their demands as of workmen or trade unions that were unreasonable. It would be the work of the Civic Federation to aid and further trade agreements and to point out the best ways of making and continuing such agreements.

In his own experience with trade agreements in the shoe trade these had been the means of practically abolishing strikes in an industry in which strikes had been of frequent occurrence.

It was the policy of the Boot and Shoe Workers' Union to impress on the unions the necessity of adhering to agreements and of living up to obligations or suffer the consequences. His organization was pledged to that principle. The result was that peace had been established through trade agreements. And as a necessary consequence this peace meant the union or closed shop which he pointed out was necessary in order to enforce the agreement. If agreements are broken in a shop the union fills the places of strikers regardless of consequences. Mr. Tobin felt that the trades union was necessary for the preservation of liberty.

LIST OF ACCEPTANCES.

Following is the list of those who accepted invitations to the banquet of the Civic Federation of New England:

EMPLOYERS.

Adams, Charles E., President Massachusetts State Board of Trade, Lowell.
Ackerman, J. E., Ackerman & Brummel, Manufacturers of Cut Soles, Boston.
Alexander, M. W., General Electric Company, Lynn.
Aldrich, John G., General Manager New England Butt Company, Providence, R. I.
Belmont, August, President Interborough Rapid Transit Company, and of the National Civic Federation, New York.
Brummel, Max, Ackerman & Brummel, Manufacturers of Cut Soles, Boston.
Bowley, James L., President Master Teamsters' Association, Boston.
Bowker, William H., President Bowker Fertilizer Company, Boston.
Balls, J. Arthur, Barber Asphalt Paving Company, Boston.
Billings, L. C., James Wilkinson & Co., Electrical Contractors, Boston.
Berry, W. F., Second Vice-President Boston & Maine R. R., Boston.
Burrowes, E. T., Manufacturer of Burrowes' Screens, Portland, Me.
Barnes, Frank L., Barnes Electric Company, Boston.
Chapin, H. B., Traffic Manager N. Y. C. & H. R. R. Co., Boston.
Capen, Samuel B., Torrey, Bright & Capen, Merchants, Boston.
Chandler, F. Alexander, Secretary N. E. Hardware Dealers' Association, Boston.
Cordingley, William R., Wilcock & Cordingley, Wool Merchants, Boston.
Covel, A. S., Treasurer Tremont & Suffolk Mills (Cotton), Lowell.
Crapo, Hon. William W., President Wamautts Mills (Cotton), New Bedford.
Cummock, A. G., Treasurer Appleton Company (Cotton Mills), Lowell.
Chase, Simeon B., Treasurer King Philip Mills (Cotton), Fall River.
Clemence, M. B., Hyde Manufacturing Company (Shoe Knives, etc.), Southbridge.
Daniels, George F., President New England Shoe and Leather Association, Boston.
Drake, Herbert T., Superintendent Douglas Shoe Company, Brockton.
Ellis, George H., Printer and Publisher, Boston.
Eaton, Charles A., Shoe Manufacturer, Brockton.
Fox, Charles K., Shoe Manufacturer, Haverhill.
Filene, Edward A., William Filene's Sons Company, Merchants, Boston.
Filene, A. Lincoln, William Filene's Sons Company, Merchants, Boston.
Frank, Philip, Boots and Shoes, Boston.
Fosdick, Frederick, President Pittsburg Steam Engine Company, Fitchburg.
Fish, W. C., Manager General Electric Company, Lynn.
Fuller, J. E., George A. Fuller Company, Building Construction, Boston.
Field, J. Howard, Charles A. Eaton Co., Shoe Manufacturers, Brockton.
Gleason, W. H., Secretary Revere Rubber Company, Boston.
Hugo, George B., President Employers' Association, Boston.
Hutchinson, George, Treasurer Clark-Hutchinson Company, Shoe Manufacturers, Boston.
Houlihan, M. J., Master Builders' Association, Providence, R. I.
Hills, George H., Treasurer Davol Mills (Cotton), Fall River.
Houghton, George C., Secretary New England Shoe and Leather Association, Boston.
Howe, Louis P., Vice-President S. H. Howe Shoe Company, Marlborough.
Harriman, Henry I., Cotton Machinery Manufacturer, Readville.
Jones, G. C., General Manager Central Vermont Railway, St. Albans, Vt.

Knight, Arthur O., Secretary and Treasurer Troy White Granite Company, Worcester.
Kunhardt, George E., Woolen Manufacturer, Lawrence.
Logan, James, Chairman Executive Committee United States Envelope Company, Worcester.
Lawrence, John S., A. A. Lawrence & Co., Commission Merchants, Boston.
Logue, Charles, Building Contractor, Boston.
Lee, Charles E., Assistant General Manager Boston & Maine R. R., Boston.
Lyman, Arthur T., Treasurer Boston Manufacturing Company (Cotton), Boston.
Miller, John L., President Granite Manufacturers' Association, Quincy.
MacColl, J. R., Lorraine Manufacturing Company (Woolens), Pawtucket, R. I.
Milne, Andrew, Milne & Chalmers, Granite Manufacturers, Boston.
Myers, S. A., Myers & Andrews, Clothing Manufacturers, Boston.
Mead, Edward C., Mead, Mason & Co., Building Contractors, Boston.
Marsh, E. A., American Waltham Watch Company, Waltham.
Proctor, Henry H., Proctor-Ellison Company, Leather Manufacturers, Boston.
Pillshury, R. W., W. S. & R. W. Pillshury, Shoe Manufacturers, West Derry, N. H.
Perry, O. H., Treasurer Middlesex Company (Woolen Mills), Boston.
Plunkett, W. C., Manager W. C. Plunkett & Sons (Cotton Manufacturers), Adams.
Plunkett, C. T., Secretary Berkshire Cotton Manufacturing Company, Adams.

JOHN F. TOBIN,
General President Boot and Shoe Workers' Union.

Pierce, Wallace L., President Walworth Manufacturing Company, Boston.
Pfahler, William H., former President National Founders' Association, Philadelphia, Pa.
Penniman, Edwin G., Master Builders' Association, Providence, R. I.
Rust, Nathaniel J., President Boston Storage Warehouse Company, Boston.
Robinson, H. C., Superintendent Southern Division Boston & Maine R. R., Boston.
Richards, James L., Boston Consolidated Gas Companies, Boston.
Smith, H. G., Fore River Shipbuilding Company, Quincy.
Stott, Charles A., Belvidere Woolen Manufacturing Company, Lowell.
Shepard, Frank R., Treasurer Employers' Association, Boston.
Shove, W. F., Treasurer Pocasset Manufacturing Company (Cotton), Fall River.
Sumner, Charles P., Agent Cunard Steamship Company, Boston.
Sherwin, Thomas, President New England Telephone and Telegraph Company, Boston.
Taylor, Charles H., Jr., The Boston Globe, Treasurer Civic Federation of New England.
Tapley, Henry F., Amos P. Tapley & Co., Shoe Manufacturers, Boston.
Tuttle, Lucius, President Boston & Maine R. R. Co., and of the Civic Federation of New England, Boston.
Winslow, W. C., Vice-President Metropolitan Coal Company, Boston.
Walcott, E. H., Secretary Boston Merchants' Association, Boston.
Wyman, Charles D., Stone & Webster (Street Railway Interests), Boston.
Washburn, Charles G. (Steel and Iron), Worcester.
Wright, John G., Wool Merchant, Boston.

REPRESENTATIVES OF LABOR.

Abrahams, Henry, International Cigar Makers' Union, Boston.
Agnew, Philip, Hotel and Restaurant Employees' Union, Providence, R. I.
Baine, Charles L., General Secretary-Treasurer Boot and Shoe Workers' Union, Boston.
Bradford, R. H., Brotherhood Electrical Workers, Boston.
Birmingham, M. J., Brotherhood of Electrical Workers, Boston.
Cain, George L., International Association of Machinists, Lynn.
Cameron, Colin W., Agent Carpenters' District Council, Boston.
Colgan, Hugh J., International Cigar Makers' Union, Boston.
Cohen, Edward, Third Vice-President Massachusetts State Branch American Federation of Labor, Lynn.
Crosman, W. L., Typographical Union, Boston.
Cooke, Herbert W., Typographical Union, Boston.
Cunningham, William J., International Association of Tube-workers, Somerville.
Collins, Peter W., President Central Labor Union, Boston.
Connolly, John J., International Association of Machinists, Boston.
Davis, Arthur G., Typographical Union, Boston.
Dyer, W. R., Metal Trades Council, Boston.

(Concluded on page 15.)

THE LAW AND THE CLOSED SHOP CONTRACT.

THE ATTORNEY FOR A CITIZENS' ALLIANCE REVIEWS JUDICIAL DECISIONS AND REACHES A CONCLUSION FAVORABLE TO COLLECTIVE BARGAINING.

[The following are extracts from a pamphlet entitled, "The Law Relating to the Closed Shop Contract," by Walter Drew, of Grand Rapids, Mich. The fact that Mr. Drew is the attorney for the Citizens' Alliance of that city makes his narrative, analysis and conclusion in favor of the legality of the closed shop and of the desirability of complete combination of labor and of collective bargaining especially noteworthy.—Editor's Note.]

A closed shop for the purposes of this article may be defined as a "shop" in which none but members of a certain union or unions can secure employment. "Shop" is a general term for any business requiring the employment of labor. A closed shop in itself is a mere condition, and cannot properly be spoken of as lawful or unlawful. The law, however, will look to the active forces by which the condition known as the closed shop is brought about or maintained and will determine if those forces in their purposes or workings be lawful or unlawful.

A closed shop contract is a contract the immediate purpose of which is to secure or maintain the condition known as a closed shop.

Such contracts are susceptible of division into several classes according to the parties to them.

(1.) Contracts among the several members of a union in which they agree not to work in a shop where non-union men are employed. These contracts are usually in the form of by-laws.

(2.) Contracts between a union and an employer by which none but members of the union are to be employed in the employer's shop.

(3.) Contracts between a proprietor and a contractor by which the contractor is to employ none but union labor upon work to be done for the proprietor.

Such contracts may also be classified as public and private. A public closed shop contract is one which a public corporation, such as a city, county, or Board of Education is a party. A private contract is one all of the parties to which are private persons or corporations.

The courts have unequivocally condemned public closed shop contracts as unlawful and void upon constitutional and other grounds, and with no diversity of opinion.

The legal history of trades unions, their conduct, incidents and agreements, is in large measure a history of the application to labor combinations of the common law of conspiracy. It seems to have been true under early English common law that workmen had no right to combine for any purpose connected with labor conditions and that their mere combination was a criminal conspiracy. The restrictions upon the right of workmen to act in combination have been more and more removed, until, at the present time, there is no substantial difference from a legal standpoint between a labor combination and any other combination. The old common law restrictions upon combinations of workmen in general also applied to combinations of masters, the courts viewing with distrust any combined effort to influence or control trade conditions. This removal of restrictions or grant of greater freedom to act in combination may be called the development of the "right to combine."

All the different legal questions connected with trades union activities are directly or indirectly connected with this so-called right to combine. The right to strike is the right of men to combine to quit work in a body. The right to boycott is the right of men to combine to refuse to deal with another. So too the closed shop contract is related to the right to combine, for it is the act of men in combination, and expresses the terms upon which they have combined. The right to make such a contract necessarily presumes the right to combine.

Besides the greater recognition by the courts of the workmen's rights to act in combination, there are two other doctrines associated with recent judicial views upon labor questions. One is the comparatively recent doctrine that labor is a commodity to be bought and sold in the market in like manner as any other article of trade. The other is the right of individual contract, which, by the development of the view of labor as a commodity, has gained a new meaning or application in labor matters. The workman like the merchant has something to sell, and has the right of individual contract in regard to the terms of sale. The fact that his commodity is labor, and not goods, has ceased to make any difference in the methods he may use in his bargaining. Undoubtedly these views have influenced the attitude of the courts toward labor combinations and have had much to do with the judicial recognition of the workmen's right to combine.

The development of the right to combine, or rather, the greater recognition by the courts of the right to combine, from the time when a combination of workmen for any purpose connected with labor matters was held

to be a conspiracy, to the present, is summed up and expressed in the modern definition of a conspiracy. A conspiracy at common law has now come to be generally defined as a combination to do an unlawful act, or to do any act by unlawful means. In other words, mere combining is no longer criminal. It must be further shown that the combination has an unlawful purpose in view, or contemplates the employment of unlawful means.

With the former restrictions upon the right of workmen to act in combination in mind it becomes clear that the question of the validity of a closed shop contract must be a comparatively recent one. Under the early doctrines such a contract would have been not only void, but also evidence of a criminal conspiracy. Does the right to act in combination as now recognized justify or legalize the closed shop contract?—is the question to be answered.

In this country the right to combine on the part of workmen has been fully established and recognized by the courts without the coercion of any statute. This right to combine was not recognized by the common law at the time our country was separated from England, and English common law became American common

WALTER DREW,
Attorney Grand Rapids Citizens' Alliance.

law. The action of the American courts, therefore, in recognizing this right on the part of workmen, though not so stated, has been in the nature of a departure from the early English common law and has amounted to a grant or creation of a right not before enjoyed. Of course there are cases to be found where our American courts have followed to a greater or less extent English precedents. These cases, however, have been more and more discredited until it may be considered as firmly established in this country that there are no restrictions whatever upon the laborer's right to combine, other than that the combination shall not be for an unlawful purpose or employ an unlawful means.

We come now to the discussion of the closed shop contract as affected by the recognition by the courts of the right to combine within the limits of the law of conspiracy.

Every contract starts with a presumption of validity. It may be said, therefore, that a closed shop contract is valid unless its purposes be unlawful or it be secured or enforced by unlawful means. But no closed shop contract which has ever come before the courts has stood this test. There is no case at law or in equity holding such a contract valid; there are many and some most recent holding such contracts void.

A closed shop contract, the purpose of which is to establish or foster a monopoly of the labor market, is contrary to public policy and void.

The rule that a contract, the purpose of which is to secure a monopoly, is void, is a familiar one. In its application to closed shop contracts two classes of cases arise: (1) Where the court hold that it is apparent on the face of such a contract that its manifest purpose and inevitable tendency is to establish a monopoly, and, therefore, that such a contract is per se void. (2) Where the courts do not hold such a contract void per se, but inquire whether under the facts of each case the purpose of the particular contract is to secure a monopoly. In the first class of cases no outside or extrinsic evidence is necessary. In the second, outside evidence

is considered in order to make clear the purpose of the particular contract in question.

The purpose of compelling non-members to join the union against their will is unlawful. Closed shop contracts having such a purpose, are, therefore, unlawful, and the attempt to enforce such a contract to the injury of persons, not parties to it, is an actionable wrong.

This is practically the same rule as the one preceding, except that it is stated from the standpoint of the non-union man. Evidently the ultimate purpose of compelling non-union men to join the union is to create a monopoly of the labor market. From the standpoint of the public, as we have seen under the previous rule, this purpose is contrary to public policy. From the standpoint of the non-union man sought to be coerced, this purpose is not only unlawful, but if attempted to be carried out to his injury, it gives him a right of action.

The agreements or conduct of combinations must have a legitimate and proper motive. The injury of third persons from mere malice, or without any justification, is an actionable wrong.

Under this head come chiefly cases involving attempts to enforce or perform closed shop contracts and the rights of third parties affected thereby.

Ordinarily, the act of an individual done with malice involves no greater legal liability than one done without malice. So long as the individual stays within his strict legal rights his motive is immaterial. Many judicial utterances may be found to the effect that the same rule applies to combinations, and the question has been much debated. It may be said, however, that the later authorities, and the present weight of authority, is to the effect that malice or other improper oppressive purpose on the part of a combination resulting in injury to a third party, confers a right of action upon the one injured. In other words, malicious conduct on the part of a combination is unlawful when it would not be so on the part of an individual.

A closed shop contract must be the voluntary act of all the parties to it, both in its inception and in its performance.

This is a most important limitation upon closed shop contracts. It means that closed shop by-laws or closed shop agreements with an employer, adopted by a majority vote of the union, do not bind the minority. It means that the vote of a majority ordering a strike or boycott to enforce a closed shop by-law or contract, does not bind the minority. It further means that if the assent or co-operation of the minority is secured by means of any coercive measures such as fines, forfeitures or other penalties, the contract becomes unlawful, and its enforcement to the injury of others becomes an actionable wrong.

If this article shall have made it clear that the closed shop in and of itself is not an unlawful thing, and has further clearly defined the limits set by the courts upon efforts to secure or maintain the closed shop, it has accomplished its purpose. The question of the closed shop contract, and the other labor questions now of such acute interest, are but different phases of an epoch in industrial history through which we are passing. The epoch started with the entry into the labor world of the spirit of combination. The epoch may be called "The Epoch of Incomplete Combination."

The very fact that combination on the part of labor is partial and incomplete, makes inevitable strife and war and legal questions. If there were 1,000 carvers in the United States, all of whom belonged to a union, it could not be said that such a union was trying to gain a monopoly, or to injure non-union men in any agreements it might make. Such a union could carry on its "collective bargaining" with the employer unhampered. It could name any wage or other conditions it saw fit, and the employer would have no option but to accede or go without the services of its members. Unreasonable demands would thwart their own purpose, for the public would arrange to do without services for which a wage not warranted by trade conditions was insisted upon. In other words, complete combination of labor secured and maintained would do away with the present epoch of strife, with its attendant bitterness and legal questions. It would bring an era of "collective bargaining" when the different questions at issue between labor and capital would be settled more than ever before by the laws of trade and not by the laws of the courts.

It is the belief of the writer, and his justification for introducing economic considerations into a legal article, that the courts are more and more recognizing the above fact; that they look upon complete combination of labor as a good and not as an evil; and that within the limitations already set they will put no unnecessary obstacle in the way, but that their attitude toward labor in combination will be broad and liberal.

THE GREAT CONFLICT IN THE BUILDING INDUSTRY ENDED.

EXPERIENCE EVOLVES A NEW ARBITRATION PLAN COMMANDING THE CONFIDENCE OF BOTH EMPLOYERS' ASSOCIATIONS AND UNIONS.

AN event of the highest importance in the building industry was the adoption, on April 22, of a new joint arbitration plan, between the Building Trades Employers' Association and the unions of the Building Trades of New York City. While this plan is local, yet it is of national consequence, since disturbances in the building trades in New York City have affected the execution of contracts from Maine to California. The plan is expected to maintain peace between about 1,000 employers and nearly 100,000 wage-earners, organized in thirty-two trades. The New York plan, moreover, may serve as a guide in bringing about peaceful conditions in the building industry in other large and growing cities.

This plan was brought about through a convention composed of three representatives of each employers' association and of each union, which was held in March. At this convention, Otto M. Eidlitz, of the Mason Builders' Association, was Chairman, and James Hatch, of the Upholsterers' Union, was Vice-Chairman. A committee of ten, five representing employers and five representing unions, was appointed to draft the plan. The members of this committee, to whose assiduous work, extending through four weeks, the unanimous adoption of the plan at the second meeting of the convention on April 22 was largely due, were:

Employers—J. R. Strong, Electrical Contractors' Association; Otto M. Eidlitz, Mason Builders' Association; Benjamin D. Traitel, Grate and Mantel Association; Lewis Harding, Master Carpenters' Association; George A. Suter, Master Steam and Hot Water Fitters' Association.

Labor—James H. Hatch, Upholsterers; Daniel J. O'Mahoney, Steam Fitters; Jess P. Larimer, House-

(Section 1 defines this territory as "all the territory known as Greater New York, unless otherwise specified in trade agreements.")

This is far more definite than the corresponding provision in the old plan, which permitted the employment of non-union men, in case a union "is unable to provide sufficient workmen, who shall become members of the

OTTO M. EIDLITZ,
Chairman General Arbitration Board.

union, if competent." Under the new provision, a non-union workman must join the union of his craft, before he can find employment; and the unions, by their own rules, are obliged to admit any competent workman of good character, thus removing an arbitrary restriction that some unions had before imposed.

Sections 4 and 5, relating to the General Arbitration Board, are entirely new, and follow:

There shall be a General Arbitration Board, consisting of two representatives from each employers' association affiliated with the Building Trades Employers' Association and two representatives from each union recognized as a party to this plan.

The General Arbitration Board shall exercise the powers delegated to it by the several provisions of this plan; shall determine the manner of adjustment of any dispute which is not specifically covered by this plan; shall adopt and amend a code of procedure, and shall determine the manner in which and by whom the expenses of special arbitration boards shall be paid.

Under the old plan, the employers' associations and the unions each elected two representatives to the General Arbitration Board, to serve six months; but there was no provision for substitutes in case of absence. The new plan provides for two alternates, and, in case

The officers of the General Arbitration Board are a Chairman and Vice-Chairman, elected by and from its members semi-annually, one to be an employer and the other an employee; and a General Secretary, to be elected by the Board for a term of one year. These officers, who serve until their successors are elected, are: Chairman, Otto M. Eidlitz, employer; Vice-Chairman, Daniel J. Mahoney, employee; Secretary, Samuel B. Donnelly, former President of the International Typographical Union. There are regular monthly meetings of the Board. Special meetings may be called by the Chairman or Executive Committee, and shall be called upon the filing with the Secretary of a written request from five of the organizations represented. A majority vote carries any question in the Board; except a member call for a division, when a majority vote of each side present and voting is required. In case of inability to agree upon a motion, a conference committee shall be appointed, which shall report a motion or motions to the meeting. All these detailed provisions are new and replace what proved to be troublesome indefiniteness in the old plan.

Important new provisions are these:

The cost of maintaining the headquarters of the General Arbitration Board, including the salaries of the Secretary and his assistants, shall be divided equally between the Building Trades Employers' Association and the unions collectively.

The headquarters of the General Arbitration Board shall not be the meeting room nor the club rooms of any association of employers or employees.

Under the old plan all the expenses of the General Board were paid by the associated employers, and its officers were in the Building Trades Employers' Club. This arrangement proved repellant to members of the

DANIEL O'MAHONEY,
Vice-Chairman General Arbitration Board.

smiths; Julius Gerber, Sheet Metal Workers; William Keating, Marble Workers.

This new plan replaces the arbitration plan adopted on July 3, 1903, which had proved in many respects a failure in practical operation, as was shown by the number of strikes and lockouts occurring during 1904. The important changes from the old plan are the result of experience, and for that reason, it is hoped, will prove effective. In the convention that adopted the plan, the representatives of all but four of the thirty-two trades were empowered to act. These four trades were the stonecutters, the cement masons, tile layers and bricklayers. But the representatives of these trades voted as individuals with the others in favor of the new agreement. Their action was afterward ratified by their four local unions.

The prominent features of the new plan will be indicated by an explanation of the important changes from the old. The plan is based upon an unqualified surrender on each side of the right to strike and the right to lock out. That is, it provides for the peace of disarmament, all disputes between employer and wage-earner to be settled through the machinery provided for arbitration. The old plan provides that no unions should strike and that no member of the Employers' Association should lock out "before the matter in dispute has been brought before the General Arbitration Board and settled."

The important section providing for the "closed shop" reads as follows:

The employers, parties to this arbitration plan, agree to employ members of the trade unions only, directly or indirectly, through sub-contractors or otherwise, on the work and within the territory described in Section 1 of this plan.

SAMUEL B. DONNELLY,
Secretary General Arbitration Board.

of necessity, the association or the union may appoint a temporary substitute. The old agreement specified that "the arbitrators from the unions shall not be business agents." These words are stricken out of the new plan, but, nevertheless, business agents cannot act as arbitrators, for it is provided that "all representatives of the unions shall be working at their trade."

JAMES H. HATCH,
Vice-Chairman of Convention Upon New Plan.

unions, who felt that the General Board was thus, at least in appearance, unduly subject to the influence of the employers, and who also felt a certain embarrassment and hesitancy in bringing their business affairs to the headquarters of the employers. This difficulty is eliminated by the establishment of the arbitration offices in a neutral place. No difficulty or objection is anticipated on the part of the unions in bearing their half of the necessary expenses.

The old agreement provided simply for an Executive Committee of the General Board, with power to appoint special arbitration boards. But the new plan is specific and elaborate in its provisions regarding the Executive Committee. This is to consist of twelve members, elected equally by the employers' and unions' representatives in the General Board, to serve six months. These are divided at the outset into six classes, serving one, two, three, four, five and six months, respectively, so that hereafter this Executive Committee will be a continuous but gradually changing body. The Committee, which meets once a week, or upon call of the Secretary, has control of all receipts and expenditures; acts as a Board of Conciliation and exercises all the powers of the General Board between its meetings, except the power to amend the Code of Procedure and fix the expenses of the Special Boards. All its decisions are to be final and binding, subject to review by the General Board at the written request of an employers' association or a union, endorsed by a majority vote of the representatives of either side present and voting.

EXECUTIVE COMMITTEE

On the Part of the Public.

Grover Cleveland, ex-President of the United States, Princeton, N. J.
Andrew Carnegie, capitalist, New York City.
Cornelius N. Bliss, ex-Secretary of the Interior, New York City.
Oscar S. Straus, member of the Court of Arbitration at The Hague, New York City.
Charles W. Eliot, President Harvard University, Cambridge, Mass.
Archbishop John Ireland, of the Roman Catholic Church, St. Paul, Minn.
Bishop Henry C. Potter, of the Protestant Episcopal Church, New York City.
David R. Francis, President Louisiana Purchase Exposition, St. Louis, Mo.
Isaac N. Seligman, of J. & W. Seligman & Co., New York City.
James Speyer, of Speyer & Co., New York City.
Charles Francis Adams, publicist, Boston.
V. Everit Macy, capitalist, New York City.
Ralph M. Easley, Chairman Executive Council, New York City.

On the Part of Employers.

Henry Phipps, director United States Steel Corporation, New York City.
August Belmont, President Interborough Rapid Transit Company, New York City.
Lucius Tuttle, President Boston & Maine Railroad, Boston.
Frederick P. Fish, President American Bell Telephone Company, Boston.
Francis L. Robbins, President Pittsburgh Coal Company, Pittsburgh.
Henry G. Davis, Coal Operator, Wilkes, W. Va.
H. H. Vreeland, President New York City Railway Company, New York City.
Samuel Mather, of Pickands, Mather & Co., Cleveland.
Charles A. Moore, of Manning, Maxwell & Moore, New York City.
Franklin MacVeagh, of Franklin MacVeagh & Co., Chicago.
Charles H. Taylor, Jr., ex-President American Newspaper Publishers' Association, Boston.
Dan R. Hanna, of M. A. Hanna & Co., Cleveland.
Marcus M. Marks, President National Association of Clothing Manufacturers, New York City.
Otto M. Eidlitz, Chairman Board of Governors, Building Trades Employers' Association, New York City.
William H. Pfahler, former President National Founders' Association, Philadelphia.

On the Part of Wage Earners.

Samuel Gompers, President American Federation of Labor, Washington.
John Mitchell, President United Mine Workers of America, Indianapolis.
El. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' National Union, Washington.
Daniel J. Keefe, President International Longshoremen, Marine and Transportworkers' Association, Detroit, Mich.
Warren S. Stone, Grand Chief International Brotherhood of Locomotive Engineers.
P. H. Morrissey, Grand Master Brotherhood Railroad Trainmen, Cleveland.
William D. Mahon, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
Theodore J. Shaffer, President Amalgamated Association of Iron, Steel and Tin Workers, Pittsburgh.
J. J. Hannahan, Grand Master Brotherhood, Locomotive Firemen, Peoria, Ill.
James O'Connell, President International Association of Machinists, Washington.
John Tobin, General President Boot and Shoe Workers' Union, Boston.
Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.

AN UNPRECEDENTED OPPORTUNITY.

The new plan for arbitration between the associated employers and the unions in the building trades in Greater New York commands confidence in its successful operation chiefly because its provisions are the fruit of experience with the former unsatisfactory plan. There is a wider interest, however, in the practical outcome of this elaborate device of arbitration. Under it, the members of some thirty-two unions have obtained three leading demands of organized labor: The eight hour day; the highest average wages paid to craftsmen in the world, and the closed shop.

Here is an unprecedented opportunity for organized labor to exhibit to its critics a broad and high-minded standard of conduct. Having won these substantial gains, it would be the height of folly for the local leaders of these unions to allow trivial or limited subjects of dispute to become sources of rupture. The unions now have equal representation throughout the machinery of arbitration. Their rank and file should be careful to select representatives capable of meeting in a spirit of fairness the representatives of the employers, and of cultivating a mutual desire to maintain peace with justice in the great building industry. Thus will they set an example inspiring to organized labor throughout the country, not alone in the building trades, but in all industries. Moreover, they have now an opportunity to disprove the assertion frequently made by enemies of organized labor, that the granting of any of its demands will only whet its appetite into insatiable greed.

Great credit is given to all those leaders, among both employers and craftsmen, whose joint efforts have culminated in this latest device for industrial peace. Without invidious discrimination, it is but fair to say that no employer in the country has worked more earnestly, patiently and devotedly for the establishment in practice of the principle of trade agreements than has Otto M. Eidlitz, the Chairman of the New General Arbitration Board, and a member of the Executive Committee of the National Civic Federation. The Secretary of this organization, Samuel B. Donnelly, while Secretary of the former Arbitration Board, whose expenses were wholly paid by the associated employers, although a loyal veteran in the trade union movement, was subject during two years to the angry criticism of every union disappointed in obtaining all of its demands. His unanimous re-election as Secretary of the new Board is a merited tribute to clear-headed fairness and indefatigable industry.

RESTRICTED INDIVIDUAL FREEDOM.

The verbatim report of the papers and addresses at the first general meeting of the Department of Industrial Economics, presented in this issue of THE REVIEW, is a body of literature of such interest and value to economic students, that it has been decided to republish the matter, with supplementary comments, in book form. A single meeting of this department will thus result in placing in every economic library in this country and abroad a volume that will go far to dissipate the confusion about "personal liberty" and "constitutional rights" that some opponents of organized labor have injected into the discussion of trade agreements and of the open and closed shop. Convincing evidence is here accumulated that any associated effort in industry must and does involve the curtailment of individual freedom. The welfare of society, as a whole, is pronounced the general measure of the extent to which this surrender of freedom ought to be carried. Further discussion may discover a more specific and immediate test.

THE NEW ENGLAND CIVIC FEDERATION.

Notable for its representative character and for its atmosphere of serious earnestness was the first general meeting of the New England Civic Federation, of which an account appears elsewhere in this issue of THE REVIEW. The gathering will extend a wider understanding of the purposes and methods of the national organization and of the associated local organizations, which will in time be formed in the industrial centers of large divisions of the entire country. The speakers,

both employers and wage-earners, were unanimously in favor of the trade agreement as a method of industrial peace, while they did not fail to emphasize the equal responsibility upon both parties, for the inviolability of the collective contract.

AN IMPORTANT DISTINCTION.

It is too bad that the National Civic Federation has degenerated into an apologist for the Standard Oil Company. The high character of the gentlemen connected with that organization has led us to expect that its energies would be directed to better ends.—*Wyoming Sentinel*.

Several Western papers have published similar comments. They evidently confuse the Civic Federation with a new organization, recently launched by Francis B. Thurber, President, styling itself the Civic Association of New York. The National Civic Federation has absolutely no relation to the latter organization.

THE C. F. U. ATTACK.

It has been pointed out in a former issue of THE REVIEW that the work of the National Civic Federation is opposed by two foes, whose enmity is natural and logical. These two foes are the militant socialists and those employers' associations which, under the false cry that the rights of American citizens are in peril, would destroy every union.

The Civic Federation would promote better relations between employers and employed by methods which both its foes oppose, some employers because they wish the peace of subjugation, and the Socialists because they wish revolution. It is especially disconcerting to the Socialist programme of the seizure of all industries by the State to behold employers, labor leaders and publicists coming together around a table in social intercourse and search after Truth, the solvent of the most difficult problems. Such association, some of the Socialist publications protest, counteracts the radicalism of organized labor. They mean that such commingling is fatal to the class hatred which they openly and insidiously ferment; that it makes more and more impossible their "self-imposed task of undermining society."

Outside of their partisan publications, the Socialists can express their hatred of the Civic Federation only by making speeches and offering resolutions in a few unions, or in some central bodies, where the radical element, including both Socialists and anarchists, is in a majority. In only two or three such bodies in the United States is this the situation, but the radicals never miss an opportunity to push forward a resolution condemning the Civic Federation. For example, one local branch of the United Mine Workers of America adopted a resolution demanding that John Mitchell, their President, withdraw from membership in the Civic Federation. When this resolution came before the national convention of the Mine Workers, it was hooted out of hearing. Once the radicals passed a resolution in the national convention of the Iron Moulders' Union, taking advantage of a slim attendance in the closing hours, requiring its President to withdraw from the Executive Committee of the National Civic Federation. The President called for a referendum vote of the union throughout the country, which resulted in the overwhelming repudiation of the resolution.

A more recent attack of this nature was made in the Central Federated Union of New York City. The radicals, although really in a minority in the New York Central Federated Union, sometimes are in temporary control, because of a light attendance of conservative delegates. It was such a meeting that passed a resolution, some weeks ago, calling for the withdrawal of all its members from the New York Civic Federation. Those labor representatives in the New York Civic Federation who belong to unions not affiliated with the Central Federated Union of course paid no attention to this resolution. Members of unions that are affiliated ignored the order to resign and demanded that a committee be appointed to investigate the charges, made when the resolution was adopted, that the labor membership in the Civic Federation was detrimental to the cause of organized labor.

This committee, consisting of Delegates Lorimer, of the House Smiths' Union; Richter, of the Musical Union; Morton, of the Amalgamated Woodworkers; Green, of

the Rock Drillers and Tool Sharpeners' Union, and Hand, of the Eccentric Engineers' Union, none of whom are members of the Civic Federation, spent two weeks in an investigation, which included a visit to the Civic Federation headquarters, where all records were placed at its disposal, and which also included fruitless efforts to extract any testimony whatever from the delegates who had made the charges, or, more properly speaking, the innuendoes. The committee finally reported unanimously that the work of the Civic Federation was altogether beneficial to the movement of organized labor and that not a single delegate who had alleged to the contrary, could be found with the courage to come into the light in support of the assertion. Among the witnesses who did testify were Samuel Gompers, President of the American Federation of Labor; John Mitchell, President of the United Mine Workers of America; William D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees of America; F. J. McNulty, Grand President Electrical Workers of the United States; Joseph Weber, President of the American Federation of Musicians; Frank Buchanan, President International Association of Bridge and Structural Iron Workers, and others.

Mr. Gompers addressed the following letter to the committee:

New York, April 28, 1905.

To the Committee of the New York Central Federated Union:

Dear Sirs and Brothers—

It is not a question with me to praise either the National Civic Federation or the work it has done or can do; in my judgment as an association it is and can be made an instrument of good. What it has accomplished is history, and regardless of carping criticism or malicious misrepresentation, those organizations of labor which have been brought into contact with its representatives, those who have been benefited by its aid, must of necessity be the best witnesses to the good that it has done.

With other representative trade unionists, I have held, that the National Civic Federation, *without a well-organized, thoroughly alert trade union movement, would be absolutely futile*, and perhaps its very existence unnecessary; but with the growth in our movement, the greater intelligence our membership manifests, the higher and deeper the interests of our fellow-workers in the success of the cause of labor, in that same degree will the National Civic Federation be helpful to us in attaining the purposes for which we are organized, and to attain them with the least possible friction or contest.

After all, what is the National Civic Federation? It is not an arbitration body, it does not foist itself either upon organized labor or upon employers. It undertakes to bring workmen and employers into a full, fair, free and fearless discussion of the views or interests that each represents, and by that brings a more intelligent understanding on both sides of the real industrial situation. It undertakes to bring representatives of organized labor in conference with employers with whom there is a dispute as to wages, hours of labor, or other conditions of employment, and by such conferences to come to an agreement by which a strike or a lockout may be avoided and averted.

When a strike or lockout has occurred, it not only holds itself in readiness, but by reason of the desire to further the interests of both, has brought and does bring the representatives of both sides together in conference, with a view of arriving at an adjustment of a conflict; and since the formation of that organization, in not one instance has any such conference resulted in anything but to the advantage of the labor interests.

Of course, when the Civic Federation undertook to be helpful to maintain industrial peace, or to bring about peace when strife had occurred, some over-zealous friends and more opponents undertook to say that all differences would be settled, that all strikes would be avoided, that organized labor would lose its power and potency to defend and promote the interests of the workers; but this was neither in the minds of those who organized it, nor of those who are still participants therein. Each man strongly and stoutly defends his convictions, the interests of his class, everywhere and under all circumstances. Discussion in its broadest sense, the bringing of men to argue and defend their convictions and the faith that is in them, must of necessity tend to bring a better and a higher conception of the rights to which labor is entitled. This has been a marked result of the conferences of all sorts which have been thus far held, and has helped to place the demands which organized labor makes upon modern society upon a decidedly higher plane.

It is impossible in the brief time I have to note the individual cases in which the Civic Federation has been of practical advantage to our movement, but it may not be amiss to mention a few cases which are typical of others too numerous to mention now. Conferences were held between the representatives of the United Mine Workers and others of organized labor with the mine

operators of the anthracite region, and though the strike occurred, the efforts were continued throughout to bring about an honorable adjustment of that controversy. These efforts, which contributed in the final termination of the strike and the advantages which were secured for the miners, have not been written and cannot yet be written. Ask the representatives of the House-smiths' Union of New York, the Lithographers' Union, the Textile Workers of Fall River, the Street Railway men of San Francisco, and other centers throughout the country; the building trades of New York, Chicago and elsewhere, the printing trades unions, the Structural Iron Workers, the Paper Makers, and many others, and they will surely and gladly acknowledge the valuable assistance rendered, both in the avoidance of conflicts and others brought to an honorable conclusion, and all of them with advantage to labor.

It is neither my desire nor duty to pronounce an eulogy upon the Civic Federation. It is an association made up of representative men in the ranks of labor, and a great number of large employers of labor, with some representatives of the general public. It discusses economic problems affecting the workers and people, and it aims to be helpful in bringing about more rightful relations between workmen and their employers with the least possible amount of friction, strife and conflict. No decisions are rendered binding any one to surrender his judgment or convictions or independence of his position. It aims to bring representative men in all ranks of life together to be helpful to their fellows. It has made conferences possible when, without it, many of them would have been impossible. It has been helpful in preventing strikes and paving the way for the adjustment of difficulties, and in no instance have either strikes or conflicts been avoided or adjusted when they have been other than helpful to labor.

Without more ado and simply based upon this statement, it must convince the most skeptical that the Civic Federation has not been detrimental, but on the contrary, has been of advantage to labor and the cause of labor, the great cause with which we have the honor to be associated. Fraternally yours,

(Signed) SAMUEL GOMPERS,
President, American Federation of Labor.

THE USES OF ADVERSITY.

There have always been much unhappiness and suffering in this world. Every effort to lighten the burdens of the race is humanitarian. But the Socialists, who would aggravate discontent, and their close allies, the sentimental exaggerators, would make it appear that all travail is unalloyed evil and a symptom of progressive social degeneracy. The apostles of despair are incessantly presenting the admitted evils of the tenebrous sweatshop, the horrors of child labor, the wretchedness of the slums and every kind of distress incident to crowded centers of population, with sensational distortion, as if they were warnings of approaching cataclysm. To those whose minds may thus be turned toward pessimism, we commend a perusal of the following article, by Prof. E. E. Slosson, of the University of Wyoming, published in the *Independent*:

When modern science began to examine critically the ladder by which man has climbed to his present position, it was found that every step was stained with blood; that life was war and suffering the common lot of all; that animals preyed upon plants and man upon animals and bacteria upon man, a cycle of suffering; that every species was an Ishmael; that birds and butterflies were not the careless, joyous things the poet thought them, living only for beauty and pleasure, but were engaged in a terrible struggle for existence; that the song of the birds was a war-cry and the adornment of the butterfly was merely war-paint. It was found that there was an awful waste in nature, waste of time, waste of work, waste of life. Of a million seeds sown by the wind only one lived. A thousand eggs were cast upon the waters to produce one fish. A hundred men labored and sweat that one might rise. It was an awful revelation, that of science fifty years ago. No wonder that it drove men insane; made them pessimists, atheists. If science had stopped here it would have been a gospel of despair.

But it did not stop; another step changed it to a gospel of hope. It was discovered that this suffering, that looked to a casual glance like an impediment to progress, was really its cause; that pain was the molder of the universe; that war was the mother of all things, as the Greek had said long ago; that the rod of affliction was the modeling tool by which God created all living things; that there could have been no happiness now if there had been no suffering in the past; that joy is the offspring of sorrow, out of war comes peace, and through death comes life. This changed the whole view. It put optimism in the place of pessimism. Man could see the uses of adversity. There was a time when there was no suffering in the world. But that was when there was no life; when the earth was without form and void and darkness

was upon the face of the deep. With life came suffering, and increase with it. Progress may be defined as increase in the capacity for suffering. A stone does not feel pain, probably a plant does. Ancient animals suffered less than their descendants. The gigantic saurians that used to creep across the Rocky Mountain plains were as big as a house, but their brains could have been put into a tea-cup. Not much chance for pain there. And finally man came, a creature built upon a new and improved plan; but his chief endowment was that he was able to suffer more. Several new kinds of suffering were invented expressly for him. He alone of all the animals suffers in anticipation of coming perils, and grieves over the errors of the past. It is the greater capacity for suffering that has made men what they are. These are they who have come up out of great tribulation.

The earliest animals were built to avoid suffering. They were as big as an animal could be, and walk. The sensitive parts were protected, as in our modern iron-clads, by defensive armor as thick as could be carried; hide and scales almost impenetrable. Now these animals are all extinct. They were beaten in the struggle for existence, and by what? *By little animals with the nerves on the outside.* The animals that were easiest hurt conquered those that were most protected. Now our museums are filled with the relics of these obsolete forms, models of inventions that did not work well, and on the walls are hanging the armor of the knights of the Middle Ages, who were beaten by men without armor. The best protected animal now in existence is the clam; the least protected is the man. To try to escape suffering is not a good plan. It has been tried on a large scale, and it does not work.

There was a time when there was no death in the world. This was long after the creation of living beings; if by death we mean a definite and certain period of life. The infusoria, the simplest organisms, are immortal. They do not die a natural death, although they can be killed. These tiny specs of protoplasm grow and divide, but we cannot say that one part is the parent of the other. It is the same individual, only separated into two parts for convenience. It lives and grows as long as the proper conditions prevail; not merely for three score years and ten, but for thousands of years. In fact, the first created speck of protoplasm is living yet, divided into innumerable parts. Later there came beings that died—spontaneously, at the end of a given time. It was apparently a great disadvantage that an animal should die when it had acquired the strength and skill of maturity, and that a new individual should have to pass through the period of helpless infancy. But the animals that died progressed and developed, while those that did not die remained stationary. Death came into the world that we might have a fuller and complete life.

Now we see more clearly what is meant by the many mysterious sayings in the Bible, that benefits arise from afflictions, that good comes out of evil, and life comes from death. People used to believe these statements; yes, they were doubtless true, but in some hazy mystical sense, nobody knew how. Now we know that they are not imaginative, but plain statements of fact; they are not figurative, but literally true.

We now know something of the benefits of suffering in the past, but why do we have to suffer? We hear that the whole creation groaneth and travaileth in pain till now, because it has brought forth US—but why does the labor continue? Here is man; intelligent man, who knows some things and thinks he knows it all; civilized man, except for occasional lapses into barbarism; man who stands erect, except when he crawls into some meanness; man with the moral law written in his heart, which he follows whenever he thinks it is good policy; man who knows God and prays to him whenever he gets into trouble; man, proud man, looks up to his Creator and says, "Here am I, the end and aim of all, Thy creation. I am worth all the pain and suffering that I have cost other beings, but do not carry this any further. Let us have peace."

This is no caricature. You will find substantially this view of the position of man in dozens of theological and scientific works. Of all created beings man is certainly endowed with the greatest capacity for conceit.

PRESIDENT MAHON'S GOOD SHOWING.

The report of 1904 of William D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees of America, shows that over 10,000 members, in 23 out of 137 divisions, have received increased wages of from one to three cents per hour. Nowhere have wages been reduced. Hours have been shortened in fourteen divisions, and nowhere lengthened. The organization paid a total of \$43,207 for sick and death benefits during the year and but \$13,130 for strike benefits; while \$17,488 were contributed to other unions. Sixty-nine divisions are working under written agreements, an increase of four, and there is a growing disposition among companies in favor of written rather than verbal contracts with the Amalgamated Association.

WELFARE DEPARTMENT
OF
The National Civic Federation

OFFICERS

H. H. VREELAND, Chairman.
CYRUS H. McCORMICK, First Vice-Chairman.
JOHN H. PATTERSON, Second Vice-Chairman.
EDWARD A. FILENE, Third Vice-Chairman.
CORNELIUS N. BLISS, Treasurer.

EXECUTIVE COMMITTEE

George W. Brown, Treasurer United Shoe Machinery Company, Boston, Mass.
W. A. Clark, President United Verde Copper Company, Butte, Mont.
Frederic S. Clark, Treasurer Talbot Mills, North Billerica, Mass.
Ralph M. Easley, Chairman Executive Council, National Civic Federation, New York City.
G. E. Emmons, Manager Schenectady Works General Electric Co., Schenectady, N. Y.
Edward A. Filene, Treasurer Wm. Filene's Sons Co., Boston, Mass.
Frederick P. Fish, President American Telephone and Telegraph Co., Boston, Mass.
Frederick S. Fish, Chairman Executive Committee, Studebaker Bros. Mfg. Co., South Bend, Ind.
W. C. Fish, Manager Lynn Works General Electric Co., West Lynn, Mass.
G. Watson French, President Bettendorf Metal Wheel Co., Davenport, Iowa.
Orrin S. Goan, Manager National Biscuit Co., New York City.
William C. Greene, Treasurer Peace Dale Manufacturing Company, Peace Dale, R. I.
B. J. Greenhut, Treasurer Siegel-Cooper Co., New York City.
F. R. Hazard, President The Solvay Process Co., Syracuse, New York.
H. J. Heinz, President H. J. Heinz Co., Pittsburgh, Pa.
Edwin M. Herr, Vice-President Westinghouse Air Brake Co., Wilmerding, Pa.
Charles W. Hubbard, Treasurer Ludlow Manufacturing Associates, Boston, Mass.
Charles H. Hulburd, President Elgin National Watch Co., Chicago, Ill.
John S. Huyler, President Huyler's, New York City.
M. E. Ingalls, Chairman Executive Board C., C. & St. L. Ry. Co., Cincinnati, Ohio.
G. Gurby Jordan, President Eagle and Phenix Mills, Columbus, Ga.
John F. P. Lawton, Assistant Treasurer and Secretary Gorham Mfg. Co. of Rhode Island, Providence, R. I.
Wm. W. Lobdell, President Lobdell Car Wheel Company, Wilmington, Del.
Arthur T. Lyman, Treasurer The Boston Manufacturing Co., Boston, Mass.
W. G. Mather, President Cleveland Cliffs Iron Co., Cleveland, Ohio.
Cyrus H. McCormick, President International Harvester Co., Chicago, Ill.
L. A. Osborne, Vice-President Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.
Thomas F. Parker, President Monaghan Mills, Greenville, S. C.
John H. Patterson, President National Cash Register Co., Dayton, Ohio.
A. J. Pitkin, President American Locomotive Co., New York City.
Thomas G. Plant, President Thomas G. Plant Company, Boston, Mass.
Albert L. Pope, Vice-President Pope Manufacturing Company, New York City.
Francis L. Robbins, President Pittsburgh Coal Company, Pittsburgh, Pa.
H. A. Sherwin, President Sherwin-Williams Company, Cleveland, Ohio.
Ellison A. Smyth, President Pelzer Manufacturing Company, Pelzer, S. C.
Nathan Straus, R. H. Macy & Co., New York City.
H. H. Vreeland, President New York City Railway Co., New York City.
J. H. Williams, Vice-President J. H. Williams & Co., Brooklyn, N. Y.
Miss Gertrude Beeks, Secretary.

CHAIRMAN VREELAND TELLS PHILADELPHIA EMPLOYERS ABOUT WELFARE WORK.

He Narrates His Experience and Emphasizes the Importance of Selecting Judicious Foremen.

The Hardware Merchants and Manufacturers' Association of Philadelphia recently evinced its interest in "welfare work" by extending, through its President, Thomas Devlin, an invitation to H. H. Vreeland, Chairman of the Welfare Department of the National Civic Federation, and President of the New York City Railway Company, to address its members upon that subject. Mr. Vreeland's address is here presented, both because of its inherent value and as an example of the widening circles of interest in "welfare work" among employers:

I understand that I am invited to address you in a dual capacity—as Chairman of the Welfare Department of the National Civic Federation, of which the President of your Association, Mr. Thomas Devlin, is a member; and as an employer having experience in the practical operation of "welfare work" among some 15,000 employees. I shall begin, therefore, with a brief statement of the scope and methods of the Welfare Department.

The very first meeting to organize this Department was attended by representative employers from various parts of the country. This was the first time that employers giving especial consideration to the welfare of their employees had been brought together. The extraordinary interest in their exchange of experiences at the outset indicated the educational possibilities of the

Welfare Department, which have been more fully demonstrated by the literature resulting from the several conferences between employers, and between welfare managers, that have been held during the past year. There are now over one hundred and fifty members in the Department, and the enthusiasm and membership are growing, while the practical results are multiplying. The educational work of this Department relates to the meaning and value of "welfare work."

The great value of our conferences lies in the fact that those who participate in the discussions are practical, successful, business men, who frankly state their failures as well as their successes in the work; or the welfare workers, specially employed to supervise welfare work. We maintain a central bureau at the headquarters of the National Civic Federation to furnish information relative to the success or failure of experiments in "welfare work." Upon request, a consulting agent is furnished to study the peculiar needs of employees in a given plant, to advise the best way of introducing such methods of "welfare work" as may be deemed essential. When desired, a permanent agent or welfare manager is recommended.

RESULTS OF PERSONAL EXPERIENCE.

Let me turn now to my own experience, and the way in which I became acquainted with the need of "welfare work" with some of its applications and its results.

At eighteen years of age I went to work in a railroad shop. In the course of time I became foreman, and step by step have filled every grade of position from foreman up to president of a street railway. In those years I did a good deal of thinking about the condition of employees.

Every man who becomes financially successful has an inclination to help his fellow men. As I became successful, I determined that my money and my personal efforts should go to aid the men engaged in the work that had been my profession.

Thousands of young men work in and about railway terminals, many of them having homes in other cities. When I was young I was in that position, and I did not know what to do with my evenings. Many of my fellows spent their leisure time in the saloons, simply because they had no other place to go.

As a result of that early experience, we have in New York a large club room, equipped with billiard tables, gymnasium, library, cigar stand and numerous other facilities; while at the power stations and terminals there are shower baths, toilet rooms and lunch rooms. At our club there are seldom less than five hundred men each night, and at the special monthly meetings, which the officers of the company attend, and at which they freely discuss every topic which may interest the wage earner, between one and two thousand workmen are present.

THE PERSONAL EQUATION.

In nine years I have been absent from only two of these meetings. I believe the attendance of the President and other officials at these meetings to be the keynote of success in this work. I keenly appreciate that it is this personal equation between officials and workmen that influences the latter, and I am careful that nothing shall disturb that friendly feeling.

There cannot be any want or serious trouble among our men or their families without our knowledge. It is the duty of every foreman to report to the head of his division every morning any case of emergency, such as might be caused by a fire, or by sudden illness. Any need for money to buy medicine, or to procure shelter, or for the care of a physician, is thus promptly met. It is especially gratifying to me to be able to state that not a single name among the employees of the company I represent has ever appeared upon the list of beneficiaries of any public charity, while so employed.

THE SELECTION OF FOREMEN.

Half of the labor troubles in all large industrial establishments are caused originally by foremen who do not know how to handle men. There is a vast difference between the small employer of half a century ago and the head of a great industrial enterprise of the present day, with its thousands of employees, where the directing heads may rarely come into personal contact with the men who perform the details of physical labor. In inspiring and creating good will, no single factor is of such consequence as the judicious selection of those who are put over and have immediate direction of the employees.

The selection of properly trained foremen is, then, a most important factor in the conduct of an industry. The old method, which still too often survives, was to select a foreman chiefly or alone because of his ability to get the most work out of the force, and with little or no regard to the question, "What are his qualifications for handling men?"

We test a foreman as to his ability and methods of discipline, but we also carefully investigate his attitude toward the employee. If he is a man calculated to antagonize the labor, we do not want him. Every foreman makes a report to me at the end of the month, telling me how many men he has discharged and his reason for doing so in every case. If foreman A discharges fifty men in a month and foreman B discharges five, we start an investigation in A's department to ascertain the cause of the trouble. If the foreman is at fault, he speedily modifies his conduct, or else we dispense with

his services. By means of a table of percentages, the manager can tell at a glance what each foreman is doing in this direction.

The effect of this good treatment of employees is apparent. Several years ago, when I established a rate of pay based upon the length of time men had been in our employ, I found that only five per cent. of them were on the payrolls for five years or more. That was the effect of the old regime. To-day eighty per cent. of our employees have been with us five years or more. Every business man will appreciate the effectiveness of the latter force as compared with the former.

THE WELFARE DEPARTMENT TO WIDEN ITS OPERATIONS.

The Executive Committee Approves the Secretary's Report and Listens to Papers and Addresses Upon Welfare Work by Prominent Employers.

The Executive Committee of the Welfare Department of the National Civic Federation, at a luncheon at the Fifth Avenue Hotel, April 25, Chairman Vreeland presiding, listened to the report of the secretary upon the work of the past year and upon plans for the future. The Committee unanimously approved the report and adopted its recommendations, looking to the enlargement and extension of the operations of the Department. The papers read and addresses delivered at this meeting are published in this issue of THE REVIEW.

The report of the secretary included the following summaries:

CONFERENCES HELD.

1. Of Welfare Workers, March, 1904. Provided general view of the Welfare Work of twenty companies in the United States. Report widely distributed.
2. Of Members, November 15, 1904. Subjects discussed by experts: Relief Associations. Banks for Employees. Labor Department. Lunch Rooms.
3. First Local Conference, in Boston, February 27, 1905. Attended by seventy-five prominent New England employers. Subjects discussed: How to Make Good Foremen—The Labor Department. Men's Clubs. Welfare Work in a Mill Town. The Welfare Work of The American Telephone and Telegraph Company throughout the United States. Stereopticon views of practical features in Welfare Work were shown.

RESULTS OF CONFERENCES.

A gratifying demand for further information including plans for sanitary appliances; photographs and special advice on club houses, employees' homes, etc. Also the recommending of Welfare Managers upon request, and the provision of special agents to install such features as lunch rooms, smoking rooms and rest rooms.

FUTURE CONFERENCES.

Sectional conferences of employers are being arranged for Cleveland, Pittsburgh and Chicago.

An annual conference of Welfare Managers will be held in June, upon request from a number who feel that such exchanges of experiences are invaluable to them.

LECTURES.

By request of Thomas A. Devlin, President of the Hardware Merchants and Manufacturers' Association, Chairman Vreeland spoke on the work of the Welfare Department of the National Civic Federation, at Philadelphia.

T. H. McInnerney, of the Siegel-Cooper Company, described its Welfare Work before the Monday Club of New York. The Secretary of the Welfare Department also gave stereopticon illustrations of Welfare Work in different industries throughout the United States.

Among others, lectures were given before the: Baltimore Club of Social Workers. School of Philanthropy, two lectures. Y. M. C. A.—Business Economy Class. And the C. W. Club of New York.

FUTURE LECTURES.

Foundrymen's Association, Philadelphia, June 7—Stereopticon Talk, showing special features for the benefit of molders.

Jewish Chautauqua Society at Atlantic City, N. J. School of Philanthropy, New York. Shoe Manufacturers' Association, Lynn, Mass., and others.

EDUCATIONAL WORK.

In addition to the publication of Reports of the Conferences, articles on different phases of Welfare Work have been widely distributed through the NATIONAL CIVIC FEDERATION REVIEW each month.

The Department has undertaken to stimulate various State Bureaus of Labor to investigate and report upon Welfare Work, with very gratifying results.

PLANS FOR FUTURE EDUCATIONAL WORK.

Further articles are to be published in the REVIEW, with illustrations, on the following subjects:

Provision for Physical Comfort of Workers.
Recreation.
Education.
Housing.

Picture pamphlets will be published, with short descriptions of views of Welfare appliances in special trades, to show by example what may be done for the employes of railroads and street railways, in the line of terminal facilities, as well as for the employes in:

Paper Mills.
Theatres.
The Rubber Industry.
Foundries; and for
Bridge and Structural Iron Workers.

BUREAU OF EXCHANGE.

Much valuable data have been collected, including literature, architects' plans, photographs and stereopticon slides. The policy of building up this Bureau will be pursued. Many employers, planning to put in certain features of Welfare Work, have obtained the experience of other employers through this Bureau of Exchange.

Among the subjects covered for inquiring employers have been:

Relief Associations and Pensions.
Savings Plans.
Money Lending.
Profit Sharing.
Wash Rooms and Toilet Rooms.
Changing House for Miners.
Rest Rooms.
Lunch Houses and Lunch Rooms.
Laundries.
Fire Protection.
Club Houses and Recreation Halls.
Libraries.
Schools for Employes.
Housing.
Reorganization of Welfare Departments.
The Labor Department.

WELFARE MANAGERS.

The following workers have been placed:

Samuel T. Stewart, General Electric Co., Lynn, Mass.
Mrs. J. J. Spencer, Siegel-Cooper Co., New York.
Miss Anna D. Mitchell, National Cash Register Co., Dayton, O.
Miss Laura Mitchell, National Cash Register Co., Dayton, O.

Several employers have since requested our assistance in securing such workers for their institutions, and recommendations have been made.

GENERAL INFORMATION.

Very much general information has been given, both through personal interviews at headquarters and through correspondence, to employers, prominent foreigners, prospective welfare managers, factory inspectors and others, who are interested in promoting the work.

WELFARE WORK OF THE SIEGEL-COOPER COMPANY.

By B. J. GREENHUT, Treasurer; read before the Executive Committee.

Ever since the firm of Siegel-Cooper Company, New York, started, we have made a special feature of doing something for our employes; but it is only within the last few years that the subject has been given especial attention. Ours was the first among the large department stores in this country, we believe, to adopt Welfare Work systematically.

To begin with, we have an Employees' Association, the directors being employes; but naturally, they are among some of our most important men and women, as we impress upon our employes the importance of having their affairs managed by those most capable.

We do not make it compulsory upon employes to join, but I do not recall the case of a single employe not a member; for the association gives such advantages at so small a cost that, as soon as its plan and purpose are explained, no employe hesitates to join. The dues are nominal, ranging from ten to forty cents per month. In addition, the firm gives the association all fines imposed upon employes for whatever cause, and these fines average about \$225 per month.

The employes derive financial benefits from the association. In case of sickness they receive half pay, and a doctor's services and medicines without charge. The death benefit is \$100. Sometimes, in case of a death in the family of an employe, when circumstances warrant, the association sends the employe from \$25 to \$50. The association makes loans to its members ranging from \$25 to \$200. A committee investigates each application, both as to the worthiness of the applicant and the object of the loan. No interest is charged and repayment is made in weekly or monthly instalments.

A sum of from \$100 to \$200 has several times been given to employes whose health required a permanent change of climate, usually because of consumption, to

pay for their transportation and care until they could find suitable work in their new homes. When our physician reports that an employe's condition is so depleted as to make a complete rest and change of surroundings necessary, we send the patient to a farm to enjoy out-door life in the country. Only those are sent who do not need medical attendance, but simply to get away from the city; and their expenses are paid for as many weeks as the doctor recommends.

The summer cottage at Long Branch for girls is one of the most attractive and valuable features of our welfare work. About four years ago, the firm bought this cottage, with its surrounding grounds, which it had previously rented each year, and presented it to the Employees' Association, with the statement that the association should conduct the establishment, all expenses being paid by the firm. The instructions were to spare no expense in procuring the best comforts and food, and the committees in charge of the cottage carry out their instructions literally. Not a penny of expense to the girls is involved, from the time they leave the store on Saturday afternoon, until they return the following week. Transportation is provided. Each week's party is personally conducted and is met on arrival by our welfare secretary, who acts as hostess throughout the summer.

The cottage accommodates about 55 girls per week. All the rooms are light and airy, well and neatly furnished, each having a single bed, so that the guests of the association feel independent. A corps of servants leaves nothing for the girls to do but enjoy themselves thoroughly. Something is provided for their amusement and recreation nearly every moment, including sea bathing, trolley rides, coaching and sailing parties, clam hakes, and theatre and lawn parties. The large grounds are well shaded with trees, beneath which are ham-

B. J. GREENHUT,
Treasurer Siegel-Cooper Company, New York.

mocks, swings, croquet grounds, and tennis courts. Thus each girl in our employ has in the summer one week of continual wholesome pleasure. At the outset of this experiment there was some natural hesitancy among the girls in accepting this hospitality, but the initial experience caused every one to express enthusiastic appreciation. We have yet to hear a single complaint from any of these guests.

I have often found it advisable in reprimanding employes to point out to them the right course to pursue in order to succeed in their work. Invariably this advice was appreciated. But my time was so taken up that I could not devote this attention to our people individually. The necessity therefore impressed itself upon me of having a tactful representative who could gain the confidence of our employes and do for them that which I could not find time to do myself. I think that we have such a person in Mrs. Spencer, our welfare secretary, who does not make the employes feel that she is there to help them, unless they wish her help. Experience has shown that the mere knowledge that there is such a person causes our people to seek her counsel voluntarily. Her effort is to help our employes to help themselves. As our business employs so many people, it has been impossible for our managers and heads of departments to bestow much attention upon the individual person. When the work was not performed satisfactorily, it was the custom simply to dismiss such an employe and engage another. This continual change proved often to our disadvantage, as we found the new person often not as capable as the one discharged. I believe that when work is unsatisfactory, there is some reason for it. It is the function of the welfare secretary to examine carefully into each case, giving the delinquent good advice and encouragement. It is often a lack of encouragement that causes lack of success. In a rapid age and surrounded by others who enjoy luxuries and occupy more enviable stations in life, it is easy for employes to become discouraged when they

do not meet with quick success in their work. But all mercantile business has repeatedly illustrated the fact that there is always room at the top. With a few exceptions, those occupying the best positions and even members of firms are those who started in the lowest grade, and who exercised energy and perseverance. The possibilities of advancement are as great to-day, if not greater, than ever before. It is impossible for people with energy, ability and a desire to work for the best interests of their employer not to receive recognition sooner or later. But the employe may not receive this recognition as soon as expected. It is possible that discouragement at such a time may cause an employe to give up trying, with the result of utter failure. Our welfare secretary tries to instill in each employe the feeling that all have equal opportunities and that recognition will surely follow individual effort, application, energy and perseverance.

Many of our employes who now occupy positions of high pay and of trust started at the very bottom. This is true of both girls and men. I believe the best people are the cheapest. The firm is willing to pay liberally for value received. Nothing should be done to give the employes the impression that they are dependent upon the firm. Try to make them independent and exercise their own judgment. If this is properly done a large percentage of the employes will work loyally for the best interests of the employer, almost unconsciously.

Sometimes the welfare secretary discovers interesting reasons underlying apparent shortcomings in work. We have found instances where an employe, because of sickness at home and inability to employ proper attendance, was obliged to spend the greater part of the night in housework and in helping the sick. Such a person, because of loss of rest and because of worry, could not put the mind upon the work at the store during the day. This state of mind was aggravated by the fear of losing the position which was sorely needed for the payment of rent and supplies. By relieving such a person from worry, through proper help at home, she is able to apply herself to the work. But this must be done delicately as often such a person will make any sacrifice rather than accept charity.

Within a few months a branch of the New York Public Library has been established for the convenience of our employes. Their appreciation is shown by its rapid growth.

In one corner of the employes' reading room is a manicure parlor. The woman employed there is paid by the association; in addition to which she receives a small charge of ten or fifteen cents from those availing themselves of her services, thus making them independent in taking advantage of this opportunity for personal neatness.

Recently my attention was called to a school of salesmanship. Investigation showed that this school would materially help those who could take the course; but it appeared that its cost might be beyond the reach of many. The managers of the school, however, were induced to make a special price for a large class of our employes. The firm assumed part of this payment, and thus was able to present to our salespeople the opportunity of taking a course at a cost of \$20. The firm advanced to the employes any part of this sum desired, allowing its repayment in weekly instalments, in some cases as low as 25 cents per week. It is yet too early to know the results that will accrue from this experiment, but I feel confident that they will be most beneficial.

More recently our attention was brought, by the Welfare Department of the National Civic Federation, to the excellent work of a lady in giving instructions in physical culture in factories where girls were employed. She showed the girls how they could, during their regular duties, by proper breathing, standing, sitting and walking, exercise the different muscles of the body. This conduces greatly to their good health. We were so favorably impressed with the demonstration given by Mrs. Rouland, that the association has employed her to give our girls the benefit of her instruction. They are enthusiastic over the innovation.

IMPORTANCE OF STEADY EMPLOYMENT.

A Member:—

I am very glad to endorse the sentiments of Mr. Greenhut as to the gradual development of the employe, rather than his discharge for minor offenses. While it is necessary to discharge at times and for serious offenses, I believe that this practice is indulged altogether too commonly. In many instances if the employe is given a little help and encouragement he will overcome the fault for which otherwise he might be discharged. In this way, two good purposes are accomplished: (1) The employer secures a better employe and (2) the employe is moved a step further on in his proper development. All inexperienced people have much to learn and are at first of little value to an employer. They will make many mistakes but the better and more intelligent, as a rule, do not make the same mistakes twice. To discharge for a given mistake only means that another inexperienced employe will take the place of the first, and probably make just the same mistakes. Hence, so long as the disposition of the employe is right and his intentions good, it is likely to result much more satisfactorily if the employer will exercise a reasonable amount of patience, and either

personally or through his assistants endeavor to give such instruction and encouragement as will in time qualify the employe to perform all of his duties satisfactorily. I believe that the authority to discharge should be vested only in heads of departments and other high-class superintendents, who should possess patience and be free from prejudice and the inclination to act upon quick impulse.

It may be well to speak here also of the responsibility which rests upon the employer to make the employment regular and constant. A man who has a regular income, even though it be a small one, say of \$10 per week, can adjust his expenditures accordingly. But, if a man is employed at \$15 a week, naturally with the expectation of regular employment, he will calculate his living expenses on that basis; and, if he is then put on short time of four or five days a week and his income perhaps reduced to \$9 for several weeks instead of \$15, he will begin to run behind and his condition will soon be worse than if employed at \$9 in the first place. Short time not only disarranges the workman's plans, but I regret to say it may also disarrange his habits. Idleness may beget dissipation. Factories producing perishable goods or seasonal goods are frequently obliged to adjust their output to a varying demand. But, certain industries should have no difficulty whatever in arranging for a continuous output proportionate to the requirements. During the season when sales are light, a reserve supply can be accumulated which can in turn be drawn upon when the demand is larger than the output, and in this way the total annual output can easily be made equivalent to the total demand. It seems to me that there are many employers in such lines of business who, if their attention were called to it, would appreciate the benefits which would accrue to their employes from regular and constant employment and who doubtless could be persuaded to arrange their work accordingly.

Would it not be well for our National Committee to consider this question?

WELFARE WORK IN A COTTON MILL.

Remarks made by G. GUNBY JORDAN, *President Eagle & Phenix Mills, Columbus, Ga., before the Executive Committee*

At the Eagle & Phenix Mills we manufacture colored cotton and woolen goods. Our employes number about 1,850. That you may correctly understand our location, I will explain, that these mills are in Columbus, Georgia, a city of about 25,000 inhabitants. The Chattahoochee River is the boundary line between Georgia and Alabama at this point. Immediately West of Columbus, and located in Alabama, are two villages, incorporated; one known as Phenix City, the other as Girard.

So far as I am advised, ours is the first cotton mill which undertook to do absolutely free welfare work for its help. Since I became president, we have taken up a few improvements, believing it would result in good for both the millowners and the operatives. Primarily, our intention was solely to help the operatives; and incidentally, if we made better people of them and made them more comfortable, we would indirectly receive some advantage, and certainly the consciousness of a duty well performed.

Beginning with the children of our operatives, we have established free kindergartens.

Columbus has the distinction of being the first city in the South to establish graded public schools. It also was the first, if I remember correctly, to establish a manual training school, and certainly was the first to establish a primary industrial school.

I am one of the trustees of the Public Schools of Columbus. It is the intention of the Board of Education soon to establish a secondary industrial school at this point, which will be largely self-sustaining. Our population being mainly a manufacturing one, this will, with a splendid system of free kindergartens inaugurated and sustained by the free-will offerings of the noble women of Columbus, the Primary Industrial School, Manual Training School, and graded Public Schools, give all the children—both white and black—of that community exceptional privileges to become independent bread-winners.

The Alabama side of the river is not so well situated because the incorporating act of these two villages limits the taxation to one-half of one per cent. As very many of our operatives reside in those villages we have established free kindergartens for our operatives' children. These we have tried to make as good as the best. The buildings are specially constructed and all that could be done in the way of simple ornamentation, perfect heating, good ventilation, large and roomy yards with plenty of flower and vegetable gardens, gymnasiums and mechanical devices for diversion have been supplied. The best teachers that we could procure are surely and certainly directing the minds of these children in the right channel.

It is our intention to follow the plan adopted by the Board of Education in Columbus and establish a Secondary Industrial School, on the Alabama side, where these kindergarten children will receive further training which will thoroughly fit them for their duties in life.

We have found the children educated in these kinder-

gartens and the Primary Industrial School more alert and bright than others; and as they become old enough to begin work in the mills they show an aptitude and a discernment for colors and designs and other things incident to the manufacture of high-grade colored goods, which is valuable to the mills themselves and must be comforting and satisfying to the children.

Our corporation established the first club in the South, and I believe the first in the United States established by any cotton mill, which was exclusively for the use of its work people. It embraced a lyceum, gymnasium, free circulating library, bowling alleys, free baths with an attendant, and all innocent games which this character of people would be liable to desire to amuse themselves with. Certain nights in the week are devoted to dances and receptions of the members' friends. This club is based on the plan of the Hollywood Inn, at Yonkers.

Several of the teachers in Columbus cross the river five or six nights each week to give lessons to women employes in domestic science, basket weaving and other useful household arts. These classes meet in a house recently fitted for the use of the Young Women's Christian Association, with the aid of some of the good ladies interested in that work.

We hope that our success in welfare work may encourage other corporations to improve upon what we have done.

THE NEW DEPARTMENT GREETED.

Labor World, Pittsburg.

That the new industrial department of the Federation can be utilized in accomplishing a grand work no person who has thought the question over will dispute. Of

G. GUNBY JORDAN,
President Eagle & Phenix Mills, Columbus, Ga.

course it has its opponents and objectors, just as the Civic Federation itself has. Some people contend that a department made up of a membership entertaining the most conflicting opinions regarding the claims of capital and labor cannot be a success, and it will fall of its own weight. We do not think that there is any force in an argument of this kind, indeed, it seems to us a most powerful reason for the existence of such an organization. These opposite and contrary opinions can be put against each other and there will then be a better chance of the false disappearing. One error will rub against another until truth is evolved. As Buckle says, it is not discussion that we should dread; it is that inertia that keeps us going along in the ruts and grooves of our forefathers. If intelligent representatives of capital and labor can be brought together, as members of one organization, to discuss methods of harmony and betterment, depend upon it good is sure to result in some way.

There is a growing desire among employers of labor to assist in putting methods of industrial peace into operation. This means organization both on the part of capital and of labor. This desire is growing despite the statements of men like Parry and the Socialists. It is a most hopeful sign and by all means none should be more anxious to encourage this growth than the wage workers. So that it can be deemed to a great extent a matter of duty for trade unionists to help in the developing of the Industrial Economic Department of the Civic Federation.

There is no reason whatever to doubt the sincerity and honesty of purpose of the leading employers of labor who are actively identified with the Civic Federation. No men can be more in earnest in their work and desire to do good than are such men as Francis L. Robbins, of the Pittsburg Coal Company, Marcus M. Marks and Oscar S. Straus, of New York. Whatever detractors of the Federation may say regarding it, the fact remains that it is a power for good. It has proven

itself such, and every additional year of its existence is finding it better qualified to fulfil its mission.

There is nothing dogmatic about the Federation and this is one of its best recommendations. It is educational and is founded on the idea that costly strife between capital and labor is not necessarily inevitable. Education will lead to a broader, a truer and more humane conception of each other's interests. This is the education that the Civic Federation is spreading, and with the aid of friends of industrial progress, hopes to spread more than ever. It aims at friendly methods of adjusting disputes and is always prepared to suggest methods that are fair and practical.

A PLEASED UNIONIST DINER.

Bulletin of the Clothing Trades.

The dinner of the Civic Federation at the Park Avenue Hotel last week was a disappointment. It disappointed those outside chronic critics who, after a previous dinner meeting mistakenly but loudly lamented the non-union things eaten and done on the occasion. It disappointed those timorous caretakers of union sensibilities who expected the lordly capitalists present to manifest their displeasure by listening to expressions of union sentiment with black frowns. It disappointed those bold soldiers of the union ranks who suspiciously expected that the unionist orators would be mealy-mouthed. It disappointed the virtuous absent extremists who foresaw that the labor men present were to be led captive into the capitalist camp. Above all, it disappointed the waiting crowds of various sociological complexions throughout America who anticipated their joy of soul on reading again that President Eliot had roared defiantly, "The scab is a hero and a saint on earth!"

None of these lucky happenings for the get-it-all-quick revolutionists or the to-sheol-with-every-union Parryites came to pass. Cigars, coffee-rolls-and waiters were properly decorated with union labels and buttons. Samuel Gompers and Frank K. Foster gallantly sent the union eagle soaring. Professor E. R. L. Seligman, of Columbia University, boosted it yet higher. Louis D. Brandeis, employers' association attorney of Boston, mounted to a lofty height in a grand strain of union praise. Francis L. Robbins, the greatest of coal barons, wrote a letter that would have done credit to a walking delegate bent on leaving his competitors out of sight. President Eliot—well, that most illustrious professor of Harvard, surpassed the others by going clear up into the clouds and staying there.

Before the evening was half over the union crowd present had caught on to the chain of events that was occurring in their favor. The orators who were to have devoted their innings against them were batting the ball high and slow their way, every hit an easy catch. The union auditors felt sure of their own spokesmen who were to follow. The feature of the evening having the greatest significance was the hearty applause given all along the lines of tables for sound union talk, and it grew tumultuous when Frank Foster sat down after a peroration in which he re-established his reputation as a brilliant speaker. The hearty manifestations of approval for much that was said eulogistic of unionism by all the speakers was balm upon all the sore spots in the hearts of the battered business agents present.

At the close of the speaking a dozen well known union representatives talked with President Eliot, and tried to argue him into being entirely good. He didn't come over in all respects to the domains of progressive unionism, but his opening words to the group after he had shaken hands with them went far toward satisfying their appetite for his conversion. He said: "Gentlemen, there has been a misunderstanding as to my attitude. I want you to know at once that I am in favor of trade unions."

There wasn't a labor man present who didn't go home with the feeling that labor had lost nothing that night through the Civic Federation.

UTILITY AND COMMON SENSE.

Dayton (O.) Journal.

The National Civic Federation has issued a tiny compact pamphlet which can be carried in the pocket and yet gives all the necessary details as to the purpose, scope and work of the organization. A study of the fifty or so small pages will convince the most skeptical of the utility and common sense of all the aims of the Federation. It has rarely, if ever, meddled in any labor controversy without quickly bringing peace. The active work of averting or settling strikes and lockouts is conducted by the department of conciliation. This body refuses to act without the consent of both sides to a controversy and its whole business is to bring the two parties together. Sometimes this can be done easily, but often it is the result of endless effort and consultation. But the one hundred and fifty-six cases already handled by the conciliating department prove how much better prevention is than cure. When the strike has not yet been declared, there are many chances for obviating trouble which disappear when the affair has come to an open rupture. A new department of the Federation is that of industrial economics, in which thoughtful men of all professions, especially editors, are associated for the study of industrial topics.

THE TRADE AGREEMENT ENTHUSIASTICALLY ENDORSED.

 Walker, Hon. Joseph H., Worcester.

THE GREAT CONFLICT IN THE BUILDING INDUSTRY ENDED.

(Concluded from page 9.)

If a decision of the Executive Committee be disapproved, the General Board must dispose of the question.

The first members of the Executive Committee are:

For the employers: James R. Strong, electrical contractors; D. W. O'Neill, manufacturing woodworkers; Frederick Usher, mason builders; R. F. Tucker, cement masters; C. G. Norman, metal covered door and window manufacturers, and Charles Kelly, mosaic employers.

For the unions: D. J. O'Mahoney, steamfitters; William Nason, marble cutters; John Issing, modellers;

Charles Dinsmore, cement masons; G. H. Reed, metal lathers, and William A. Parsons, journeymen plasterers.

The busy, as well as delicate, nature of the Secretary's office is indicated by the provision that "all complaints shall be addressed to the Secretary, who shall endeavor to adjust them, and report them to the Executive Committee."

When a trade agreement exists in a given trade, all disputes are to be settled by a Trade Board of Arbitration, with an umpire, if necessary. Should there be failure to agree upon an umpire, or should either side fail to abide by the decision of the Trade Board or the umpire, the General Arbitration Board is to act within twenty-four hours. Disputes in trades where there is no trade agreement are referred to the General Board.

The old plan referred all questions as to jurisdiction of trades to the General Board, it being understood that such kinds of work already recognized as in possession of a trade were not subjects of arbitration. The new plan deals far more elaborately with this subject, providing for a conference, called by the General Secretary, between the unions and employers' associations interested, to settle the dispute by conciliation or arbitration.

Refusal or failure to adjust brings the subject before the General Board or Executive Committee, which may refer it to a special board, if conciliation still fails. Work heretofore recognized as in possession of a trade is not arbitrable.

The new plan defines the unskilled trades and provides that any difficulty arising in them shall be adjusted through the mechanics of the trade in which the unskilled are working. If the mechanics of a trade repeatedly refuse to file a complaint, it may be presented upon the written request of five organizations.

The new plan provides for Special Arbitration Boards of not less than four members, selected from members of the General Board, to meet within twenty-four hours, when notified by the General Secretary.

The representatives of any union or employers' association in the General Board may select the members of a special board to act for them, but no general arbitrator can act when the dispute is in the trade which he represents. If there is failure for two weeks to select special arbitrators by any party, the Executive Committee shall select the special arbitrators.

The old provisions as to arbitration papers are made much more detailed. They must be drawn by the General Secretary, specifically state the issue, and provide that all parties agree to abide by the decision of the Special Board or umpire, who must be selected before the case is opened. If any party refuses to sign the papers, the Executive Committee is to determine, from the papers in the case, the specific question to be arbitrated. Hearings are stenographically reported, each party receiving a copy. A majority vote must include at least one representative from each party. A verdict so reached, or by decision of an umpire, shall be final and binding. No decision by the General Board, Executive Committee or a Special Board can be amended by an organization of employers or employees. Members of Special Boards are guaranteed re-employment when their duties as such cease.

The new plan excludes lawyers from all proceedings. The reason for this is that experience with legal counsel in trade arbitrations has not proved satisfactory, it being the duty of counsel to gain every advantage through legal subtleties, while those familiar with the trade itself are more likely to reach a just conclusion through the knowledge gained by experience and the exercise of practical common sense.

A MESSAGE OF PEACE.

Edward J. Wheeler in *Homiletic Review*.

The best two Christmas messages which the year has brought to the United States, come to us, one by way of the office of the Secretary of State at Washington, the other by way of the National Civic Federation. The former message consists of the successive announcements of the signing of arbitration treaties. The second Christmas message to which we refer is also an announcement of provisions to avert war, but in this case industrial war. If "war is hell," industrial war is at least purgatory. The number of strikes chronicled in the annual report of Samuel Gompers, President of the American Federation of Labor, for the year ending September 30, is 1,806. The direct cost of these strikes to the men in the Union is given as \$2,864,642.13. Of these strikes, 1,193 were won by the employees, 194 were lost, 233 compromised, 178 pending. Such statistics tell us something, but they cannot tell us of the suffering, the violence, the passions unchained, the waste of time and destruction of property, the moral deterioration, the privations of women and children—all the deplorable adjuncts that go to make up so many of the strikes. There is not a great labor leader in the country, there has not been one for many years, who does not regard a strike as a deplorable, even if necessary, method of settling labor difficulties. Now comes the National Civic Federation with its Christmas message. In a little pamphlet dated "1905," it tells what the organization has done, is doing, and hopes to do, to secure "Education, Conciliation, Industrial Peace." Last year a conference was held in New York City under the auspices of the Federation, which elicited an unanimous expression of opinion that trade agreements afford the most practical method yet devised for securing harmonious relations between employers and wage-earners. In consequence of this conference, a Department of Trade Agreements was formed by the Federation, the object of which is not to arbitrate but to avert labor difficulties. . . . According to the pamphlet from which we take the above instances, there are fifty other examples of trade agreements or collective contracts in operation to-day through as many industries, including the highly important agreements between the railway corporations and railway brotherhoods. If there is to be heard anywhere in America any better echo of the angels' song of "peace to men of good will" just at this time, we have missed hearing it.

PEACE WITH LIBERTY AND JUSTICE.

(Continued from page 4.)

ucts, the past few months have witnessed the effort to bring together companies classed as outside the pool or as independent, through the so-called Southern Iron Merger.

The hardware trade affords interesting examples of these pools, which are characterized by nearly all the general features that have been enumerated. Some of the lines of hardware industry, however, are not included in the pools, but in what are called "gentlemen's agreements." These pools and agreements as a rule take in all the manufacturers in a given line. Their whole purpose is to prevent hardware merchants from selling goods to their local customers as they please. So elaborate is the machinery of combination necessary for this end that there now exist eighteen state organizations of retail hardware dealers, extending from Connecticut to Colorado, that fix the price of every article on the shelves.

Ninety per cent. of the drug trade in the United States, from manufacturer to the corner store, is controlled by a combination whose whole object is to restrain the man behind the counter from selling at as low a profit as he pleases. This control of the trade begins with the mammoth Wholesale Druggists' Association and extends to local associations of retailers that reach every town in the country. New York City was the last of the greater centers of population to be brought into this combination, through a mass-meeting that organized practically all the retail druggists in the metropolis. The union between wholesalers and retailers is made more complete by the organized manufacturers who have a system of distributing their products to retailers by direct contract and by serial numbers, so that the most petty transaction can be traced.

The freedom of the press is one of the vaunted accompaniments of constitutional government. But free as may be the thoughts expressed, the price at which they must be read in book form is severely regulated. Probably every buyer of a book has seen within its covers a printed slip bearing the terse statement:

"In accordance with the agreement of the American Publishers' Association * * * this book must be sold at retail at the published price without discount."

That printed slip means that there is a combination between 95 per cent. of the publishers of all kinds of books in the United States and about 90 per cent. of the wholesale and retail booksellers. The publishers made an ironclad agreement to sell no books to booksellers who cut prices. All this was to prevent the freedom to sell literature at less than a fixed price; thus placing an embargo upon thought itself.

How much individual liberty now remains to the railway president? How far is he permitted to run his road to suit himself? In the case of railroads restriction of competition has come to be recognized as so necessary that government regulation is demanded. "No competition," says the Interstate Commerce Commission, "is so destructive as that between railways." Hence that commission has recommended that railway pooling should be legalized. It is a general contention on the part of railway managers, however they may differ as to method, that something must be done to put the railroads on a basis of equality to prevent ruinous rate competition, which, it is claimed, is the root of rebates, drawbacks, underbidding and all the other practices that are not only inimical to corporation earnings, but are detrimental to the interests of unfavored shippers. The development of the "community of interest" idea is an evidence of the gradual working of the natural law of self-preservation, without, thus far, the artificial aid of legislation. Yet whole communities are demanding strict government regulation of railway rates, fearing the effect of free competition (or individual liberty) upon their industries and population.

THE CENTRAL PROBLEM.

Thus we see to what a large problem the tracing to its cause of a single phenomenon in the field of labor leads. Any other such phenomenon as the centralization of banking, the merging of railway systems, the reduction of the acreage or the burning of cotton, the opposition to labor-saving machinery, the closed or open shop, the boycott, piece work and day work, the shorter workday, the regulation of immigration, or child labor—any of these we shall find, when analyzed, to be associated in some way with this instinctive effort to restrict or remove ruinous competition through the voluntary abdication of individual action. How, then, shall that effort be made to yield the largest good, instead of the greatest evil, to all society? Shall the answer be found in forbidding all combinations and in unbridled competition between individuals? Or in abandonment of all individuality through the control of all industry by the State? Or in some ground between these extremes, where there shall be found neither excessive competition, ruinous alike to employer and wage earner, nor monopoly of capital or of labor, grinding the face of the consuming public?

Just one word as to the nature of liberty. The question presents itself to my mind as a question of results. It was not until the associations of labor

learned the lesson taught them by the captains of industry and discovered the power of association that this extreme solicitude for the preservation of liberty as an abstraction arose and in such large degree possessed the public mind and the minds of our teachers during the past few years. We take exception to the classification of the associations of labor with the trusts; the motive is not the same. The contention of the seller of labor is for larger liberty and larger life; for a higher standard of living; for a wider education. And we point to the handwriting on the wall, that where the trade union is there comes the broader education, the more comfortable home and the higher standard of living. The man who protects himself through the association of labor does not water his stock; he does not defraud by legalized preferment any portion of the community. Those who are bound down by the iron bands of circumstance in the work-a-day world have been for generations and centuries struggling and struggling and struggling for liberty, and the whole inspiration of the labor movement of the world is for liberty, not as I said at the outset, that abstraction which can be defined and interpreted in various phases, but that real liberty which means better sustenance, more care for those dependent upon the wage earner and those things which make life better worth the living.

The work of our American Federation of Labor, with its vast host of affiliated organizations, speaks for itself. It has taken from the child the liberty to work in the factory and placed it in the school room; it has protected the breaker boy in the mines; it has safeguarded the life and limb of the worker in dangerous occupations; it has raised the school age, even against the protests of our State Board of Education in my own commonwealth; it has in every way given larger opportunity for the seller of labor to develop those faculties which God has given him, by giving him that greater equality which is the equality above all most desired in the association of labor, that equality of opportunity, either in bargaining for the sale of the commodity of labor, or in laying hold of those things in life which make for higher civilization.

Chairman Belmont: Gentlemen:—Whatever be our theories, when we put them in practice, if that practice involves something new, ultimately the law will have to pass upon them, and it is therefore fitting that we should hear from the law, and I introduce to you one of the leading members of the Bar, the Hon. Louis D. Brandeis, who will address you.

THE DESIRABLE INDUSTRIAL PEACE.

Mr. Brandeis:—

Gentlemen: We do want industrial "peace with liberty," but in this country, at least, material well-being is an essential condition of liberty. In most trades some form of union of employes is required for the attainment or preservation of this liberty. The single workman, standing alone, is in the power—at the mercy, of his employer. The union, while it works for liberty in curbing the power of the employer, necessarily restricts in some measure the freedom of its members. This is an inevitable incident of organization. To secure the benefits of society, including political and civil liberty, we surrender to society a large part of the rights and privileges man would be free to exercise in a state of nature. The trade union exacts from its members no more.

It is not true that the "success of a labor union" necessarily means a "perfect monopoly." The union, in order to attain or preserve for its members industrial liberty, must be strong and stable. It need not include every member of the trade. Indeed, it is desirable for both the employer and the union that it should not. Absolute power leads to excesses and to weakness. Neither our character nor our intelligence can long bear the strain of unrestricted power. The union attains success when it reaches the ideal condition, and the ideal condition for a union is to be strong and stable, and yet to have in the trade outside its own ranks an appreciable number of men who are non-unionists. In any free community the diversity of character, of beliefs, of taste—indeed mere selfishness—will insure such a supply, if the enjoyment of this privilege of individualism is protected by law. Such a nucleus of unorganized labor will check oppression by the union as the union checks oppression by the employer.

THE UNION SHOP AND LIBERTY.

The cause of industrial liberty will ordinarily be best subserved by an open shop in which a strong union has a predominating influence. But it is not true that the closed shop—that is, the shop open to all willing to become union men, and to such only—will never give us peace with liberty. The union shop is not necessarily prejudicial to industrial liberty; its adoption may, at times, be indispensable to the attainment or preservation of liberty. The conditions in a trade may be such that the union must, temporarily, endeavor to enforce the union shop by every legal means in its power.

Such a condition arises, for instance, where the employer, while pretending to run an open shop, is actually and insidiously discriminating against union men. It

may arise even if the employer's attack be an open one. In such cases, adoption of the union shop becomes a proper war measure. It may possibly, even in the absence of direct attack by the employer, be at times an instrument which it is desirable to use temporarily in order to secure for the union the strength necessary to enable it to exert a predominating influence in the trade. The analogy to the tariff protection of infant industries suggests itself.

NON-UNION COMPETITION.

Again, if the conditions of a trade are such that non-union labor can find a fair field for employment, the existence within that trade of shops which are open only to union men may be most conducive to the general welfare. The union then works out its regulations and demands under the spur of the competition of non-union shops. The non-union employer works out his relations to labor under the spur of unionism, the knowledge that only very enlightened self-interest can prevent the union from finding lodgment in his establishment, or the loss of his best employes attracted elsewhere by conditions secured in union shops.

If then, the union shop may be at times an effective measure for securing the existence or the efficiency of the union, which is in itself essential to the industrial liberty of the employes, its introduction should not be condemned absolutely and without qualification, unless it be that the union shop is necessarily illegal as infringing some fundamental inalienable right of the employer or of non-union workmen. There are indeed a few cases in some of our inferior courts which seem to declare that agreements with employers to establish the union shops are illegal as interfering with the employer's "right of contract", as unjustly discriminating in favor of one class, and thereby interfering with the workman's "right to work", and as tending to create a monopoly. None of these positions seem tenable.

THE RIGHT OF CONTRACT.

It does not interfere with the employer's right of contract to induce him to enter into a certain contract. Every contract which any person enters into interferes in some way with his future freedom of contract or other action. That is the very purpose of entering into a contract. The "right of contract" is the right to restrict one's freedom of action. This sacred right of contract is limited only by the requirements of public policy as expressed either in rules of the common law or of statutory prohibition. The privilege for which employers have most strenuously contended in the past is the right to employ, that is to contract with, whom they please—union or non-union men. The employer exercises this privilege when he elects from day to day to employ union men. No sufficient reason suggests itself why he should not be permitted to agree in advance for a limited time, or until further notice, that he will employ only union men.

It is not an unjust discrimination against certain workmen, or an interference with their right to work, for a private employer to employ only persons of a certain class. Nor does an agreement to make his selection on such lines, however capricious or unreasonable, interfere with any one's rights. A discrimination between two classes of workmen cannot be unjust unless there is a right not to be discriminated against, in other words, a right to equality of treatment. So far as relates to private employment, there is no such right. The right to work for a private employer is merely the right to be allowed to work if one can find a willing employer.

An agreement to employ union men only undoubtedly tends in some degree to a monopoly, but the tendency ordinarily would be very slight and remote. It certainly is not the law that every contract which tends however slightly towards the creation of a monopoly is unlawful. If it were, no large manufacturer could contract to increase his plant, for such a course tends inevitably towards securing a larger share of the market, thereby driving out competition and to that extent tending towards a monopoly.

In the case of strikes, employers usually assert with much vehemence that in the absence of intimidation, violence, or coercion, the places left vacant by union strikers could be readily filled by non-union men. It is conceivable that the union control in one or all branches of trade might become so great, or be exercised in such a manner as to present the evils attendant upon monopoly and call for intervention by law. But if that time should come there would be no occasion for agreements to employ exclusively union men.

EXPERIENCE MUST TEACH.

Experience—the natural law in the industrial world—will alone teach us the best course to be pursued, and that course, when laid out, will doubtless follow eventually the lines of liberty:

In the first place, liberty on the part of the employer to agree with the union for a closed shop whenever the inducements offered are sufficient to lead him to voluntarily renounce for a time his absolute freedom to choose such workmen as he pleases. Then, a recognition by the unions that their interests will be best subserved by omitting all attempts to restrict the choice of the employes, and devoting their efforts to increasing the

attractions of unionism for the workmen, and to removing the incidents of unionism most objectionable to the employer. The wisest labor leaders have already taken this position, and have among other things declared the policy that the union label must be regarded as a valuable privilege to be acquired through assent to the closed shop, but that where such assent and hence the union label are withheld, the union workman may still work side by side with his non-union brother.

The union label means to-day—goods made in a union shop. It may come to mean goods made under union conditions, whether produced in a closed or an open shop. Whichever its meaning in a given case, the label is the most appropriate means of conveying information to which every citizen in a free country who is interested is entitled. It is an instrument of persuasion, not essentially differing from the manufacturer's trade mark, under which he seeks to induce customers to buy only a certain brand—"None genuine without our label." The Consumers' League adopts the same method of informing the public what articles are made under conditions it regards as fair and wholesome, and urging special favor for such goods by the consumer. To prohibit the use of such means of conveying information would appear to be an appreciable abridgement of the right of free speech. To prohibit American citizens from acting upon such information would be a serious infringement of their liberty.

We want industrial peace with honor—not the honor of the combatant, but that honor which "is the finest sense of justice that the human mind can frame" and which in a democracy must include something of fraternity as well as liberty.

In such a peace—with liberty, justice and fraternity—and hence with honor, the public is profoundly interested; because it involves the whole future, the success or the failure, of democracy. And the public which is so interested is not "three quarters of the American people" but the whole.

Chairman Belmont: It will interest us, gentlemen, now, to hear from one to whom the subject is more a question of practice than of theory; a man standing at the head of large industrial interests and who makes it a part of his daily life to adjust in that industry, which is one of great importance, the different questions which divide the laborer and the employer. I call upon Mr. Francis L. Robbins.

I have just been informed that for reasons Mr. Robbins cannot be present, but has sent a paper to be read, and I will ask Mr. Easley to read it to you.

TRADE AGREEMENTS AND INDIVIDUAL LIBERTY.

By FRANCIS L. ROBBINS, *President Pittsburg Coal Company.*

In considering the query presented to us this evening, "How far does associated effort in industry involve the curtailment of individual liberty?" I have been led to the general reply that no associated effort in any field of human activity is at all possible without the voluntary surrender or modification of some measure of individual freedom of action. This proposition is supported by all human experience in attaining progress in any direction. Whether it be in the formation of governments, from the family to the clan, the tribe, the township, the county, the state; whether it be in the promotion of a religion, through missions, parishes, dioceses, national and international ecclesiastical bodies or federations of denominations; whether it be the sustaining of national autonomy and rights against other powers, through the ramifications of diplomacy or by war, with all its sacrifice, discipline and many branches of organization; whether it be the advancement of morality, the prevention of crime, the reformation of the depraved, the rescue of the oppressed—whatever the effort, from the elimination of the "white plague" to the creation of a new republic, both history and current activities show the instinctive resort of all humanity to the union of many units for a common purpose.

INDUSTRIAL ASSOCIATION REQUIRES SACRIFICE.

Our topic is confined to the restraint upon individual liberty involved in association in industry; and to my mind, observation and experience both show that industrial association involves, for its success, a considerable degree of willing sacrifice of the theoretical right to do as one pleases, so long as one does not infringe upon the rights of others. This is true, whether the association be one of employers or of wage earners; and it becomes conspicuously true in the collective contract between organized employers and organized wage earners in any industry, or group of allied industries, known as the trade agreement. Any such contract involves a series of acceptances of restraint of individual freedom, beginning with the individual employer or the individual shareholder in an employing corporation on the one side, and with the individual wage earner and his local union on the other. This series of successive waiving of individual freedom proceeds in the case of an employing industry, from the formation of a simple partnership to the organization of a corporation and to the merging of several constituent

corporations. It proceeds in a parallel way in the case of the employed in an industry, from the acceptance of mutual obligations by individual wage earners in a local union to the combination of such unions in city, state, national and international federations. At every step, on either side, there must be some acceptance of restriction of individual liberty for the sake of concerted action for the common benefit.

TRADE AGREEMENTS DEFENDED.

There undoubtedly exists a good deal of misunderstanding as to this necessity of the curtailment of personal rights through trade agreements. There are some employers who still protest that the signing of a trade agreement regulating hours, wages and conditions of work infringes on his personal right to conduct his business as he sees fit. Such an employer forgets that he is continually making contracts, other than with labor, and entering combinations, that restrain and modify his conduct of business.

An example of this adverse attitude to the trade agreement is found in the following quotation from a recent issue of the *Industrial Independent*, the official organ of the national organization, that practically opposes all dealings with organized labor:

"The trade agreement would form a monopoly of employers, form a monopoly of labor, and induce them to make terms with each other to the advantage of both monopolies. It would deprive the individual of his constitutional right to work for whom and what he pleases, compelling him to surrender his allegiance as a free American citizen before he could work and live. The right to do with one's labor as one pleases is guaranteed by this free government of ours, but under trade agreements this guarantee would not be sufficient. It would have to receive the stamp of organized employers and employees before it would be considered good."

This is an exaggerated and perverted statement. The trade agreement involves no "surrender of allegiance as a free American citizen," and deprives the individual of no constitutional rights. The individual exercises his constitutional right, whether an employer or a wage-earner, when he enters voluntarily into association with others for the attainment of advantages which he could not secure by individual effort. When two such associations deal with each other, it is for the purpose of increasing the efficiency and productivity of an industry, which necessarily implies that their agreement is for the good of all the community.

It is indeed the benefit of society at large that inspires and justifies sacrifice of individual liberty. I regard the trade agreement, involving as it does a voluntary adjustment of personal freedom to the common weal, to be of the highest importance to the future of the country as a method of reaching harmonious relations between capital and labor.

THE BITUMINOUS AGREEMENTS.

In no great field of industrial activity, enlisting billions of capital and employing a vast army of men, is there a more signal example of benefit to the general social welfare than in the operation of the trade agreements between the Bituminous Operators' Associations of Western Pennsylvania, Ohio, Indiana and Illinois, and the wage earners organized as the United States Mine Workers of America. These agreements would be impossible did not each of the parties to the contracts recognize that the exercise of individual liberty must be made to accord with the interests of society as a whole.

These agreements are formed biennially at a convention composed of representatives of the operators' associations and of the organized mine workers. The agreements are worked out in detail and by localities. Upon them rests the stability of the production, transportation and marketing of fuel. Only their existence and the fidelity to their obligations of the wage earners themselves prevented the immeasurable disaster of a strike of the bituminous workers in 1902, simultaneously with the anthracite strike. Only the recognition of the mutual advantages of these agreements led the operators to propose a compromise scale at the convention of 1904, and led the miners to accept, by a referendum vote that compromise, although it involved a reduction of wages. The appreciation of the value of these agreements could have no more convincing evidence than their withstanding this dual test—that the associated employers should propose a reduction far less than they believed to be warranted by the conditions of trade then existing, and that the mine workers should accept a share of the burden of decreased profits due to adverse market conditions.

Now, who are the parties to these agreements, whose value I have but cursorily indicated? On the one side, they are the organized operators of four states, on the other, the organized mine workers. But they are individual operators, whether in business as persons, firms or corporations. They cannot form themselves into the four state associations without some sacrifice of their individual liberty to do as they please with their own properties. The owner of one mine, producing coal of a peculiar quality, or enjoying special facilities of transportation, or having measures worked with particular economy of labor, might find temporary advantage in refusing to enter into an association with other operators that would destroy or lessen these fortuitous advantages in competition. But looking beyond his immediate, temporary personal advantage, he surveys the whole range of the industry and extends his prospect over a period of a year or two years. He takes

into consideration the superior advantage in the long run of being assured a steady market, of the absorption of a reasonably continuous output, and of the opportunity to enter a joint agreement that will enable him to calculate with some assurance of certainty the great factor of labor cost entering into his production and sales.

In case the operator is a corporation, its officers carry into this joint agreement the waiving also of the individual liberty of its shareholders. This statement applies, indeed, to the business transacted by all corporations. The confusion that would arise, should every individual shareholder demand the exercise of individual liberty of judgment as to every act by and on behalf of a corporation, is indescribable. Indeed, it is plain that in the modern business world no transactions between corporations or between corporations and persons would be possible unless shareholders waived their individual liberties of action and entrusted them in block to directors and executives.

MUTUAL CONCESSIONS AND RISKS.

But to return to the interstate bituminous agreements. The other party to them is the union of mine workers, as represented in the interstate convention. According to the theory of individual liberty, every mine worker in the bituminous field of the four states concerned has the right to sell his labor to the owner of the mine where he works, upon such terms of wages, hours and conditions as he pleases. He surrenders that right when he joins the union, in order that he may share in the advantages of a collective contract, even at the risk that errors may be made in that contract that will work during its term to his disadvantage. The employer makes a similar surrender and takes a corresponding risk. It is conceivable that in some cases local conditions may make the union scale less than the individual mine worker might be able to exact from an individual employer. It is equally conceivable that in some cases other local conditions might make it possible for an individual operator to impose the acceptance of a lower scale than that agreed upon between the association operators and the miners for that district. But both the miner and the operator have learned by experience that there is a larger and a more permanent advantage in the subordination of individual liberty to joint agreement through the chosen representatives of their two organizations.

STABLE TRANSPORTATION ASSURED.

All that I have said applies also to trade agreements between shippers and the wage earners organized under the title of the International Longshoremen, Marine and Transport Workers' Association, with whose representatives we meet yearly and make contracts covering the terms and conditions of hauling and transporting coal from every port in the Great Lakes to the mouth of the Mississippi. These contracts mean the stability and prosperity of transportation, throughout a territory imperial in extent, of fuel, ores, lime, lumber, stone and grain. It is these contracts, taken together, that make the capitalists and the wage earners interested in the production, transportation and marketing of bituminous coal the leaders, during the past seven years, in the actual accomplishment of peace in their own industry throughout an immense area of this country, and affecting favorably in turn all the other industries of transportation by land and water, and of manufacture, that consume fuel. The mine operators realize that this result, with its benefits to invested capital, could not be attained without restraint of their individual freedom of action. The mine workers realize that in their corresponding individual sacrifice labor is concerned all along the line—the labor of the man who delves, the labor of the mine worker above the ground, the labor of those who load and unload vessels and cars, the labor of the vessel crews and trainmen, the labor of the men who deliver the fuel to the consumer.

Thus, with all their faults of detail, trade agreements in principle and in practice are the very embodiment of far-reaching benefits to employers, wage earners and the general public, through the voluntary surrender of individual liberty. (Applause.)

Chairman Belmont: The next speaker, gentlemen, and the last on this subject, needs no introduction to you. He is Vice-President of the National Civic Federation and President of the American Federation of Labor, Mr. Samuel Gompers. (Applause.)

"LIBERTY IS BREAD."

Mr. Gompers:—

Mr. Chairman and Gentlemen: I feel that I have deep cause for regret that I have not had time and opportunity to write down carefully what I would like to say to you to-night. With a large number of others, I am engaged in the fight; and it is not often that one who is fighting has much opportunity to write, without interruption, in calm moments, thoughts that occupy his mind. I had even little opportunity to acknowledge the receipt of the letter from Chairman Easley asking me to speak at this meeting to-night.

The work in which this Civic Federation is engaged is to my mind exceedingly important. It gives the opportunity of bringing together men who differ widely upon important features and facts regarding this great

industrial problem. I think we owe a debt to President Eliot for his utterances at the last meeting of the Civic Federation, which led to the response that at the moment I felt impelled to make, because he brought conspicuously to the attention, not only of the members of this Civic Federation, but of the thinking, active men in the worlds of labor, business and education, how it is possible for men to draw from a given state of facts diametrically opposite inferences. President Eliot then said, and repeated to-night with emphasis, that what we want is "industrial peace with liberty."

No man having any regard for the welfare of the human family will dispute the proposition that we want peace with honor, peace with justice, peace with liberty. But when there is strife or discord, when conditions are such as to make conflict inevitable, is it not true that we modify our conceptions of honor to the exigencies of the contest, or to the nature of the question at issue? Is it not true that we are constantly changing our concept of justice? Is it not true that there is a modification of what was generally accepted by the term "liberty"?

SOME HARDSHIPS OF LIBERTY.

The conditions of industry as they existed when the workman emerged from the state of feudalism into what was known as the free competitive system of society, and which brought in its wake the introduction of machinery, followed by the discovery of gas, so that the machines could be operated by night as well as by day—the conditions of the working people during those periods cannot be read by investigators, by sympathetic men and women, without touching them to the very core of their being. And yet we had then the highest conception of the liberty of the workingman. The workingman was untrammelled by organization. He did not yield one jot of his liberty to his fellows in a union. He enjoyed liberty to the full. That liberty spelled for the workman long hours of daily toil, scanty wages, a miserable hovel for a home, unsafe and unsanitary workshops, factories, mills, and mines.

During the early period of our present system of industry there went forth from some of the work people of Great Britain, particularly those in the textile industries, a demand upon Parliament for the establishment of a twelve-hour work-day. That demand was resisted as strenuously then as is the demand of organized labor to-day for a nine or an eight-hour work-day, and always, then as now, upon the two-fold ground: (1) that industries could not afford it, and (2) that it invaded the individual liberty of the worker. Despite these objections, despite hostility, despite antagonism, the organizations of labor continued to grow in Great Britain. And they have grown here. They are not, as some people imagine, importations. They are the result of our conditions in the United States. They showed their first living existence in Massachusetts and New York, where workmen went on strike as early as 1806, to enforce their demand for a reduction in the hours of labor. The shipwrights and the tailors struck even at that early day, when they found that there were no other means to secure any consideration of their rights. But the organization of labor could not grow in the United States, so long as this was overwhelmingly an agricultural country. Nor could they grow fully, so long as slavery was one of the institutions of our country. But with the cessation of the Civil War, the great impetus of industry, the factory system, the concentration of production, the invention and introduction of new machines—all these applications of new forces to industry tended to bring about organizations of labor. For the workmen observed that industry was becoming specialized, divided, subdivided, and that they were becoming as a mere atom in the great industrial hives—only one little factor in the great industrial plants.

UNION RESTORES INDIVIDUALITY.

I beg to submit this condition to our friends who oppose the organization of labor, and who assert that in its union men lose their individuality. Counter to that I present this statement: That in modern industry, with its great machines, which have specialized and subdivided labor, the workman is deprived of his individual liberty the moment he enters a modern industrial plant; and that the individuality which the workman has thus lost has been regained in the economic and social importance which they have achieved by associated effort in their unions. It is true, if we accept liberty to mean some fanciful thing with which to conjure, if we imagine liberty to mean that we may run riot, that we may totally disregard our own interests and that we may make our actions prejudicial to the interests of our fellows—it is true that the workmen lose their individuality and liberty by becoming members of a labor union. We all of us surrender to society certain things that are sometimes called liberty. We surrender them in order that we may be the better safeguarded in the exercise of our natural rights and of our true liberty.

I quoted at the last meeting Heine as saying: "Freedom? Freedom is bread. Bread is freedom." I am in entire accord with Heine. He did not mean simply the piece of bread such as this in my hand, that one may eat, but all that the term implies. Liberty can be neither exercised nor enjoyed by those who are in poverty. Material improvement is essential to the exercise and enjoyment of liberty.

Any one may say that the organizations of labor invade or deny liberty to the workmen. But go to the men who worked in the bituminous coal mines twelve, fourteen, sixteen hours a day, for a dollar or a dollar and twenty-five cents, and who now work eight hours a day and whose wages have increased 70 per cent. in the past seven years—go tell those men that they have lost their liberty, and they will laugh at you. Go to the wives who have received the benefit resulting from this higher wage and the companionship of their husbands; go to their children and compare them with the children who were deprived from going to school and have grown up to become miners and miners' wives, and see the difference in the standard of education and of morals; say to these miners' wives and children to-day that their husbands and fathers have lost their liberty by joining the union! Go to the bricklayers who worked formerly ten hours a day, but who for the past several years have enjoyed the eight-hour work-day with higher wages, with greater comforts, with larger enlightenment and social activity—tell these bricklayers that their liberties have been invaded! Go to the workers in the clothing trades, who worked in the sweatshops, whose very homes, even whose bedrooms were the factories where they toiled, and who organized and fought and won and lost and won and lost again and again, until that healthier public judgment was formed that abolished sweatshops—go to them and tell them that their liberties have been invaded by the unions! And so, through all the gamut of industries that I might enumerate. And then again go to the other industries in which you find little or no organization among the working people, and note there the comparatively long hours, low wages, misery and poverty. If those working people only had the power to speak their minds, if they had only the semblance of an organization that would give them the opportunity to exercise their freedom of speech, they would tell you in such thunderous tones that you would hear the echo and re-echo that their hope of liberty is through unions.

We hear much of the strike due to organization. But, pray, what say you of the strike of the unorganized workmen? Indeed, much of the larger number of strikes occur among the unorganized workmen. The fact is that organization is the workman's protection and secures for him, generally, many of the advantages that he enjoys, without the necessity of striking. But what would you do with the unorganized workmen who strike? Would you outlaw their effort because of lack of development, their failure of preconceived associated effort, the simultaneous movement that impels them, in desperation, to protest against their constantly deteriorating condition?

THE SUPREME COURT AND THE BAKERS.

We are told to make our appeals to the law and there find the means to secure our rights as workmen, or to find relief from onerous conditions. May I call your attention to a recent occurrence? The United States Supreme Court has just declared the ten-hour law for the bakers in the State of New York unconstitutional. It is neither my desire nor my purpose to criticize the highest judicial tribunal of our country, for which I entertain the highest respect; but one cannot always defer even to the judgment of that tribunal, and particularly when we see the court, divided by a vote of five to four, declaring as unconstitutional an act that was the result of decades of discussion and of an aroused public conscience; an act that had been tested and upheld as constitutional through the various courts of New York, and only decided to be void when it was brought before the Supreme Court of the United States.

Without discussing the merits or demerits of that decision, let me call your attention to the fact that the four dissenting judges designate the majority decision of the court as the most far-reaching that has been handed down in over a hundred years. There is now no law upon the statute books of New York limiting the hours of labor of the bakers. Let me call your attention to a few of the conditions that obtained in the bakery trade before the passage of that law. It seems a peculiar incident in human life that bakers were always required to perform their work underground and facing a great furnace, perhaps to remind them of what awaits them hereafter (laughter). It was a rule that bakers were always required to board and lodge with the boss baker. Their trade, therefore, set a premium on single blessedness; it was a practical prohibition against marriage. The bakers worked every day in the week, every week in the year. They would sleep anywhere. Sometimes, as one said facetiously, they would "lie down on the dough and rise with it" (laughter). They suffered more than any other workmen.

BETTERMENT BY EVOLUTION.

Now, the Supreme Court has decided a law to relieve such conditions unconstitutional. Assuredly, the boss bakers had some purpose in mind when they incurred the expense and the trouble of carrying their appeal to the highest judicial tribunal of the land. It is only fair to assume that they want the spoils of their victory. In other words, they will want the bakers to toil more than ten hours a day. I ask our friends who speak so eloquently of the liberty of the workmen, and who advise the workmen never to enter an association because they will surrender their liberty—I ask these

gentlemen to answer themselves the question—What are these bakers going to do? Go back to the old conditions? Work eleven, twelve and more hours per day? I don't know what any one else may think, but so far as I am concerned, when that test shall come, and there is no other means to prevent it, I will urge these bakers to strike, and to strike hard, to enforce the ten-hour day for themselves.

No one believes for a moment that conditions to-day are perfect. No one imagines that there shall be no progress, that there shall be no improvement economically, socially and morally. Every one of us has his day dream and believes that in a year, or ten, or fifty, or a hundred, or a thousand, or a million years, a better day is coming. The question with us is whether, in our own time, if we are agreed that there is a better day coming, we shall work toward that day. I do not believe in an ultimate, absolute finality of anything—not even of life. If there is a division of opinion as to how the better day is to be attained, we must, nevertheless, work gradually and naturally and rationally toward its attainment. There are some who would have the better day come within our time, in a decade, immediately, or, perhaps, sooner. (Laughter.) But it behooves us to do our share in our time to help in the evolutionary process that shall go to make up a better life for all our people. The question is with us, not whether an improvement is going to occur or not. It is going to occur. We find that this movement of discontent, with existing conditions, is world-wide. It is a question whether it shall take the form, as in Russia, of bloody revolution, or the plain, modest American evolutionary method of attaining betterment through the trade-union movement.

As for us workmen who have so far developed as to surrender the fantasy of so-called liberty (the sort our opponents have in mind); we believe in the American method of the trade-union movement. You can look the whole country over, look the whole world over, and you will find that wherever there has come the organization of labor, in that same degree has depravity and misery and poverty disappeared.

CIVIC EDUCATION OF UNIONISM.

We speak of our great sovereignty of American citizenship. Yet we know that every right-thinking public man is concerned because there exists even to any extent the pollution of the ballot box through the purchase or influencing of votes. Let me tell you, my friends, that in the industries that were unorganized you could always tell the political opinion of the workmen when you knew the political opinion of the employer. You will find that to be true to-day in our country wherever organization does not exist. But you cannot make voting cattle out of eight-hour workmen. Workmen who toil eight hours a day have time and opportunity to acquaint themselves with the current questions that affect the people of our country. They earn wages at least sufficient to warrant them in expressing contempt for any one who may, for any financial reason, desire to influence their vote. The organizations of labor help not only to raise the economic and material standards of the workmen and of their families, but also their manhood, their character, their independence and their citizenship. When an organization does that, not only for one class of workmen, but for all who participate in the benefits resulting from organization, that is not curtailing liberty, but is giving a new meaning to the word liberty through the enjoyment and the fullest fruition of the benefit which comes from an enlightened mind and a broadened sympathy for all fellow men. (Applause.)

Chairman Belmont: It has been suggested that before this meeting adjourn there may be some gentlemen present who would like to address the meeting, and, with that end in view, any one desiring to do so would be recognized by the Chair—but limited to five minutes in making such address, and a real five minutes, with the request not to exceed it.

I will therefore ask if there is any one present who would like to speak upon the subject which has been before us to-night and which is of interest to us all.

If not, as I see that no one has volunteered, I desire, on the part of all, to thank the speakers who have entertained us this evening, and bid them and all of you good-night. (Applause.)

THE DISCUSSION REVIEWED.

A Critical Observer's Reflections on the Debate Before the Industrial Economic Department.

By J. W. JENKS, Professor of Political Economy in Cornell University.

While at the meeting of the Department no resolutions were passed, and while there was no formal agreement upon any of the points under discussion, it seemed, nevertheless, that in the addresses given, certain points were made on which there was unanimous agreement.

I. It was generally conceded that association, both of capital and labor, was necessary and desirable.

II. It seemed likewise to be conceded that this association on both sides did of necessity involve a certain degree of curtailment of individual liberty. The association of capitalists necessarily, and to a certain

degree properly, curtailed the individual liberty of action of its members, in order to produce better results for all; and likewise the members of labor unions very properly and wisely gave up some of their individual liberty of action in certain ways in order to secure to better advantage their other individual interests and their liberty of action in other ways.

The question as stated, "How far does associated effort in industry involve the curtailment of individual liberty?" was not the main question discussed. But one could gather from incidental expressions of nearly all of the speakers that, as a matter of fact, the associations of capitalists on the one hand and of laborers on the other do often actually curtail individual liberty as much as they think necessary to secure the accomplishment of their ends, provided they have the power. It was intimated by several of the speakers that this curtailment of individual liberty for the purpose of securing these ends was sometimes carried so far on both sides that it was contrary to the general interests of society.

The main question actually discussed may, perhaps, be stated in this way: "How far *ought* associated effort in industry be permitted to curtail individual liberty in carrying out the purposes of the organizations?" An attempt to answer this question regarding the degree of curtailment of individual liberty that ought to be permitted, was made by two of the speakers, while there was an intimation in President Eliot's remarks that such interference ought not to go far, certainly not to the use of the boycott or of monopoly. In Mr. Robbins' paper it was suggested that these associations might properly restrict individual liberty so far as that could be done without infringing upon the rights of others; and Professor Seligman, in his address, implied that these associations might properly restrict individual liberty so far as this restriction was consistent with the promotion of the public welfare, but no further.

It will be evident to any one that these tests, while very suggestive, in shaping our ideals, and quite possibly sound, are nevertheless of little practical value in the settlement of any individual dispute. When, for example, an employer attempts to restrict the liberty of action of any of his employees, he invariably says, and generally believes, that he is going no farther than is necessary to secure his own rights, and that he is not infringing any proper rights of the laborer; whereas, the laborer, with equal sincerity, declares that he is asking only his own rights and that the employer's demands are wrong and unjust. If, instead of the word "rights" we use the word "justice" there will be found the same difference of opinion in applying the test.

Or, again, if we adopt Professor Seligman's principle, which is clearly sound, we shall find scarcely less difficulty in its application. At the time of the coal strike, certain sympathizers with the strikers did not hesitate to say that the strike could not be won unless pressure were brought to bear upon the strike breakers, which amounted to threats of physical violence against individuals, and they would not have hesitated to say that it would be in the public interest to employ violence rather than to lose the strike, if violence were necessary as they thought probable. The leaders, so far as I know, discouraged violence. On the other hand, the sympathizers with the nonunion man believed that any such invasion of individual liberty was directly contrary to public interest.

Can there be found, then, any test that is practicable in its application in individual disputes by which one may determine the degree of restriction of individual liberty that ought to be allowed? If any such test can be agreed upon by employers and laborers it will serve a useful purpose as a starting point for further action, even though the test be very imperfect in itself.

In the long run public opinion, it is generally conceded, settles all such questions, and we believe that in the long run it settles them right, although it may temporarily, in answering a specific question, be wrong. Now, is there any way in which public opinion can give an answer which is in any way direct and positive in specific cases? The only way in which public opinion has any official expression is through the acts of government as expressed in law. We may have a hazy belief as to what the public thinks upon any subject, from reading the newspapers, from talking with friends and acquaintances, and from judging others by what we ourselves think; but any such judgment is likely to be doubtful, and there certainly can be many differences of opinion regarding it. On the other hand, the government exists to carry out the will of the people, and any act of the government, whether moral or immoral, wise or foolish, is an official expression of the public will. Until that declaration is reversed by other governmental action, either of the Legislature or of the courts, it stands, and must stand, among all civilized peoples, as the expression of the people's will. May we not then find in law—which is the concrete expression of the people's will—a practicable test by which, for the time being, we may agree that the limitations which may be placed upon individual liberty by the action of associations of either capital or labor shall be determined? This agreement will not prevent our working toward other ideals. The principle may perhaps be stated as follows: Associations of capital or of labor are

to be permitted, in the carrying out of the purposes for which they exist, to curtail the individual liberty of others, whether capitalists or laborers, so long as they act clearly within the law. As soon as they violate the law their acts ought to be universally condemned.

It will be noted that this test does not claim to be as high a test as that of justice or of rights or of public welfare, and these ends should be sought always; but existing law is a practicable test that can be immediately applied to specific cases.

It must be noted again that in suggesting this test it is by no means considered that either associations of capitalists or trade unions must depend upon law to attain their ends. They must in all probability in most cases depend upon their own actions applied directly instead of through the Legislature, but in so acting they must not go beyond their legal privileges.

Mr. Gompers, in his address, called attention to the fact that the Supreme Court of the United States had declared unconstitutional the New York act, limiting the hours of labor of the bakers to ten; and he asserted that he should consider it his duty to urge upon the bakers to strike, should it prove necessary, in order to secure a ten-hour day, and not to wait until an act should be passed which would be declared constitutional. In that assertion, Mr. Gompers was not going beyond the principle laid down, so long as the bakers in their strike should do nothing contrary to law. It was undoubtedly right for them to attempt to secure a ten-hour day, through act of the Legislature, but it would also be entirely practicable under this principle, for them, if possible, to secure the same result through an agreement with their employers, brought about by a strike or the threat of a strike, so long as they did nothing illegal. The observance of law on the part of both employers and laborers in their dealings with one another, and with the public, does not seem to go very far. It ought to be a matter of course, but, in fact, it would be a decided advance over present conditions. Associations of employers and of labor often accuse each other of violations of law, and, sometimes at least, on apparently good grounds.

If, now, this test is to be considered practicable and useful, then, the whole doctrine may, perhaps, be summed up as follows:

1. Associated effort in securing its purposes may from this point of view take any action that is not contrary to law.

2. If the law restricts the action of associations to an extent that they think unwise and unjust, it is proper and best for them to attempt to have the law so amended as to give them greater liberty of action in restricting individual liberty.

3. It is usually, if not invariably, more detrimental to the public welfare to secure even a just end by illegal means than to wait until justice can be secured under the law, either by amendment to the law or by some change in the methods employed which are still legal.

a. Is the above suggested test a practicable one?
b. Is there any other test that is practicable?
c. Will associations of employers and of laborers now abide by such a test?

The observance of law would not hinder work toward an ideal that is beyond existing law.

Comments of an Observer Who Would Eliminate Coercion from the Problem.

By MARCUS M. MARKS, *President of the National Association of Clothiers.*

The statement of President Eliot draws a sharp distinction between industrial peace with honor and industrial peace with liberty. I fail to see, however, where the line can be drawn between these conditions. To my mind there can be no true industrial peace without honor nor without liberty; other so-called peace is slavery. It is the peace of the brute creation, enslaved to man—not the peace of noble manhood.

We must all agree that in joining a union or an employers' association, individual liberty is to a certain extent surrendered. Workmen and employers have the liberty to surrender their liberty, but should not be forced to do so. This, to my mind, is the crucial point. Coercion is the destroyer of industrial peace—there is no true peace under its screw. Coercion embitters employer and employee. What causes its use? Lack of patience—brutal pleasure in the triumph of superior force. If labor and capital would work for better conditions along the lines of least resistance, patiently and persistently, they would reach permanent improvement, real industrial peace, with honor and with liberty, much sooner than by force. Furthermore, the results of force are apt to be temporary and followed by reaction.

The great bone of contention just now is the closed shop. Omit coercion and let missionary work on the part of the unions bring about the union shop, where conditions warrant, and the trouble is practically over. The unions should legitimately strengthen their own ranks and not force men into the union, nor try to compel the employer to make unwilling converts to their cause. Many employers would cease their opposition to unionism if they did not fear being compelled to say to a workman, "join the union or starve!" I know many employers, and gladly state that I am one

of them, who are strongly in favor of workingmen's unions, but who consider it just as vicious for an employer to be compelled to coerce a workman into joining a union as it would be for the union to be compelled to coerce an employer to join the employers' association.

It may seem that this theory, while correct, is difficult to carry out in practice, but I have great faith in leaders in high authority; their very positions are apt to raise them to the level of lofty ideals and give them strength to live up to and carry them into practical effect.

If it be true that evolution, not revolution, voluntary agreement, not coercion, will bring about the healthiest and most permanent conditions of true industrial peace then indeed is the work of the Civic Federation most important, to prevent, or at times end, clashing between labor and capital. How? By substituting patience for temper, persuasion for coercion, conference in place of strike and lockout. May the influence of the Civic Federation in this direction grow and grow.

LIST OF ACCEPTANCES.

The following accepted invitations to the dinner of the Department of Industrial Economics:

Allen, William H., General Agent Association for Improving Condition of the Poor, New York.
Arnold, C. K., Philadelphia.
Archibald, James P., President New York Brotherhood of Painters, Decorators and Paper Hangers, New York.
Belmont, August, President Interborough Rapid Transit Company, New York.
Bright, E. D., President The Railway World, Philadelphia.
Brown, Roscoe C. E., New York State Civil Service Commission, New York.
Buchanan, Frank, President International Association Bridge and Structural Iron Workers, Cleveland, O.
Buchanan, Joseph R., Labor Editor New York American and Journal, New York.
Butler, John K., Simpson Crawford Company, New York.
Beggs, James, American Federation of Musicians, New York.
Brandeis, Louis D., Lawyer, Boston.
Baine, C. L., Editor Shoe Workers' Journal, Boston.
Baldwin, Joseph C., President Boston and New York Dye-wood Company, New York.
Cooke, Frederick H., Counselor at Law, New York.
Call, Homer D., Secretary-Treasurer Amalgamated Meat Cutters and Butcher Workmen of North America, Syracuse, N. Y.
Cease, D. L., Editor Railroad Trainmen's Journal, Cleveland, O.
Chamberlain, Leander, Director Federation of Churches and Christian Organizations, New York.

THE NATIONAL SOCIOLOGICAL ASSOCIATION.

Cincinnati Volksblatt.

It is a somewhat free translation which we use for the name of the association known as the National Civic Federation, and yet we believe it to be the proper one. The term "civic" does not relate only to matters pertaining to civil life; its meaning is broader, embracing every citizen's activities toward society. The study of such matters comes under the heading of sociology.

The organization whose object we are endeavoring to describe etymologically is deserving of a detailed account. If it is at all possible to reach an understanding between capital and labor, it can be expected from this organization, whose members are prominent capitalists, labor men, scientists and philanthropists. Social peace can only be attained through such men. Labor and capital formulate their demands, science determines their justice, and philanthropy endeavors to lessen the rest of the problem that cannot be solved.

The greatness of the powers that co-operate in the Sociological Association constitutes a welcome contrast to the opposing society, the Manufacturers' Association, whose one-sided point of idea has condemned it to fruitlessness, and whose actions are annoying rather than appeasing.

The latter consists not only exclusively of manufacturers, but of those who hold the most extreme ideas, and who are led solely by selfish gain, consequently failing to appreciate advantages which are in their interest. Comparing the speeches and articles of Parry, President of the Manufacturers' Association, with the speeches and articles of the Sociological Association, one notices immediately the distinction between men adhering to a one-sided point of view, and men grasping the problem in all its greatness and seeking to solve it in a calm way. This contrast has acquired a personal phase, adding much to the characterization of the Manufacturers' Association. The latter has termed the Sociological Association a feasting organization, whose sole purpose it is to awaken in the workingmen hopes of things to which they are not entitled. In saying this, the Manufacturers' Association stamps every endeavor to represent the rights of the workers as a hostile action.

The meeting of the Sociological Association which has just come to a close demonstrated that the Federation does not limit its activities to banquets, but is eagerly laboring to establish social peace. As proof of this, we regard the announcement that the Federation has undertaken steps to connect itself with similar organizations in Europe. That is equally as wise a step as it is just, which recognizes a heretofore disregarded fact, that the labor question needs international co-operation in order to settle it successfully. If in one country the average working hours are eleven, and in another nine, if in one country women and children toil unhampered and in another such labor is restricted, the conditions of production are at such variance that progress seems impossible. The conditions of labor must be nearly the same throughout the world, if the position of the working people is to be improved.

A remarkable paper was the one of Mr. Carnegie, who distinguished himself by his intimate knowledge of the subject he treated, and hence it was instructive and elucidative, seemingly making it appear that the Federation will soon reach its aim. In equally an interesting and convincing way Mr. Carnegie explains that the labor problem exists in this country actually only for one-seventh of the entire population of workers. For the 10,000,000 workingmen who pursue an agricultural career, there is no hindrance of the social peace known as strikes; the same applies to the 5,500,000 persons who busy themselves with housework. Small manufacturers have no difficulties with their employees. Deducting the number of smaller establishments, there are left, of the 7,000,000 industrial workingmen, only 3,000,000 who do not enjoy the blessings of continuous peace. This difficult problem is thereby reduced to such an extent that of the 22,000,000 workingmen of this country, only 3,000,000 employed in large industries and in the mines, are to be satisfied in order to establish harmony between capital and labor. Mr. Carnegie explains how this is to be accomplished. As the first condition, he suggests that good wages should be paid whenever business conditions make it possible. This suggests the logical thought that employees cannot demand higher wages than such as are justified by business conditions. Mr. Carnegie notices nothing alarming in the fact that workingmen ask for higher wages and employers refuse to grant them; to him this appears natural, just as though goods were for sale. The buyer makes his offer, and the seller insists on his price. Not being able to agree on the price, there is no reason for animosity. In the relations between capital and labor a different state exists, causing a suspension of production when the two parties cannot reach an agreement. For the purpose of preventing such a state of affairs Mr. Carnegie suggests the introduction of arbitration boards. This suggestion recommends itself because it will cast aside men of extreme ideas on both sides, who are known to be the main causes of strikes. Practice has

sufficiently demonstrated that the plan possesses much practical value.

Industrial peace has been by such means practically established in one of the most important industries—in the coal mines. This point of view is strengthened by Mr. Carnegie, by an observation which is remarkable to the highest extent. He tells the manufacturers of the Parry type, whose principle consists in an unconditional surrender of the toilers, that a manufacturer can add no greater injury to his business than to part from his experienced employees, so as to save on wages by employing new men. Whatever he saves on wages on one side, he loses double the amount on the performed labor on the other side. The meaning of this observation, therefore, is that the employer has a greater interest than the employee to prevent strikes. Such a view is held by every sensible manufacturer. Mr. Carnegie furnishes a psychological contribution to the labor question, when he seems to justify acts of force by striking employees, saying that the indignation of the experienced worker can be easily explained, when he is replaced by a less able person and thereby deprived of the means of subsistence both for himself and for his family. A workman should not be exposed to such torture. In so far as employees are advised to prevent strikes, this view is unquestionable. Of course, the right to commit acts of force cannot be recognized.

The reader will share our view, that Mr. Carnegie's speech does not only bear an element of enlightenment, but also furnishes proof that the establishment of good conditions between capital and labor is not one of the problems that cannot be solved.

SAUCE FOR GOOSE AND GANDER.

Wall Street Journal.

The less interference with economic law, the better. More freedom of trade, less tariff restrictions; more competition, less monopoly; more liberty, less legislation and governmental interference—those are ideals to strive for and work towards. But we are always in danger of going to an extreme in the advocacy of any principle. Freedom is so desirable that we must have it at any cost, but too much freedom means anarchy. Law is essential to public order and justice, but too much law becomes tyranny. The highest human happiness lies somewhere between the two extremes of tyranny and anarchy. Mr. Parry pleads for industrial freedom. To that we say "Amen." But too much industrial freedom would lead to industrial anarchy.

Order and justice must rule in our industrial relations. The danger is that measures taken to secure order and justice may lead to industrial tyranny. Somewhere between monopoly and unrestricted competition, lies the point of highest "economic" efficiency and national prosperity.

But the thing that we would especially call attention to, is that Mr. Parry in his appeal for "industrial freedom," limits that beneficent principle to labor. He wants freedom for labor. But how about freedom for capital? He is much concerned about economic law in its relation to labor, but how about economic law and capital? What is sauce for the goose is sauce for the gander.

One of the mightiest developments now going on in the world of business is concentration of capital. We are told that concentration is a result of natural economic law, and that any interference with it would be followed by the penalties which always visit violation of law. This concentration, however, is working toward the wiping out or reduction of competition which is freedom. It is working for regulation of production, and maintenance of stable rates and prices, and such regulation is interference with the law of supply and demand.

What is trades unionism but another phase of concentration? May not labor copy capital? When we begin to talk about law and freedom, let us be sure that we mean law and freedom for everybody alike, both master and servant, employer and employed, capital and labor.

Incidentally we may remark that Mr. Parry is doing the cause he advocates more harm than good, and the labor unions might help themselves by contributing to Mr. Parry's campaign expenses.

EXTREME MEASURES; EVIL RESULTS.

Staats Zeitung, New York.

The "Citizen's Industrial Association," assembled in convocation in this city, has formulated its demands, which sound well at first reading and appear justifiable at a glance, but which are not entirely sincere. If it is said that the association's sole object consists in creating freedom for labor, and in preventing a wage-worker's idleness because he is not a member of a trades union, then it does not coincide with the utterances of the president of the association and of other speakers who spoke at this and at previously held conventions. It is, furthermore, entirely wrong to condemn as a whole the legal regulation of hours constituting a work-day. The principle maintained by the association, that the freedom of individual agreements should not be curtailed, is out of date.

As a matter of fact, this association does not intend

to solve the so-called social question in a peaceful and sensible way. On the contrary, the association is organized to combat demands of laborers; disregarding the form in which they are presented, as was shown by the unmeasured attacks made upon the Civic Federation. That has at least a noble object. The "Industrial Association" is controlled by fanatics of the worst kind, who seek to conceal their true motives when they say that they do not desire to make any distinction between organized and unorganized workers. Its real object is to destroy all trades unions, without regard to their constituted form. So often and emphatically has this been stated at its meetings that it can no longer be denied. And yet, this association does not realize that an employers' association cannot claim any more reasons for its existence than an organization of employees.

The last demand of the association consists in a short sentence: "The enforcement of laws." With this we coincide fully. Its meaning is, however, more significant than one thinks. What the association really demands is not only that the existing laws shall be enforced, but that they shall remain unchanged. There can be no such thing. Legislative measures that were enacted when factories were practically unknown are not sufficient, now that the United States has evolved into an industrial state of the highest order. We will have to follow the example set by all other civilized countries, in that new laws will have to be enacted which will meet the changed conditions of the working people. Every observer of conditions knows that the old laws are insufficient; they are just as burdensome to the employer as to the employee.

He who obstructs the process of evolution pours oil on flames. He adds nothing to the solution of a continuously fiercer growing battle, but embitters it. He himself becomes an obstacle to progress, and increases the danger of a nearing flood by his attempts to stem it. It is beyond doubt that trades unions have committed grave sins. Underlying all of their movements are their just and reasonable demands for the enactment of new laws which will meet changed conditions. The fanatic who desires to obstruct the attainment of those wishes embitters the case. Mutual recognition and regard are necessary, and this cannot be demanded by one party if it refuses to grant them in the same measure to the other party. A solution by force will be the result of strengthening the extremes and inciting trouble. It is doubtful whether such a solution, if brought about by the fanaticism displayed by the "Citizen's Industrial Association" will be of advantage to the manufacturers.

OPENING OF EMPLOYEES' CLUB ROOMS.

(From *Store Notes*, official organ of the Howe & Stetson Department Store Employees' Association.)

The new club rooms in the Moses Building, which will be ready for opening shortly, have been planned and arranged for use by our president and general manager, Messrs. Howe and Eastman, and Miss Matae B. Cleveland, who has come to New Haven especially to look after the work of instalment. Miss Cleveland is an expert in this line of work and comes here through the Welfare Department of the National Civic Federation.

So much interest has been manifested in these club rooms, and so much anxiety has been shown for their existence, that the news that they are nearly ready for use will be hailed with delight. The employees will especially welcome the announcement that the serving of lunch in the large dining room, in accordance with the plans, will so soon begin. The dining room will accommodate as many as one hundred at a time. It is intended to divide the working force of the store into four divisions, the first of which will go to the dining room at 11.30 and the last at 1 o'clock. Everything has been planned to permit quick service and it is hoped that the clerks will thus be enabled to take a little stroll, after luncheon, and still get back for their duties within the allotted half hour.

Upon one side of the dining room will be placed the reading and resting room, furnished with library tables, lounges and chairs, and provided with newspapers and other literature. On the other side will be the smoking room, while the kitchen will take up a large space across the rear of the big hall.

Even before completion, the hall and adjoining rooms will be dedicated to future social uses by a dance, under the management of the entertainment committee of the Employees' Association.

The prevention of strikes or lockouts by the National Civic Federation is a new proposition to both employer and employee, yet, in its comparative infancy, it has to its credit a splendid record of prevented breaks between capital and labor. It is to be hoped, and it is expected, that the men who are really interested in the question of industrial peace and who are in touch with the National Civic Federation will do much toward adjusting many controversies that, without their kindly offices, might result in disagreement to the point of separation. —*Labor Clarion*, San Francisco.

The National Civic Federation Review

VOL. II. No. 8

NEW YORK, JUNE, 1905

TEN CENTS

IS THERE AN IMMIGRATION PERIL?

THE POPULAR IMPRESSION THAT THE SCUM OF EUROPE INVADES THE UNITED STATES
VIGOROUSLY COMBATED BY QUALIFIED EXPERTS.

THE growing volume of immigration and its relation to American industry was the general topic discussed at the quarterly meeting of the Civic Federation of New York and vicinity held on June 19 at the rooms of the Board of Trade and Transportation, 203 Broadway. Special questions considered in relation to the subject were: What is the net annual gain in the population of the United States from this source, and what is its character? Is there any practicable and desirable plan for distributing the immigrants throughout the country? What percentage of the arrivals is undesirable, and what, if anything, can be done to reduce this? What proportion of the 64 per cent that arrive at Ellis Island remains in this city? What industries does this affect, and how?

The participants in the discussion all spoke with the authority of expert knowledge. The information that they presented and the opinions they expressed were such as to correct much popular misapprehension upon this subject; such as, for example, that a great majority of the arrivals are from the jails, asylums and poor-houses of Europe. They were also of such a nature as

to emphasize the importance of the topic. For that reason, a resolution was adopted requesting the National Civic Federation to appoint a committee to give especial consideration to the relation of immigration to American industry, including particularly methods of its distribution and existing and proposed legislation; the committee to be composed of men of national reputation and to make a public report as soon as practicable. Among the illustrations accompanying this report are reproductions of photographs of immigrants, selected by the officials at Ellis Island as typical both of those admitted and of those deported. A verbatim report of the proceedings follows:

Charles A. Moore, President of the New York Civic Federation, in calling the meeting to order stated succinctly the scope of the discussion. He introduced as the first speaker Nathan Bijur, President of the State Conference of Charities and Vice-President of the United Hebrew Charities.

Mr. Bijur:—

Mr. Chairman and Gentlemen.—I doubt whether I can say more than a word or two on one or two of the

suggestions contained in the invitation, as the subject is so broad as to be impossible of thorough treatment in the short compass of a few informal remarks.

As a lawyer I take the liberty of advising my friends that it is impossible to discuss a problem unless we know what the problem is.

It is a very common thing to hear of the evils of immigration and the misfortune brought upon the United States by the immigrant, and of the hardships and burdens of the immigrant. Personally, I have no knowledge of these burdens; personally, I have not seen the evils as the term is applied particularly to immigrants, and I have searched in vain for a categorical and clear statement of what the trouble may be. I know that we have in the United States, and particularly in New York City, a great many poor people. That is nothing new. It simply carries out the prediction contained in the good old book. I presume we shall have those poor with us for a long time to come. I have no knowledge whether there were poor people when the original Americans monopolized the inhabitancy of this country, that is, the North American

ALIENS WAITING FOR TICKETS AT RAILWAY TICKET OFFICE, ELLIS ISLAND STATION.

Indians, but so far as our civilized history goes, we have had the poor among us ever since the first immigrant landed here, in the person of Columbus.

Now, in regarding the question of the immigrant—not the evils of immigration, but the question of the immigrant—we are frequently furnished with statistics. Let me say a word about statistics. Statistics should never be gathered by an advocate. Statistics should be gathered by a statistician. You know the old joke about three kinds of lies: Lies, and blank lies, and then statistics. That is a very unfair characterization of statistics. Statistics, if gathered by a statistician, do

Now I will read this relation of the number of new immigrants to the actual population by decades:

1821 to 1830, 15 to the 1,000.

1831 to 1840, 47 to the 1,000.

1841 to 1850, 100 to the 1,000.

1851 to 1860, 110 to the 1,000.

And now in subsequent decades, 73, 73, 104, and in the decade from 1891 to 1900, 59 to the 1,000.

In other words, not only is the ratio of increase by immigration not growing, but it is actually diminishing. That is to say, the number of immigrants who came in between 1891 and 1900 is very much fewer to the

burden upon the community by occupying the charitable and the penal and the reformatory institutions which the public have established. Then you are told that there are two kinds of immigrants—desirable and undesirable, the desirable being those that are designated as the ones who are kin to us in race or blood or habits, and the undesirable are all the rest.

But an analysis of the figures, which it would be altogether too voluminous a task to undertake here will indicate that while it is true that the alien and the foreign-born furnish a large proportion of the census of our charitable institutions, it is not true that the unde-

MAIN BUILDING, ELLIS ISLAND.

IMMIGRANT CHILDREN ON ROOF GARDEN, ELLIS ISLAND.

present the pictures of fact. After we have the statistics we may honestly determine whether we are an advocate or an opponent of the particular question which the statistics elucidate. The trouble with very much of the statistics gathered on the subject of immigration is that they have been sought after with a view of proving or disproving some previously conceived theory.

Now, when we look at the question broadly, what have you here about immigrants and immigration? That there is such an enormous number of immigrants coming into the United States at the present time. I have taken the trouble to look up some figures, in fact they have been collated by a number of men interested in the subject, and some of these have been published. A very interesting tale is the one prepared by Mr. R. P. Falkner and published in the *Political Science Quarterly* for March, 1904. Taking the decades from 1821 to 1900, 1821 to 1830, 1831 to 1840, and so on, he shows the relation of the total number of immigrants to one thousand inhabitants of the initial population. That is, the relation of the number of immigrants coming in during each ten years, to the number of inhabitants of the United States then present in the United States.

general population than the number of immigrants who came in in 1841 to 1850, 1851 to 1860, 1881 to 1890, and the other periods that I have named. So that this tremendous inrush of immigrants is something that is tremendous in its absolute figures but very small in its relative figures to the general population of the United States.

Now, when you remember that the State of Texas, which is larger than Germany, is alone capable of feeding a population and holding a population very much larger than Germany, which is, I think, some fifty-five million, and that the total number of inhabitants of Texas is about three and a half million, you will see that there is room, at least in some parts of the United States, for an increase of population, whether by immigration or otherwise.

But when these figures are presented we hear another objection to immigration, namely, this: It is true we need two hundred million, or we can stand two hundred or three hundred million more population, but we want them in the West and we want them in the South, and they should not come in the great cities; but that is where the immigrant flocks.

Now, it is equally interesting in that relation to see what the growth of urban population has been in the United States in recent years. From 1891 to 1900 the increase of population in the United States as shown by the last census was 13,000,000. That is, new inhabitants of the United States, whether born here or coming here as immigrants. Now, out of the 13,000,000 the growth of population in the urban communities was 7,600,000; in the semi-urban communities 2,000,000, and in the rural communities, 3,400,000. That is, the urban and semi-urban population grew 9,600,000 while the rural population grew 3,400,000. The total immigration during that period was but 3,600,000. It is perfectly evident, therefore, that the tremendous growth of the urban communities was not due to the immigrant at all, or at least was only due to the immigrant to the same extent that it was due to the native. The people from the country have come to the city, because either they liked it better, or thought there were greater opportunities in the city. If we are going to shut out from our city, because of some rule that we arrogate to ourselves the power to make, the people who now live in the country who prefer to live in the city, we should have to shut out the Vice-President of the National Civic Federation, Mr. Oscar S. Straus, and we should have to keep from our city lines a gentleman who has recently distinguished himself, named Mr. Thomas F. Ryan. There are other men you might think of who have come from rural communities to the cities and have not been a great burden upon the city institutions or upon the charity of the rich.

Now, what other general objection do you hear to the immigrant? You hear this, as I have said: First, there are too many of them. Well, the figures do not seem to show that, proportionately considered. Next, they flock to the cities more than the native does. That does not seem to be borne out by the figures. But, you are told, the immigrant in particular becomes a

sirable, so-called, that is, the south and the eastern European furnishes that larger proportion. On the contrary, an analysis of our criminal and of our charitable statistics will show that the so-called desirable aliens from northern and western Europe, occupy—well, nearly double the amount of room in our charitable and penal institutions that is occupied by the so-called undesirable immigrant from southern and eastern Europe. I want to say a word after all about this occupancy of our charitable institutions. The immigrant comes here and generally for the first ten or twenty years, until the new generation is on its feet, the immigrant is poor; the immigrant takes what we might call the laboring oar in the community. Is it any wonder that he occupies our hospitals and our insane asylums? Not at all.

You see, statistics must always be regarded from a comparative standpoint. You must differentiate, you must classify.

If you compare the statistics of accidents that happen in the City of New York and pick out, say, the firemen, you will find the proportion of accidents is much larger among firemen than among other people. It is their duty to meet with accidents. And the same might be said of the police. If you pick out the immigrant, who is generally the worker, it is quite natural you will find more immigrants in the hospitals than natives, because

PAUPER ALIENS—DEPORTED.

ROVING SERVIAN GYPSIES—DEPORTED.

TYPICAL SLOVAC WOMAN.

this. I cite it merely to dissuade rapid judgment from insufficient figures. I know of no inference that can be drawn from this. But you go about and you know from your own experience that the children of the immigrant are the most ardent citizens and the most ardent students in our schools and colleges.

We have a notion that the immigrant comes here poor and that, therefore, he is a burden on the community.

What would we do without the poor? Somebody has got to do this work. The history of the United States has been that in every irruption of a large number of immigrants the people who have been here before have been, as I think some politician once expressed it, kicked up into a higher place. It has been the history of this country since 1821 that every time a poorer class comes in, it takes the last economic strata of the community and pushes it up a peg. And that is going on to-day exactly as it did in 1830 and in 1840.

If we establish a purely economic or financial basis for immigration I am afraid we would be apt to exclude a great many gentlemen who are to-day quite a factor in the community—we would have excluded them, one of whom I see sitting here now, another of whom has become famous the world over as the greatest ironmaster, and yet when he came here he was quite incapable of getting in by a show of cash in hand.

There is a different question, not the question of anti-immigration, but the question of sifting the immigrant who comes in. When it comes to the question of keeping out the diseased, the actually pauperized, the actually criminal, who, gentlemen, come here, I think, not of

TYPICAL HOLLAND DAMES.

the immigrant is the man who takes up the employment which brings about the accidents; he takes up the employment in which the work is hard and dangerous. It is no wonder that he breaks down, and it is no wonder that he is injured.

On the question of intelligence I have never heard the immigrant criticised. There is a vague notion that the immigrant is illiterate. That is not true. Moreover, whether the original immigrant be illiterate or not, his children are more literate than the children of the native American.

I was very much startled to find a little set of figures that gave these facts: Natives of foreign-born parents who could not speak English in New York State, according to the 1900 census, 2,500; in Wisconsin, 5,000; in Minnesota, 2,740, and in Pennsylvania there were natives born of native parents who, nevertheless, the children, could not speak English to the number of 19,000.

Now, there is nothing significant in this; there is no conclusion to be drawn from

STALWART SPECIMENS FROM ROUMANIA.

Do we want to go back to the old humdrum, or do we not want to have all these elements?

And then here is one other consideration. I need not go into the history of the United States to say that if the United States stands for anything, it stands for political and for religious freedom, and I think I voice the sentiments of the American people in its true sense if I say that so long as there exists a man or a group of men in any part of the civilized world who are persecuted or oppressed because of peaceable political or religious beliefs and purposes, so long the doors of the United States will have to remain open. (Applause.)

The Chairman.—The Chair will call on Mr. A. W. Sullivan, editor of the *Weekly Bulletin of the Clothing Trades*.

Mr. Sullivan:—Mr. Chairman and Gentlemen.—Being asked a few days ago my views on immigration, I replied, "Exclusion." Thereupon I was invited to come here and outline my position.

TYPICAL ROUTHENIAN WOMAN.

their own accord, but because they are sent here—that is a different question. Anything that we can do to protect ourselves against the burdens that probably belong in other communities we should do. Whether we can do that by imposing a money penalty upon the immigrant that comes in I doubt very much. Whether we charge a \$2 a head tax or a \$25 a head tax, it is my impression it will make no difference. I think the community—I do not mean this as applying to Germany or France—but I think the community in Germany or France or Austria or England, or wherever it is, will pay the \$25 to get a pauperized immigrant in here. But the honest immigrant, who deserves to come in and who may have only \$10, will be kept out. Financial bases for immigration are very artificial and very dangerous.

I do not know that I can add anything more—excepting to say one word: There is something in this question of immigration altogether outside of figures and dollars and cents. The United States is great, not because of any one class of its population, but just because it represents an amalgamation of various types. There have been brought to us all the forms of activity that have made modern civilization what it is, and the United States has become on that account a microcosm. We have got our love of art from the Italian; we have a lively and active spirit, perhaps from the French and from the Irish; from the German we got our love for music. From all these continental nations we are beginning to learn how to rest. Now, why do we want to keep these elements out? What is the matter with them? From the Russian we are getting an idealism to which we ourselves have been strangers for decades.

FROM ROUMANIA TO MICHIGAN LUMBER CAMPS.

The transatlantic steamship lines, almost exclusively non-American, in the last three years, coming and going, have carried wage workers in migration to the number of more than three millions; any one may compute for himself how nearly the gross earnings of these companies from this traffic have approached one hundred million dollars. If the average of the railroad and steamboat fares spent within this country by these migrants has been ten dollars, the inland American transportation companies have garnered from them about thirty millions dollars. If the manufacturers and mine owners and the employing classes in general have availed themselves of one-tenth of this providential supply of cheap labor, in substituting it for labor previously better paid by 10 per cent., they have saved in the three years in wages a matter of fifty million dollars. Crumbs sufficient to keep them alive falling from this traffic have also been picked up by some thousands of contractors, padroni, employment agents, slum landlords, and dealers in small patches of "our" undeveloped resources. If in America it could occasionally happen that lawmaking should result from pull and steering, the not somnolent interests mentioned might perhaps be tempted to try their turn in asking Congress for something good. Having overstuffed the

CHARLES A. MOORE,
President New York Civic Federation.

cities to a point of acute indigestion, they might come forward and suggest a project for loading up the hinterland.

Among the numerous articles afloat on the ocean of print during the last year or two advocating government aid in distributing the arriving millions, none has suggested a clearly considered, specific, detailed plan. "Kansas announces its need of forty thousand agricultural laborers for the coming harvest;" "the South is always calling for more field workers;" "immigrants have reclaimed many abandoned New England farms;" "healthy new communities can be nurtured from the bosom of Nature itself;" "land is offered everywhere on desirable conditions;" "plenty of room in our West, Northwest, South and Southwest"—these glittering pearls, borrowed from the phraseology of the real estate boomer, have been dangled before us, but out of it all we have been given no definite project.

To what part of this country can the coming poverty-stricken swarms be sent where they will surely benefit themselves and the community?

Shall we recommend the Pacific Coast? For twenty years rural California has been the gleaming ground of thousands of roving, homeless white blanketmen and of great gangs of yellow and brown men, whose movements depend on the successively ripening crops on large plantations in various parts of the State. To-day the entire Pacific Coast is in the throes of an agitation for the exclusion of all Asiatic laborers. The *San Francisco Chronicle* says that there are now in California thirty-five thousand Japanese, and on the whole length of the Coast fully one hundred thousand, the majority having arrived in the last five years, and a former agent of the Industrial Commission reports that "the number of Japanese in California alone is greater than the total number recorded at all ports of the United States in ten years."

Shall we send immigrants to the Northwestern States? The last number to hand of the *Butte (Mont.) Reveille* redescribes the remarkable movement of American citizens to Canada. It says the number going this year will be fifty thousand; Collier's counts on a hegira of one hundred thousand a year. Why don't these people stay and develop the alleged virgin riches of the country they are deserting?

Next, Colorado. Are we to send a hundred thousand more laborers to that noble State. Last year the United Mine Workers spent nearly half a million dollars in the Rocky Mountain region supporting moderate union

demands and came to grief. But perhaps there are other vast mining districts only awaiting the "magic hand of labor" for their needed development. There's Illinois, the State of Mr. Joseph Leiter, having, Professor Commons tells us, thirty-seven thousand coal miners, 60 per cent. being foreign born, the majority, arriving since 1894, having taken the places of Americans and Americanized miners from Western Europe. There's West Virginia, the scene of a long series of strikes, still on, many of the non-unionists newly arrived foreigners and the union men being described in the *United Mine Workers' Journal* this month as living under a reign of terror, the victims of lawless opponents. There's the Alabama mine district, where the United Mine Workers have recently had eight thousand men out, but where convicts have long been busily employed. There are the anthracite regions of Pennsylvania, where the Slavs and their descendants number one hundred and ten thousand, if we may believe Dr. Peter Roberts, of Mahanoy City, a systematic observer of the subject.

It is no longer proposed that immigrants adapted to the work be sent to the New England textile mills, which now largely employ not only French Canadians, but Armenians, Greeks and Portuguese, with remnants of the English and Irish who two decades ago pressed in on the American employes. None are to go to the iron and steel mills of Western Pennsylvania, where the callous indifference to their swarming foreign human life has recently moved the Austrian, German and Italian Consuls to seek an investigation. Skilled immigrants are not to be assigned to communities according to their trades—for example, potters to the pottery towns, packed with importations from England; glassworkers to the middle West, over-run with Belgians who came under inducements; quarrymen to Vermont and Massachusetts, where the union organ is printed in four languages. Are our beneficent railroads still clamoring for more foreign construction hands? Or are there really not enough half-employed Italian gang laborers in this country now? The Ninth Special Federal Report (p. 29) put the percentage of the unemployed unskilled Italians in Chicago at 56.97. Dr. Peter Roberts writes that after the great anthracite strike, when the mining industry was rushing, the collieries did not average more than two-thirds time.

What region or occupation in America is not already over-supplied with cheap foreign labor?

Ah, agriculture! Every farmer needs a hired hand! Five million farms; five million hands wanted! Five years more of business for the steamship companies before our vast national stomach shall be crammed to the throat. Unsophisticated persons there are who still echo the marvellous tales told about farm help somewhere growing rich on harvest-hand wages. And what is the big, broad, blanket-like fact that covers the entire proposition? It is this: For fifty years the average yearly earnings of the American farmhand have been the lowest in the entire national wage scale. From 1860 to 1890, except during part of the Civil War, the annual farm wages was variable in but the slightest degree. Aside from the census, the Department of Agriculture has made repeated investigations, one official conducting five of them within twenty-five years, and always finding this same state of facts. The census of 1900 reported a small increase, but the late Dr. Spahr, making special inquiries in 1899 as correspondent of the *Outlook*, found that general farm wages in Arkansas, for example, had fallen from \$18 a month to \$10 within fifteen to twenty years. Those excellent citizens who find mental recreation in belittling the laboring classes sometimes indulge in agreement on a fallacious prejudice according to which the working man shuns the country and loves the city's lights. The fact and principle involved are otherwise. America's labor, following the line of least resistance in striving for the American standard of living, cannot be expected to remain contented at an occupation whose rewards do not include a united family life, a home or wages above that of the day laborer. As to the attractions of the South and Southwest, continually advertised during the last quarter of a century, the foreigner believes them to be counteracted by competition with the negro, who, acclimatized, disciplined to subservience, by nature a season worker, presents to the world an example of the survival of the fittest.

But, "the immigrant is to buy land," "the era of the small farmer is at hand," "suitable acreage can be had on most desirable terms." Reply: The three hundred thousand Southern Italians, Hebrews and Poles arriving last year landed with an average capital of \$13 per person. The Industrial Commission in 1900 gave the average for these nationalities for years as respectively \$8.84, \$8.67 and \$9.94. Our immigrants reach here on the brink of want, the general average of their capital in 1904 being \$25.70. Nearly all are untaught in American methods of agriculture and of selling produce. The barrier between the \$10 foreign capitalist and the independence of an American farmer's life is mountains high—his need of food, clothing and shelter until he can surely produce a paying crop, his need of at least a part of the purchase price of his land, his ignorance of our language and commercial methods.

Where, in the name of horse sense, is there to-day a dearth of common labor in America? In what region will not brawn and backbone, of itself, appear, ready

and willing, whenever a living wage is offered? In 1900, the census tells us, the percentage of those engaged in gainful occupations who were unemployed during some portion of the year was for the whole country 22.3; in 1890 it was only 15.1. In agriculture the percentage was 20.7.

[At this point the speaker said that to deliver his entire address would overrun his time; he therefore asked leave to print. Granted.]

One quarter there is to which the non-English speaking creatures with but \$10 between themselves and pauperism can count on being rushed posthaste to work. It is where there is a strike or lockout. In one occupation they are given an indulgent trial for the passing hour by solicitous employers. It is as strikebreakers. Unrestricted immigration is unlimited government aid to union wreckers.

The cry now is for "distribution!" The unemployed are already well distributed in every State of the Union. The many great strikes of the miners the last two years should be deeply significant to those who urge sending the laborers out away from the cities. That is where the miners are. The miners are diggers, delvers, laboring men, as closely related to farm workers as any other class. If really any rural part of this country wants labor, underpaid, partly employed mine workers

ROBERT WATCHORN,
Commissioner of Immigration at Port of N. Y.

are so distributed by the thousands that it is strange they do not respond to the demand.

The problem of immigration admits at its present stage of only two modes of interference.

The first mode is further to extend the present policy, which, ostensibly that of assistance to the immigrant, is really a costly and indulgent paternalism toward parasites on the American people. Further steps in its pursuance will provide for more dividends to foreign corporations subsidized by European governments, possessed of ships convertible to war uses, and developed with the intent to drive our American marine from the seas in peace and in war. These further steps will also call for more rackrent for slum landlords, more rakeoffs for contractors, padroni and foreign agents of transportation, more voting cattle for our political stockyards, more blood for real estate sharks more non-unionists for manufacturers' combines, more outlay for every charitable and penal institution in this country, and incalculably more misery for America's wage earners.

Shall I illustrate by facts?

Not alone more riches and power for foreign steamship companies, but help to foreign governments. We read only last week that the Royal Steamship Company of Great Britain, built up by a subsidy of a million dollars a year, is to establish a line between America and the Mediterranean ports. We are informed that the English Government has a sovereign interest in the great new convertible Cunarders. The advertised present activity of the Italian Government in supervising emigration greatly results in keeping in Italy conscripts for the military service. The long continued practice of deporting public dependents has been astutely permitted by foreign governments to be shifted to a new form of insurance company. Professor Edward T. Devine writes that at Bremen and other points of embarkation are agencies with offices in many parts of Central and Southeastern Europe which contract for a price a safe landing in America or a free return to all comers. In this transaction the hand of neither government nor steamship company can be seen. But steamship officials are not always so modest. On January 26, 1897, the restriction bill being up in Congress for a vote, a German steamship official telegraphed to doubtful members threatening them with defeat at the next election if they voted for the act—if we may believe the Restriction League, which prints the telegram,

with names, in one of its leaflets. Mr. Lodge declared in the Senate, without contradiction, that another telegram had been sent at the time to every American newspaper carrying the company's advertising.

More fees to steamship agents! Stimulating emigration to America is in Eastern Europe a recognized profession. A representative of the United States Treasury Department investigated the subject in the summer of 1903. He found that in Europe drummers for steerage passengers to America included school teachers, notaries, postmasters, pedlars, peasants, and even priests. Mr. Ward assures us that the seven thousand steamship agents scattered throughout Italy have succeeded in persuading many thousands to come here who otherwise would have remained at home.

More success to Italian padrone and American contractor. For example, Rome, New York. That city let out to the lowest bidder certain public works. He sent to New York for a gang of two to three hundred Italians. They came and did the work at wages representing a degenerate level for Americans. They lived in shacks, ate animal food, wore foreign clothing, lived meaner than at home, for economy's sake. They saved their full share of the \$25,000,000 annually sent to Italy by New York's Italian banks. To the town shopkeepers they brought little or nothing; to the State, no taxes; to the jail, assault cases; to the public schools, itch and trachoma. The city of Rome, N. Y., had numerous workmen who would have been glad of the work. But, as in ancient times, foreign serfs labored on the municipal improvements while Rome's proud citizens stood idly by. In this respect the history of Rome has been repeated in a hundred American cities.

NATHAN BIJUR,
President State Conference of Charities.

To the employers' combines that are engaged in the crusade against trade unionism the hordes of fresh immigrants have been an inestimable blessing. These combines are invariably composed of intense Americans, bound by hooks of steel to every American tradition save traditional American wages. They'll drive the American wage workers out of a trade, and when their foreign non-unionists purge themselves and join the unions, will upbraid them for their un-Americanism.

An example, the clothing trade. The New York State Department of Labor (p. 43, Report of 1902) has pronounced the sweatshop a result of immigration. Dr. George C. Stiebling, of St. Mark's Place, New York, thus defines sweatshops: Workshops "in which clothing is manufactured and which serve at the same time as dwelling rooms to the bosses, their families and boarders"—"overcrowded, ill ventilated, over heated, full of dirt, filth, vermin and stench;" consequently, "unwholesome, health destroying and disease breeding." Joseph Baroness two weeks ago publicly stated that never were sweatshop conditions worse than at present on the East Side. In 1904, the Immigration Bureau reports, 23,508 tailors arrived. Besides, a benevolent society maintains schools for tailors on the East Side. Last summer the wholesale ready-made clothiers' combine, with philanthropic intent, established another school and union blacklisting employment bureau in Astor Place. This combine's organ, the "Daily Trade Record" (March 28, 1905), thinks well of the proposed Ellis Island great exhibition hall. It wants there, as a part of it, "a big clothing factory, in which arriving immigrants could note the class of tailoring work to which they are best adapted. Agents could be stationed there to direct them to the concerns in different markets most in need of their service. In this way considerable labor trouble would also possibly be averted." True, for the Chicago special order tailoring unions charge the combine with boldly violating its trade agreements, and refusing to submit the point to arbitration, because uncontrolled immigration permitted it to lock out its Scandinavians, Germans and naturalized Hebrews having \$100 apiece, and lock in Bohemians, Poles, Italians

and greenhorn Hebrews possessed of \$13 apiece, less immigrant fare to Chicago.

Can the Ellis Island officials guarantee that the incoming hosts booked for the suburbs will not stray to the cities? The federal inspectors, obeying the recent reform laws relating to pauper, insane, criminal, diseased and contract labor immigrants, last year deported the largest proportion ever known—and that was less than 1 per cent. The law's guarantee to protect us from these classes is plainly worthless. There's hardly a skilled trade in America, there's no industrial center employing highly specialized labor—from wood working to chemistry, from musician to cloth dyer—that cannot bear overwhelming testimony to violations of the contract labor law. The Federal Census Bureau reports that while the native born inmates of American insane and charitable institutions are 3 to 1,000 inhabitants the aliens number 30 per 1,000. Dr. Shively has estimated that 23,000 tuberculosis immigrants were landed in New York in 1902. The State of New York alone has 6,000 aliens in its public insane asylums. Of the 44,985 aliens in the insane, penal and charitable institutions of the United States, 19,764 are insane. Goodwin Brown, a specialist in lunacy statistics, predicts that in ten years the alien insane will cost the United States \$50,000,000 a year. A writer in the Brooklyn Eagle has recently estimated that the cost to New York State of its foreign born poor is annually \$12,000,000. Of 2,595 cases cared for by the New York Lying-in Society only 315 were patients native born. Multitudinous are the phenomena that government inspectors cannot either see or foresee. And astonishing are the things they are unable to do. The New York State Free Employment Bureau, with a million job seekers to experiment on, found places last year for about 7,000. The State Commissioner of Labor, when his inspectors last January captured in Elizabeth street tenements numerous bundles of men's clothing being finished in unlicensed dwellings contrary to law, refused to make public the names of the manufacturers owning the goods, since the statute gave them that discretion.

Good reasons, and many of them, in all the facts just mentioned for not enlarging the powers of labor bureau officials over Europe's impoverished millions thrown overboard in New York Harbor.

The second mode within sight of dealing with the immigration question is exclusion. As President Roosevelt said in his message, let us welcome the desirable and reject the undesirable. I submit that every immigrant who cannot pass an illiteracy test and prepay an insurance of \$50 against becoming a burden to this country, to be used for his deportation if necessary, is undesirable.

I also hold that a period of total suspension may become a necessity. This is conservative as compared with a decision of the United States Supreme Court, rendered in May, 1895. This was: "The power of Congress to exclude aliens altogether from the United States, or to prescribe the terms and conditions upon which they may come to this country, and to have its declared policy in that regard enforced exclusively through executive officers, without judicial intervention, is settled by our previous adjudications."

The illiterate among the immigrants over fourteen years of age, coming from Eastern and Southern Europe, were in 1900, 38.8 per cent.; in 1901, 46; in 1902, 44.3; in 1903, 40; in 1904, 43. The State Department of Labor reports that "the two countries having more than 50 per cent. of illiterates furnish one-fourth of the whole number of New York's aliens."

Reject the illiterates, require the fulfillment of the obvious obligation insisted on in wise New Zealand, that the foreigner shall not become a public burden, and the results will stagger the imagination. The colossal European marine leeches will no longer get drunk on both foreign and domestic blood; the discontented democratic hosts of Europe will be strengthened through the retention of their brothers at home; the working men of America will soon begin to pour out money to our business men, for their advancing wages will at once absorb a fair share of the enormously increasing product of the country. An authority in the New York building trades equal to the best recently told me that with immigration suspended common labor in this city would be \$3 a day within one year. The clothing trade unions would quickly proceed to enlist every garment worker, Hebrew or Gentile, in Greater New York, and their label would insure the well attired classes that no consumption sputum infected their coats.

Have no fear that the foreign born wage workers now here will not, after a brief campaign of education, favor exclusion. Why is only one immigrant in eighty a Frenchman, one in forty an Englishman, and one in several hundred a Swiss? It is because the masses of those intelligent nationalities are already educated in the fact that, all things considered, the economic level of the American wage earner is but a bare notch or two above that of their own land. The 10 per cent. of immigrants returning disgusted to Europe teach them that point. The immigrants now in this country can on humanitarian grounds repel the charge of selfishness in voting for exclusion. As one of the speakers said when the United Hebrew Trades voted for suspension of immigration for five years, "We are in a trap here; let our brothers at home keep out of it." When the unions of the State of New York voted, two

hundred to two, for suspension, it was avowedly done without prejudice of nationality or race, but purely for economic causes, and in the belief that governments owe it to themselves to work out their special problems of poverty within their own boundaries.

The Chairman.—Gentlemen, this is what the Governor of the State of North Carolina says to you here in a letter:

State of North Carolina,
Executive Department.

RALEIGH, June 17, 1905.

Charles A. Moore, President New York Civic Federation.
Dear Sir.—It is with deep regret that I have to write you that it is impossible for me to be with you on June 19 to attend the immigration meeting. Our State at this time is offering the very highest inducements to immigrants who will make good laborers, and also to farmers. Our farmers are willing to furnish the land, the stock, the necessary working tools, and give the party furnishing the labor half of all that is made. I wish it was so I could be with you and extend an earnest and open-armed invitation to all to come to our State, but am compelled to send my regrets.

Yours very truly,
(Signed) R. B. GLENN,
Governor.

The Chairman.—The next speaker will be Dr. Joseph H. Senner, ex-Commissioner of Immigration:

Dr. Senner:—

Mr. Chairman and Gentlemen.—We do not propose here to have a college debate dealing in generalities of all kinds. We propose to fall back on the specific points mentioned in the two circular letters received. The second letter I want to mention first, because it contains the stupendous statement that the great majority of the arrivals, which is more than two-thirds of a million, are from the jails, asylums and poorhouses of Europe. I wish, gentlemen, that statements of this

J. W. SULLIVAN,
Editor Weekly Bulletin of the Clothing Trades.

kind would be entirely dropped from the discussion of the immigration question. There may have been some isolated cases in immigration of persons coming from poorhouses or jails, but I can positively state that no number of such cases has been or is among the arrivals at Ellis Island. And further I can state that if they exist they are not among the steerage passengers, but they are among the first and second cabin passengers. (Applause.)

We have here to consider the question of what is the net annual gain in the population of the United States from immigration, and what is its character?

The net annual gain in figures has been treated of by the first speaker, but the gain in numbers, gentlemen, is very little as compared to the gain in wealth to this country by any immigrant arriving here.

If with me you pride yourselves upon the fact that we have the greatest home market of any empire in the world, you must not forget the fact that it is no doubt due to immigration. It is immigration that has made possible the immense development of our industries.

Having had the opportunity to witness in tens of thousands of cases and with my own eyes to see the immigrant arriving upon this shore, poor, destitute, more than simple in all his make-up, and a year after to have seen the same immigrant, whether a man or a woman, come to Ellis Island again to call for her sweetheart or for her husband or for children or for a friend, the difference, gentlemen, between the parties as they arrived and the parties as they appeared within a few months is simply wonderful. They have entirely changed; all their clothes are American and their new make-up is quite respectable. It is absolutely wonderful to any one who remembers their condition when they arrived. Our great home market, with its feeding of millions and millions of skilled laborers, was only made possible by immigration.

In the same way it was only by immigration that we could build up such a wonderful network of railroads, many of whom had to go into the hands of receivers every time immigration came to a standstill, or because

the constructors of such railroads had been rather visionary as to the time which would be necessary to fill up their country.

There is the net gain for our country which has been secured from immigration, not to speak of the fact that without immigration the number of our population would be immeasurably smaller than it is now, because our immigrants do not believe in race suicide.

Is there any practicable and desirable plan for distributing the immigrants throughout the country?

When I was Commissioner of Immigration at this port I conceived first the idea that the problem of immigration will in time be solved only by the proper distribution of immigrants all over the country into those places where they can be of the most good to themselves and to the country they live in. I then suggested in the immigration investigation report of 1895 that a clearing house should be established in Ellis Island for that purpose. I am very glad indeed that the present Commissioner General about two years ago took up the very same idea. I admit it appears rather impracticable for sometime, but only because our laws forbid instructions to immigrants about the benefits and advantages of sections of this country by any kind of advertisements or educational work abroad. This clause of the law would have to fall first. But then, with the previous education of emigrants given to them partly in their own homes before they make up their minds as to where to go,

EMIL L. BOAS,
General Manager Hamburg-American Line.

partly on board of the steamship and finally on Ellis Island itself, such education I believe would be practicable and would finally lead to the point that immigrants could settle in places for their own welfare and for the welfare of the country, instead of being allured as to-day by all kinds of incidents or by the glowing accounts of some interested person.

A great deal is also said about the inducement of emigration by the steamship companies. I have no reason, whatever, as you know—I suppose most of you know—to be in any way interested, directly or indirectly, in or for the steamship companies. But do you believe that the zeal of the steamship companies or of their European agents to induce emigration has been smaller during my term of office, when only 250,000 to 400,000 immigrants used to land annually, than it is now, when 1,000,000 immigrants land? Just the opposite. You may rest assured that at that time when immigration was only 250,000 to 400,000 a year they worked much harder than they do now when immigration, so to speak, falls into their lap. It is the hundred million dollars spent right here in the neighborhood of New York on tunnels, it is the agency of all those people who prosper and write about it to their friends abroad, it is this that creates immigration and not any agency, which would be actually helpless in the case of dull times such as we had in the middle of the nineties.

The first thing we have to do under all circumstances is to exclude all and every undesirable immigrant. But in speaking about a desirable or undesirable immigrant I beg to differ from the first speaker, who classified them according to races or origin. Every immigrant in himself, his individuality, his personality, has to be judged and appraised in order to determine whether he or she is desirable or not. (Applause.)

Every one who, for any reason whatsoever may appear to be undesirable is to be rigidly excluded. And I am glad to state that under the present regime this is absolutely and conscientiously done.

Now this is the first axiom of treating the immigration problem. The second, however, is in my opinion and my conviction: Don't place any unnecessary hardships or obstructions in the way of any desirable immigrant that desires to come to the land of the free. And the third axiom is this: When they are found desirable

endeavor to place them by governmental assistance and by the assistance of all private associations and corporations, in such localities, in such environments, where they will find a good future for themselves and where they will benefit the country to which they have come. I thank you for your attention. (Applause.)

The Chairman.—The next gentleman I desire to call upon is Mr. Emil L. Boas, the General Manager of the Hamburg-American Line.

Mr. Boas:—

Mr. Chairman and Gentlemen.—I do not want to make a set speech. I simply want to mention a few figures and correct impressions that have gone abroad for a long time.

It is said, first, that this country annually increases by immigration from 700,000 to 1,000,000. But first of all, sight is lost of the fact of how many leave every year. Now, in this city alone, in the City of New York, we had last year 571,000 arrivals in the steerage, but 323,000 left in the steerage. So there was an actual increase of only 56 per cent. And so it is in the other ports, so that in the four ports of the North Atlantic, Boston, New York, Philadelphia and Baltimore, there were 693,000 arrivals, but 359,000 departed in the steerage. So that there was an actual increase only of one-half of this number. Now, I want you not to forget this whenever the newspapers or any persons speak of the enormous increase. Sight should not be lost of the fact that half of the number go out of the country.

A Voice.—Do they take back any money with them?

Mr. Boas.—I do not know. They do their work during their stay here and have actually earned whatever they take back. (Applause.)

Besides, I wish to call attention to the fact that one of the speakers has said that the poverty stricken hordes of Europe come over here. Now, according to the figures of the Commissioner General of Immigration the immigrants that arrived last year were first of all thrifter than ever before; they showed up no less than twenty millions of dollars in coming over (Applause), and that was four million dollars more than the larger number that arrived the year before. So they are not a poverty stricken horde.

Mr. Sullivan.—The figure was \$25.78 per head.

Mr. Boas.—That is only what they are showing up on the request of the Commissioner.

The Commissioner's official report states that the immigrants showed up the amount mentioned, and if this is only \$25 per head, and if that were all that they possessed upon arrival, it must not be forgotten that it costs them something to break up their homes, that they have to pay the railroad fare to the port of departure, Hamburg, Bremen, Antwerp, Rotterdam, etc., and the steamship fare from the continental port to the American port which is at present at least \$36 per head, so that adding up all the traveling expenses alone, they must have between \$60 to \$70 for each person, which, with the \$25 shown upon arrival, makes \$85 to \$95 each. A family of six must, therefore, have had before starting over \$500! These are average figures. Now, do you call a man in this country who has put away over \$500 for a rainy day as belonging to the "scum" and to "poverty stricken hordes?"

The money which these immigrants bring is, however, by no means their whole addition to the wealth of this country, for it has been computed by political economists that the economical value of every able-bodied male immigrant over twenty years of age represents on an average the sum of \$1,125 actually added to our working capital; in that way the wealth of this country is annually increased by hundreds of millions of dollars.

I only wish to remark again that the steamship lines are not scouring Europe to bring over immigrants. I want to refer to the very able article written by Mr. Whelpley in the *North American Review* of this month, in which he makes the statement that the laws of European governments are made with the view to retaining the population there. They don't want to lose it. And the steamship lines are not allowed to scour Europe and distribute circulars that point in glowing colors to the advantages of America. All they are allowed to do is to announce their sailings, and if they do anything else they are severely punished. The greatest emigration agent is the United States mail, the letters that are sent from here, the letters sent home from this country, that say what a man makes when he works, that is the immigration agent that brings the people to this country. (Applause.)

These letters bring information upon which implicit reliance is placed, and cause the people in the old home to sever their connection with that which is dear to them and go to the strange country beyond the sea. An emigration agent could talk till doomsday before he would have the same effect. These conditions will never change as long as the advantages are greater in this country than in Europe. There is no better barometer of the business conditions than the number of immigrants that come to this country. If times are good they will come.

Mr. Sullivan.—May I interrupt to ask one question? May I ask you whether it is correct, as Prof. Devine says, that in Bremen and in numerous other quarters about Europe there are insurance companies which will insure the coming emigrant that he will be landed here, and if not landed here that he will be brought back? A

gentleman of the Treasury Department says to-day there are 7,000 agents, and that even the priests are among the agents. I very much regret to interrupt you.

Mr. Boas.—I cannot possibly speak for the numbers of people who consider themselves emigration agents in Europe, and those are figures that are assumed. I cannot controvert them. Anybody can make a statement of that sort, that priests are emigration agents or that there are 7,000 agents, or any other number. I speak for the steamship line that has been charged with scouring Europe to bring the poverty stricken hordes over here. That is absolutely untrue. It is not allowed by law, and I wish to say the steamship companies and their agents are lawabiding citizens. We abide by the law here and abroad. Here is the Commissioner of Immigration, he can say what we do to conform to the American law.

One of the speakers referred to \$10 immigrants. The steamship lines had a war last year and rates went down to a very low basis, and the newspapers announced that in consequence of these low rates hordes, thousands, hundreds of thousands would come over here. Statistics have shown that last year during the lower rates fewer arrived than the year before, and fewer than this year when the rates are high. That only shows that the passage money has absolutely no influence on immigration at all. (Applause.) There is another point I wish to make: It is again the same old story, if times

JAMES P. ARCHIBALD,
Secretary New York Civic Federation.

are better here the immigrants are bound to come, and who comes? It is the energetic man who has the courage to break away from the ties that bind him, it is the intelligent man who can appreciate that his condition will be better here than on the other side and who can cut loose from his ties and come across to the unknown country, and it is the man with savings who can afford to go—that is the man who comes, and the poor, the ignorant, the scum, the people who are not energetic, they stay behind. They do not come to America. So I wish to contradict again the statement that it is the poor, the uneducated, the criminal horde that come over here. We have laws that restrain the criminal from coming to this country. Here is the Commissioner of Immigration; it is his business to exclude every one that is undesirable. The steamship lines do not bring the undesirable here, and if any should slip in there is the man to keep them out, and he does keep them out, too. He observes the law, and so do we. That is all I wish to say, gentlemen. (Applause.)

The Chairman.—Permit the Chair to suggest this, that any gentleman present who is interested, and I presume every one here present is interested in this great question of immigration—if any one has not visited Ellis Island and observed the immigrants landing, I ask him to take the opportunity of doing it at the first available moment. It will be the greatest education to him as to these "hordes," these "pauperized people." You will see as bright, intelligent figures, capable looking people, as you will find in the same number of their class anywhere in the world. I think this is a subject that should interest every thoughtful American, whether a property owner to a little or a great extent, who employs labor. And if he will go over there and take the courtesy of the Commissioner of Immigration, he will be surprised as to the people who come here as immigrants, and at the manner of handling immigrants.

In the last few days a prominent railroad man told me it would be impossible for the West to have kept its tracks in condition to run over them if it had not been for immigrants, absolutely impossible.

The man who is going to speak next is the man who, in my judgment and from my observation, is the best qualified to tell us the truth as to the character of the immigrants, and to answer any questions about them.

I am going to call on the Hon. Robert Watchorn, Commissioner of Immigration at Ellis Island. (Applause.)

Commissioner Watchorn:—

Mr. Chairman and Gentlemen.—When I assumed charge of Ellis Island I stated to a committee that called on me to participate in some meeting of this or similar character, that I did not believe that a Commissioner of Immigration had any business to participate in the discussion of questions of immigration; that I believed it was his business to enforce the law as it now stands and leave it to the good judgment of the people of this country and Congress to alter the law when it ceased to be satisfactory. I have concluded since I sat here this afternoon that, notwithstanding the very handsome manner in which the invitation to be present here this afternoon was framed and delivered to me, that I made a mistake in departing from that conclusion.

I am quite sure from what I have heard this afternoon that the subject is very thoroughly understood without any information from the Commissioner of Immigration, and I am not quite sure in my own mind that there are not some people who know more about the practical enforcement of the law than I know.

It is not for me this afternoon to say to you whether I believe the law as it stands to-day is satisfactory or not. There is just one thing that prompted me to come here this afternoon more than any other, and that was that I might be able to state to you, on my honor that at the present time the law, as it is, is being rigidly and

he should not be allowed to come in; and the inspectors, acting upon their best judgment under the law, will decide that he should be deported; then there will come forward some of the very best citizens of this land who will undertake to prove to the government that it is utterly impossible for such a person to become a burden on the community, and they will bring such pressure to bear and file such proofs with the authorities at Washington that even such a person will be admitted, no matter what the inspectors may do in the premises. Now, I would like to point out, so far as I am concerned, that when a certain standard of test has been established and it is proven by all the tests that may be applied that that person is liable to break down at a certain point and somebody will have to support him, whether that somebody be public or private, there should be very good reasons assigned why such a person should be admitted, and Congress ought to stipulate that he ought not to come in.

One of the speakers representing the steamship lines said that they were obeying the law. I believe they are, but it is because they are compelled to. (Applause.) If you were to relax the rules and leave it to their good judgment and patriotic sentiment, undesirable immigration would increase in contrastive proportion to said relaxation. The power to exclude and the power to deport is just in proportion to the power to fine or punish for violating the law. Now, I have no fault to find with the steamship companies as such. I think they are endeavoring to obey the law. Not because they have any special scruples about violating it, perhaps, but because they do not like the punishment that is meted out to them for not observing it. This is probably rather a serious stricture to make on some of them, but my good friend, Dr. Senner, who preceded me, knows that since his term as Commissioner the power to punish has been very largely increased, and in proportion to that power to punish, an increased respect for the law has been demonstrated.

Now, gentlemen, I should like to ask you all to come to Ellis Island. What concerns me now most is this: I want you all to know, and I want you all to believe, that just as the law stands and is interpreted by the courts and other competent authorities, it is being rigidly and honestly enforced, and if, after you have discussed this matter to your satisfaction, you believe that the law can be improved, as I believe it ought to be, all you have to do is to make that known to Congress. Get the law amended, and I assure you that the government has ample machinery and satisfactory facilities for enforcing it effectively.

Whether the great number that are coming in are a detriment to this country or a benefit is not for me to say. My chief function at the present time is to see that the quality is just what the department and the courts have decided it should be. As to the quantity, I do not think that you will expect me to deal with that. I do not think it would be proper for me to deal with it. But I do hope that those of you who wish to be more thoroughly informed of the difficulties encountered by the Bureau of Immigration in enforcing the law, would come to Ellis Island and exchange views with those officers with a view to getting the law intelligently amended in order that we may still further eliminate those from the incomers that are likely to be a detriment to this country in part or in whole.

I am quite sure that from the Chairman down, there are those here, as I stated before, who are amply qualified and able to discuss that feature. So far as getting acquainted with the practical end of it is concerned, none of you will need a pass to come to Ellis Island. You will all be welcome, and if you can point out to me where the present system of enforcing the law can be improved I shall most cheerfully welcome your suggestion. (Applause.)

The Chairman.—We have here this afternoon with us Mr. M. V. Richards, Land and Industrial Agent of the Southern Railway Company, who has done a great deal to build up the Industrial South. I was at Washington a short time ago and the president of the road pointed to a map, and speaking of the change that had occurred since he came in charge, showed that on three hundred miles of that system three hundred cotton mills have been erected.

Mr. Richards:—

Mr. Chairman and Gentlemen.—I come to you to-day quite in sympathy with the foreign immigrant; I mean the immigrant who comes to our shores for the purpose of bettering his condition and is willing and competent to avail himself of the great opportunities our country affords those seeking a competency and desiring to conform to the splendid rules and regulations which go to make this the leading nation in the world. I have no sympathy with the immigrant who is not capable of appreciating the privileges extended to the homeseeker. I would uphold a most rigid investigation of immigrants before they are permitted even to purchase tickets to the United States. We can, in my opinion, well afford to strengthen immediately the Department of Commerce and Labor, so that it can organize its forces in Europe sufficiently to carefully investigate immigrants seeking admission into this country. It is our duty as Americans to throw safeguards around our shores, and while we welcome the thrifty progressive and substantial newcomer, we should strongly fortify ourselves against the undesirable class.

The trend of immigration to this country has been to

the West through the ports of New York, Boston, Philadelphia and Baltimore. Until within the last few years foreign immigration into the Southern States was limited. The last census shows that the States of Virginia, Kentucky, Tennessee, the Carolinas, Georgia, Florida, Alabama and Mississippi, all of which I have the honor to represent by reason of the railroad I am connected with, having lines running through or to those States, had only 1½ per cent of the total foreign-born population of the United States, or 156,284. These States occupy a very peculiar position in reference to immigration. Since the Civil War the South sent about two and one-half millions of white people into the North and West and received from all sources less than one-half that number of immigrants. One State alone sent out to other sections 415,000 people and received only 190,000, showing a net loss of about 230,000. Massachusetts sent 300,000 people to other States, but received 845,000 from Europe alone.

The reason for this movement from the South to the West and North is well established. It will be interesting to note that no section of the United States has advanced more rapidly during the past ten years in agriculture, manufacturing and commerce than the Southern States. This advancement has been made under many disadvantages. It is well known that not many years ago the South was without money, without credit, and—as has been shown—immigration was pouring out, rather than coming in. The results accom-

DR. JOSEPH H. SENNER,
Ex-Commissioner of Immigration.

honestly enforced. I have been told and have seen quoted in the newspapers that there is very great room for improvement, and I have no doubt that some people might improve on conditions at Ellis Island from their own point of view, but I do not believe that a man who stands for a wide open policy, who would let everybody in because his sympathetic feelings get the better of him would be the proper man to enforce the law; nor do I believe that a man who has concluded, for reasons best known to himself, that there are already enough people in this country, and for that reason and that only, no more should come, that he would be a fit and proper person to administer the law.

I do not agree with some of the speakers here this afternoon that the law as it now stands is all that it ought to be. I think there are some people coming into this country to-day who ought not to come in. But I think the law is inadequate to keep them out as it now stands. I do not undertake to say to you how far this tendency to exclude should be extended, but I will give you one or two points for your consideration, and I leave it to you to judge whether what I suggest ought to be given serious consideration.

I have heard a great deal about the term "undesirable." Now, what constitutes an undesirable person? When you begin to discuss that one phase and turn it over in your mind you will follow the process of elimination until you get down to a point where the number will be very small comparatively and somebody will be apt to dispose of the whole question for you by still further reducing it; and if you leave it to all those who are actively interested in this question, there will not be many that will fall under the ban of undesirable. What is needed, in my opinion, is a drastic law which shall state specifically what is desirable and what is not desirable.

Now, let us take a case in point: An immigrant steps off the boat and the doctor takes him in hand, looks him over as to his mental capacity and as to his prospective physical endurance, what he is likely to stand, at what point of pressure he will break down and become a burden to somebody who will support him voluntarily or otherwise, and the doctor says he will probably break down very soon, and for that reason

M. V. RICHARDS,
Land and Industrial Agent, Southern Railway.

plished by the South under these conditions have at last attracted the attention of the outside world. The South is now recognized as one of the desirable fields for people with limited means and for the employment of capital. A few years ago the railroads, state authorities, manufacturers and farmers in the South found that their country could be best advanced through increased immigration. A systematic campaign has been carried on, and to those who have labored earnestly, seriously and persistently in promulgating information concerning the South, it is very gratifying to observe that the South to-day is in the minds of people throughout the North, Canada, and many parts of Europe, as a field for settlement and investment.

We have established numerous factories throughout the Southern country. You will be interested to know that over 2,500 manufacturing enterprises were located within the last three years upon the line of the Southern Railway. These factories each give employment to anywhere from five people to 2,000 people. A large percentage of the employees in these factories were drawn from the farming sections. The immigration into the South has not been equal to the migration of people from the farms of the South to the factories. While we have progressed remarkably well in our agricultural development, if we could have kept all of our farmers on the farms, induced immigrants to come in, open up and develop more farms and accept employment in our factories, our agricultural development would have been far greater and our factories would be larger to-day than they are.

We have appeals to us from farmers and manufacturers in all parts of the South for laborers. We can accommodate several million people. They can be provided with pleasant homes and profitable employment. The future of the immigrants locating with us, I do not for a moment doubt, will be in line with their desires and necessities.

We have systematically laid the foundation for the introduction of a foreign population by securing Germans, Scandinavians, Italians, French, Bohemians and Poles from the Northern States. We are now ready to receive the raw immigrant from Europe. We

Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.

THE IMMIGRATION PROBLEM.

It is a noteworthy discussion of a problem of the highest national and economic importance that we present to our readers, in the verbatim report of the consideration of Immigration in Its Relation to American Industry, by the Civic Federation of New York. The opinions of the speakers at that meeting are well worthy the careful perusal of both employers and wage earners, as well as of students of the economic questions involved in the absorption of an influx of aliens into our population and its ultimate effect upon production and consumption.

The most impressive and, probably to many, the most surprising feature of this discussion, is its refutation of the widely prevalent impression that the tide of immigration is choked with the social debris of Europe, contributed from its jails, asylums and poorhouses. The evidence of both statistics and observation adduced at the meeting went to dissipate this alarmist misapprehension. Upon the contrary, it was shown that an accumulation of capital, to an amount that would cause a similar saving by the family of an American workingman to be regarded as a result of unusual thrift, must precede the migration of a European family to the United States. Impressive also were the statements as to the unsatisfied demand for labor in the South and West and the suggestion as to the distribution of the newcomers away from the ports of arrival. Conversely, the plea of those who believe that the interests of American labor demand the restriction or exclusion of immigration was forcibly presented.

The National Civic Federation will comply with the request of the New York branch to appoint a national committee to consider this question and to report its recommendations to a general conference to be held in the fall. The composition of this committee, which will be of a character commensurate to the importance of the subject, will soon be announced. Its investigation and report may be expected to have a direct and practical bearing upon the solution of the problem.

SOCIALISM AND REVOLUTION.

We present upon following pages an exposition of the new campaign of "scientific Socialism," which is cunningly designed to captivate the support of minds more sympathetic than thoroughly trained and more susceptible to emotion than solidly grounded in the fundamental and unshakable principles of political economy. If we have appropriated considerable space to this recently developed strategy of Socialist leaders, it is not because we consider their creed of revolution really dangerous to republican institutions. There is no occasion to view with alarm a movement which openly and flagrantly proclaims its purpose to "undermine society"; for, in this free country, the absence of repression makes of the most violent of its utterings mere vaporings. But it does appear to be well worth while to place clearly before the public, and particularly before those who take special interest in current economic developments, the real ultimate design of these Socialists who pose as would-be benefactors of the working mass, whom they classify as the "proletariat," of whom they are themselves not a part, whose true aspirations and growing capacity of self-elevation they do not comprehend. The real representatives of the working mass have repeatedly rejected and denounced the apostles of social despair and revolution as the most dangerous enemies of those who would maintain the honor and elevate the living conditions of American labor.

There is another reason for this arraignment of those who avow their sympathy with Socialism as a remedy for economic evils and who would instil its deceptive doctrine into the minds of collegiate and graduate students. Just as the popular conception of Socialism is inexact, often confusing it with many causes plainly worthy or entitled to respectful consideration and debate, ranging from the restriction of child and woman labor to governmental ownership of public utilities, so it is possible that some of the personally estimable signers of the call for an "Intercollegiate Socialist School" may not have realized the true purpose of the cult with which they have identified their names. The very processes of unconscious exaggeration of industrial evils, of incessant contemplation of the most lamentable social distress, which they would employ to convey the sym-

pathetic impression that modern civilization is a failure, may have wrought more upon the imagination than the reason of these self-proclaimed Socialists. It is possible that some of them may be amazed at the revelation that what they have regarded as an altruistic and harmlessly esoteric theory exhales, noxiously if innocuously in this land, the spirit of treason. There can be no half-way position for these men. They must array themselves either as patriots or as open enemies of the institutions of the one country that stands pre-eminently in the history of mankind for the development of democracy.

There is a mental temperament predisposed to champion the creed of a minority. Its argument is that every great cause that has ultimately triumphed in history was at its initial stage the cause of a minority, and that, therefore, the minority must always be right. The defective logic is obvious. Nevertheless, there is a fatuous charm to a vanity that would fain believe itself a part of the "saving remnant," ignoring the fact that a "remnant," instead of being "saving," may be the vilest shoddy. The Socialist minority in this Republic is neither admirable nor formidable, but its advocates, whether malignant or self-deceived, should be paraded in their bald attitude of revolutionists.

A QUESTION OF DISCIPLINE.

We have a letter from a Connecticut employer asking us to give a list of men expelled from unions for assaulting non-union men or for participating in mob riots during strikes. Our correspondent admits that labor leaders denounce these offenses in their speeches, but says that he has never heard that a union expelled a member for such lawbreaking.

We can give no list of names, although a union in Chicago did assist last year in the prosecution of one of its members for violence and did expel him upon conviction. There may be other similar instances. We have asked the same question of labor leaders and their answer has been in substance this:

"We cannot expel these men except through regular processes provided by our by-laws and constitution. We must have the evidence to convict."

Any man who commits such an act will deny it, and his particular friends will shield him just as every accused person is shielded in the courts every day. When violence is committed and arrests are made, the organization cannot act until after a conviction, and then it does act. The same obstacles arise when demand is made for the expulsion of members from a church. How many churches to-day are expelling men whose rascality in "high finance" has been exposed during the last two years? Take a list of them and one will be surprised to find how prominent some of them are in ecclesiastical organizations. But, so long as nothing is proved against them in the courts it would be most difficult for a church committee to prove anything which the regularly constituted authorities, with their machinery for convicting of crime, cannot prove. If public prosecutors cannot find evidence, how much less can the trustees of a church or the trustees of a union find the evidence to expel their respective members?

STRIKES AKIN TO WAR.

From the Chicago Tribune.

While so many are working for international peace, it would be well if more were working for industrial peace. A strike may be as great a calamity as a battle, and the public sentiment should be educated to realize that strikes, like wars, should be measures only of the last resort. This does not mean that working people should not try to better their condition. That, of course, will be their ceaseless and proper effort. Nations continually strive to strengthen their international positions. But they no longer resort to war, except for the gravest and most fundamental reasons, and when all hope of settlement through negotiations, arbitration, or compromise has been exhausted. The cost of even victorious war is so great as to destroy by anticipation many of the benefits which it brings. So with the strike. The men who get better wages or better hours through strikes rather than through negotiations, arbitration, or compromise, lose in advance many of the benefits which spring from their improved condition.

On the other hand, employers who refuse to treat reasonably with their men, and so bring about strikes, lose a great deal through even the strikes they win.

SOCIALISTS SEEK TO INFLAME THE MIND OF AMERICAN YOUTH.

A PROPOSAL TO INCITE COLLEGE STUDENTS TO REVOLUTION—ORGANIZED LABOR REPUDIATES THESE FOES OF AMERICAN INSTITUTIONS.

(By the Editor.)

SOcialism schemes to plant its germs of discontent, despair and revolution in new fields. Its advocates, having failed to capture the mass of wage earners, have projected a campaign beyond them, planned to pervert the minds of the professional classes and of the younger and more impressionable recipients of higher education. The new venture in behalf of Socialism is in part revealed in the following call, published early this month, and addressed to college men and women, for the formation of an Intercollegiate Socialist Society:

In the opinion of the undersigned the recent remarkable increase in the Socialist vote in America should serve as an indication to the educated men and women in the country that Socialism is a thing concerning which it is no longer wise to be indifferent.

The undersigned, regarding its aims and fundamental principles with sympathy, and believing that in them will ultimately be found the remedy for many far reaching economic evils, propose organizing an association to be known as the Intercollegiate Socialist Society for the purpose of promoting an intelligent interest in Socialism among college men, graduate and undergraduate, through the formation of study clubs in the colleges and universities and the encouraging of all legitimate endeavors to awaken an interest in Socialism among the educated men and women of the country.

The call was signed by J. G. Phelps Stokes, Thomas Wentworth Higginson, Charlotte Perkins Gilman, Oscar Lovell Triggs, Clarence S. Darrow, B. O. Flower, William English Walling, Leonard D. Abbott, Jack London and Upton Sinclair.

THE LATEST DESIGN OF SOCIALISM.

An "Intercollegiate Socialist Society," which would stand committed by its very title to the advocacy rather than to the study of a doctrine, is directly in line with this latest scheme of Socialism to extend its propaganda toward the so-called "upper social classes." Thus "The Collectivist Society" is the title of an organization in New York City, whose object is definitely stated by The Worker, an official organ of the Social Democratic party, to be that "of disseminating Socialist literature among the professional classes, persons not ordinarily reached by the party propaganda, particularly." This organization, according to the same authority, first recruited its membership by appearing in the guise of "a sort of American 'Fabian Society,'" that is to say, a kind of go-slow, conservative-radical body. But it speedily advanced beyond this stage, and, as was announced in connection with its second general dinner, on November 19, 1904, now "frankly accepts the fundamental tenets of scientific Socialism." By "scientific Socialism," it may be explained, the Socialists mean the out-and-out Karl Marx uncompromising school of revolution.

The Publication Committee reported at this same dinner that "ministers, Catholic priests, secretaries of the Y. M. C. A., physicians and instructors and seniors in the various colleges are the groups at which this propaganda has been mainly directed." These Collectivists issue a general invitation to sympathizers "to encourage the Society in its determination to assist in strengthening the Socialist party by making propaganda for Socialism in quarters not ordinarily touched by party agitation."

CHARACTERISTICS OF SOCIALIST AGITATORS.

It is interesting to observe that the promoters of the proposed Intercollegiate Socialist Society and of similar movements, inspired by self-imposed solicitude for the toiling masses, are almost never workingmen, and have nothing in common with the interests of laborers. This statement is true of 90 per cent. of all the Socialist writers, workers and open-air orators. Their roster is largely made up of briefless lawyers, pulpless clergymen, professional writers, ex-professors whose usefulness in college faculties has ceased to exist, sentimental exaggerators in social settlements, faddists, economic freaks, and here and there some man of wealth, whose capital has come to him through inheritance or marriage and whose vanity is tickled by being called a "millionaire Socialist, devoting his wealth to the uplifting of the downtrodden masses."

This heterogeneous aggregation is earnest, persistent and fanatical. In Russia, such devotees would develop under restraint into terrorists and include bombs in their political arsenal. But in a country of free speech, free press and free ballot, their fulminations usually expend themselves in the heated atmosphere of street corner harangues, or in the academic excitements of social coteries that flutteringly aspire to sensationalism, or in perfervid literature.

The serious pose of these apostles of the impossible has its counterpart in the antics of the quarreling professional agitators, who expend their force in mutual denunciation. One Socialist organ makes these remarks concerning the candidate for Mayor of an opposing Socialist faction in a large city:

Who is this man?
First, he is not a workingman.
He is a smooth, political huckster and grafter of the rankest type, besides leaving behind him, when he left Minneapolis, a

record well known to the Republican hoodlums in Minnesota, back in the '90s.

I met this man at the last national disgraceful convention at Chicago, where grafters and boodlers flocked in majority numbers. I could not help but regard him as I did, as he strutted about the convention hall dressed in broadcloth and silk stockings, buckled up with a one-eye glass and a gold chain dangling from the glass, tied in the button hole of a ten dollar silk vest, and his ten dollar silk slouch hat.

No workingman delegate of the fifty-two Socialists dared to speak to this gentleman worker of the workers.

Another evidence of the esteem in which these social "purists" hold one another's capacity for hastening the millennium by the revolutionary route is this excerpt:

The Socialists who have been trying to rid the Debs party of its fleas and barnacles are about tired of trying. Organized as it is, with grafters, traitors, and spies, from Maine to California, and from Minnesota to Florida, and with state constitutions and platforms drafted in such a way that a man or woman cannot be a member unless they are grafters and old party politicians.

In fact, a perusal of the organs of the factions of Socialism in this country would show that each Socialist believes every Socialist of another brand to be a liar, fakir, boodler and traitor. They preach "class-consciousness" and exhibit an amusing variegation of self-consciousness. They do not denounce all society and capitalism with more virulence than they denounce one another. They would create a new social order. And yet they display nothing but disorder in their own ranks. Their constant tempest in a teapot is in itself a demonstration of their utter incapacity for public affairs and an indication of the confusion, leading inevitably to anarchy, that would follow the inauguration of their impossible regime.

WHAT IS SOCIALISM?

But just what is this Socialism, with which these highly respectable gentlemen announce their sympathy and which they propose to promote? Let the following utterances, culled from the official organs and recognized spokesmen of Socialism, answer:

Far be it from me to deny that Socialism is a menace. It is its purpose to wipe out, root and branch, all capitalistic institutions of present-day society. It is distinctly revolutionary and in scope and depth is vastly more tremendous than any revolution that has ever occurred in the history of the world.—*Jack London*.

We give the capitalist class due notice of the possibility of volcanic eruption—we mean the real article, not the kind they have in New York. In every upheaval a terrible retribution would be enacted on the capitalist class. The French Revolution and the Paris Commune ought to serve as warning examples.—*Social Democratic Herald*.

The Socialist party is a party of revolution, not of reform. No reform of the present order of society, however radical or sweeping it may be claimed to be, will satisfy its class-conscious supporters.—*Eugene V. Debs*.

Desperation is born in poverty, and hunger will fire the heart and nerve the arm of rebellion.—*Socialist Magazine*.

The war between the capitalist class and the working class is bound to grow in intensity and to continue until one or the other is destroyed.—*The Worker*.

The proletariat will possess itself of the government, apply democracy to industry, abolish wages, which are merely legalized robbery, and run the business of the country in its own interest.—*Jack London*.

To large numbers of people the earth is little better than a dungeon—they are simply serving time on earth at hard labor, in order that an imperious few may lead butterfly lives.—*Social Democratic Herald*.

Such measures of relief as we may be able to force from capitalism are but a preparation of the workers to seize the whole powers of government, in order that they may thereby lay hold of the whole system of industry and thus come into their rightful inheritance.—*Socialist National Platform*.

This revolt in the form of demands for an increased share of the joint product is being carefully and shrewdly shaped for a political assault upon society. The leaders intend to direct the labor revolt to the capture of the political machinery of society. With the control of the police, the army, the navy, and the courts, they will confiscate, with or without remuneration, all the possessions of the capitalist class which are used in the production and distribution of the luxuries and necessities of life. They mean to apply the law of eminent domain to the land and to extend the law of eminent domain until it embraces the mines, the factories, the railroad and the ocean carriers.

The Socialists turned their energies upon the trade union movement. To win the trade unions was well-nigh to win the victory. Instead of antagonizing the unions, the Socialists proceeded to conciliate the unions. "Let every good Socialist join the union of his trade! Bore from within and capture the trade-union movement."

To-day the great labor unions are honeycombed with Socialists. At work and at play, at business meeting and council, their insidious propaganda goes on. Night and day, tireless and unrelenting as a mortgage, they labor at their self-imposed task of undermining society.—*Jack London*.

The employers' associations that fight the unions will soon recognize that Socialism is a movement that will call a different strike from that of any trade union—that will not ask for shorter hours or a few cents more wages, but will ask the whole product and point the way for the producer to pass down and out of the industrial field. The Socialists ask no arbitration. They do not recognize that the employer has any rights to arbitrate.—*International Socialist Review*.

INNOCUOUS THOUGH INFLAMMATORY RHETORIC.

Let no reader be alarmed at these quotations. The tropical rhetoric of these solicitous guardians of helpless American labor, in their "self-appointed task of undermining society," through debauching the mind of youth, cannot flourish under the temperate atmosphere of democracy. Familiarity with the virulence of Socialism makes it ridiculous. There is no danger in a parade of words whose very violence proclaims their impotence. Yet there is something offensive to

patriotism in the spectacle of respectable citizens declaring their "sympathy" with doctrines that strike at the very foundations of the institutions of our country. While the ultimate aims of the Socialists and the Anarchists are antithetical, they follow precisely the same method and use the same material in preparing the minds of their hearers to adopt their theories. Both of them rail violently against existing institutions. Both of them denounce in unmeasured terms the present constitution of society. Both of them dwell upon the most extreme and exaggerated evils. The burden of the street corner speech of a Socialist agitator could not be differentiated with a microscope from that of a foaming Anarchist. The one would excite the passions of a pliant nature to the frenzy of murder as thoroughly as the other. At the time of the assassination of President McKinley, the Socialists were loud in their condemnation of the Anarchist murderer. Yet Socialist oratory alone would have inflamed the hatred of a disordered mind as hotly as did any of the Anarchist literature that Csolgolz read.

Are these seditious teachings of class hatred and social revolution to be made a part of the college curricula? Are the more or less distinguished signers of the call for an "Intercollegiate Socialist Society" really willing to stand before the fathers and mothers of the college youth of the country as the sponsors of such teachings to their children? The authorities of the University of California were incautious enough to permit one of the signers of the call, Jack London, to address a meeting of the student body of which he was at one time a member. This is what he gave them:

"You are drones that cluster around the capitalist honey-vats. Your fatuous self-sufficiency blinds you to the revolution that is surely, surely coming, and which will as surely wipe you and your silk-lined, puffed-up leisure off the face of the map. You are parasites on the back of labor." One capitalist among London's auditors interrupted. "Do you know what will be the result of your revolution?" he asked. "Anarchy, civil war, death and crime will be the results of the revolution you are prophesying." "I know it," shouted London; "but what are you going to do about it?"

STUDIES OF THE ABNORMAL.

But not all of the verbal batteries employed in the campaign of Socialism are directly vituperative and revolutionary. The projected "Intercollegiate Socialist Society" would hardly fail to include in its course of instruction excursions into another kind of literature that is used as a subtle ally to franker propaganda, through inspiring a mental protest against the present social and industrial system. This literature exists in abundance in two forms. One is the dark and gloomy description of all the nether strata of society; the other consists of sensational and exaggerated statements in newspapers concerning such recognized abuses as work in sweatshops, child labor and unsanitary tenements. The first and more pretentious of these forms is devoted to hideous, horrific pictures, drawn with revolting realism, of all that is pitiful, abnormal, shameful, vicious and criminal in the most degraded slums of the great cities. The effect upon the mind of any reader of this literature, of an average amount of sympathy, is most depressing. Its effect upon a nature supersensitive, either by temperament, by youth, or by temporary adversity is so unwholesome, that within the past month newspapers have reported two suicides, one of a man and one of a young girl, both attributed to the mental despair caused by reading these Socialistic studies of human degradation. Without questioning the scientific value and importance of learning all the ills that afflict the modern social structure in order to seek their remedy, it must be admitted that an exclusive concentration of the attention upon these painful phenomena, especially when they are pictured with sensational rather than philanthropic intent, must destroy correct perspective in the social outlook. If an ornithologist were to confine his studies and lectures to the habits of the buzzard, he would convey to his students the impression that all bird-life was sustained by carrion. The keeper of a prison, whose days and nights are spent among convicted criminals; the superintendent of an asylum in whose ears continually ring the ravings and wailings of the demented; the caretaker of a pest-house, whose eyes are constantly filled with the spectacle of the human body when afflicted with the most loathsome plagues—if these persons, useful and honorable as are their several offices, were continuously and persistently to exploit their painful and shocking experiences before the public as representative of prevalent conditions, they would create a tidal wave of pessimism. Indeed, it is a familiar fact that the reflex action upon those too long and constantly surrounded by such environments not infrequently has dire and even fatal effects upon the strongest minds and most resistant wills, leading to melancholia and suicide. The at-

mosphere surrounding the social settlements, steeped with appeals to sympathy and pity, has a disheartening effect upon some of the young college dwellers, whose fine enthusiasm has led them into the midst of squalid misery, exciting socialistic impulses. A surgical clinic may be of the highest scientific value when conducted in the amphitheatre of a medical school; but if held upon a street corner it would be degraded into an exciting of morbid fascination.

SOCIOLOGICAL EXAGGERATIONS.

Exaggeration, not always wilful or malicious, but based upon superficial inquiry into conditions wholly novel and necessarily unfamiliar to the observer, is available material for the Socialist orator. Not long ago a conservative newspaper in one of the largest American cities contained a long article, headed in striking type: "Women Inspect Sweatshops. Members of the State Federation Clubs Appalled by Awful Conditions Found Here. Making Men's Pants at 28 Cents a Dozen. Stitch, Stitch, from Dawn to Dark." The article, which is typical of its class, described the visit of a group of fashionable club women, who had become interested in the "study of sociology," to a slum tenement. It told with gloating detail how these social explorers discovered forty families upon two floors, "herded together like cattle. In one foul, rank room, two women, with wan, drawn faces, were sewing on men's trousers. They were mother and daughter. Born almost with a needle in her fingers, neither had ever known what it was to rest." Questioned by one of the compassionate club women it was "learned" that the women were paid 28 cents a dozen for "making" trousers; and that each of them, "by stitching incessantly from dawn to dark," could by the utmost effort "make" two dozen pairs a day. Hence the glaring head-lines.

It happened that this sensational article so stirred the compassion of a certain philanthropist that he employed a trained investigator to make an inquiry. Observe the result: A thorough search at the address given failed to discover any forty families crowded like cattle upon two floors. Instead, the dwellers were housed in fair comfort. The two sewing women were found, cheerful and contented. Instead of "making" trousers, they were finishing trousers upon which all the heavy work had been done by machinery in a factory. It was further learned that the husband had steady work and good wages; that the mother and daughter were sewing merely to earn a little extra money; and that this sewing was quite incidental and did not interfere with their housekeeping and the care of three young children. It is needless to say that the philanthropist did not find occasion for his charity.

All this is not to minimize the deplorable evidence of poverty and distress in city tenements. Nor is it to disparage the efforts of the good men and women who devote time and energy to praiseworthy and often effective social service. Neither is it to obscure the value of legislation and of rigorous public administration in elevating the social, industrial and sanitary conditions in congested centers of population. But it must be admitted that the article quoted, especially as it was published in a conservative journal, would spread broadcast an impression far from the truth and quite available for those who would stimulate discontent.

A conspicuous and recent example of sociological exaggeration is a book entitled "Poverty," by Robert Hunter. Ever since its publication last winter, this book has been advertised by Socialist organs as one of the "great works" of the day. The preachers of despair fairly revel in Mr. Hunter's assertion that there are 10,000,000 people in the United States in the grasp of poverty. Yet this assertion has been discredited by all those whose training, experience and opportunities of observation qualify them to estimate the true value of such figures; and even Mr. Hunter admits that he is "largely guessing."

The Socialists acclaim this book as written by one who has come down from the "upper walks of life" into the slums and made a series of shocking but scientifically accurate discoveries. They never betray their knowledge that this author belongs to their own school, but always convey to the reader the inference that he is an unprejudiced observer. They have even published "A Review by John Spargo," which would lead the reader to assume that the book had won the approval of a severe critic; whereas, the criticism was merely that of one Socialist patting another on the back.

An assertion of this same socialistic sociologist that 70,000 children in New York City went breakfastless every morning to the public schools was advertised all over the country, being exploited by the sensational press in every large city. The Board of Education, after a special investigation, declared Mr. Hunter's statement to be grossly exaggerated and without foundation in fact; while the Health Department could find, out of 275,000 school children examined, only 825 improperly fed.

Further remarkable evidence of his reckless exaggeration is afforded by the experience of the Salvation Army. No one will accuse that organization of any disposition to minimize the existence of distress. The Salvation Army undertook to supply free breakfasts to the "70,000 suffering little ones." In reply to an inquiry

as to the result of this charitable enterprise, an agent of the Salvation Army made this report:

That the conditions as represented by Mr. Hunter were very much exaggerated; that the Army established in all nine or ten stations in different parts of the city; that they never had more than 500 children apply at the total number of stations in one day, and this number only the first two or three days; that the number gradually dwindled down, necessitating the gradual closing of the stations, until they were reduced to one or two, and then no one having applied for a day or two, these last stations were closed; that the Army had soup, cocoa, coffee and rolls for the applying school children, but that the children stated they did not care for the soup or cocoa, and preferred merely the coffee and rolls; that if a child who had coffee and rolls for breakfast was considered breakfastless, then there were many thousands of such in New York City. This would apply equally to thousands of business men and capitalists.

Another choice bit of morbid rhetoric by the same imaginative "sociologist" follows:

In the Chicago stockyards are 50,000 on the verge of pauperism. They are in practical slavery. I have seen children of ten years of age working all day in great vats of blood. Incurable rheumatism before the age of twenty-five is reached is a common result, and tuberculosis even among the children is extremely prevalent. They have nothing to look forward to but death.

In fact, no such condition as described exists in the Chicago stockyards. The statement quoted was denied as promptly as possible and its absolute falsity was exposed. But no denial is as sensational as an accusation, and it is not to be expected that this denial will ever catch up with the swift circulation of the original children-in-vats-of-blood fiction.

Space permits but one more example of this nature, out of thousands that could be arrayed. A professional woman, having exceptional opportunities for observing the life of workers in the tenements, recently published the following statements:

Every garment worn by a woman is found being manufactured in tenement rooms. The coarsest house-wrappers to the daintiest lace gowns for a fine evening function are manufactured in these rooms. All adornments of woman's dress, the flowers and feathers for her hats themselves—these I have seen being made in the presence of smallpox, on the lounge with the patient. All clothing worn by infants and young children—dainty little dresses—I have seen on the same bed with children sick of contagious diseases, and, into these little garments is sewed some of the contagion.

Her statement, whose accuracy is not questioned, unintentionally conveys the impression to the average reader that such repulsive and dangerous conditions are prevalent, instead of exceedingly rare and necessarily corrected as soon as detected. Her peculiar use of the words "every garment worn by a woman," and "all clothing worn by infants and young children," leads to an unconscious inference that is startling. The official records of the Board of Health show that during the past two years there have been not more than seven or eight cases of smallpox per year in all Greater New York. In fact, the sanitary authorities consider the disease so rare, in proportion to the population, as to be practically eliminated.

Now, in their "self-imposed task of undermining society," the Socialists eagerly seize this kind of literature and exploit it to the fullest extent. Jack London, in his speech at the University of California, quoted freely from the hysterical assertions of Mr. Hunter about poverty, in order to impress his college hearers with the notion that the world outside groans in a state of universal, abject misery, whose only salvation is "revolution." If the "Intercollegiate Socialist Society" were to succeed in carrying out this part of its programme, mischief might result.

The effect upon the young mind of such distorted pictures, accompanied by an appeal to its generous impulses, can only be conjectured. The student, carefully trained for serious and important work in the world of which he knows so little, might thus be perverted into advocacy of a doctrine, presented to him as a panacea, but whose ultimate significance he is too immature to perceive.

DECEPTIVE TRICKS OF SOCIALISTS.

These promoters of "intelligent interest in Socialism" would doubtless cajole the students in their projected intercollegiate society with tricks similar to those habitually employed by the professional agitators of the cult. For example, the vice-president and actuary of an insurance company recently delivered an address claiming Socialism to be the phenomenon of the 20th century. Thereupon the Socialist organs heralded this address as an acknowledgment from a Wall Street capitalist that Socialism is inevitable, wholly suppressing the fact that this self-same Wall Street capitalist, strange as it may seem, has been a Socialist for twenty years, treating the address as if it were a tribute from an enemy, instead of being the plea of a partisan advocate. They printed it in pamphlet form and published this advertisement:

That first lot of leaflets giving the remarkable setting forth of the philosophy of Socialism by Vice-President Weeks, of the New York Life Insurance Company, went off like hot cakes. We were whipped out of them almost before we knew it. Order early if you want any of the new lot. Ten copies for a dime, one hundred for 35 cents and a thousand for \$2.50.

It is one of the stock tricks of the Socialists to deceive the public as to the strength of their following. Immediately after every election, when official returns of the balloting for the candidates of the various minor parties are not at hand, they announce tremendous gains in their vote. For example, directly after the last Presidential election their party officials gave the statement to the newspapers that the popular vote for Debs had increased to 600,000. This was accepted by the public as a statement of fact. Subsequently official

data reduced the Socialist vote to less than 400,000 and it was admitted that the enrolled party membership was less than 25,000. But this revised and corrected statement reached only a few. The original claim of 600,000 Socialist voters in the Nation remained unchallenged and furnished the text for many an excitable editor, who swallowed the Socialist figures at their face value and wrote a post-election article "viewing with alarm" the remarkable "percentage of increase" in the Socialist vote.

LABOR LEADERS DENOUNCE SOCIALISM.

But it may interest some of those who profess such solicitude for the "working class" to learn what the genuine, hard-headed workers themselves think of their revolutionary theories. How do the proposed beneficiaries look upon their doctrinaire would-be benefactors? They may be astonished to learn that there is not to-day a representative officer of any important labor organization in the country who does not, upon every occasion, denounce the Socialist propaganda of these silk-stocking faddists who would propose to force an entrance into the college lecture rooms. The American Federation of Labor, which contains the largest number of organized wage earners in the world, has defeated every effort of the Socialists to commit it to their cause, at its annual conventions for the past four years. So overwhelming, indeed, was the Socialist defeat in its last annual convention, held in San Francisco, that most of the Socialist leaders have openly abandoned this form of attack and declare that they no longer wish to capture the American Federation of Labor.

Instead, they now plan to destroy it. Thus the leaders of organized labor are actuated by two motives in their antagonism to Socialism. They are opposed to its creed, because it is wholly opposed to the spirit and operation of American institutions. They also fight it as the openly recognized enemy of the trade union movement. The call for an industrial convention in Chicago on June 27, to form a new national labor organization, was signed only by leading Socialists. That movement was promptly denounced as "treason" by Samuel Gompers, President of the American Federation of Labor, in the following language:

"Tis treason, gentlemen! The defensive actions of the rank and file, as well as advocates and defenders of the trade union movement, do not seem to commend themselves to the callers of the Chicago convention, nor have they commended themselves to the other Socialists, who are either openly aiding or encouraging the effort to destroy the trade union movement, while a number of other Socialists are hoping against hope that the destructive work may be crowned with success.

Do the convention callers or their friends imagine for a moment that the trade unionists will sit idly by and see the great organizations which they have builded to protect and promote the workers' interests, and which are the bulwarks of defense and opportunities for progress and advancement—see these attacked, maligned, and sought to be divided or destroyed without a word of dissent or protest?

The official journals of the Western Federation of Miners, the American Labor Union, the Socialist Review, and all other Socialist publications, are virulent in their malicious abuse of the active trade unionists, professing friendship for the American Federation of Labor, and yet proposing to supplant it by the call they have issued.

When any man or set of men mask behind the pretense of friendship for labor, then attempt to undermine or to open fire upon the most successful general organization of labor that the world has yet seen, the American Federation of Labor, we say, "This is treason, gentlemen; it is treason."

President Gompers gave a good example of the straight-from-the-shoulder fight that trade unionism makes upon Socialism, in the following forcible conclusion to a speech against a Socialist resolution, delivered in Faneuil Hall, Boston:

I want to tell you, Socialists, that I have studied your philosophy; read your works upon economics, and not the meanest of them; studied your standard works, both in English and German—have not only read, but studied them. I have heard your orators and watched the work of your movement the world over. I have kept close watch upon your doctrines for thirty years; have been closely associated with many of you, and know how you think and what you propose. I know, too, what you have up your sleeve, and I want to say that I am entirely at variance with your philosophy. I declare it to you, I am not only at variance with your doctrines, but with your philosophy. Economically, you are unsound; socially, you are wrong; industrially, you are an impossibility.

John Mitchell, President of the United Mine Workers of America, itself the largest single labor union in the world, is equally emphatic in his denunciation of Socialism:

I advocate not industrial revolution, but industrial progress. The deadening blight of Socialism would wither progress. The virile, active forces of industry, enlisted in the wage system under the form of capital and labor, can be brought to work mightily, through sane and rational agreement, for that progress of industry which means the advancement of civilization and the lightening of the burdens that still oppress humanity. This progress can be stimulated by negotiation and, when necessary, by conflict. The Socialists abhor all such progress and denounce every method that has been discovered, including the trade agreement, for its encouragement. That is why the Socialists seek, either by assault or by "boring from within", to destroy or to disintegrate the trade union movement, because its aim and its effect are the betterment of society as a whole. The instinct of individual self-improvement is the life-blood of labor unionism. The control of all industry by the State, heing against that instinct, could result only in either anarchy or despotism.

If any of the dilettante triflers with revolution are still in doubt as to the estimate in which their plan to undermine society is held by labor leaders, let them inquire of such men as the following:

James Duncan, General Secretary Granite Cutters' National Union, Quincy, Mass.

E. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.

Daniel J. Keefe, President International Longshoremen, Marine and Transport Workers' Association, Detroit, Mich.

THE WANTON, INHUMAN, INDEFENSIBLE CHICAGO STRIKE.

FRANKLIN MACVEAGH LOOKS BEYOND ITS EXCESSES TO THE GREAT UNDERCURRENT OF UNIONISM INDISPENSABLE TO CIVILIZATION.

(Address by Franklin MacVeagh before the Cincinnati Commercial Club.)

MR. CHAIRMAN AND GENTLEMEN:

You may question an appearance of impartiality toward labor unions, by a Chicago man lately escaped from a state of street ruffianism and a general mix up of brickbats, lumps of coal, glass bottles, stones, brass knuckles and the rest of the familiar equipment of disorder and slugging incident to Chicago strikes.

And you may not welcome Chicago suggestions about labor unions; our city being considered a high-roller in labor matters. Chicago's labor ferment, however, it is fair to say, is but part of the wider ferment, because of which many of the problems of our national development are finding their chief forum in Chicago and this Middle West.

Doubtless our teamsters' strike has not heightened Chicago's authority. But you must admit that it is a credit to our originality. For it is unique as a finished example; being an unprecedented combination of every mistake and every abuse which unionism has so far

It has driven the unwilling union men from their jobs, denied non-union men the right to work, and the employers the right even to attempt to do business.

It encouraged hideous strikes of children.

It has done everything it could find to do that would forfeit the good will of the public, and it has raised up against itself a nearly unanimous public opinion from ocean to ocean.

It is a strike and boycott of an oligarchy of unfit leaders, who have sacrificed with impartial indifference the rights of the employers, the citizens, the teamsters and the union cause. It is a strike which the rank and file have had little to say about, which has had no cause to fight for and no reason to fight, which is wanton, wasteful, inhuman, deplorable and unnecessary from any and every point of view. A Philadelphia lawyer could not find a word to say in its defense. It has closed the mouth of apology.

The initial blunder of the oligarchy was taking it for granted that the employers would have no scruples against buying immunity, or would have no principles or self-respect for which they would fight. It is unsafe to count upon the pusillanimity of peaceful American citizens.

Such is the latest dire experience of Chicago. But even this does not shut Chicago's eyes to the underlying just positions of unionism. Because war breaks out between Japan and Russia we do not forget the permanent values of civil government, nor the fruitful progress of the years and areas of peace. All through the injustice of this guerilla warfare, Chicago's employers and press have more than ever pledged themselves to a fair field for unionism. And the present is particularly a juncture for holding on to the just habit of discrimination between fundamental unionism itself and its wretched excesses.

For with all its faults—and its faults are grievous and many—unionism is a great movement. It is far too great; it relates its fortunes far too surely to every section of our national life and society, and it concerns far too vividly the far-reaching issues of present civilization, for us to confine its sphere to its own membership and its own leadership. Evidently its fortunes are bound up with those of the employers. But its relationships extend immensely further, even to the limits of present human society. The union labor movement is no mean part of the whole movement—industrial, social, intellectual and spiritual—that now has the stage of the world. For good or ill it is a significant part of the big life of the time. It is part of that greater human union which is carrying forward, and I believe upward, the general movement of mankind.

Unionism has so much power for good and so many possibilities of evil, that it must not be dealt with by employers as a mere enemy, or with habitual impulses of belligerency, notwithstanding those undeniable occasions when unions must be fought relentlessly to a finish. For the situation is permanent. It is childish to think we can abolish labor unions, for the public opinion of all nations has accepted them as fixtures. We must develop, not abolish them. And the employers, as sure as there is moral responsibility anywhere in the world, must assume a distinct share of the responsibility for the increase of their usefulness and for the correction of their faults. And we come a long way toward progressive unions whenever employers deal with them as friends.

But final friendly acceptance of labor unions, either by employers or the public, will not take place until all of the unions have definitely abandoned two wholly revolting and abominable methods which it is impossible for the American people ever to condone. I mean physical violence and the breaking of contracts. Other methods may be debatable. Even the open shop is not a closed question. But the breaking of contracts, and the breaking of heads are not in the nature of subjects for debate.

There is a controlling fact about violence that should be made clear and prominent. I mean the fact that it is never a private offense. It is a public offense, wherever and whenever committed. It is always an act against the government. Crime is crime.

The violence committed by strikers and their sympathizers does not differ from any other crime. It is simply crime. Such violence therefore takes issue, not with employers, but with the public authorities, and the issue is taken up, by the government necessarily as its own.

The important thing to notice is that this crime is no part of the strike. It is extraneous and incidental, and as external as if committed at another time.

A strike is a test of whether an employer can run a business to his satisfaction without the strikers, or whether the strikers will have to be called back. Everybody agrees as to that. And it must be agreed that this test cannot be made without a fair field, and that there is no suggestion of violence or disorder in the

In short, let these poseurs as friends of labor address the entire roster of the 125 chief officers of the national and international unions. Among them all will not be found more than a half-dozen who will not tell the advocates of Socialism that their programme is foolish and unwelcome and that it would be regarded as dangerous were it not known to be utterly weak, contemptible and incapable of making headway against the common sense and sound economics of the captains of organized labor.

THE SOCIALIST ANTI-UNION PLOT.

These labor leaders are men who cannot be deceived as to the ulterior purposes of the Socialists. They are acquainted with all their treason, stratagem and wiles, for they have been fighting the Socialists for years, not only in national and international trade unions, but in state and city federations of labor, as well as in thousands of local unions. In ninety-nine out of a hundred of these contests, the leaders of organized labor have completely routed the Socialists; yet they do not relax their vigilance of Socialist tricks nor lessen the vigor of their denunciations of Socialism itself. Every friend of the recognized methods of attaining industrial peace, such as conference, conciliation and arbitration, and who has had experience in dealing with strikes and lock-outs, has learned how to identify the Socialist. He is generally the loud-mouthed blatant agitator, whose every word is directed against the settlement of any controversy between capital and labor, because he does not wish peace, but revolution. A recent article from the pen of Luke McKenny, of the Wire Lathers' Union, published in a labor magazine, states the situation so truthfully and succinctly that we quote it here:

Their active workers are led by men who are both vengeful and unscrupulous. Expressing principles that are directly antithetical to trades unionism, and down in their own hearts bitterly opposed to trades unions, they are, nevertheless, found ever at the forefront in labor matters.

Seek for the prime mover in some abortive and disastrous strike—you will find a Socialist.

Look for the sponsors of arbitrary boycotts, defamatory and insulting resolutions denunciatory of employers; in fact, anything that will tend to besmirch the name of labor or involve it in difficulties and you will come upon a Socialist in ninety-nine cases out of a hundred.

It cannot be gainsaid that in the rank and file of the Socialist party there are many conscientious but mistaken union men, and even among the leaders there are a few men of unimpeachable character. But recking to heaven as a stench in the nostrils of organized labor is the "party" with its vicious and irresponsible—even corrupt—leaders and labor can never assert itself; can never meet nor expect to meet its employers upon fair and equitable terms until it has thrown off this noxious burden for good and all.

Equitable agreements with employers, collectively entered into, and arbitration, that will be entered into in good faith by both sides, as a means of settling differences, is the ideal system, in my opinion, for the future relations of Capital and Labor. But in our own ranks we must inculcate a vital principle: that trade agreements honestly entered into shall be honorably and inviolably kept and respected during their life. But, in order to effectually maintain this principle, the party Socialist, to whom an agreement with Capital is more honored in the breach than in the observance, must be relegated to the rear for good and all.

But now the question presents itself to us: "How can we the soonest rid ourselves of this nuisance?" I would answer: By following in our local and central unions the same methods invariably used by the Socialists themselves. This, in brief, means regular attendance at our meetings and united and aggressive action against this disturbing element at all times. In our local bodies you will seldom find the Socialist absent. He is there to answer the roll call, not, you may be sure, for any particular love he bears for his union, but to be ready to exploit his visions of Utopia; he is there in force on election nights and he lets the conservative element indulge in petty electioneering for practically unimportant positions, while he sees to it that the delegation from the local to the central body is of his own stripe, as a unit, if possible. Once he is in the central body he follows the same plan of campaign. If the central organization publishes an official paper, the "red-buttonite" sees to it that, by manipulation at each election, his party furnishes the staff and controls its policy. And the paper under its "red button" management gives about three-fourths of its editorial space to the advancement of "class conscious propaganda," while the balance is given to comment upon existing labor troubles, usually containing such vicious and unwarranted abuse of employers that troubles which might have been adjusted are prolonged indefinitely, to the great hardship of the workmen involved and to the Satanic delight of the "class conscious" freak who edits the paper, who uses two or three columns of space to point the trouble out, as "an object lesson, showing the necessity of voting the Socialist party ticket at the next election."

See to it that no Socialist is sent to a central body or to a convention as a delegate. It may seem arbitrary advice, at first thought, but when we consider the fact that we are endeavoring to combat insidious and unscrupulous foes, whose very existence in our ranks is a constant menace to us, we should stifle all such wandering thoughts, use "the big stick" and use it effectively.

We have endeavored to group some of the salient

Merchant and Publicist, Chicago.

evolved. One may study in this one strike all the defects, excesses and deplorable features of the labor movement—and with the brilliant effect undimmed by any of its virtues.

It was at first sympathetic, though the teamsters had agreements specially prohibiting sympathetic strikes.

They struck for the garment workers, but only when the latter had long lost their cause. And they did not strike against the employers of the garment workers, but, like lightning from a clear sky, against houses with whom their own relationships, and those of all other unions, were satisfactory and unruffled. They struck only such houses as had never, to their knowledge, seen a garment worker in their lives—with the single exception of one house who had as a side show of their business nineteen tailors, and who didn't care a penny if they did not have one. The houses with whom the garment workers had their strike were not molested. They were exempt. They were prime favorites. The teamsters never turned their eyes their way.

It was not merely a sympathetic strike, and sympathetic by pretense; but it immediately became also a reckless criminal boycott, with automatic alternations of strike and boycott that could not stop short of involving, in the end, every employer in Chicago, whose business used a team. And yet, so fatuous and ill-considered were their plans that the strike leaders expected to restrict the strike.

The strike has broken every contract it could lay its hands upon, and as nonchalantly, and almost as frequently, as the leaders take a drink.

It has picketed, not legitimately, or in self-defense, but maliciously and to terrorize.

It has blockaded the streets with union teams, though less than formerly, because comparatively few teamsters sympathize with the strike.

It has slugged at every turn and at every distance.

It has disregarded the courts, both state and federal, and has loudly resented any legal restraints.

By common belief it was not a genuine strike at all, but "conceived in sin and born in iniquity," with sympathy as a pretense, and with revenge and cupidity hopelessly confused in inconceivable motives.

It has broken the peace into little bits, and has resented and resisted protection, even by the police, for the legitimate and necessary business of the employers.

It has terrorized the retail merchants throughout the city.

**CONDITIONS UNDER WHICH FOUR THOUSAND
EMPLOYEES WORK AND LIVE IN
BOURNVILLE, ENGLAND.**

By EDWARD S. THACKRAY.

Bournville is about five miles from Birmingham and lies in one of the beautiful Worcester valleys, through which runs the pretty river Bourn, in a district largely wooded and pastoral. Close by the station the factory of the Cadbury Brothers, Limited, cocoa and chocolate manufacturers, was erected some twenty-six years ago, and was one of the first factories in England to move from the city out into the country, where now about four thousand employees enjoy the beautiful surroundings.

WORKING CONDITIONS OF EMPLOYEES.

The entrance by the lodges to the office and factory buildings is through a rock garden, having a pathway arched by bowers covered with flowering creepers. Close to the entrance are the cycle houses, where the employees can leave their machines and have them thoroughly overhauled and ready for use when leaving at mid-day or evening. Between the blocks of buildings the grounds are laid out in gardens, planted, in the winter months, with evergreens, and in the summer, with flowering plants. The walls of the buildings themselves are covered with creepers.

The work hours are based on the eight-hour day. The women usually arrive at 9 and leave from 5 to 5.30, having a break of an hour for luncheon and recreative purposes at 12.30. On Saturdays the factory closes at noon the year round.

The work rooms are so arranged that the temperature is kept even, ventilators being freely used. During the

ENTRANCE TO THE OFFICE AND FACTORY BUILDINGS.

cold months, heat is obtained from the hot steam-pipe system, over which the fresh air from outside is thrown. All the rooms are exceedingly lofty, and the numerous windows and skylights furnish a means of drawing off excessive heat.

In the card box department special appliances have been installed for drawing off the fumes which rise from the heating of glue, so that the rooms where this process is going on are absolutely free from any suspicion of odor which would in any way affect the health.

The employees wear white uniforms. The first one is supplied free by the company to each employee. The second is paid for, half by the company and half by the employee; but after that, each employee pays for the uniform, but buys the material through the company at 25 per cent. less than cost.

Every facility is provided for the employees to sit at

their work, if they choose. In each room throughout the factory, drinking fountains are installed, also telephones, suggestion boxes and other incidentals to make the work pleasant. Plants are profusely distributed throughout the interior of the works, adding considerably to the home-like aspect of the work rooms.

A complete ambulance system is in vogue. There are in each room ambulance boxes which are in charge of several accredited persons. Three nurses, a doctor, and a dentist, whose services are free to employees, hold office hours daily for those who may be poorly, and they also attend to any individual cases of minor disorder on the premises.

Separate retiring rooms for the men and the women are provided, and these are well equipped with beds, couches and easy chairs.

The dining room for girls, which is distinct from that for men, accommodates some two thousand, food being

A LOFTY WORKROOM.

APPLIANCES FOR DRAWING OFF FUMES.

provided daily, at cost prices. A cup of coffee, tea, cocoa on a glass of milk may be had for a ha'penny; a large basin of soup with bread for a penny; a plate of meat, vegetables and pastry for a four-pence. Fresh fruit is brought in daily from the fruit growing district around the factory, and is often consumed in the dining rooms within two or three hours after it has been gathered. An expert is employed to select only the best and brightest fruit for the dining rooms. In the general laboratory of the establishment all food supplies are subjected to analytical tests for purity. The entire time of some thirty employees is occupied in connection with the kitchen and restaurants.

There is also a large heating chamber provided, into which the employees may put the lunch which they have brought from home. The doors of the chamber are then pulled and within an hour the lunches are hot.

The forewomen have their own separate dining room, fitted up with easy chairs and couches and supplied with all the current magazines and newspapers, so that they may have their rest where they can secure the needful quiet for the better carrying out of their duties.

RECREATION.

All of the employees have a fortnight holiday in the summer, and the management arranges with the railroads to run cheap trains to the seaside places all along the coast. The works are closed for a week at Christmas time and five days at Easter, which is a few days longer than is customarily given in England by other large firms.

The recreation grounds for the employees are very extensive and are divided into distinct sections, one for the women and the other for the men. The grounds for the women are laid out in tennis courts, net ball grounds, croquet grounds, and also large sections for swings and other games. The trees are many and of noble proportions; among them inviting seats have been arranged for those who prefer to take their rest quietly and read or chat together.

Bournville Hall, the old family mansion which belonged to the estate, is utilized as the women's club house, and associated with this club are many societies for the general welfare of the girls.

A girls' bath house is now being completed, containing swimming and other baths for the exclusive use of the female employees. Before the erection and completion of this building, architects were sent to the various countries on the continent to procure the best plans for the efficient installation of these baths. There is a large swimming pool in the center, and in the gallery around are private baths of every description.

A gymnasium is provided for the girls. This affords accommodations for the classes, which all the girls not over sixteen years of age are obliged to attend twice a week, to receive instruction in various exercises for physical development.

On the other side of the lane from the girls' recreation grounds are the recreation grounds for the men. The cricket field is sufficiently large to run four full counter-matches at one time. In connection with this cricket field are open air swimming baths, fishing pools, bowling greens and tennis grounds, so that all tastes are satisfied. A gymnasium pavilion is also provided for the men, which is filled with all the appliances associated with athletics. There are also two large football fields.

Associated with the outdoor sports are walking clubs, whose members take rambling tours, looking up old cathedrals and other buildings of historic interest, and enjoying the beautiful scenery along the road. There are also harriers, or groups of men in light silk suits, who start out and run for some twenty miles over fields, fences, walls and brooks, with no particular goal in view. This is a favorite sport in the winter months.

During the summer months the brass band gives performances in the recreation grounds and in the parks, and in the winter the orchestral and choral societies give various concerts in the large dining hall of the works.

EDUCATIONAL.

The intellectual side is not overlooked. A large library in the room adjoining the girls' dining room is at the disposal of all. Connected with this department are

classes in plain sewing, fancy work; also lectures in cooking, ambulance work and other subjects which will be helpful to them in connection with their home life. No fees are charged for these lectures and classes.

There is a large youths' club house, which is used by any of the employed men who are not over nineteen years of age. In connection with this, there are a library and lecture rooms. Bagatelle boards, chess and whist rooms are provided.

Another building is utilized for a club house for the clerks, where there are billiards and other games, with reading rooms and a lending library.

EMPLOYEES' HOMES.

Adjoining the works is the beautiful village, which is the result of Mr. George Cadbury's loving and philanthropic heart and head. When a youth, associated with Sunday School work in Birmingham, and especially with neighborhood work, as he visited the poor living in wretched, so-called homes, he made a vow that should wealth ever be vouchsafed to him, he would devote a large portion to improving that state of affairs. This desire has been fulfilled, and Bournville is now an object lesson to the world, showing that beautiful homes can be secured by even a man of low wages, at small cost.

Many of the homes built on the estate rent at from four to six shillings per week. These houses contain two or three bed-rooms, sitting room, small kitchen, bath and washing conveniences, and all have a kitchen-garden attached. Some of the larger houses, renting at from seven to eight shillings per week, are most artistically arranged. The effect on the dwellers generally has been to bring about a desire to make their homes beautiful; and thus is spread abroad an influence for keeping the husband, wife and family to their own hearth, rather than, as is the case elsewhere, allowing wretched surroundings to drive them to frequent saloons or other places which tend to blunt all that is highest and best. In many cases, individual persons, after seeing the bright interiors of some of the houses, have not rested until they themselves have arranged their rooms along similar lines; and in this way the general tone of house decoration has been elevated. From this has sprung a desire that their children shall be neatly clothed and they themselves dressed with care and cleanliness.

By the trust deed the garden must be at least three times as large as the area covered by the house, so that enough vegetables may be grown to supply a family of six. At the end of each garden a fruit orchard is planted, containing apple, pear and plum trees, currant bushes and other small fruits.

Playgrounds are provided for the children and the gardener overlooks the children to see that they come to no harm. These grounds are away from the main roads.

The roads of the village are all laid out with the object of taking advantage of triangular and other

GIRLS' BATH HOUSE AND SUN REST HOUSE.

(The latter so arranged that the gardener can revolve it during the day.)

LUNCH ROOM FOR TWO THOUSAND GIRLS.

small sections of land for parks. Along all the roads trees are planted and each road is named for a tree, such as Elm or Sycamore.

VILLAGE SCHOOLS.

There is now building on the estate a system of the most perfectly equipped schools in the country, which

room and small kitchen. By the side of each bed is a bell pull communicating with the next house, so that in case of sickness, assistance can be easily called. The furniture is of solid oak, and every thought has been given to make conveniences such that the occupants have every comfort. The almshouses accommodate about one hundred.

is costing Mr. Cadbury over twenty thousand pounds. These will be for the benefit of those living on the estate as well as for others living in the neighborhood.

CARE OF THE SUPERANNUATED.

The late Mr. Richard Cadbury, whose interest in the welfare of the community was great, caused to be erected a number of almshouses, fitted up with every comfort. These almshouses are occupied by those who have been associated with the works, if any such need the help; also by others who may be nominated, and whose character is thoroughly satisfactory. The almshouses surround a quadrangle of beautiful lawns and gardens, so that their environment is wholesome and cheerful. Each house contains a bedroom, sitting room and small kitchen.

MEN'S RECREATION GROUNDS.

STOVE FOUNDERS AND IRON MOLDERS AGREE.

A Year's Demonstration of the Peace Resulting from the Enforcement of Collective Contracts Leads to a New Agreement.

The annual report of Chauncey H. Castle, President of the Stove Founders' National Defense Association, is a notable recognition, from the employers' standpoint, of the practical value of trade agreements, and of the increasing respect for their inviolability among both employers and wage earners. The recent convention of the association ratified the new agreement made by its Conference Committee with the Iron Molders' Union, a prominent feature of which is an increase in the ratio of apprentices. The following are extracts from President Castle's report:

This is the twentieth annual meeting of the Stove Founders' National Defense Association, and while your officers have, during the last year, had a large number of grievances to adjust, none of them were of a very serious nature. This may be accounted for by the fact

that the officers of the various organizations with which we have agreements have become more familiar with the objects and intents of the agreements and impressed with their importance and value in the settlement of questions in dispute. I am pleased to be able to say that in all cases the letter and spirit of the agreements have been carried out, so that peace and harmony have prevailed.

The number of cases of general importance that have been adjusted during the last year is 71. Of this number those involving the molders were 36; mounters, 28; polishers, 7. In six instances the molders quit work and were, in accord with the agreements, obliged to return before consideration could be properly given their grievances. In the same number of cases the mounters who had gone out on an independent strike were, under agreements, obliged by their officers to resume their work pending adjustment. In one or two cases our members shut out their workmen through error, but on being admonished by us opened the shop to them while the grievances were being taken up and adjusted under the agreements. In all instances the questions were adjusted without difficulty, with little expense and in full accord with the intent and purpose of our agreement.

COLLECTIVE BARGAINING.

Its Successful Growth and Application in the Highly Sub-Divided Shoe Industry.

(Shoe Workers' Journal.)

COLLECTIVE bargaining is manifestly the most economic method of disposing of the wage, hour and conditions problems between employer and employees. The development of sub-divisions of labor and specialization in our industries has introduced seventy-five or more divisions and sub-divisions of the work formerly done by one individual.

There are few industries in which this process has been carried on to a greater extent than the shoe manufacturing industry. Formerly the negotiations between the employer and employee were for the price of the shoe made complete, but now there is a separate and distinct bargain for each of the many operations into which the work has been divided and specialized. In the past the shoe manufacturing industry was confined almost entirely to one section of the country, but it has gradually branched out until it is conducted to-day in all sections. The industry, the labor and the product have undergone great changes. From the small shop of the proprietor-worker to the immense factory; from a few hundred factories located mainly in one section to fifteen hundred scattered throughout the country; from practically one system to a thousand; from the individual making the shoe complete to seventy-five individuals performing as many different operations; from the segregated workers to thousands of associated workers under one roof; from hand work to machine work; from a comparatively few styles of shoes to a great variety of styles the shoemaking industry has steadily progressed. The development from the old to the modern method of shoemaking has introduced an immense variety of details in the accounts and management of the factory and a consequent increase of expenses. These details and the expense thereof are minimized by collective bargaining. The saving does not end there, but extends to every department of the factory. Collective bargaining introduces a closer mutual relationship, a spirit of helpfulness among the workers, which eliminates disharmony and unnecessary interference with each other, points out unnecessary obstacles and wasteful methods and installs the most economic systems of distributing and getting out the work. When there are incentives and inducements to the workers to co-operate to facilitate and promote the work of each other a saving in space, time, labor and money results to the employer. The concentration of capital, labor and management have effected wonderful economies, and the concentration of bargaining (collective bargaining) is their economic corollary. When unions first engaged in collective bargaining they were inexperienced, and at times evinced a disposition to be arbitrary, and did not always employ the best specialist or the best and most business like methods.

Often the tactics of the old form of organization were applied to an entirely new and different form, a business form, of relationship between employer and employee. In fact, methods that would not pass business scrutiny and would be suicidal in other lines of bargaining were indulged in by both employers and unions. The same tolerance, restraint, recognition and courtesy which influenced the relations between buyers, sellers or bargainners in other lines of commodities, business or trade, did not mark the relations between employers and unions in their bargains. This, coupled with the opposition of the employer and the inexperience of the union in conducting the business of collective bargaining, often resulted in waste rather than economy. Unfriendly relations, prejudiced, selfish and unwise opposition and wrong methods of execution did not affect the principle of collective bargaining or disprove its just claim to be the most economic and just arrangement for the adjustment of prices, hours and conditions of labor, although it detracted from its utility and efficiency. With the development of more reasonable relations between employer and unions and the adoption of sound methods, collective bargaining has been perfected along business lines and established its economic value in a variety of directions. It has introduced the union and arbitration agreement which fixes the price, hours and conditions of labor subject to change by mutual consent, thus limiting the bargains and bargainners and adjustment of disputes to the union representative, and the bargaining time to a fixed date. The whole matter is often settled and the question disposed of for the period stated in the agreement in one and usually in a few interviews between employer and representative of the union. It tends to impartial treatment and impartial wage scales as uniform as conditions will permit. It affects the economics before mentioned, accruing from a closer relationship and mutual helpfulness among the workers. It is the economic principle of associated effort, which enables one man to act for many, given a new application. It embodies the economics of simplification, systematization and concentration. It developed the most economic processes of doing the work and is the practical originator of the best factory systems in vogue to-day, systematized by the employer.

THE WANTON, INHUMAN, INDEFENSIBLE CHICAGO STRIKE.

(Concluded from page 11.)

proposition. Indeed, the suggestion of violence would destroy the proposition. And it would destroy strikes themselves, for it is inconceivable that a strike could be instituted if it proclaimed violence as a part of its proposition. If violence or disorder occurs it is wholly foreign to the test. It is "pure cussedness," and a refusal to fight fair. To consider violence a factor in a strike, and to hold the man struck against responsible for it, would be like putting two wrestlers in a fair ring and then let the friends of one of them break into the ring, slug the other and fix the blame for the slugging on the man slugged.

The intellectual confusion which makes the maintenance of public order a part of a strike issue must be cleared up. Striking is one thing. Breaking laws is another thing. But many people are honestly, and others not so honestly, confused as to this plain distinction, including, especially, in the two classes mayors, aldermen and those well-meaning people whose sympathy for the workman is never baked quite through.

Such people think that the police are a part of the employers' advantage, instead of what they are—a burdensome imposition upon their business. Certainly a man who is attacked by robbers is not taking an unfair advantage if he allows the police to rescue him. Now, no policeman ever guards a wagon or place of business except to ward off crime. No strike calls the police. Only crime calls them.

As to breaking contracts, labor unions are in no different case from anybody else. There is no moral exemption for any man or body of men that breaks contracts. Nor is there any hope of public or private respect for a contract breaker. A contract breaker is an utter misfit either as a citizen or a business man. There is no help for him except to be born again. And until contracts become sacred with all unions, until the public mind believes union contracts to be as good as gold, unionism will not be finally accepted by either the employers or the people. Happily, however, the strong and honorable men who are rising to the highest positions in the union movement understand as well as we do that it is vital for unions to keep faith.

One of the finest things ever done by a union man was the action of John Mitchell, when he resisted the sympathetic strike of the bituminous coal men while his anthracite strike was on. They could not strike without a violation of contracts, and he not only would not accept help through a breach of faith, but used every influence of his personal authority and that of every friend he could rally about him, to avert what he considered the dishonoring of his people. That example is celebrated, but there are abundant examples less conspicuous, by other tried labor leaders who are helping to make unimpeachable the contracts of the unions.

But much remains to be accomplished. The inviolability of contracts and the stern discountenancing of violence must become universal articles in the very creed of unionism. And these articles must become seasoned and confirmed before the American people will give its full endorsement to a cause and an institution that it is nevertheless anxious to adopt.

What would be the effect upon the fortunes of the labor unions, of the radical elimination of violence and broken contracts from their records? What could result but strength, success and progress?

First, there would be a new good will and co-operation on the part of the employers. Employers and workmen would soon come into cordial relations. That of itself would add immensely to the facilities of the unions.

But a more powerful ally than the good will of the employers is the good will of public opinion. With that as an ally everything is possible. Without it nothing is possible.

Public opinion will work for the working man if it can at the same time be just and moral. It is eager to be upon his side, and can be discouraged only by the conduct of the unions. It backs the honest man; but it will back him all the sooner if he works for wages. Nothing, however, can persuade it from despising and hating a contract breaker or a slugger.

There are various issues between employers and the unions, beside the sacredness of contracts and the maintenance of peace. But they are mostly debatable issues, respecting which final settlement may be a long time deferred but may always be expected. These issues require far more consideration and discussion than they have yet received. Much more experience and much more knowledge is needed for their final solution. But the two indispensable eliminations will make it possible to treat these other issues fairly, and in the end, wisely.

But not only are there issues to be settled. There are reforms to be effected in the labor movement. And all must help.

The unions, in frequent instances, suffer prodigiously from corrupt, incompetent or brutalized leadership, though it should exalt the pride of the American people that in so short a time so many of the highest places in the unions are filled by men who are an honor to the American name.

The unions are suffering too from the insufficiency

of their government. Their government is an attempt at the extreme democratic form of the town meeting, and it frequently produces instead of a democracy a dangerous oligarchy. Some modification of this form of government, or some evolution from it, or some new safeguards and checks, are necessary to prevent the running of many of the unions by their parasites—the grafters, the demagogues and the fools.

The needed reforms in whatever direction will take time. But what I want to say, with particular emphasis, is this: that for these reforms the workingmen themselves can never be wholly responsible.

The employers must accept a share—an important share—of this great responsibility.

And unionism makes large demands on our intelligence as well. In the first place there is the obligation to train ourselves to discriminate between the permanent values and meanings of unionism and the excesses incident to the first growth of an immense new power. The evolution of wise leadership and conservative membership in a new movement of workingmen must be slow. And it must be made at the cost of strange misconceptions of rights, of wild and illegal notions of self defense, of hostile mistrust of employers, and of deplorable disregard of the sanctities of law and order. Any man who will calmly and competently reflect upon this great matter will see for himself both that these phenomena are inevitable, and that they are entirely apart from the fundamental meanings, intent and values of the labor movement. They produce deplorable, and sometimes horrible facts and conditions; but they are, after all, superficial and might be temporary. It is our duty, substituting reason for feeling, to learn and understand the true significance of these excesses; and while dealing with them as they deserve to be dealt with, to always have a mind that looks beyond them into the depth of the great undercurrent which can, eventually, carry the whole American working world forward to calm prosperity.

We must accept the fact, too, that great changes in the conception of personal and property rights have come or are coming, as part and parcel of the democratic evolution. And among these is the acknowledgment—partly already legal and partly only as yet intellectual—that in employment matters there are two parties instead of one. A man who used to say I will run my business to suit myself, has to modify that exclusiveness. Some of us feel sometimes that we should be outrageously happy if we had even half to say about our business. In some respects a man can, it is true, run his own business—but in other respects public opinion, and not infrequently public law, steps in and limits his exclusive control.

But the chief requirement, after all, is that we shall believe that labor unions are indispensable to the advancement of mankind and to the growth of its civilization, for therein lies their profoundest claim. That is the great reason why we must not be halted by their present excesses, their present injustice, their present brutalities. That is why the movement must be purified, humanized and made wise and progressive. And that is why the labor movement—a large factor in the progress of the nation and the world—does not wholly rest upon the shoulders of the workingmen, but is a responsibility of yours and mine.

It is mere idleness to talk of an advancing civilization which doesn't include the advancing civilization of the workingmen. The development of only you and me, the rising comfort and manners, the rising intelligence and education, the rising character and morality, the rising altruism and ideals, the rising imagination and thought of only you and me and the few, would be a poor fruitage in that great garden of God where mankind has been placed to plant, cultivate and harvest the developments of progress and civilization. To leave out of the count vast sections of the people would be to defeat all the human purposes of Heaven.

And we cannot leave them out of the count. They will not be left out. For, why are the imperishable instincts and impulses of development and progress implanted in the race if they are not to carry forward and upward the whole people and not merely a small fraction of the people? What is there to satisfy, as a finality, the human intelligence, the human imagination, the human spirit, but the progress of the whole people?

But, how in the world, under present industrial and social conditions, can the workingmen of America hold their place, or how can we employers help them to hold their place, in the slowly but surely advancing columns of the army of civilization without the protection—the only protection—of their self organization? It would not be possible. It would not be conceivable. They would fall by the wayside—helpless victims of the vicissitudes of a cruel and inordinate competition. Where else but in this self protection is there even a breakwater, to moderate those high waves of immigration that are forever rolling in upon our working people from remoter and remoter Europe, where wages and the standards of living are miserably lower and lower?

The problems are difficult enough even with labor unions, for the unions are imperfect enough to suit their most fastidious critics. But without the unions the problems would be hopeless.

Therefore, for the larger reason that without the unions there would be the chaos of modern progress

and the travesty of modern civilization, and for the immediate reason that the unions need, above all, right direction and development, their claim upon all who care, within the unions and without, for the fate of all orders of men, is a claim with the highest sanctions.

I know how comparatively few there are as yet among union men themselves who relate the union movement to the general interest of society. The motives of union men necessarily are mainly selfish and interested. And the disinterested view appears imaginative to many employers who experience the aggressiveness of the unions. And treating the present problems—some of them very sordid problems—with intellectual sympathy, patience and hopefulness, may well look like optimism. But optimism isn't the blackest crime in the calendar. At least men are sometimes hung for worse crimes than optimism.

And to go, in conclusion, a step further along the path of cheerfulness and hopefulness—availing myself for a moment more of the opportunity of an exceptional audience—I shall let myself believe that this nation, which is the first that has had both the purpose and the free opportunity to accomplish the impartial development of its people as a whole, will not fail in this its distinctive and incomparable mission. Speak of idealism! Speak of idealism! There is no optimism and no idealism, there is no sane dream, that exceeds the accepted and grounded national propositions of the American people. Our foundation creeds revel in magnificent imagination. But not one article of those creeds lies outside the realm of the rational and the practicable.

The persistence of the centuries has broken the bondage of the individual man—and the American nation is the expression of this triumph. But democracy, under whose banner the slow and tenacious progress was made, had one steadfast dream—the development of all the people. It broke the vested privilege of the monarchs and the nobles, that all men together might rise steadily and forever, step by step, with the upgrowths of civilization. And the American nation, which speaks to the world, as no other nation is commissioned to do, in the name and with the voice of democracy, will not let its enfranchised individual carry his liberties so far as to defeat the interests of his fellow men! and will not replace the abolished privilege of the nobles with a new privilege of the rich. Neither will it weakly turn as a refuge from plutocracy to the negations and the paralysis of socialism. But, avoiding both, America will gladden humanity with the spectacle of a whole people advancing in happiness and civilization by an honest enforcement of the policies of "a square deal."

SOCIALISTS SEEK TO INFLAME THE MIND OF AMERICAN YOUTH.

(Concluded from page 11.)

phenomena of the Socialist program which its advocates now seek to inject into the systematic instruction of the higher institutions of learning. It has been pointed out that the varied and eccentric constituents who make up the "57 varieties" of Socialism, together with the revolutionary doctrines themselves that they announce, constitute a menace more ridiculous, in this free land, than grave. But this effort to distort the social vision and inflame the misguided ardor of youth against existing institutions, if it were permitted full and unchecked scope, might have a deleterious effect upon some of those who are in training for the leadership in the thought and action of the future. But it is shown simultaneously that the real toilers of the land, as represented by the leaders of organized labor, reject and repudiate these apostles of gloom and revolution, for whose welfare these "scientific Socialists" display such concern in their fantastic campaign.

These millions of wage earners can rely upon the solid support of the uplifting, progressive and patriotic forces of the Republic—the pulpit, the press, the colleges, the leaders of public thought—in nullifying the doctrines of despair and class hatred, whose advocates openly boast their purpose to undermine society and overthrow the institutions of free, popular government.

There is no more worthy or better publication in circulation to-day than the MONTHLY REVIEW of the National Civic Federation. THE REVIEW takes the position that it is not only wrong but is foolish for employers to undertake the destruction of the trade union movement. It urges upon both employer and employee the necessity of coming together in friendly conference and settling their differences. Where they cannot agree THE REVIEW urges the next best thing, which is arbitration.—*Cooper's International Journal*.

The Civic Federation is composed of the representative men in the business world, the labor movement and the philanthropic life of this nation, and much good has been accomplished by the organization in harmonizing the relationship between capital and labor.—*Louisville Journal of Labor*.

IS THERE AN IMMIGRATION PERIL?

(Concluded from page 7.)

can place him in neighborhoods in which are successfully established people of his own nationality. We do not doubt but what we will be successful.

Not many years ago I remember we established the first settlement of Germans in a State on our line. The forerunners of this settlement were brought from the congested sections of your city, New York. They were followed by German-speaking people, friends of friends and acquaintances of acquaintances. There are now several hundred German families in that section and more are wanted, and as they come, properly establishing themselves, they will be successful. In the same section we have colonies of Bohemians, Hungarians and some Scandinavians, all of whom are being joined by friends from the North and Europe. Recently we established a colony of French-Canadians. These people came from Canada to the United States, and after working around the mills in New England for a time found that they would be better satisfied if engaged in agricultural pursuits. They purchased farms in the South, at practically their own terms. They are satisfied and are being joined by other French people. We now have French colonists coming to us from Europe. True, the number is limited, but the foundation for an increased immigration is being laid. We have many Scandinavian farmers and business men located with us, and more are coming annually.

Recently I had the pleasure of making an extended trip through the South with the Italian Ambassador, Baron Mayor des Planches, at which time he studied several of the Italian colonies located on our system. These colonies were found most prosperous and contented. There is abundant room for many thousand Italian families on Southern farms and in Southern mills. We have to-day applications from not only farmers, but manufacturers as well, for Italian laborers. They will be given steady employment, and those desiring to own homes of their own will have no difficulty in being accommodated. We visited one settlement of Italians numbering about 175 families. Each family works from 20 to 30 acres of land for which they pay rental. They are furnished equipment, seed and supplies, as well as houses to live in. The statement of their net earnings shows that no farmer earned less than \$350—some of them as much as \$1,375. This was accomplished without any capital, and no investment whatever on the part of the Italian family, excepting the labor. I note this to show that the family without capital can succeed in the South.

It would seem appropriate for me to make the following suggestion as an aid to the solution of the problem:

Of the many thousands of immigrants now domiciled in your city, a considerable proportion come from farms in Europe. They come to this country to better their condition, to secure a home in free America. They are without any knowledge of the country beyond your city limits. They are not assimilating with our people, and I question whether they will; at least not as rapidly as they would, if placed in the rural districts. To distribute and establish these people we must have a location and money. With land, some money and people much can be accomplished. We have these three factors:

1. Desirable lands in the South at low prices.
2. Capitalists in the City of New York, in the North, and some in the South.
3. The people in congested districts.

Let us bring these three together.

The Commissioner of Immigration of the United States has, in my opinion, wisely recommended, that he be authorized to permit the various States to establish on Ellis Island, bureaus of information, the purpose being to reach the immigrants before they are permitted to enter the United States, and direct them to suitable homes, sending them direct thereto from Ellis Island. We are anxious to have many of these people in the South, and are ready to consider taking them; we believe we could aid materially in relieving the situation here in New York if we were permitted to go among these immigrants, making our investigation and selection, that is, giving the immigrant reliable information concerning the advantages we offer, the opportunities existing in the South, so that he can intelligently consider the proposition we would make. This done in advance of the immigrant having an opportunity to taste metropolitan life would, we believe, send more people away from the city than are going at this time. I would further suggest that the various organizations in your city interested in the caring for and protection of these immigrants be given sufficient support to properly connect themselves with people throughout the United States, likely to be interested in securing immigrants, thereby enabling these societies to do considerable more good work in directing people to suitable homes.

The Chairman:—Gentlemen, this is a national subject, and time will not permit of much further present discussion to-night. We have some gentlemen from the West here whom I would like to invite to show the immigrants the advantages of the West. Somebody is evidently getting men who want to work, for I can't get farm hands out on my farm twenty-five miles away. There is a scarcity of labor in the country, and

I do not know whether they go South or where they go, but I can't get them.

Mr. James P. Archibald:—

Mr. Chairman and Gentlemen: It was my intention to read a paper here to-day from the labor standpoint and to endeavor to express the feelings of the working people in regard to the question of immigration. I feel that it would have settled some of the assertions that have been made here to-day in regard to unlimited desirable immigration.

I will detain you but a few moments, Mr. Chairman, but I want to get square with you because I could not read my paper, but I will endeavor to have it printed in the proceedings of this meeting. It is a paper that I prepared ten years ago. When I was invited to address this meeting, I read over this old paper and found that it expresses my views now just as if I had written it yesterday.

Way back in 1892 the Central Labor Union of New York interested itself very much in immigration, and I was one of the committee that was then selected to investigate and report to the Central Labor Union. We did so, and our conclusion at that time was that no desirable man should be prevented from landing in this country. That is my opinion. I am amply satisfied that the interests of the labor people will be conserved, at this point at least, because of the fact that the Commissioner at this point to-day is a man in whom all of us who have the pleasure of his acquaintance have unqualified confidence. (Applause.)

As this question is likely to give rise to discussion all over the country, and perhaps compel the attention not only of our State Legislature, but of our National Government, I believe it behooves the Civic Federation to be in a position to put itself on record as to its attitude towards this great question, the principal part of which I believe is the distribution of the immigrants in the country. Mr. Chairman, I move you that the Civic Federation of New York and Vicinity request the National Civic Federation to appoint a committee composed of men of national standing to investigate this question of immigration and report to the National Civic Federation at as early a date as possible.

The resolution offered by Mr. Archibald was adopted unanimously and the Chairman declared the meeting adjourned.

The following is the paper submitted by Mr. Archibald:—

It should be clear, in our opinion, to every thinking man that a course of public policy which would diffuse labor all over the country is the great necessity of our times. Every year, and in their tens of thousands, there come to us men and women whose life experiences have been wholly connected with farming. They come from countries where militarism and landlordism eat the substance of the people, where taxation and rents have reduced them to an almost entirely impoverished condition. Hence, when they reach our ports, they have little or no money; they are ignorant of our resources; they do not know where to go; and if they did they would not have the means to defray the cost of transportation.

The result is that they remain just where they first land. They crowd the districts which are already overcrowded. Want and misery, filth and disease are the inevitable concomitants of such unnatural conditions. Hunger must be at least partly appeased. The "sweater" comes to offer something for its appeasement, or the employer of "scab" labor is at hand to give work for starvation pay, or the employer of union labor is besieged with applicants for work until, even were he a philanthropist, he could not find places for all. The remainder go to the wall. They go down and down. Public and private charity are next taxed to the last degree of endurance. A standing army of paupers is created. Trampdom is filled to repletion. The criminal classes are increased by many, at first, unwilling recruits. Public health is endangered. Public appreciation of man's inherent dignity is lessened. Public morality is assailed in a vital part, while the multiplication of suffering by tens of thousands of able-bodied men and women tends to destroy the finer feelings of humanity and to create a brutal hard-heartedness in the stead of Christian love and fraternal sympathy. Meanwhile the South and West are calling loudly for the very class of labor which most abundantly discharges itself on our shores. But there is no organized means to supply it. The poor immigrant is unable to help himself or place himself within the reach of fair opportunity for work.

Now, why is this not remedied? And is it not apparent as the noonday sun that the means of our remedy are in the hands of our Governments, both national and state?

And is it not equally clear that the whole country would be improved and the condition of workers everywhere be ameliorated if an effective remedy were applied? So far as our State Governments are concerned, it seems to be wholly within their power and entirely within their province to maintain labor commissioners at this point, whose duty it would be to hold constant communication with the national officials of immigration, and take concurrent action with such officials to take charge of the immigrants in directing, divesting and transporting them to a place where labor

is required. If credence is to be given, as no doubt it should, to the press of the South, they are more in lack of labor than of capital in those fertile States. The want of farm labor fetters the farmers, who cannot increase the areas of improved and cultivated lands because they cannot find laborers to do the work. Good pay awaits the sober, industrious laborer. Plenty awaits the able-bodied workers if they only get there. But unadvised and unaided, our European immigrants cannot and do not get there. Vast treasures of national wealth remain undeveloped while vast additions to national poverty are made with each new influx of what might be manipulated to public and private good.

Nor is it in farming alone that the South, Southwest and West are calling for more workers. Alabama and Georgia cry out for more mechanical labor every day. Tennessee is rich in mineral wealth, while her soil has but to be scratched for abundant results. Florida calls for fruit growers. Louisiana offers great sugar opportunities. Arizona, the Dakotas, Nebraska, the wonderful State of Washington, Montana, Texas—but why further enumerate?—all these States require the industry (and have ample opportunities for its exercise) of millions yet to come; and it only remains for us to distribute and transport our immigrants where they are most needed. Such action would stop overcrowding. The general good would be promoted, and in the general advantage of the States the whole country would share. The organs of plutocracy may shriek "paternalism" as much as they may when dealing with this feature of the labor problem; they may desire to the top of their bent that there shall be yet more overcrowding in our already congested districts, so that concentration of capital may find a defenseless, impoverished concentration of mere human machinery at hand to be dealt with according to the dictates of soulless greed; but to this great policy of adequate, intelligent and well-directed distribution of labor the country must come.

Nor are we without example and precedent, in a limited degree, in this matter. One of the greatest governors of Massachusetts, the long-headed, far-seeing, wise and patriotic Andrews, once sent one hundred respectable, well-educated daughters of that State to the extreme West. They had been educated to an employment then crowded. There was nothing before them but starvation or the indescribable infamy of the streets. At the expense of Massachusetts they were saved from either of these awful alternatives. Provided with suitable escort, they were removed to a part of the country where their education, labor and thrift were most needed. They were placed where they could be of efficient help to themselves and to those about them. The result proved the wisdom of the great Andrews, and what he caused to be done for those one hundred young women can be done by our National and State Governments if they but rise to the height of the occasion in behalf of our immigrants.

It may and will be objected that the State has no right to interfere with individual liberty, and that such direction and transportation of immigrants would infringe on their individual rights; that they have a right to further congest the labor supply in our large cities if they choose; that they have a right to further overcrowd the already overcrowded tenement house districts if they wish to do so; that they have a right to increase the fierce competition for means of mere existence and further add to the burdens of labor in places where its superabundance is the superinducing cause of cheap wages and consequent hardship to the community. But such objection cannot stand the test of logical examination. It is self-evident that the State has the inherent right to protect itself against pauperism and its consequence, heavy taxation. It is not upon the barons of monopoly the burdens of taxation fall. It is the industrious poor of New York, with outrageously high rents flowing into the pockets of the landlord class, whose evicting propensities out-Herod the Herods of Ireland, who bear the burden of taxation for almshouses, houses of correction, penitentiaries, city hospitals and prisons. When trouble comes in financial circles thousands are thrown out of employment, and when the unemployed are brought to utter destitution the State or the municipality must come to their relief.

The idle and profligate are among us, but what shall he done with those who are only anxious for work, and the morality of whose lives under the most wretched conditions excites the admiration of every Christian or philanthropic observer, be he in religious belief or what he may? If the State has the right to organize for punishment, it must have an equal right to organize for guardianship. To prevent further overcrowding in this and other large cities would seem to be one of the highest forms of guardianship the State can exercise; and we hope that in due season, before the evil becomes unhearable, our statesmen and legislators will cease for a season their selfish scramble for place and power and give to the question of labor distribution their best thought and action. By so doing they will urge forward the car of American progress, create tens of thousands of American homes, cause civilization to bloom over trackless prairies, build up a citizenship that shall be a tower of strength to the Republic and invoke on our statesmanship the benedictions of Him before whose all-seeing eye the humblest workingman stands the equal of the wealthiest capitalist.

The National Civic Federation Review

Vol. II. No. 4

NEW YORK, JULY—AUGUST, 1905

TEN CENTS

WELFARE WORK AND THE PANAMA CANAL.

THE COMMISSION SECURES EXPERTS FROM THE WELFARE DEPARTMENT OF THE NATIONAL CIVIC FEDERATION TO REPORT UPON RECREATION.

TWO experts in Welfare Work, furnished by the Welfare Department of the National Civic Federation, sailed for the Isthmus on July 20, in the company of Chairman Shonts of the Isthmian Canal Commission and Chief Engineer Stevens. These men are W. E. C. Nazro, Welfare Manager of the Plymouth Cordage Company, North Plymouth, Mass., and Edward A. Moffett, editor of the *Bricklayer and Mason*, New York.

These experts were engaged by the Canal Commission especially to investigate the needs and oppor-

tunities on the Isthmus for the recreation of the workers engaged in canal construction, to put their conclusions in the form of definite recommendations, and to arrange to have carried into effect such plans as are adopted. The whole purpose is to secure the physical and mental welfare of the thousands of employes of the United States Government who, for years to come, will work and live in a climate and amid environments wholly different from their previous surroundings. These employes include heads of departments and chiefs of bureaus; clerks, stenogra-

phers, and a large number of engineers and rod-men, many of whom are college graduates; steam dredge men, high-class firemen, machinists; many hundreds of locomotive drivers, yardmen, steam drill operators, carpenters, bricklayers, plumbers, and mechanics.

Before sailing, Chairman Shonts thus explained, on behalf of the commission, the introduction of recreation into the work of canal construction:

"We have appreciated the necessity of doing something in the way of providing recreation for employes on the canal, and we have decided to take steps in

DEPARTURE FOR THE ISTHMUS OF WELFARE EXPERTS ON STEAMSHIP MEXICO.

that direction at once. It is absolutely true that down there our American employes have had no means of amusement. We are going to provide tennis courts, baseball parks, and perhaps fields for such other athletic sports as are suited to the climate. These opportunities for wholesome open air exercise and amusement will be especially valuable and welcome to the clerical force, and others whose work is largely sedentary. We intend, also, to have club houses erected, with every facility for reading and for all kinds of games and indoor amusements. In connection with these clubs and their various rooms, there will be reasonable opportunity for men to spend money in a proper way, who wish to do so. Before undertaking this plan we consulted with officials

W. E. C. NAZRO,
Welfare Manager, Plymouth Cordage Co.

of the National Civic Federation. The Welfare Department of that organization has put into practical shape some excellent ideas for providing entertainment and recreation for the employes of large industrial establishments. We are convinced that these plans can be adapted to meet the conditions on the Isthmus. We shall take with us accordingly, two experts that the National Civic Federation has furnished to look over the field and prepare definite plans.

"These plans will include also better houses and quarters for the men. The problem of housing is highly important, and clamors for immediate consideration.

"We recognize that a government employe down on the Isthmus is entitled to a habitation and surroundings in keeping with his American standard of living. These additions to our preliminary plans may

impede the actual work on the canal a little, but the delay will not be serious. It is far better to attend to this need in advance, and insure a contented and well housed army of employes, than through neglect to invite discontent and lack of enthusiasm in the work, not to speak of the sanitary question.

"Again, we are going to take steps to improve the food, and see that it is provided at the lowest possible figure. When we have accomplished these things, I believe the storm of complaints about the situation on the Isthmus will have ceased, that everybody will be contented, and that we shall in the end make a great gain, because of these preparations for recreation and wholesome living. With healthy underlying conditions we shall accomplish infinitely more, with less cost and less friction."

The experts furnished by the Welfare Department of the National Civic Federation are well qualified to prepare these desired plans for recreation. Mr. Nazro graduated from Harvard University in 1897, with the degree of B.A.S. upon landscape architecture, the laying out of recreation grounds, etc. In 1898, he received the degree of S.B. in architecture, having made a special study of all recreation buildings, such as club houses, gymnasiums, etc. After leaving college, Mr. Nazro traveled through England, France, and Italy, devoting most of his time to the study of these subjects. After returning from Europe he spent two or three years in practical work along the line of architectural and mill construction, and studying particularly the adaptation of sanitary conditions, light, etc., in the construction of mills, to the needs of employes. He was for a time with a large engineering firm, which made a specialty of mill construction. From there he went to the Plymouth Cordage Company as Welfare Manager, to take up their work of mill architecture, landscape improvements, homes for employes, a library, lunch-house, recreation hall, athletic association, and the development of other Welfare features. Mr. Nazro has carried on this work successfully for four years, and won the gold medal for his specialty at the St. Louis Exposition.

Mr. Moffett, as the editor of the official journal of the Bricklayers' and Masons' Union of America, has made a special study of all subjects connected with the welfare of skilled labor in the building trades, of which there will be a great deal employed on the Isthmus. In his capacity as a national representative of labor, he will make a thorough study of the prospective conditions that will surround the mass of employes on the canal. He will thus be able to render valuable assistance to Mr. Nazro in preparing a report to the Isthmian Commission which, it is hoped, will clear away a great deal of the popular misapprehension upon that subject.

Upon completing their investigation, Messrs. Nazro and Moffett returned to New York, where, after their arrival on the eve of THE REVIEW's going to press, they made the following preliminary statement:

"Inasmuch as we are to make an official report to the Isthmian Canal Commission upon our investigation into what has been done and may be done to make the

Canal Zone more habitable for employes, we obviously could not say anything that might anticipate our findings and recommendations.

"Speaking generally, it is well known that conditions on the Isthmus have been unfavorable for the employment of labor. Yet at the same time, our investigation warrants our saying that they are not as bad as they have been represented. In undertaking this stupendous enterprise, our Government has from the first met with most difficult problems, not the least of which has been the proper housing, etc., of the employes. Still, it must be said that the officials engaged in canal construction are making conscientious efforts to mitigate the hard physical conditions with which the employes have had to contend. It is plainly evident

EDWARD A. MOFFETT,
Editor Bricklayer and Mason.

that the Commission is determined to remove the slightest ground for whatever dissatisfaction may have existed. At the same time, we should say that the Isthmus with its tropical climate is no place for a man who expects to find all of the creature comforts to which he is accustomed at home. A man unaccustomed to the rough side of life, or at least unwilling to meet it, has no place on the Isthmus.

"We believe the efforts to better the conditions of employment on the Isthmus are to be continued with more intelligent direction. A day or two before we left, it was announced that Chairman Shonts, of the Commission, and Chief Engineer Stevens had issued a mandatory order to the effect that all work on the Canal should cease forthwith save the work of providing ample accommodation for employes already on the ground and for those yet to come."

NATIONAL IMMIGRATION CONFERENCE.

A Representative Gathering, at Our Largest Port of Entry, to Discuss a Problem of Inter-Continental Importance.

A National Conference upon Immigration will be held in New York City, December 6 and 7, under the auspices of the National Civic Federation. The decision to give the investigation of this subject a national scope followed the many and widespread manifestations of interest in the discussion, at the midsummer meeting of the Civic Federation of New York, of the growing volume of immigration and its relation to American industry.

Invitations have been sent to the Governors of all the States to appoint each ten delegates to the National Conference. The responses have been prompt and favorable, and it is already assured that practically every State in the Union will be represented by delegates familiar with the needs and desires of their localities as to influx of population and with its relation to their industries. The following is the formal invitation:

SIR: Your Excellency is invited to appoint ten delegates to represent your State at a National Conference on Immigration, to be held in New York City, December 6 and 7, under the auspices of the National Civic Federation.

Some of the questions to be discussed under the general head are:

What is the character of the net increase in the population of the United States from immigration?

Should existing legislation looking to the elevation of this character through the exclusion of undesirable elements be extended and made more effective?

Should there be any change in the system of inspection, such as having it made at ports of departure, or at the home sources of emigration, or at both?

Are there any external influences tending to stimulate the volume of immigration?

What are the nature, extent, and locality of the demands in the United States for more labor?

What domestic industries and what labor crafts are most affected by the influx of alien labor, and in what ways?

What percentage of European immigration remains in the ports of arrival, such as New York, Boston, Philadelphia, and Baltimore?

What practical method can be devised of distributing immigration, especially for agriculture, to points where it may be needed?

What will be the effect of the distribution of large numbers of immigrants in the South upon the problem of industrial education and social betterment of the negro race?

Should the exclusion of Chinese coolie labor be made more rigid, and should it be extended to Japanese and Korean labor?

How shall the admission of exempted classes of Asiatics, such as scholars, merchants, and tourists, be regulated?

In fact, any topic related to immigration and its effect upon our national life and industries that the Conference wishes to consider may be included in its proceedings.

Yours respectfully,

(Signed)

August Belmont, Samuel Gompers, Oscar S. Straus, Bishop Henry C. Potter, John Mitchell, Archbishop John Ireland, William D. Mahon, Charles A. Moore, Warren S. Stone, Ralph M. Easley, Samuel B. Donnelly, Committee.

At the request of the Committee, the following were appointed by the Civic Federation of New York to co-operate in the preliminary arrangements; in the reception and entertainment of delegates, who will come from all parts of the country; and in making every effort conducive to the success and public value of this national gathering:

William H. Allen, General Secretary Association for Improving the Condition of the Poor.

J. Willis Baer, Secretary Board of Presbyterian Home Missions.

Nathan Bijur, President State Conference of Charities.

John N. Bogart, President Trades' Union Social Club.

Michael Brayer, Cloth Finishers' Union.

William O. Coakley, Lithographic Press Feeders.

John Cooper, The Cooper-Wigand-Cooke Company.

James Daly, Dock Builders' Union.

Charles Delaney, Granite Cutters' National Union.

Edward T. Devine, President National Conference of Charities and Correction.

Otto M. Edlitz, Building Trades Employers' Association.

R. Watson Gilder, Editor Century Magazine.

Edward Gould, International Brotherhood of Teamsters.
B. J. Greenhut, Treasurer Siegel-Cooper Company.
C. L. Graff, Secretary Retail Dry Goods Association.
J. H. Hatch, United Upholsterers' Union.
James P. Holland, International Brotherhood of Stationary Firemen.
Daniel F. Jacobs, Cigar Makers' Union.
Arthur P. Kellogg, Assistant Editor Charities.
Philip Kelly, Theatrical Protective Union.
B. A. Langer, United Garment Workers.
Thomas B. Lavey, Iron Molders' Conference Board of New York and vicinity.
Edgar L. Marston, Blair & Company.
E. A. Moffett, Editor Bricklayer and Mason.

TRADES UNION SOCIAL CLUB.

A New York Organization, Containing National Labor Leaders, Plans a Dollar Dinner on Labor Day.

The Trades Union Social Club of New York, as its name implies, of officers and members of trade unions in that city, and a goodly number of the officers of national organizations of labor.

A COMMISSION TO INVESTIGATE PUBLIC OWNERSHIP AND OPERATION.

THE NATIONAL CIVIC FEDERATION INITIATES AN EXHAUSTIVE INQUIRY, AT HOME AND ABROAD, TO LEARN HOW FAR THEY ARE DESIRABLE.

THE Executive Council of the National Civic Federation, upon request of its Departments of Industrial Economics and of Trade Agreements, has decided to appoint a Commission to make a thorough investigation, in this country and Europe, of National and Municipal Ownership and Operation of Public Utilities.

The current discussion and acute agitation of this subject indicate its hold upon the popular mind and the necessity for its analytical and comprehensive examination. Its present debate is often inconclusive, because of contradictory or unsatisfactory statements of fact. It is intended, therefore, that this investigation shall disclose the actual results of public ownership and operation, as far as they have been undertaken in the United States, and of their more extensive practice in foreign countries. The ascertainment of these facts will afford a solid basis upon which to found discussion and conclusions for the guidance of future policy.

The scope of this inquiry will cover the relative advantages of Public Ownership and Operation, as compared with Public Ownership and Private Operation and Private Ownership and Operation. Each system will be examined with regard to its effect upon, among other topics:

Wages, hours, and conditions of labor;
Collective bargaining;
Cost and character of service;
Political conditions, civil service, spoils system, and municipal corruption;
Financial results;
Taxation.

The Commission will meet early in the fall to determine upon its program and methods of work. Among those appointed are:

Melville E. Ingalls, Big Four R.R., Cincinnati, Ohio.
Isaac N. Seligman, Treasurer Citizens' Union, New York City.
Oscar S. Straus, Merchant, New York City.
Albert Shaw, *Review of Reviews*, New York City.
Franklin MacVeagh, Merchant, Chicago, Ill.
Alexander H. Revell, President Chicago Civic Federation, Chicago, Ill.
Walter L. Fisher, Secretary Municipal Voters' League, Chicago, Ill.
Robert W. De Forest, Attorney at Law, New York City.
Wm. D. Foulke, Attorney at Law, Richmond, Ind.
Edward Rosewater, Editor *Bea*, Omaha, Neb.
Charles W. Knapp, Editor *The Republic*, St. Louis, Mo.
Frederick N. Judson, Attorney at Law, St. Louis, Mo.
Austin W. Fox, President City Club, New York City.
John G. Agar, President Reform Club, New York City.
Ambrose Sweeney, President Cleveland Chamber of Commerce, Cleveland, Ohio.
Alfred F. Potts, President The Commercial Club, Indianapolis, Ind.
H. W. Goode, President General Electric Co., Portland, Ore.
Frank A. Vanderlip, Vice President National City Bank, New York City.

W. D. Mahon, President Association Street Railway Employees, Detroit, Mich.
John Mitchell, President United Mine Workers of America, Indianapolis, Ind.
Samuel Gompers, President American Federation of Labor, Washington, D. C.
Daniel J. Keefe, President International Longshoremen's Association, Detroit, Mich.
E. E. Clark, Grand Chief, Brotherhood of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' National Union, Boston, Mass.
John F. Tobin, President Boot and Shoe Workers' Union, Boston, Mass.
Timothy Healy, President International Brotherhood Stationary Firemen, New York City.
F. J. McNulty, President International Brotherhood of Electrical Workers, Washington, D. C.
F. W. Taussig, Harvard University, Cambridge, Mass.
Edwin R. A. Seligman, Columbia University, New York City.
J. W. Jenks, Cornell University, Ithaca, N. Y.
Henry W. Farnam, Yale University, New Haven, Conn.
Frank J. Goodnow, Columbia University, New York City.
Leo S. Rowe, University of Pennsylvania, Philadelphia, Pa.
Carroll D. Wright, Clark College, Worcester, Mass.
John R. Commons, Wisconsin University, Madison, Wis.
Henry C. Adams, University of Michigan, Ann Arbor, Mich.
Hugo Meyer, University of Chicago, Chicago, Ill.
J. H. Hollender, Johns Hopkins University, Baltimore, Md.
John H. Gray, Northwestern University, Evanston, Ill.
Alexander Humphrey, Stevens Institute, Hoboken, N. J.
Edward W. Bemis, Superintendent Water Works, Cleveland, Ohio.
William J. Clark, General Electric Co., New York City.
Walton Clark, Vice President Traction Co., Philadelphia, Pa.
Samuel Insull, President Edison Company, Chicago, Ill.
P. F. Sullivan, President Boston and Northern Street Railway Company, Boston, Mass.
Charles L. Edgar, President The Edison Electric Company, Boston, Mass.
Thomas Lowry, President Twin City Rapid Transit Company, Minneapolis, Minn.
Horace E. Andrews, President Cleveland Electric Company, Cleveland, Ohio.
J. C. Hutchins, President Detroit United Railway Company, Detroit, Mich.
George F. McCulloch, President Indiana Union Traction Company, Indianapolis, Ind.
Hamilton Holt, Editor *The Independent*, New York City.
Lawrence F. Abbott, Editor *The Outlook*, New York City.
Graham Taylor, Editor *The Commons*, Chicago, Ill.
Talcott Williams, Editor *The Press*, Philadelphia, Pa.
R. R. Bowker, *Publishers' Weekly*, New York City.
Milo R. Maltbie, Franchise Expert and former Editor *Municipal Affairs*, New York City.
T. C. Martin, Editor *Electrical World and Engineer*, New York City.
D. L. Cease, Editor *Railroad Trainmen's Journal*, Cleveland, Ohio.
John P. Frey, Editor *Iron Molders' Journal*, Cincinnati, Ohio.
John F. McNamee, Editor *Locomotive Firemen's Magazine*, Indianapolis, Ind.
Edward A. Moffett, Editor *Bricklayer and Mason*, New York City.
C. H. Salmons, Editor *Locomotive Firemen's Journal*, Cleveland, Ohio.
S. M. Sexton, Editor *United Mine Workers' Journal*, Indianapolis, Ind.
Louis D. Brandeis, Attorney at Law, Boston, Mass.
Edwin Burritt Smith, Attorney at Law, Chicago, Ill.
Edward A. Filene, President City Club, Boston, Mass.
Townner K. Webster, President City Club, Chicago, Ill.

George E. Hooker, Secretary City Club, Chicago, Ill.
Frank Parsons, President National Public Ownership League, Boston, Mass.
W. D. P. Bliss, Sociological Author, New York City.
George C. Sikes, Municipal Voters' League, Chicago, Ill.
Charles A. Conant, Morton Trust Company, New York City.
V. Everit Macy, Capitalist, New York City.
Marcus M. Marks, Manufacturer, New York City.
Slason Thompson, Railway Managers' Association, Chicago, Ill.
James F. Jackson, Chairman Massachusetts Board of Railway Commissioners, Boston, Mass.
F. E. Barker, Chairman Massachusetts Board of Gas Commissioners, Boston, Mass.
H. B. F. Macfarland, President Board of Commissioners District of Columbia, Washington, D. C.
William Wirt Howe, former President American Bar Association, New Orleans, La.
Clark Howell, Editor *Constitution*, Atlanta, Ga.
George H. Harries, Vice President Washington Railway and Electric Company, Washington, D. C.
J. W. Bramwood, Editor *Typographical Journal*, Indianapolis, Ind.
Homer D. Call, Secretary-Treasurer Amalgamated Butchers' Association, Syracuse, N. Y.
Amos K. Fiske, Editor *New York Journal of Commerce*, New York City.
Charles S. Gleed, Attorney at Law, Topeka, Kan.
John Green, Editor *Broadstreet's Journal*, New York City.
S. W. Meek, the *Cleveland Leader*, Cleveland, Ohio.
Bradford Merrill, Editor *New York World*, New York City.
James H. McGraw, President McGraw Publishing Company, New York City.
James O'Connell, President International Association of Machinists, Washington, D. C.
William F. White, Vice-President North American Company, New York.
J. W. Sullivan, Editor *Clothing Trades' Bulletin*.
William H. Brown, Secretary Civic Federation of Chicago.
Roland Phillips, Editor *Harper's Weekly*, New York City.
C. A. Rook, President Dispatch Publishing Company, Pittsburgh, Pa.
Angus Sinclair, Editor *Locomotive Engineering*, New York City.
Clarke B. Firestone, Editorial Staff *Evening Mail*, New York City.
Henry C. Watson, Editor *Dun's Review*, New York City.
James P. Archibald, Brotherhood of Painters and Decorators, New York City.
John A. Schleicher, Editor *Leslie's Weekly*, New York City.
Charles Kirchhoff, Editor *The Iron Age*, New York City.
Edgar H. Van Euen, Vice President New York Central Railroad Company, Boston, Mass.
Thomas F. Woodlock, Editor *Wall Street Journal*, New York City.
O. R. Young, General Manager *International Steam Engineer*, New York City.

Up to date, acceptances of their appointment have been received from nearly all of the above list. Each has been requested to indicate the most convenient time for him to attend the first meeting, between September 15 and October 15.

It is not expected that the entire Commission can devote its time to such an investigation; but it is believed that subcommittees can be appointed which, with experts, will examine the various phases of the general subject and report their findings to the full Commission. It is hoped that such a subcommittee of nine will make a three months' investigation of conditions in European cities.

JOHN N. BOGART.

room as a social center for the local labor leaders and as a rendezvous for visiting representatives of unions, and holds meetings to discuss economic subjects.

An illustration of the activity of this club is found in its recent decision that there should be a revival of interest in Labor Day, which was first made a legal holiday in New York State, and that its observance, in addition to a pleasurable picnic, should include some consideration of the higher purposes of this

annual celebration of organized labor. The club voted to have a dinner on the evening of Labor Day, with appropriate addresses. A committee of arrangements was appointed, composed of William F. Long, of the lithographers; Morris Carmody, hatters; Francis J. McKay, boilermakers; Jesse Larimer, housesmiths and bridgebuilders, and Captain William Bruer, of the Sandy Hook pilots. The committee met immediately and determined that it should be a dollar dinner, and that two hundred of the representative New York labor leaders should be brought together around the banquet tables.

Many of the veteran members of the club were delegates to the old Central Labor Union when, twenty-two years ago, the resolution was adopted declaring (three years before there was any law on the subject) that "the first Monday in September of each year shall be designated and recognized by the workmen of New York City as a holiday, and be called Labor Day."

The club comprises in its membership Samuel Gompers, President, and Thomas I. Kidd, Vice-President, of the American Federation of Labor; William D. Mahon, President Amalgamated Association of Street

and Electric Railway Employees; George Preston, General Secretary International Association of Machinists; James Wilson, President International Patternmakers' League; John S. Henry, General Secretary International Wood Carvers' Union; William H. Frazier, General Secretary International Seamen's Union; John J. Pallas, President New York State Workmen's Federation; James P. Archibald, ex-President Central Federated Union; Herman Robinson, Secretary Central Federated Union, and fifty of the leading business agents and other officers of New York unions.

Its officers are: President, John N. Bogart, organizer American Federation of Labor; Vice-President, Edward A. Moffett, editor of the *Bricklayer and Mason*; Recording Secretary, John B. McNerney, International Secretary, Patternmakers' League; Financial Secretary, Frank A. Corbett, business agent Job Press Feeders' Union; Treasurer, Eugene A. Johnson, delegate Musicians' Union, 310.

A SOCIALIST ATTACK CRUSHED.

The Boston Central Labor Union Welcomes the New England Civic Federation, and the Cigar Makers Honor Its Officers.

Organized labor in Boston, through its highest and most authoritative body, the Central Labor Union, has expressed cordial approval of the formation of the Civic Federation of New England, and the earnest sympathy of the trade union movement with its plans for pro-

JOHN B. MCNERNEY.

moting industrial peace. Simultaneously, organized labor has discovered and repudiated a temporary victory of the Socialists in the local branch of the Cigarmakers' Union. It was, in fact, the temporary success of the Socialists in passing resolutions, in a meeting of the cigarmakers' local, when they were momentarily in the majority, that led to the subsequent enthusiastic commendation of the Civic Federation by the Central Labor Union, and virtual repudiation of the resolutions by the cigarmakers themselves.

The first general meeting of the Civic Federation of New England, held in the Quincy House on April 26, was devoted to the advocacy of trade agreements. The trade agreement is a method of attaining pacific progress in industry that is most abhorrent to Socialists. Among those who attended that meeting were Frank H. McCarthy and Henry Abrahams, respectively First Vice-President and Recording Secretary of the New England Civic Federation. Mr. McCarthy was also a former President of the Central Labor Union, of which Mr. Abrahams is Recording Secretary. Both are members of the Cigarmakers' Union, No. 97, of Boston.

At a meeting of that union, on May 12, when there was but a slim attendance, the Socialists carried the following resolutions by a vote of 147 to 105:

Whereas, The daily press of April 27 printed the names of several of our members as being present at a banquet given by the Civic Federation, and

Whereas, The printing of such names as members of the Cigarmakers' Union would lead the public to believe that they were present at that banquet as representatives of Cigarmakers' Union No. 97, and

Whereas, The Civic Federation, an organization founded for the purpose of continuing capitalistic control in the industrial world by keeping the workers unorganized and offering their services during times of strife to betray them, as, for example, the Boston Teamsters' strike, and

Whereas, The president of the Civic Federation stands for the scab shop as against the union shop, and who, by his actions as president of the Interborough R. R. demonstrates that he bitterly opposes the efforts of the trades union, he it

Resolved, That we, in meeting assembled, do not allow any

(Concluded on page 4.)

CHIEF JUSTICE PARKER ON LEGAL RIGHTS OF UNIONS.

A DECISION BY THE HIGHEST COURT OF NEW YORK THAT OFFSETS A MUCH-QUOTED DECISION IN MASSACHUSETTS.

UNFRIENDLY critics of organized labor, in the daily press and in periodicals, have been making much ado over a recent decision of the Supreme Court of Massachusetts, in the case of *Berry versus Donovan*. This decision was, in brief, to the effect that a labor union commits an illegal act when it causes the discharge of any worker for the reason that he is not a member of the union. The decision even held that such action was not justified by the fact that the employer had previously agreed with the union to employ its members exclusively.

The facts leading up to this decision are that a non-union shoemaker sued an officer of the Boot and Shoe Workers' Union for procuring his discharge from employment. This discharge was enforced under a contract between the union and a firm, the firm voluntarily agreeing to employ only members of the union and not to maintain in its service any non-members. The Supreme Court held that the contract between the union and the firm (whose legality was not before the Court) did not justify the union officer's demand for the plaintiff's discharge, and that the latter was entitled to damages.

This decision is cited extensively in connection with a recent decision by the Supreme Court of Illinois, to the effect that members of a labor union could not legally compel, by threats, a contract for the exclusive employment of fellow-members. This opinion incidentally advanced the dictum that the closed shop contract is "illegal and criminal." That dictum was, however, no part of the decision, as that question was not before the Court.

The effort is made to create an impression in the public mind that these decisions, rendered by the highest Courts in Massachusetts and Illinois, go far to establish first, that a union commits an illegal act in causing the discharge of non-union men by a strike, or by a threat to strike; and second, that the closed shop contract is a violation of law. The fact is ignored that the Massachusetts decision, even though of the highest Court in that State, is directly controverted by the highest Court in New York, the Court of Appeals, in the decision rendered by Chief Justice Alton B. Parker, in the case of the *National Protective Association versus Cumming*. The fact is also ignored that the Supreme Court of Illinois sustains the decision of the lower court in the case of *Christensen versus People*, upon grounds wholly aside from the legality of the closed shop contract, which, as stated above, is no way involved in this decision.

It is pertinent, therefore, to recall the decision rendered in 1902 by Chief Justice Parker: for that decision, by the highest Court of New York, should in fairness be held before the public eye as conspicuously as the contradictory decision by a court of only corresponding rank.

Indeed, this New York decision goes even further in upholding the right of a union to demand, and to take measures not in themselves illegal to compel, the exclusive employment of their members than does the Massachusetts decision in denying that right. The official report of Chief Justice Parker's decision (New York, 170) thus summarizes its scope and significance:

A labor union may refuse to permit its members to work with fellow servants who are members of a rival organization, may notify the employer to that effect and that a strike will be ordered unless such servants are discharged, where its action is based upon a proper motive, such as a purpose to secure only the employment of efficient and approved workmen, or to secure an exclusive preference of employment to its members on their own terms and conditions, provided that no force is employed and no unlawful act is committed. If, under such circumstances, the employees objected to are discharged, neither they nor the organization of which they are members have a right of action against the union or its members.

The history of the case culminating in this decision is brief. Charles McQueed, being refused admission into a union entitled the Enterprise Association of Steam Fitters, organized another union, which was incorporated as the National Protective Association of Steam Fitters and Helpers. Delegates of the older union, among them Cumming, ordered strikes wherever the members of the National Protective Association were employed, resulting in the discharge of the latter. McQueed procured an injunction against the Enterprise Association, which appealed to the Appellate Division of the Supreme Court. The Judges there vacated the injunction. The Protective Association thereupon carried the case to the Court of Appeals, which sustained the Appellate Division.

In giving the opinion of the Court, Chief Justice Parker recognizes "the right of one man to refuse to work for another on any ground that he may regard as sufficient, and the employer has no right to demand a reason for it," and continues:

But there is, I take it, no legal objection to the employee giving a reason, if he has one, and the fact that the reason given is, that he refused to work with another who is not a member of his organization, whether stated to the employer or not, does not affect his right to stop work, nor does it give a cause of action to the workman to whom he objects because the employer sees fit to discharge the man objected to rather than lose the services of the objector.

The same rule applies to a body of men who, having organized for purposes deemed beneficial to themselves, refuse to work. Their reasons may seem inadequate to others, but if it seems to be in their interest, as members of an organization, to refuse longer to work, it is their legal right to stop. The reason may no more be demanded as a right of the organization than of an individual, but if they elect to state the reason, their right to stop work is not cut off because the reason seems inadequate or selfish to the employer or to organized society. And if the conduct of the members of an organization is legal

ALTON B. PARKER,
Former Chief Justice N. Y. Court of Appeals.

in itself it does not become illegal because the organization directs one of its members to state the reason for its conduct.

Some things may be treated as the subject of a grievance, namely, the desire to obtain higher wages, shorter hours of labor, or improved relations with their employers, but this enumeration does not, I take it, purport to cover all the grounds which will lawfully justify members of an organization refusing, in a body and by prearrangement, to work. The enumeration is illustrative rather than comprehensive, for the object of such an organization is to benefit all its members and it is their right to strike, if need be, in order to secure any lawful benefit to the several members of the organization. as, for instance, to secure the re-employment of a member they regard as having been improperly discharged, and to secure from an employer of a number of them employment for other members of their organization who may be out of employment, although the effect will be to cause the discharge of other employees who are not members.

And whenever the Court can see that a refusal of members of an organization to work with non-members may be in the interest of the several members, it will not assume, in the absence of a finding to the contrary, that the object of such refusal was solely to gratify malice and to inflict injury upon such non-members.

Justice Parker made an important point in his decision regarding the influence upon safety of life of a trade union requiring a system of examination and a certificate of qualification for work. He argued "So long as the law compels the employee to bear the burden of the injury" due to the "negligent acts of a reckless coemployee . . . it is clearly within the right of an organization to provide such a method of examination and such tests as will secure a careful and competent membership, and to insist that protection of life and limb requires that they shall not be compelled to work with men whom they have not

seen fit to admit into their organization, as happened in the case of the plaintiff." Upon this point Justice Parker further said:

I know it is said in another opinion in this case that "workmen can not dictate to employers how they shall carry on their business, nor whom they shall or shall not employ;" but I dissent absolutely from that proposition, and assert that, so long as workmen must assume all the risk of injury that may come to them through the carelessness of co-employees, they have the moral and legal right to say that they will not work with certain men, and the employer must accept their dictation or go without their services.

Entirely aside from this question of safety of life, the decision entered into the question of motive. Justice Parker said that he does not assent to the following proposition, laid down in the earlier case of *Bowen versus Matheson*:

If an organization strikes to help its members, the strike is lawful. If its purpose be merely to injure non-members, it is unlawful. If the organization notifies the employer that its members will not work with non-members, and its real object is to benefit the organization and secure employment for its members, it is lawful. If its sole purpose is to prevent non-members working, then it is unlawful.

The following is the most sweeping portion of Justice Parker's decision:

The defendant associations, as appears from the finding quoted, wanted to put their men in the place of certain men at work who were non-members working for smaller pay, and they set about doing it in a perfectly lawful way. They determined that if it were necessary they would bear the burden and expense of a strike to accomplish the result, and in so determining they were clearly within their rights, as all agree. They could have gone upon a strike without offering any explanation until the contractors should have come in distress to the officers of the associations asking the reason for the strike. Then, after explanations, the non-members would have been discharged and the men of defendant associations sent back to work. Instead of taking that course, they chose to inform the contractors of their determination and the reason for it.

It is the giving of this information, a simple notification of their determination, which it was right and proper and reasonable to give, that has been characterized as "threats" by the Special Term, and which has led to no inconsiderable amount of misunderstanding since. But the sense in which the word was employed by the Court is of no consequence, for the defendant associations had the absolute right to threaten to do that which they had the right to do. Having the right to insist that plaintiff's men be discharged and defendant's men put in their place if the services of the other members of the organization were to be retained, they also had the right to threaten that none of their men would stay unless their members could have all the work there was to do.

A SOCIALIST ATTACK CRUSHED.

(Concluded from page 3.)

of our members to attend as members of Union 97, any meeting that is held under the auspices of the Civic Federation, and be it further

Resolved, That we consider the Civic Federation unworthy of our support and to be condemned by Organized Labor.

In adopting this resolution, the Socialists ignored a letter from the Teamsters' Union of Boston, denying that the Civic Federation had "betrayed" them in their strike.

The same local union of cigarmakers held an election of officers on June 13. Mr. Abrahams was a candidate for Recording Secretary and Mr. McCarthy for delegate to the Central Labor Union. Elated by their success in smuggling through the above resolution, the Socialists announced that they would defeat both these men. But the effort failed, both being elected by substantial majorities. The total vote of over 1,600 for officers indicates how slender was the attendance at the meeting which adopted the hostile resolutions, and demonstrates that the Socialists are, in fact, in a minority in the cigarmakers' local. Its action in honoring the two men whom the Socialists opposed, because of their official connection with the Civic Federation, was, in effect, a repudiation of the resolutions of May 12.

The Boston Central Labor Union, however, went still further, and on May 21 adopted the following:

Resolved, That the Boston Central Labor Union expresses its approval of the establishment of a branch of the Civic Federation in Boston, believing that the basic principles underlying the conduct of that organization merit the cordial endorsement and hearty cooperation of men and women identified with the American Trade Union movement.

Resolved, That we, the delegates to the Boston Central Labor Union, in regular meeting assembled, express on behalf of the organized trade union movement of Greater Boston profound appreciation of a movement based upon a full, free understanding of controversies between employer and employee, whose efforts toward substituting mediation, conciliation, and arbitration for the drastic weapons of strike, lockout, and boycott should receive the fullest commendation of American wage earners.

In commenting upon this action of the Central Labor Union, its President, Peter W. Collins, wrote to Hayes Robbins, the Secretary of the New England Civic Federation: "Only those who were in attendance at our meeting can appreciate the sincerity of the Central Labor Union. The hearty cooperation it intends to accord the Civic Federation was very strongly and unanimously expressed, not only by the resolution of confidence, but by the very hearty approval of the sentiments it contained by the rank and file of labor."

BOTH SIDES WOULD AVERT A GREAT COAL STRIKE.

A. COAL DEALERS' PANIC EFFECTUALLY QUELLED BY THE STATEMENTS OF PRESIDENTS
DAVID WILLCOX AND JOHN MITCHELL.

THE speaking tour of John Mitchell, President of the United Mine Workers of America, in the anthracite regions of Pennsylvania has been accompanied by a series of sensational rumors and reports that another coal strike, involving both the anthracite and bituminous fields, was imminent. The sources and the terms of these reports were suggestive of a deliberate effort on the part of some large dealers in coal to scare the consuming public into heavy and general buying, in anticipation of a famine. These tales dwelt with particular emphasis upon the threatened peril of a great coal strike this fall; whereas it is a well known fact that the miners, both bituminous and anthracite, are working under trade agreements which have withstood every strain, and will not expire until March 31, 1906.

That no such present danger exists, and that there is on both sides an absence of desire for a conflict when the bituminous and anthracite agreements expire simultaneously for the first time in their history, is shown by the utterances both of one of the largest anthracite employers and of Mr. Mitchell, speaking on behalf of his union. The employer is David Willcox.

DAVID WILLCOX,
President Delaware & Hudson R.R.

President of the Delaware and Hudson Railroad Company, who contributes to the August issue of the *North American Review* an article entitled "Present Conditions in the Anthracite Coal Industry."

President Willcox thus summarizes his own article (the emphasized type is our own):

"The existing conditions have, therefore, all been the result of arbitration in which both parties were represented. They have secured to the employees a rate of wages which the Commission held to be proper when the 'prepared' or domestic size of coal sell at \$4.50 per ton with an advance as the price increases, and have also provided machinery by which all grievances have been adjusted and which will be equally available for that purpose in the future.

"The employers have no desire to disturb these results, which have been so painfully and expensively reached by Arbitration, and are perfectly willing to continue the present arrangements indefinitely. There is no association of the employers generally, such as is attempted in the case of the employees; indeed, either one would probably incur the charge of illegality under the anti-trust acts. The Supreme Court of Massachusetts has just held that an attempt to exclude non-members of a union from employment violates the prohibitions of monopoly, and other courts have made similar rulings. As already pointed out, everything suggested as the subject of a general contract between the employers and employees has been secured by the award. Therefore, no contract with the union is necessary for the protection of the employees; the Commission held that nothing of the sort would be admissible save on conditions which the union has failed to carry out, and any such arrangement would tend to defeat the award of the Commission and the decisions of the courts establishing the principle that employment must be open to all irrespective of membership of trade unions or otherwise.

"It is, indeed, grotesque to call such arrangements contracts, for, as Mr. Mitchell says in his work on *Organized Labor* (p. 227), 'the union no more guarantees that any particular man will work than the em-

ployer guarantees that work will be provided for any particular man.' Manifestly, there can be no contract where nobody is bound to anything. The illogical and illegal scheme of having all the labor organized in a great industry controlled by one organization and compelling all the employers to enter into contracts with that organization, rather than with their own employees, is rapidly passing away, and agreements of employment are fast reverting to their natural form of arrangements between the parties concerned.

"It may be added that the anthracite coal industry has been under investigation by the Interstate Commerce Commission, unhampered by the rules of evidence (194 U. S., 25) for two years and a half, without result. Although no formal decision has yet been made by the Interstate Commerce Commission, it is not too much to say that the manifold charges which have been made with such resonance and iteration for so many years past against those engaged in the industry have collapsed under investigation.

"The present state of the industry is, therefore, exceptional. All the existing conditions have been settled by arbitration, to which the employees were parties, and the machinery has been successfully provided through the Conciliation Board for adjusting any future questions. The methods of transacting business have been fully investigated and have not been found objectionable in any respect. What possible ground can exist for disturbing this situation and subjecting the country to the hazard of another anthracite strike?"

President Mitchell, in an interview at Scranton, was thus reported in a dispatch to the *New York Herald* of July 31:

"I believe some apprehension was caused by a report originating in Pittsburg that I had sent T. L. Lewis, Vice-President of the United Mine Workers, to arrange with the officers for a general strike which was supposed to offset a lockout on the part of the anthracite operators. The strike was alleged to involve the bituminous and anthracite miners, and to be effective in a month or two.

"There was no truth whatever in that statement. Mr. Lewis was in Pittsburg on other business. All the bituminous miners in Arkansas, Missouri, Illinois, Indiana, Ohio, Michigan, Western and Central Pennsylvania and some other points have agreements with the operators' association until April 1, when the award of the Anthracite Coal Commission expires. It is only natural that when so many men are released from contract obligations the public would feel some anxiety. And regardless of the fact that both operators and miners may be, and I believe are, desirous of renewing these contracts as they are now, or modifying them as the conditions of the coal trade may warrant, there is, of course, an element of danger that they may not agree. There is the same risk in our affairs that there might be in any other.

"But the attitude of our organization is simply this: We want to be in a position to make a contract that will be as advantageous to our people as possible. Personally I am satisfied that we will be able to negotiate another contract in the bituminous district, which will insure a continuance of the relations now existing between operators and miners in that field, and I am hopeful of like results in the anthracite region. I am sure that whatever differences may exist between the anthracite operators and the mine workers can be readily adjusted if the two interests will make any efforts to come together in a spirit of fairness."

Mr. Mitchell spoke as if he had no doubt whatever of such a result.

"I feel," he continued with deliberation, "that the last strike of 1902 was a lesson not soon to be forgotten by miners or operators. It is, of course, natural that the miners and operators of the anthracite districts should make such preparations as are necessary to defend themselves against any emergency that may arise next spring. Both miners and operators are doing this, the former by organizing their men, the latter by stocking coal. But these preparations do not necessarily mean there is any danger of a conflict. They are the precautions of prudent men. In our case the indications are that every miner in the anthracite field will be in the organization by April 1. They are joining now in thousands.

THE ANTHRACITE SITUATION.

(Editorial in *Wall Street Journal*, August 4.)

Referring to the article in the current number of the *North American Review* on the anthracite coal situation, written by Mr. Willcox, President of the Delaware & Hudson Company, the *Sun* points out

that Mr. Willcox on behalf of the coal operators considers the present agreement with the miners entirely satisfactory, and is willing to have it continued. Mr. Willcox says:

"The employers have no desire to disturb these results, which have been so painfully and expensively reached by arbitration, and are perfectly willing to continue the present arrangements indefinitely."

The *Sun* thinks that Mr. Willcox undoubtedly speaks with authority, and that it is impossible to believe that he would speak in this fashion if the operators contemplated any steps in the direction of changing the present position to the disadvantage of the miners. It professes to see, in the steps taken by Mr. Mitchell to strengthen the union, evidence that the miners intend to fight for something better than present conditions. It is unable to account for the activity of the union on the theory of self-defense merely because, as it says, "where no attack is contemplated no defense is necessary."

This strikes us as ridiculous. What would the *Sun*

JOHN MITCHELL,
President United Mine Workers of America.

say if the government of the United States, placing in evidence the declarations periodically made by representatives of foreign countries, that the one thing that foreign countries desired at all times was peace with the United States, were then to announce that as foreign countries contemplated no attack upon the United States, no defensive measures were necessary? We can imagine the screech with which our neighbor would greet a message from the President proposing to abolish the navy and dismantle the coast defenses. Yet it is precisely this that it expects of Mr. Mitchell as the head of the Miners' Union. It proposes that, on Mr. Willcox's statement that the operators are satisfied with present conditions, Mr. Mitchell should at once abandon his efforts to strengthen his union.

If we mistake not our neighbor is a firm believer in the advice to "speak softly, but carry a big stick." Can any one blame Mr. Mitchell for doing the best he knows how to maintain a strong union of mine workers in the anthracite regions? Does any one suppose that present wages and conditions would rule in the anthracite region if there had been no union? If there were no union in the anthracite regions to-day, how long would present conditions last? We believe that there can be but one answer to these questions. Admitting that the union has been directly responsible for many infamous outrages, and regretting that unionism in general can not divest itself of direct responsibility and therefore guilt in this respect, we must, nevertheless, take things as we find them. And facts being facts, Mr. Mitchell is perfectly warranted in preparing for war so as to assure peace.

If the operators desire to enlist the public on their side of the case at the start, they can do so by formally and officially notifying everybody that they are willing to extend the present agreement in the regions. The public will then want to know from Mr. Mitchell where he stands, and why he stands there. But meanwhile no fair-minded man can find fault with Mr. Mitchell for looking after the fences of his organization.

TRADE AGREEMENTS FORMED IN FOUR GREAT INDUSTRIES.

TYPICAL EXAMPLES OF THE SUCCESS AND INCREASE OF COLLECTIVE CONTRACTS BETWEEN LARGE EMPLOYERS AND LABOR ORGANIZATIONS.

THREE important national trade agreements, tending to secure harmonious relations between labor and capital in the great industries of iron and steel, inland water transportation, and iron molding, have recently been formed. These agreements are of importance even wider than these industries, since they affect favorably, because of their interwoven relations, many other spheres of production, and have a direct tendency to ensure stable conditions in every branch of trade. In addition to these, the Chicago, Burlington & Quincy Railroad, which has refused to recognize organized labor since its bitter and noted strike in 1886, has resumed the policy of conference and collective contracts with its employees.

IRON, STEEL AND TIN.

The assurance of peace in the iron and steel industry during the coming year, accompanied by the abandonment of the restriction of output by the Amalgamated Association of Iron, Steel and Tin Workers, is the highly important result of conferences in June and July between delegates of the organized wage earners

HENRY PHIPPS,
Director U. S. Steel Corporation.

and representatives of two of the largest employing corporations in the country. These are the Republic Iron and Steel Company, with which an agreement was reached at Detroit on June 9, and with the American Sheet and Tin Plate Company, which was signed at Pittsburg on July 3. Among those active in the negotiations on the part of the Amalgamated Association were its President, Theodore J. Shaffer, its President-elect, P. J. McArdle, and its Secretary and Treasurer, John Williams. The Republic Iron and Steel Company presented its terms through its President, Alexis W. Thompson, and its Vice-President, Archibald W. Houston; while on behalf of the American Sheet and Tin Plate Company, the scales were signed by its President, John A. Topping, and its First Vice-President, C. W. Bray. The new scale fixes eight hours as a day's work in finishing mills working three turns, which is to be done wherever practicable; and eight hours are to be a day's work in tin and black plate mills.

The Amalgamated Association also made the important concession that the rebate on tin plate for export, after August 1, 1905, shall be changed, should business conditions demand, from the present rate of 1½ per cent. to 3 per cent.

This is a concession involving such an intimate knowledge of trade conditions that the arrival at an equitable conclusion could result only from their frank and full discussion between representatives of the employing corporation and of the workers. In this case, organized wage-earners have agreed to reduce the labor cost of a product so that it could be sold as cheaply as by a foreign competitor. This product, tin plate, is bought in large quantities by the Standard Oil Company, for making cases in which oil is shipped abroad. Before the rebate in wages was granted, the American company was unable to compete with the tin plate makers of Wales. This concession was made originally only after months of investigation by the Amalgamated Association, which decided that this re-

bate should come out of the wages, not of the workers in tin sheet mills alone, but should be distributed among all members of the union, and be paid out of its national treasury.

In general terms, the wage scale of 1904-05 were adopted for the coming year in the agreement with the American Sheet and Tin Plate Company. The importance of this agreement is enhanced by the fact that its terms were immediately adopted by practically all of the independent employers.

In the agreement with the Republic Company, the workers secured a restoration for boiling iron of the scale of 1903-4, which the *Amalgamated Journal*, the official organ of the Amalgamated Association, says "is generally regarded as being the best scale that the boilers ever worked under." The muck scale was advanced at the same rate, and there were other minor advances. Of this agreement, the *Amalgamated Journal* says:

The Republic company and the Amalgamated Association can well afford to give their respective representatives a vote of thanks for bringing to pass such an honorable and amicable settlement. It will undoubtedly result in knitting the company and the Association closer together, making each more willing to make concessions when conditions and circumstances demand.

It will be remembered that a symposium upon the Shorter Work Day, published in *THE REVIEW* for September, 1904, contained the opinions of a large number of representative wage-earners and editors of labor papers upon the advisability of granting certain concessions in return for fewer hours of work, among them being the removal of restrictions of output. At least a dozen of the writers in that symposium denied that such restrictions existed in their crafts, and declared that it is the sincere policy of unionism to place no limit upon the amount to be produced by any worker in a given time. But nearly a score of writers, admitting that restrictions do exist, declared that they should be removed for economic reasons. They pronounced restriction short-sighted, because increased productivity is essential to higher wages.

Still others, while agreeing with this general economic proposition, defended restriction of output in certain callings, as a protection to labor against excessive strain caused by "pace-makers," or against physical conditions of unusual hardship, or as an insurance of greater safety in construction upon whose soundness or stability human life depends, such as bridges, buildings, and ships.

The Amalgamated Association is a union that has hitherto been one of the conspicuous adherents to the restriction of output, on the ground that the labor in the manufacture of iron and steel is especially severe, and that, unless some limit were agreed upon, physical exhaustion and injury would result. The operation of the new plan in this industry will be observed with interest, both as to its results in the labor cost of production and in the welfare of the workers.

The *Amalgamated Journal* says:

The new scale was negotiated under the most trying circumstances. The American Sheet and Tin Plate Company had determined upon certain departures from past conditions. The conferees representing the Association put up a strong fight against the Company's proposition, and it is safe to say that if arguments could have won the convention scale, it would have been accepted by the officials of the company. The conference committee deserves only praise from the rank and file for the strenuous fight they put up for the convention scale, and it was only when it became apparent that the officials of the American Sheet and Tin Plate Company were set in their purpose of acquiring the changes set forth in their proposition, and had been fortifying their position to press their claims to the point of operating their plants non-union, did the Association's conferees yield in as graceful a manner as possible. Circumstances were against declaring a strike at this time to sustain the convention's demand.

The *Labor World* of Pittsburg says of the agreement:

The very fact that a union agreement has been made is a matter of great public moment and is of the utmost importance to trade unionists all over the country. It will tend more than anything else to aid in the re-strengthening of the A. A., and this is something that is of infinite worth to the Amalgamated Association and to all organized labor.

Probably the most important feature of the new agreement between the A. A. and the American Company is the abolition of the limitation of the output rule. This is not only a step in the right direction, but goes toward removing one of the most damaging objections to so-called trade union policy. This limitation of output rule has for years been a blemish on the economic wisdom of the association. It has afforded argument, and powerful argument, to the bitterest foes of trade unionism. It has always, in view of the fact of a limitation of hours of work, been utterly devoid of the support of logic and argument. It has caused immeasurable trouble, and has, in fact, almost brought the association itself to complete destruction. It will require years for the A. A. to redeem the injury that the folly of this rule has imposed upon it.

Now that this limitation of output rule has been obliterated, do not let us overlook the fact that it is due to President Shaffer more than to anyone else that the absurd condition has been discarded. He has valiantly and ably opposed the rule within the ranks of the association. While he could have made his advocacy more public, and thus more forcible, he has yet preached an unpopular proposition with vigor among his fellows.

For years it has been a decidedly unpopular work among the rank and file of the organization to oppose this limitation of output rule. At the recent annual convention of the A. A. the continuance of the rule was upheld by a large majority, and even in face of the opposition to it of President Shaffer. So that let the retiring president have all of the credit due him for the disappearance of an exceedingly mischievous and highly unsound rule.

The *National Labor Tribune*, also of Pittsburg, another labor journal, takes a somewhat different view of the industrial result of the removal of restriction:

The agreement reached between the A. A. conference committee and the representatives of the American Sheet and Tin Plate Company in this city on Monday, is one of the most momentous in the history of the Amalgamated Association. This is not only because it averts a strike, but because of the terms of the agreement itself, which provides for the abolition of the limit on output. There has been no article in the constitution of the Amalgamated Association that has been more stubbornly adhered to than this one. The refusal to remove the limitation has resulted in numerous lockouts of late years. It has probably lost the association a number of the mills controlled by the combine, and it looked very much as if a continued adherence to the limitation would provoke an early fight with some of the largest independent manufacturers, who claimed that they could no longer afford to stick to the association scale on this account. There has undoubtedly been a powerful combination of circumstances pressing the association to recede from its former position.

THEODORE J. SHAFFER,
President Amal. Asso. Steel & Tin Workers.

While for some time foreshadowed, therefore, the removal of the limitation is still somewhat of a surprise. Its ultimate consequences are hard to foresee. It is, of course, a material advantage to the manufacturer. It means that the men in the mills will be subjected to a greater strain than ever, and the man who cannot do a yeoman's work will not long survive the increased severity of the struggle. There will probably be a very considerable increase of production at once, and we think it reasonable to suppose that in the end the workers will be doing a great deal more for a good deal less pay. Naturally, too, the increased average output per man will decrease proportionately the number of men for whom there is employment.

It is the old story of machinery replacing labor over again, and it is not necessary to follow the matter further here. We are told that the machinery which displaces labor always requires more labor than it displaces. This seems paradoxical, but let us hope it will prove true in the present case.

GREAT LAKES SHIPPING INDUSTRIES.

This year has witnessed a renewal of the annual agreement between the International Longshoremen, Marine and Transport Workers' Association and the Dock Managers at Lake Erie ports. This has proved one of the most successful of trade agreements in the United States, in preventing strikes and lockouts, while it is one of the most far-reaching in its pacific effects. The Longshoremen's Association, of which Daniel J. Keefe is President, covers more territory than any other labor organization in the world, extending throughout the inland commerce of Canada and the United States and into the ports of two oceans, the Gulf of Mexico and Central America; while it maintains fraternal relations with corresponding organizations in Great Britain and Europe. It was organized by Mr. Keefe in 1882, and its wage-scales have been advanced an average of 60 per cent. since 1895. Its agreement with the Lake Erie dock managers covers thirty-nine divisions of trade, but its essential provisions are uniform.

This agreement is reached at an annual conference between representatives of the union and of the organized employers. The delegates from both sides to this conference are vested with full power, so that no

confirmation of their conclusions is required. A marked characteristic of this conference is that the various subjects to be included in the agreement are previously referred to committees of the union. Before these committees, union men present the employers' side of the case. By this method, the union conferees, when they meet the representatives of the employers, are prepared to discuss every article of the proposed contract, both from their own and the employers' point of view. This preliminary process conduces greatly to the dignity and harmony of the annual conference. Every demand advanced by either side has been thoroughly discussed in advance; and the labor delegates are not likely to present demands to the employers whose justice they have not been able to prove before a committee of their fellow-craftsmen. In the conference, each article of the contract is first adopted by a majority vote and then confirmed by a unanimous vote. In this way the will of the majority is made binding upon all. Any subject not covered by the agreement, and any dispute as to its interpretation is subject to arbitration, and work must continue pending the decision, which both sides are pledged to accept. The principal contract and the local contracts formed in accordance with its provisions are neatly printed in compact form, and every worker is furnished with a copy, so that he may refer at any moment to its exact language.

This conference is also noteworthy for its yearly emphasis of the inviolability of the contract. The Longshoremen's Association is often cited by employers as one of the best examples of the responsibility of unions for keeping contracts. Any local union violating its contract is subject to expulsion. Not only has

H. COULBY,
Chairman Lake Carriers' Association.

this penalty been rigidly enforced, but in the case of one recalcitrant union, the Longshoremen's Association, being unable to furnish all the union labor required, sent non-union men to fill the places of the men who had been expelled for striking in violation of the agreement.

One article provides for cases of unusual work in these words:

It is understood that occasionally when any unusual work arises in isolated cases not covered by this agreement, the men, when called upon, shall perform such labor; and the compensation therefor shall be determined and adjusted between the representatives of the local organizations and the dock managers or owners, and in event of any disagreement shall be arbitrated.

The joint conference this year adopted a resolution declaring that the principle covered in this article is:

That any and all contracts made between the local manager and the men directly involved shall be held inviolate for all work not specifically covered in exhibits attached to and made part of this contract, and

That any one trying to break such agreement or in any way interfering with its performance, shall be barred as a representative, and shall not be permitted to work under this contract, and in all cases work shall not be interrupted on any account.

Resolutions were also adopted requiring all grievances or suggested changes in the contract to be submitted to the chairman of the dock managers and the president of the union prior to the next conference; and that any future addition to the contract must receive the two-thirds vote of the delegates of the conference.

The agreement is for the navigation season of 1905, and also covers winter work from December 1, 1905, until May 1, 1906. Wage schedules are attached as part of the contract. All employees are to be members of the local organization whenever such men can be had who can perform the work. When such men can not be had, the dock managers have the right to secure any other men who can perform the work satisfactorily, until members of the union can be secured. No man shall be discharged without just cause, and any man discharged shall be notified of the cause.

If any controversies or grievances can not be settled by the local representatives of the union and employers, they shall be arbitrated by choosing a third disinterested man, the decision of any two to be final. "If the representative of the local organization and the representative of the dock managers or owners can not agree upon a third man, then each side shall choose a disinterested man—the two disinterested men thus chosen to choose a third disinterested man, and said three men shall constitute a board of arbitration, and the decision of a majority of said three shall be final, and all parties shall abide thereby." This board must meet within ten days after the difference arises.

No beer or intoxicating liquor shall be brought upon the property of the dock managers. No man under the influence of liquor shall be permitted upon their premises. No employee shall leave the dock during working hours without permission. Pure and fresh drinking water with oatmeal and ice shall be provided on the dock.

STOVE-MANUFACTURING INDUSTRY.

One of the most important of the national trade agreements, which has been ratified with one important modification for the coming year, is that between the Stove Founders' National Defense Association and the Iron Molders' Union of North America. The modification relates to the ratio of apprentices, which has long been a subject of debate between the organized employers and the union. This year, the representatives of the Molders' Union, in conference with a committee of the Founders' Association, agreed to a considerable increase in the ratio.

As its name indicates, the National Defense Association was formed to fight. That was twenty years ago. Since then, while still militant for the rights of its members, the association has demonstrated that the trade agreement, with its provisions for arbitration, is efficient in preventing strikes and lockouts, or in affording a method for adjusting troubles when they do occur.

In this industry, the organizations of both employers and wage-earners have shown a progressive appreciation of the inviolability of contracts. During the last year, for example, seventy-one disputes were adjusted through the method provided by the national agreement. In twelve of these cases, the molders and the mounters had struck, but in accordance with the terms of their agreements were obliged by their national officers to resume work before their grievances could be adjusted. In two cases, employers suspended operations, and they, also, were compelled by the officers of the National Defense Association to cease their lockouts while their complaints against their men were being adjusted under the terms of their agreements. All of the other cases were settled without even temporary resort to either strike or lockout. In the words of Chauncey H. Castle, President of the Founders' Association: "In all cases, the letter and spirit of the agreements have been carried out, so that peace and harmony have prevailed. This is because the local as well as the national officers of the unions have become more and more familiar with the objects of the agreements, and more and more impressed with the prime importance of their strict observance; while upon our side, we have admonished our members against resorting to the lockout in violation of the trade agreement."

Joseph F. Valentine, President of the Iron Molders' Union of North America, declares: "Our trade agreement proves every year a practicable and efficient method of promoting peace in our industry, through the adjustment of grievances, by conference between representatives of the organized employers and workers, and, when necessary, by arbitration."

To these two Presidents are first referred for settlement disputes as to subjects not covered in local agreements, when a majority of the molders in the foundry concerned are union men. In case the two Presidents can not agree, the dispute is referred to a permanent conference committee of six, composed of three members of each side, the decision of a majority to be binding.

A NEW RAILWAY AGREEMENT.

The Chicago, Burlington & Quincy Railroad Company is a recent example of the conviction on the part of a large employing corporation that it is a sane and wise policy to enter into contractual relations with organized labor. Ever since the great strike on its system in 1886, this company had ignored the national brotherhood organizations of railway employees. But during six weeks, from the middle of June until the end of July, a board composed of representatives of the Brotherhood of Locomotive Firemen formulated their propositions and held a series of conferences in Chicago with officials of the Burlington corporation, which resulted in the signing of a schedule, covering wages and conditions of work for the ensuing year, satisfactory both to the corporation and the employees.

The *Chicago Chronicle*, a journal severely and usually adversely critical of organized labor, said in

its report of the successful conclusion of these conferences:

"So quietly did this organization of locomotive firemen attend to their business during this meeting that few guests of the hotel were aware of its presence. The members were in the halls, in the restaurants, and everywhere in the hotel, but neither by word nor act did they disclose their identity or the object of their mission.

"The impression this board made on those familiar with its work was that if labor unions and officials of corporations met in the same friendly spirit that actuated this body and the representatives of the company that the millennium in the labor world would be at hand, and that strikes and their attendant riots would be at an end.

"The board, after completing its schedule, met in conference for several days with the officials of the Burlington. The schedule was thoroughly discussed and the arguments were sometimes exciting, as might have been expected. However, it was clear sailing from the start when Mr. Daniel Willard, Second Vice-President of the Burlington system, said:

"I am not opposed to labor unions, and I was a member of one myself. I was a member of the Brotherhood of Locomotive Engineers before any of you men were here. I am familiar with most of the questions that bring you here."

"This remark was followed, in an equally generous spirit, by N. C. Allen, chairman of the board, who said:

"We have been fair both to ourselves and to the company, and followed the policy of our organization along the line of conservatism. We think that, after due

DANIEL J. KEEFE,
President Longshoremen's Association.

deliberation, we have decided on rules that will be a benefit to the men and also to the company. It is the policy of our organization if we find men that will not look out for the interest of the company the same as if it were their own organization, we will not stand for them."

The Burlington at the various conferences was represented by Mr. Willard, Mr. Holdridge, Mr. Gruber, Mr. Clark, Mr. Torrey, Mr. Smith, Mr. Judson, Mr. Byron, Mr. Ross, and Mr. Nutt.

The protective board represented the 1,700 firemen who are employed on 9,000 miles of railroad, and whose compensation monthly runs from \$80 to \$140 each. The members of this board were:

N. C. Allen, Chairman; Norman Allen, J. Hannahan, Grand Master of the Brotherhood of Locomotive Firemen; Willie Hannahan Finley, J. S. Ford, secretary; Otto Schultz, vice-chairman; Maurice Larson, alternate, secretary and treasurer; W. K. Hess, F. O. Paulus, M. L. Houlihan, William McCormac, O. A. Brouse, W. S. Bixler, J. M. Barber, A. M. Deen, J. E. Cambronn, Howard Timmel, Frank Armstrong, C. W. Tillett, A. G. Cookingham, F. L. Bradley, Thomas J. O'Neill, R. V. Brown, Thomas Flocke, R. E. Tucker, C. W. Reissig.

The conferences ended with a display of good feeling between the officials of the Burlington company and the representatives of the Firemen's Brotherhood. The protective board adopted resolutions expressing its appreciation of "the invaluable services rendered by our worthy Grand Master, John J. Hannahan, in obtaining the best pay schedule west of Chicago." Mr. Hannahan is a member of the Executive Committee of the National Civic Federation.

There can be no hope for winning untimely and irrational strikes. A just cause always meets a responsive public sentiment, without which no strike can be won, and for which an irrational strike can not appeal, and it is necessarily lost. Such was the Interborough strike. It was apparently an unnecessary and untimely strike, and did not appeal to the public. It was lost.—*Motorman and Conductor*.

ORGANIZED LABOR AND THE ISTHMIAN CANAL.

PRESIDENT GOMPERS, OF THE AMERICAN FEDERATION OF LABOR, INSISTS UPON HUMANE CONDITIONS AND PROTESTS AGAINST EMPLOYING COOLIE LABOR.

THE President of the American Federation of Labor, Samuel Gompers, delivered an address recently before the Trades Union Social Club of New York, upon the relation of organized labor in the United States to the construction of the Isthmian Canal. This address was delivered upon the evening of the day of the sailing for the Isthmus of the two Welfare experts. This official adoption of Welfare Work by the United States Government received the hearty approval of the President of the American Federation of Labor.

Mr. Gompers spoke as follows:
Mr. Chairman, and Members of the Trades Union Social Club:

You will understand the pleasure it is for me to be here and address you, especially on a subject of such importance as the one to consider which this meeting is held. It is not necessary to criticize the formal selection of the Panama route for the construction of the canal. I don't know that we would change the route even if we desired. I don't know that it is desirable, or, even if desirable, whether we can with advantage even discuss it. I think it is agreed, however, that the greatest difficulties in the construction of the canal will be met upon the Isthmus of Panama. Its climatic conditions, its geographical situation, the well-known diseases, the ills and the ailments, to which the men who go there are subject, are known to every one.

It is claimed that there is no obstacle so great that the American people can not cope with and eventually overcome it. And, in truth, there is a long line of achievements to the credit of our people. We might look to many of the tropical countries, some of which have come under the jurisdiction of our government, in which in former years and under the old régime diseases of this same character marked their victims by the thousands; and as soon as we have entered those regions, we have, if not entirely eliminated the germs of these great awful climatic diseases, reduced them almost to a minimum, and the possibilities for their future elimination seem promising, so that they may be as free from them or very nearly so as we are free from them in the main land of the United States.

The construction of the canal, all men are agreed, is essential to the world's great progress. That it will be an impetus to industry and commerce, bring peoples into accord who are now remote from each other and into closer proximity, by reason of being able to reach each other more readily; that it will be beneficial to the country's great commerce—to the carrying of the great commerce of the world more readily—is easily understood and accepted by all; that it will make for better opportunities and conditions and tend to the uplifting of the world, I think is also agreed. But in the building of the canal, great as its opportunities will be when completed, largely contributing toward the world's progress as it will, wonderful with its potentialities as it will be, there is one thing that must not be lost sight of. The coral reefs are very wonderful; but the millions and millions and millions of insect lives that have perished in making those reefs must not be repeated or duplicated in the loss; in the sacrifice of human lives in the building even of the interoceanic canal. There are some achievements that are too costly in human life even to be ventured.

The organized expression of the American people, our Federal Government, has undertaken this task. I am always glad of things that may be helpful. I believe to-day that in the great undertaking we must be careful in our adverse criticism, lest we overstep that which is fair, which may result in harm to our own integral life, and lay us open to the criticism of the peoples of other countries.

I think we are all agreed that in the industries of our time there are too many lives lost and too many limbs hazarded, and the health of too many of our people placed in jeopardy; and I think we also believe and hope and are confident that, as the workmen of our country and our time shall organize, and as we shall impress upon the minds of our fellow-citizens the necessity for more humane conditions under which labor shall be performed, there shall be greater precautions for the health and life and limbs of our fellow-workmen. We shall make greater progress upon these lines. That we have accomplished much, all of those who have studied, as well as those who have lived during the industrial progress and development of the organization of labor, will agree. But yet, one can almost count with a degree of accuracy the number of men who lose their limbs, whose health is undermined and even destroyed, who even lose their lives, by reason of our modern methods of industrial and commercial life. And we aim to improve the conditions of labor so that it shall not be so hazardous to either our lives or limbs or health.

We don't undertake to say that we shall stop industry because it involves the loss of life or of limb or of health even to as large a degree as it does now. We insist that there shall be better protection against machinery; that there shall be better sanitation; that there shall be better hygienic conditions; and shorter hours of labor, giving us liberty and more leisure and time for the recuperation of our health and of our strength; and that we shall have higher wages with which we may buy the things that contribute to our health and our strength, physical, mental, and moral.

I want to approach the subject of the Panama Canal and in its construction in the light of that thought that I have tried to express. We want the canal; we are agreed upon that. At this time, there is no choice as to the route. The Panama route has been chosen. We are committed to that. And as long as there is, I suppose, a fair chance for the prosecution of the work, though under adverse influences, there will be no change in the route. In Panama, and throughout that great miasmatic country through which this canal has to be dug, life is not congenial. The conditions

SAMUEL GOMPERS,
President American Federation of Labor.

are not such as contribute to health and comfort; are not such, I imagine, as would allow one to regard it as a health resort. In the Convention of the American Federation of Labor two years ago, a resolution was passed, and I think unanimously, declaring that the construction of the canal is a great world's benefit; and then it was declared that the preference should be given to the laborers of America. Now, if we want the work, I take it that we shall be compelled to submit to some of the privations, some of the difficulties, and that we shall also enjoy some of the advantages and pleasures that come from organized society and civilized labor. No man has the right to assume to take employment on the Panama Canal and expect that every Sunday he can visit Coney Island. It won't do for our men who may take this work to expect to go to a roof garden in the evenings. The man who undertakes work of that sort must realize that for the work in which he is engaged he will have to make some sacrifices of what we in our civilized lives expect to enjoy as a recreation after our day's work is done. I don't want any one to imagine that I harbor in my mind the idea that the condition of the American workman is such that he enjoys invariably Coney Island and roof gardens and all that sort of thing; but I have tried to put it rather extravagantly, so as to emphasize my thought.

I want to repeat that the lives of our American workmen are too valuable to be sacrificed upon the scheme of building the canal, and, further, that the conditions of labor in and around the canal for the workmen must be such as to make life and the conditions of life at least tolerable, and that no man shall feel that he in his zeal for the world and for our civilization has made his life a burden and not worth living.

I have been in correspondence with a number of people employed near and on the canal. I want to be entirely frank with you and say that the date of the last letter which I received is more than two months ago, and of whatever change in conditions may have occurred between then and now, I can not speak. I

can only speak of the conditions up to date of the letter which I last received. I want to read that letter to you:

I read a florid interview with one of your labor union friends in which he told me of the arrival of the two Bates brothers in Chicago and of their coming to Panama. I believe that at the time he said that he would overrun the Isthmus with union men at salaries of \$190 and \$165 per month, with bonuses of \$1 per cubic yard for every yard over 125,000 per month which their shovels excavated.

If you want to have some facts in regard to the situation here, listen to the following: The union should not rush men down here with the idea that they are going to get high wages and an easy snap. Every man should have his contract hard and fast before he comes here.

In regard to the Bates brothers. The steam shovel engineer received \$190 and the crane man \$165 per month. There are only two other engineers and two other crane men receiving such salaries in the whole Isthmus. The six men are, outside the heads of departments, the highest salaried men in the employ of the Commission. In the Rocky Mountains, where they operate their shovels, they will be very lucky if they get out even 20,000 cubic yards per month.

The steam drill men who work with the shovels receive \$50 per month. The pit men receive \$75. A foreman of drillers receives \$75. A fireman on the steam shovel receives \$75. These salaries do not compare very favorably with the ones in the States.

There are other disadvantages. Board at Culebra, the station where the excavating is being done, is \$21 per month. Quarters are provided by the Commission in all except a few cases.

All except the professional men and officers work ten hours per day. Ten hours here means starting at 6 o'clock in the morning and keeping at it in the hot sun until 11.30. The afternoon hours are from 1 to 5.30. Salaries are but little better in the States, and the hours are hardly what can be called a union scale. In Panama and Colon the rates of board are even higher. The men are not provided with quarters, but are given an allowance of 8 per cent. of their salaries for that purpose, which is in all cases inadequate. Rents are increasing weekly.

An experienced machinist, blacksmith, boiler-maker, plumber, carpenter, mason or such, receives 45 cents per hour and works under the same conditions. He will not be given transportation to or from the States, and will be paid only for the time he works.

A general foreman, and there are not a half dozen on the Isthmus in these trades, gets \$150 per month. An ordinary foreman gets from \$83.33 to \$125, and an assistant foreman gets from \$50 to \$75 per month.

The above wages are paid in gold, and only to Americans. Subordinate employes are paid in silver, which is \$2.16 silver for \$1 in gold. Not a few Americans are on the silver pay roll.

In the mechanical and building trades the foremen get 60 cents per hour in silver. An assistant foreman gets 50 cents, an artisan gets 25 to 40 cents. Ordinary laborers get either 15 or 17½ cents silver per hour.

No union man should come down here with the hilarious idea that he is going to get high wages and an easy time. If he has a contract he may be all right. Most of them, even with contracts, are dissatisfied and anxious to get back.

I have not mentioned the malaria, which every one gets, the yellow fever, which comes to more than a few, the scorpions and the tarantulas, and many other things which give local color to the country.

I can not understand why there should have been any question raised as to whether the eight-hour law of the United States should apply to the work in the digging of the canal. Is it not agreed, at least among a large portion of our fellow-citizens, that the eight-hour day for Government work is long enough? Not even the worst antagonist of organized labor has made any attempt to change the law and practise of the eight-hour workday in the Government employes. If eight hours' work a day is sufficient in the United States, with its comparatively advantageous climate, how much more essential is it that no longer than eight hours should constitute a day's work on the Isthmus of Panama?

Organized labor has given me an opportunity of visiting several parts of this world, and among them Cuba and Porto Rico. They are considered as a part of the tropics, and yet any one who knows, who has been there, in either of those islands, knows that one of the great causes of the enfeebled condition of the workmen, heretofore of Cuba and still of Porto Rico, is due to the fact that they work abnormally long hours. And a climatic comparison between Cuba and Porto Rico on the one hand, and the Isthmus of Panama on the other, is as like our seashore and the climate of the Netherlands. While men work and live, and till the ground from which come lethal fumes, surely eight hours ought to be enough to constitute a day's work.

And now, I want to speak in regard to the employment of Japanese and Chinese on the canal. I have no antipathy to the Chinaman. In fact, so far as he is a man, I have no antipathy to him at all. The objection that I, in common with all members of organized labor, in common with every thinking citizen of our country, entertain to the Chinaman is this—that he is a cheap man, and that he and his fellows are entirely incompatible with the civilization of the people of our country.

I don't want now to discuss this Chinese problem. It is too big to discuss in a few minutes. But I want to say a word or two regarding the so-called Chinese boycotts of American made goods. A few months ago a committee of American merchants called upon the

(Concluded on page 20.)

THE IMMIGRATION PROBLEM.

A SYMPOSIUM TREATING OF SOME OF ITS IMPORTANT PHASES BY WRITERS OF WIDELY
VARIANT VIEWS AND DIVERSE CONCLUSIONS.

WE present upon the following pages a collection of articles bearing upon The Problem of Immigration. Each of the writers has approached that subject from his individual point of view, and it is inevitable that each should arrive at his own conclusions. When grouped together in this way, the articles afford an interesting opportunity for the economic student to compare opposing premises, different methods of reasoning, and several plans of treatment proposed. It is to be observed that the writers are all agreed in their recognition of the importance of their problem and in their patriotic desire to find a sound solution.

BISHOP POTTER ON IMMIGRATION.

He Regards Equity and Freedom from Racial Prejudice Essential Elements in its Restriction.

BISHOP HENRY C. POTTER, of New York, in an interview on August 6, declared that the question of immigration ranks as one of four great civic problems uppermost just now in the minds of thinking citizens, the three others being municipal ownership, the relation of labor and capital and the negro question. The Bishop, who is a member of the "general public" section of the Executive Committee of the National Civic Federation, thought that the restriction of immigration is a subject to be "sifted mentally apart from bias and partisan conviction" at the National Conference in December, called by that organization. The Bishop further said:

"The question of the restriction of immigration is one which, so far as the constituent principles of our American republic are concerned, touches the foundations. Originally the republic was declared to be a refuge for the downtrodden and oppressed of every nation, race, and creed. Of late years in the interests of particular classes of labor we have enacted certain restrictive laws which have had in them conspicuous elements of injustice, and which are now, in the boycott of American products, which is almost universal in China, producing their appropriate results.

"There has not been in the history of American politics a more dramatic illustration of the punishment of a political party or parties for special legislation than this. A much larger interest, and one which at the same time is inextricably allied to the labor interest, is to be punished for the folly of a special legislation which aimed to protect a particular class.

"The questions which now confront the American people are twofold: Whether (a) there should be any restriction to immigration, and (b) if so, upon what that restriction shall be based. It is not only perfectly competent, but perfectly equitable for a nation to restrict its immigration in its own interests. Self-preservation, we are wont to say, is the first law of nature. The American Republic exists for the illustration and propagation and the maintenance of certain ideals of civic government and of personal freedom. The invasion of a race which would destroy these would be a sufficient ground for resisting such invasion and excluding the invader, and no less would this be true of moral standards. The basis of high political ideals is a moral basis. The nation rests upon the cornerstone of the eternal righteousness, and a race which by its moral or religious standards would assault these would strike at the foundations of the Republic. Therefore, some restriction of immigration has in it the essential quality of equity.

"But, the moment this has been said, it should be remembered that this restriction can only be equitable when it is impartial. Its basis should be certain requirements which demand equally of all and every race certain qualifications for American citizenship. I believe that a common law which bore equally upon all those various races and peoples that are knocking at our doors would command the sympathy of the Republic and the votes of the upright men, but any proposed legislation must have in it the essential notes of equity and absolute freedom from racial prejudice."

HOW SHALL WE SELECT OUR IMMIGRANTS?

An Argument in Support of Proposed Additions to the Classes now Excluded.

(By Robert De C. Ward, of Cambridge, Mass.; Republished by permission of *Charities*.)

WE are now witnessing an annual immigration of about a million people, taken largely, as formerly was not the case, from countries that are strangers to the institutions and traditions on which our republic was founded. When present methods of

transportation are further developed, we may see the annual arrival of two or three times that number, largely derived from countries still more remote and alien to our methods of government. In the face of such facts it is only those who seem to the writer to be optimistic beyond the bounds of reason, or the hopelessly incautious, or those selfishly interested, who do not say to themselves that the stream must be further checked and regulated.

We can not justly charge with prejudice against the alien those who wish a more careful selection of the fathers and mothers of future American children. We can not count as un-American those who, with the late Gen. Francis A. Walker, believe that this stream of "pipe line immigration" will, if left to itself, flow on "as long as any difference of economic level exists between our own population and that of the most degraded communities abroad." We can not justly call those narrow or inhuman who see the danger of having our future standard of citizenship, and the future physical

HENRY C. POTTER.
Bishop, Protestant Episcopal Church.

condition of our people, determined by the greed of a few transportation companies.

We still welcome, as we have always welcomed, those immigrants who, however humble, add to the health and to the sum of good citizenship of our country, but we have the undoubted right to restrict, regulate, or prohibit any alien immigration that proves a menace to the standard of living of our wage-earners or a danger to our democratic form of government, an influence tending to pull down rather than build up our national health and physique.

In trying to effect a solution of this problem, it is obvious that we must bring about united action, on the part of those who believe that the time has come for something to be done. As a step in this direction the writer has given below a brief explanation of a number of measures that have most strongly recommended themselves to those who have within the last few years given study and labor to the subject of practical legislative remedies and to their application.

Means should be taken to assist in the more complete enforcement of our present laws. Most of these laws are excellent so far as they go, and so far as they can be enforced by officials, hitherto largely unsupported by the public in the face of interested and often unscrupulous opposition. * * * Our only safeguard against endless fraud, dishonesty, deceit, and political pull is popular support of those who are trying to administer the laws. No body of Federal officials deserves as hearty support as do the men of the United States Immigration Service. Nor is there any body whose work should be watched with more jealous care.

Our immigration laws should be amended, and there should be further additions to the excluded classes. Many suggestions have been made concerning further restriction. Some, such as consular inspection abroad, or the admission of aliens on a five-year probationary period, would be clumsy, expensive, and largely ineffective. Other measures, such as a large head-tax of \$50 or \$100, are open to criticism as carrying exclusion too far. Others, such as a wholesale distribu-

tion of aliens over our country districts, are palliatives rather than cures, and can not of themselves solve the immigration problem. No one can doubt that a well-directed and intelligent distribution of aliens of strong physique over farming districts where they will find work which they are fitted to perform, and where they are wanted, should be encouraged. But it must be remembered that the immigration which we most need to check is made up of people who are not fitted for an agricultural life; that our agricultural communities do not desire a wholesale and indiscriminate invasion of Slav, Latin, Hebrew, and Asiatic immigrants, but want something else; that the effect upon the sections in which the distribution takes place is not always for the best, and that the immigration which we are now getting is crowding out the class of immigrants who used to be in the majority, and who went readily into the country. In the corn belt of the West, as has recently been shown, the newer immigrants, because of their lower standards of living, have an advantage over the native-born farmers. Again, the immigration of Italians and other alien laborers into the South will doubtless cause a migration of the negroes to the cities—a result which those familiar with the conditions of negroes now congested in cities can not fail to view with apprehension. Further, to attempt to relieve our slums by dispersing their inhabitants, without at the same time further restricting the numbers of newer aliens who will pour in, is like trying to keep a boat bailed out without stopping the leak.

No distribution of immigrants should be thought of if the States to which they are to be sent do not welcome them. A canvass of the different States, made within six months, brought forth from the officials to whom the inquiries were sent a vigorous protest against the shipment of southern and eastern Europeans from the city slums into their States. In the South to-day there is need of pickers in the cotton fields in some sections, of skilled workmen in factories in others, and of mine laborers in others. The demand for "cheap" labor without regard to the effects which the wholesale importation of "cheap" laborers will have upon the community comes from a comparatively limited number of capitalists, and from certain Southern railroads. The majority of the thinking people of the South, who know something about the evils which have come in the train of the newer alien immigration in the North, do not look with favor upon the wholesale importation of cheap and ignorant alien labor. Such an importation might, it is true, give a temporary relief, but it would bring in its wake, in the future, many vast and complex problems which the South has not yet had to face. * * *

1. *The head-tax should be raised.* The act of March 3, 1903, increased this tax to two dollars. This money is paid by the steamship companies, and is simply added to the price of the passage ticket. The immigrant himself knows nothing of the payment. The head-tax is paid into the United States treasury, forming what is known as the "immigrant fund," and is spent in maintaining the immigration service. This head-tax should be increased to twenty-five dollars. The chief reason for advocating such an increase is that we have no other means of keeping the steerage passage rate to the United States at a figure which brings it somewhere near the rate to South America and other countries to which immigrants are likely to go. When a steamship war is on, the steerage rates may drop to ten dollars, or even less, as they did in the summer of 1904, and as they seem likely to do again. Such a reduction immediately brings a large influx of desperately poor and generally undesirable aliens, as was the case last year. An increased head-tax means a larger "immigrant fund," and that means more effective administration of existing laws and better care of the immigrants. It is objected to an increased head-tax that the honesty and character of an immigrant do not depend upon his ability to pay a certain sum of money, and that undesirable persons, criminals for example, might easily pay the tax. In answer to this objection it need only be pointed out that the higher head-tax is not to be substituted for the other restrictive clauses of existing law; it is to be added to them. Criminals are already excluded by law. They would be excluded—if detected—even if they could pay the extra passage money necessitated by a larger head-tax. An increased head-tax is intended as a means—the only means within our reach—of keeping the steerage passage above the level of pauper rates, and is one of the few practicable methods of reducing the flow of undesirable immigration to a point where it can be properly assimilated. The United States should not be chosen by an immigrant, as it now often is, because it is the cheapest country to go to. It should be se-

On the Part of the Public.

Grover Cleveland, ex-President of the United States, Princeton, N. J.
Andrew Carnegie, capitalist, New York City.
Cornelius N. Bliss, ex-Secretary of the Interior, New York City.
Oscar S. Straus, member of the Court of Arbitration at The Hague, New York City.
Charles W. Eliot, President Harvard University, Cambridge, Mass.
Seth Low, Publicist, New York City.
Archbishop John Ireland, of the Roman Catholic Church, St. Paul, Minn.
Bishop Henry C. Potter, of the Protestant Episcopal Church, New York City.
Charles J. Bonaparte, Secretary of the Navy, Washington, D. C.
David R. Francis, President Louisiana Purchase Exposition, St. Louis, Mo.
Isaac N. Seligman, of J. & W. Seligman & Co., New York City.
James Speyer, of Speyer & Co., New York City.
V. Everit Macy, capitalist, New York City.
Ralph M. Easley, Chairman Executive Council, New York City.

On the Part of Employers.

Henry Phipps, director United States Steel Corporation, New York City.
August Belmont, President Interborough Rapid Transit Company, New York City.
Clarence H. Mackay, President Postal Telegraph Cable Company, New York City.
Lucius Tuttle, President Boston & Maine Railroad, Boston.
Frederick P. Fish, President American Bell Telephone Company, Boston.
Francis L. Robbins, President Pittsburgh Coal Company, Pittsburgh.
Henry G. Davis, Coal Operator, Elkins, W. Va.
H. H. Vreeland, President New York City Railway Company, New York City.
Samuel Mather, of Pickands, Mather & Co., Cleveland.
Charles A. Moore, of Manning, Maxwell & Moore, New York City.
Franklin MacVeagh, of Franklin MacVeagh & Co., Chicago.
Charles H. Taylor, Jr., ex-President American Newspaper Publishers' Association, Boston.
Dan R. Hanna, of M. A. Hanna & Co., Cleveland.
Marcus M. Marks, President National Association of Clothing Manufacturers, New York City.
Otto M. Eidlitz, Chairman Board of Governors, Building Trades Employers Association, New York City.
William H. Pfahler, former President National Founders' Association, Philadelphia.

On the Part of Wage Earners.

Samuel Gompers, President American Federation of Labor, Washington.
John Mitchell, President United Mine Workers of America, Indianapolis.
E. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' National Union, Quincy, Mass.
Daniel J. Keefe, President International Longshoremen, Marine and Transportworkers' Association, Detroit, Mich.
Warren S. Stone, Grand Chief International Brotherhood of Locomotive Engineers, Cleveland.
P. H. Morrissey, Grand Master Brotherhood Railroad Trainmen, Cleveland.
William D. Mahon, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
Theodore J. Shaffer, President Amalgamated Association of Iron, Steel and Tin Workers, Pittsburgh.
J. J. Hannahan, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
James O'Connell, President International Association of Machinists, Washington.
John Tobin, General President Boot and Shoe Workers' Union, Boston.
Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.
William Huber, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.

THE CONDUCT OF PUBLIC UTILITIES.

The appointment of a Commission, by the Executive Council of the National Civic Federation, to investigate National and Municipal Ownership and Operation of Public Utilities, in this country and Europe, is designed to meet a want that grows more evident and pressing with the rapidly extending discussion of the subject. That want is of exact and complete facts, without which discussion is obviously wasted, and whose ascertainment in the light of all available experience is essential to wise public policy in the future. The comprehensive scope and scientific purpose of this investigation are outlined in the announcement made in the newspaper press and published upon another page of THE REVIEW, while the personnel of the Commission is an assurance that the inquiry will be conducted in the interest of no one school, party or faction, but will be directed to placing argument upon a solid basis of fact.

The general subject readily divides itself into various systems, under each of which an accurate comparison is practicable of various economic, industrial and civic results. The question is so large that the examination of its several phases will doubtless be assigned by the Commission to subcommittees, carefully chosen with a view to educing "the truth, the whole truth, and nothing but the truth." It is expected that one subcommission, composed of about nine members, will spend at least three months in Europe, upon a thorough study of the results of Public Ownership and Operation. The collection and publication of these reports will be a substantial aid to the crystallization of sound opinion upon one of the greatest questions affecting the industrial, financial, and moral welfare of communities and nations.

THE IMMIGRATION CONFERENCE.

For the first time since the earliest colonists set foot upon the land destined to become the United States of America, a National Conference, composed of officially designated representatives of these States, is to consider the problem of immigration in its relation to our industrial and social prosperity. The response to the call for the Conference from students of this problem reveals an expert appreciation of its growing importance and a confident expectation that the gathering that will convene at our largest port of entry on December 6 and 7 will make intelligent progress toward its solution. In its promotion of this Conference, the National Civic Federation, as an organization, has committed itself to no attitude of approval or opposition as to any of the propositions concerning the regulation, restriction, suspension, exclusion, or encouragement of immigration that have been advocated. The Conference will be an open forum for debate by the best thought of the country in the hope that an earnest thrashing out of every phase of the subject may result in definite recommendations of far-reaching consequence and value to our present and future national welfare.

The Governors are accepting the invitation to appoint delegates to the National Immigration Conference in such number as to make it certain that practically every State in the Union will be ably represented. Their letters indicate the intention of many Governors to attend in person with their delegations.

We present in this issue a symposium of informative articles upon the immigration problem by writers whose studies of several of its phases have led them to widely different conclusions.

WELFARE WORK ON THE ISTHMUS.

The Isthmian Canal Commission has received general and merited commendation for its decision to introduce Welfare Work into the stupendous enterprise which the Government of the United States has undertaken. In fact, under the general title of Welfare Work may be grouped practically all of the preliminary preparations, in the way of sanitation, housing and commissariat, for which operations in the actual construction of the Canal have been temporarily halted. It is conceded that the delay incident to these

preparations is a wise investment of time and effort to place upon a sure and safe foundation a task which will consume, during an undetermined number of years, an enormous amount of human energy and skill.

The Canal Commissioners have included in these general preparations definite provision for reasonable and wholesome recreation for the army of employes who will be required to live and work amid climatic and physical conditions radically different from those to which they have been fitted by training and ancestry. The travail of spirit must be lightened for greater physical effectiveness and mental alertness. To this end the Commission engaged two experts, furnished by the Welfare Department of the National Civic Federation, to investigate the needs and opportunities in the Canal Zone for the recreation of the workers, and to embody their recommendations in a report. The Welfare experts selected, W. E. C. Nazro and Edward A. Moffett, were peculiarly fitted to render the Government this valuable service.

The importance of the realization of this purpose upon the Isthmus was forcibly presented to an audience of representatives of organized labor in a recent address by Samuel Gompers, which we publish in this issue. The President of the American Federation of Labor utters a broad and high recognition of the importance of the canal to the commerce of the world; but he would have a due regard for the wholesome living of the workers and for the protection of occidental civilization accompany the bisecting of the Americas.

ANTHRACITE AND OTHER AGREEMENTS.

That the present conditions in the anthracite industry are pacific, and that sincere efforts will be made, on the part of both operators and workers to maintain peace when both the anthracite and bituminous agreements expire simultaneously, is indicated clearly by the statements of David Willcox, President of the Delaware & Hudson Railroad Company, and of John Mitchell, President of the United Mine Workers of America. The significance of President Willcox's statement, that the anthracite employers "are perfectly willing to continue the present arrangements indefinitely," is equaled by that of President Mitchell that a great strike would be "criminal," "without first exhausting every conceivable effort for a peaceful adjustment."

In connection with the process of conference and conciliation between operators and miners that is here suggested, we invite the attention of President Willcox, as well as of other large employers, to the accounts, in this issue of THE REVIEW, of typical trade agreements that have been formed this year in four great industries. These agreements are cited as representative of the growth of collective contracts. They are convincing witnesses to the success and the increase of that method of industrial peace. Such facts are not in harmony with President Willcox's view that "agreements of employment are fast reverting to their natural form of arrangements between the parties concerned." Every year sees more employers who prefer to enter into contracts with organizations rather than with individual employes. We doubt that President Willcox really meant all that his language implies. He, of course, well knows that every large railroad in the country makes agreements with the railway Brotherhoods instead of with individuals, his own road being no exception.

A highly successful conference of Welfare Managers and Special Welfare Workers—those who have charge of any particular phase of Welfare Work, such as men's clubs, technical schools, lunch houses or relief departments—was held in Atlantic City, on July 25. An account of the proceedings will be published in the next issue of THE REVIEW.

The June number of THE REVIEW quoted an extract from an article by Luke McKenny, of the Wire Lathers' Union, setting forth the opposition of organized labor to Socialism. That article was originally printed in *The Mechanic*, New York, to which esteemed labor periodical we omitted, through an oversight, to give due credit.

THE ORIGIN OF "THE INTERCOLLEGIATE SOCIALIST SOCIETY" DISCLOSED.

ITS DEFENSE BY THOMAS WENTWORTH HIGGINSON, IN "HARPER'S WEEKLY," ANALYZED AND REFUTED.

(BY THE EDITOR.)

THE "Intercollegiate Socialist Society" will not capture American universities for revolution and anarchy. Its scheme would have been impossible in any event, and it did not threaten any real danger to our social and political structure.

But that men whose names are generally accepted as standing for culture and good citizenship should be permitted deliberately to announce such a project without rebuke would have been to ignore their public challenge to patriotism. It was necessary to consider that there are people in this country who esteem at least some of the signers of the call for the formation of a society to teach Socialism as serious, disinterested, high-minded philanthropists. It may be conceded that the signers are endowed with a large share of these qualities, but with them is now revealed the added fact that in so far as they are Socialists they are opposed to the institutions of this Republic.

A multitude of letters, received from university and college presidents and professors, from ministers of the gospel and from representative men in the professions, have thanked THE REVIEW not so much for its disclosure of the real aim of the projected society, which is generally ridiculed, but for its information as to the vigorous and successful opposition of organized labor to Socialism.

That exposure has called forth another kind of response—a response of mingled consternation, evasion, and abuse. The revelation in cold type of the unequivocal and undeniable purposes of Socialism has caused a fluttering among the flock of dilettante sympathizers with the effort to "undermine all society"; to "enact a terrible retribution upon the capitalist class, comparable to the French Revolution and the Paris Commune"; to "fire the heart and nerve the arm of rebellion"; to "confiscate all the possessions of the capitalist class"; etc., etc.

It was to be expected that the signers fully committed to the creed of Socialism would respond with vicious attacks upon the article. It was a plain, straightforward exposition of the doctrines which such a society would undertake to instill into the receptive minds of American youth, in the course of training for positions of leadership in the rising generation. It placed the signers of the call in the position of subscribing to those doctrines, since its language explicitly stated that the "undersigned" regarded the "aims and fundamental principles" of Socialism "with sympathy" and believed that "in them will ultimately be found the remedy for many far reaching economic evils."

But it is not what most of the signers may say that concerns the general public. The one man in the list whose signature was a surprise to those familiar with his standing in the literary and ethical circles of New England was Thomas Wentworth Higginson.

It is alone with his reply to a criticism in *Harper's Weekly* that we shall deal in this article. We reprint in full his response:

DUBLIN, N. H., July 14, 1905.

To the Editor of *Harper's Weekly*:

SIR,—I observe in a recent number of your valuable journal an expression of surprise that my name should be united with others in the formation of an "Intercollegiate Socialist School" which "aims to imbue the minds of the rising generation with Socialistic doctrines." This last phrase is your own, for I at least am connected with no organization for the purpose you here state. As to the names with which mine is united I am not concerned; as Theodore Parker used to say, "I am not particular with whom I unite in a good action." As to the object in view it is clearly enough stated in the call itself; the movement does not aim to produce Socialists, but to create students of Socialism.

It is based on the obvious fact that we are more and more surrounded by institutions, such as free schools, free text-books, free libraries, free bridges, free water-supplies, free lecture courses, even free universities, which were all called Socialistic when first proposed, and which so able a man as Herbert Spencer denounced as Socialism to his dying day. Every day makes it more important that this tendency should be studied seriously and thoughtfully, not left to demagogues alone. For this purpose our foremost universities should take the matter up scientifically, as has been done for several years at Harvard University, where there is a full course on "Methods of Social Reform—Socialism, Communism, the Single Tax," etc., given by Professor T. N. Carver. This is precisely what the "Intercollegiate Socialist School" aims at; and those who seriously criticize this object must be classed, I fear, with those medieval grammarians who wrote of an adversary "May God confound thee for thy theory of irregular verbs!" I am, sir,

THOMAS WENTWORTH HIGGINSON.

We regret, Mr. Higginson, to be compelled to prove that most of the statements in your letter are wholly incorrect. We shall give you credit for not knowing the facts when you wrote it. The whole scheme of the Intercollegiate Socialist School—as you should have known before you signed that call—is promoted in this country by the Collectivist Society, whose purpose is not the scientific study of Socialism, but "the spread of its propaganda among the professional classes." The scheme has its root among Socialist groups that day and night are plotting revolution in European cities, as we shall proceed to show you.

First, as to the origin and purpose in this country of the Intercollegiate Socialist Society:

Upton Sinclair, a Socialist writer, whose name appeared with that of Mr. Higginson as one of the signers of the call, recently wrote a letter to the editor of the *New York Worker*, an official organ of the Socialist party, with the request that it be reprinted promptly by "the rest of the party press." His letter strips all disguise from the purpose of the proposed Society:

To the Editor of *The Worker*:

I beg to say a few words to the comrades concerning the Intercollegiate Socialist Society, a call to which was sent out recently. The work of this Society will be the organizing of those college men and women who believe in Socialism, to aid in propaganda clubs at our colleges, to select and distribute literature, to furnish speakers, and to aid in every way the work of inducing college students to take an interest in Socialism. That this is a most important movement, capable of wide growth and usefulness, all comrades must admit.

In commenting upon this letter, the *Worker* remarked:

While the majority of the students in the colleges and universities are probably children of capitalists, large and small, and while the majority of the children of capitalists are either fanatical believers in the Gospel of Getting-on or else hopeless devotees of the Senior Prom. and the Sophomore Cotillion, yet there remains a number of real men and women—young and full of energy and capable of great things—who belong of right to the Socialist movement.

Again the *Worker* published on August 5 a call "addressed to all those interested in the formation of an Intercollegiate Socialist Society"—addressed, therefore, to Mr. Higginson. This highly interesting document reveals that it is intended to send the original call for the formation of the Society to "the secretary of every institution of learning, with request to put on bulletin." The announcement continues:

Here is submitted an outline of the ideas of those who have been instrumental in sending out the call:

"The Society should be open to all who are or ever have been students in any American college or are engaged in educational work.

"Its purpose should be the interesting of college students and teachers in the subject of modern Socialism.

"Its methods should be the bringing together in one body of all persons interested in this work, the discussion of plans, the establishing of an agency for their prosecution.

"The forming of clubs for propaganda work in all college and high schools.

"The selection and distribution of literature suitable for college men."

In reply to this communication kindly state name and address, college and high school and year; Socialist organization of which you may be a member, dues you would feel able to pay, any work at which you could help; speaking, organization, correspondence; a list of all persons who would be interested in this plan."

(Signed) M. R. HOLBROOK, Secretary,
P. O. Box 1663, New York.

An application was addressed to the Secretary for information and literature. Promptly in response came several Socialist pamphlets, all issued by the Collectivist Society, and revealing that its Secretary and headquarters are the same "M. R. Holbrook, P. O. Box 1663, New York." Among the enclosures was a printed request for a contribution, with this added assurance of a secrecy quite appropriate to a conspiracy to "undermine society": "No mention, except by permission, will be made of the name of any one who writes to us." This was signed, as above stated, "The Collectivist Society," with the same address as was affixed to the "Intercollegiate" call. The identity of interests and purposes of the two organizations is thus clearly established.

As to the Socialism of the Collectivist Society, let us again quote the *Worker*. The recognized mouthpiece of the Debs Socialists stated the purpose of the Collectivist Society to be that of "disseminating Socialist literature among the professional classes, persons not ordinarily reached by the party propaganda, particularly. Originally a kind of Fabian society, this organization has since proclaimed itself as frankly accepting the fundamental tenets of scientific Socialism"—a term of the cult which signifies outright revolution.

So much for the relation between the Collectivist Society and the Intercollegiate Socialist Society; so much, also, for Mr. Higginson's denial that he is connected with an organization that "aims to imbue the minds of the rising generation with Socialistic doc-

trines." His denial is thus brought face to face with the official announcement of the purpose of this Society: "The forming of clubs for propaganda work in all colleges and high schools; the organizing of those college men and women who believe in Socialism, to aid in forming propaganda clubs at our colleges."

But this proposition to hold what Mr. Higginson would have considered as a harmless academic discussion, in peaceful college classrooms, of Free Bridges, Free Water, Single Tax, and Irregular Verbs assumes another aspect when its real origin is disclosed. This scheme was not conceived amid the tranquil shades of Cambridge nor yet at a tea-party of the Collectivist Society. It is in reality a cis-Atlantic outcropping of an ambitious international enterprise, whose purpose is to sow the seeds of Socialism in all the universities, colleges, normal schools and lecture-rooms of the world. This movement has manifested itself in the form of three international Congresses of "Socialist Students and Graduates" at Brussels, Genoa, and Paris. At the last Congress, students were present from universities in Russia, Poland, Bulgaria, Armenia, the West Indies, Belgium, Holland, Italy, Denmark, Hungary, Germany, Austria, and France. A report of this Congress in the *International Socialist Review* says:

"The Socialist students of the great American universities, Harvard, Columbia, Brown, and Chicago, had joined the Congress. These comrades showed great activity during several months, and even established an intercollegiate Socialist bureau. For reasons unknown to us, they could not, as expected, be directly represented."

Prof. Enrico Ferri, now of the University of Palermo, Italy, addressed the Congress upon the question of "how to bring into Socialism the greatest number of students." A recent Socialist publication describes this professor as "undoubtedly the greatest living figure in the Socialist movement," and adds the uncomfortable statement that he received, not long ago, "a sentence to sixteen months' imprisonment for a political offense, in the name of the King of Italy." His advice to the Congress may, therefore, be accepted as that of an expert in teaching Socialism both in the lecture-room and the cell. Prof. Ferri said:

"We should introduce Socialism into the students' minds as a part of science, as the logical and necessary culmination of the biological and sociological sciences. No need of making a direct propaganda which would frighten many of the listeners. Without pronouncing the word Socialism once a year I make two thirds of our students conscious Socialists. Among workmen it is necessary to add the Socialist conclusions to the scientific premises, because the workman's psychology permits it, and indeed requires it; before an audience of bourgeois intellectuals, it is necessary to give the scientific premises alone, and let each mind draw its own conclusions."

This Congress made a formal call, says the *International Socialist Review*, "on the groups of Socialist students to make an active propaganda among normal school professors, who will, in turn, transmit their Socialist convictions to the teachers they will have to train, and who thereby may do a work of capital importance throughout the country."

A further evidence of wily strategy appears in the following resolution adopted by the Congress:

"That the best means of propagating Socialism in the universities is to organize, along with clearly Socialist circles where they are possible, neutral circles for the study of social sciences."

M. Boucher, in a report presented to the Congress in the name of the Group of Collectivist Students in Paris, invited:

"The Socialist students to enter the People's Universities, either as professors or as voluntary critics; there is, apparently, the real battle-field for the Socialist students, there is the role which is most suitable to them in the whole range of the movement; that which will excite the least antagonism, and where they will be the most useful."

The announcement was made at this Congress of the forthcoming of the *Socialist Student*, edited "by our Brussels comrades," and "designed as the international organ of Socialist students." Doubtless this valuable periodical would be included in the "literature" which Mr. Higginson's proposed Society would consider "suitable for college men."

Here we have, stated in detail, the program of the international organization of "Socialist Students and Graduates." This program includes precisely the insidious device of forming "neutral groups" for the study of social sciences, which Mr. Higginson would

(Concluded on page 20.)

WELFARE WORK IN MERCANTILE
HOUSES.

Previous articles in this Department have shown what can be done for the welfare of employees in large factories. It is now proposed to show by typical examples how Welfare Work has been introduced in both large and small mercantile houses. This statement must be more or less general in its scope, but detailed information in reference to the work described may be had upon application to the Welfare Department of the National Civic Federation. The articles that follow are supplied by officials of the several establishments

A CHICAGO EXAMPLE
OF WELFARE
WORK.

The distinctive characteristic of the Welfare Work of Marshall Field & Co., Chicago, is to be found in the pervading spirit of the place. To have the several thousand employees "intelligent, loyal, happy, and progressive" has been the company's primary aim. Just dealing with the employees has established relations of genuine friendliness.

This design is well and concisely expressed in the following rule:

It is the wish and purpose of the house that no employee, no matter how unimportant the position may be, shall be forgotten or lost sight of, but that instead every one whose name is on the pay roll shall be recognized as a part of this great force, and that individual effort shall be carefully and frequently considered by the one above in authority.

Several methods are actively used to appeal to the intelligence and enlist the interest of all the employees without regard to their length of service. Little leaflets are freely distributed containing useful information, attractively presented, for their direction and encouragement. One of them, for example, contains terse precepts gathered from memoranda of meetings between the manager and the heads of departments and their assistants. Another is the letter written by Marshall Field to a prominent clergyman upon "The Virtues that make for Commercial Success." The idea is that the readers may find something peculiarly pertinent to themselves or to their work.

The pay envelopes which employees receive each week are variously imprinted with suggestive quotations bearing upon some of the most familiar and essential practical rules of conduct in daily life. One enumerates more than twenty reasons "Why He Was Not Promoted," some of the statements being:

He watched the clock.
He was willing, but unfitted.
He didn't believe in himself.
His stock excuse was, "I forgot."
He learned nothing from his blunders.
He chose his friends among his inferiors.
He never dared to act on his own judgment.
He did not think it worth while to learn how.
He did not learn that the best part of his salary was not in his pay envelope.

Another explains the "Value of a Mistake," while a third gives a table showing the way savings and interest accumulate when systematic deposits are made. Here and there in the rooms devoted to the employees are posted attractive placards setting forth injunctions helpful to those struggling for self-improvement, and homely but pertinent proverbs. One containing the caption "DEVELOPMENT" reads: "Push steadfastly against the boundary lines of to-day's limitations and your scope will be wider to-morrow"; and another headed "SALESMANSHIP" states: "The essentials are: integrity, courtesy, tact, knowl-

edge of merchandise, judgment, accuracy, energy, personal appearance, and dignity."

In order to develop initiative and bring about improvement in details, the firm invites criticisms from all employees upon any point in system and method, in either their own sections or elsewhere which, in their judgment, can be bettered. Whenever such suggestion is regarded as practicable by the manager and is adopted, a reward of one dollar is paid. This system, besides bringing to the firm the improvements caused by accepted suggestions, causes the employees to be watchful, studious, and interested in the general improvement of the store. Section managers or assistant managers are not rewarded for suggestions for improvements regarding their own sections, as such suggestions are regarded as included in the duties of their positions. The firm pays a reward of one dollar for all corrections of errors (other than typographical) in its advertisements. It is considered an error in the advertisement when there is any exaggeration; when the price is wrong; when a word is misspelled; when the language is grammatically incorrect; or when a false statement occurs. The effect of this is to increase the interest of employees in the advertisements, and to cause them to be able to answer intelligently questions asked by customers, whether the goods inquired about are in the employee's section or not.

Library. A subscription bureau enables the employees to enjoy the benefit of special prices for periodical literature which the firm is able to obtain.

Employees may purchase goods for their own use at special prices, the discount ranging from six to twenty per cent.

Employees detained at home because of illness receive half pay.

A vacation of two weeks is allowed, each summer, to those employees who have been with the firm twelve consecutive months, beginning before September 1, and one week is allowed those who have been employed six consecutive months, beginning before March 1.

When men employees are called upon for jury service, as they frequently are, the firm protects them against financial loss. They are expected to spend all spare time, during business hours, at the store, as jury duty rarely requires the entire day. All jury vouchers are turned over to the paymaster. The pay for jury service is \$2 a day. Those whose wages are less than this sum receive the full amount of jury money. Those whose pay exceeds jury wages are paid the difference by the house. The time given to the business by employees during their term of jury service is also recognized by the manager.

The firm encourages enlistment in the militia, and allows, to the young men who join, the extra week necessary each summer for the annual encampment, at half pay.

New features of Welfare Work are added from time to time, the company aiming to do all in its power for the general good.

SCOPE OF THE WORK
IN A NEW YORK
DEPARTMENT STORE

About three thousand five hundred of the five thousand employees of R. H. Macy & Co., New York City, patronize its lunch room daily. The employees' lunch room occupies a large space, of which one portion is partitioned off for the men. It is possible to buy all that appetite demands for eight cents. A sample menu contains:

Tomato Soup	3c.
Beans and Pork	3c.
Potato Salad	3c.
Sandwich	4c.
Quarter of a Pie	4c.
Ice Cream	3c.
Tea, Coffee or Milk	1c.
Oranges	2c. or 3c.
Different kinds of Cakes	1c., 2c. or 3c.

In the winter roast beef and other hot dishes are served. Fruit may be purchased at cost.

Tea, coffee, or milk is given free to all minors, such as cash girls, bundlers, and stock girls. All are expected to buy tickets for other articles on the menu desired, unless they are without money. Then upon application the minors receive free tickets for lunches. Whatever is left in the lunch room at the close of the day is supplied free to the night porters.

Employees are allowed to eat in the lunch room their lunches brought from home, and to supplement them with anything for sale. Very few, however, do this, as they can get lunch so cheaply that they prefer to buy it. The allowance of time for luncheon is three-quarters of an hour. The employees go to luncheon in shifts which begin at 11 a. m. and extend to 2.30 or 3 p. m. The first shift numbers usually about seven hundred, and is the most popular because many employees are hungry as early as eleven o'clock, and some of them think they will be better served then than later; this, however, is an erroneous impression, as the same quality of food is served to the last as to the first shift.

Large locker rooms are provided containing wire lockers. Two employees share a locker, and each pays twenty-five cents for a key upon taking employment with the company. When the employee leaves the service, the money is refunded upon the return of the key.

There are separate toilet rooms on every floor for the men and women. Each contains wash bowls, closets, and shower baths which may be used at any hour by obtaining permission. The baths are more in demand in summer than in winter. Facing the shower baths are curtained, individual dressing-rooms.

The company supplies soap and towels, and there are two fine large mirrors in each toilet room. The

YOUTH'S GYMNASIUM.
EMPLOYEES' WRITING AND READING ROOM.
EMPLOYEES' LUNCH ROOM.
GIRLS' GYMNASIUM.
GIRLS' MUSIC AND RECREATION ROOM.

The educational work includes, during the busy months, beginners' meetings to which all, employed mornings, are sent at four o'clock each afternoon. A little talk is delivered relative to the business methods of the house and its policy and wishes concerning the employees. These talks are illustrated with charts.

It is endeavored to throw about the girls employed in the establishment an atmosphere of protection. To that end the young men begin work at 8 a. m. and the girls at 8.30, while the girls leave at 5 p. m. and the young men at 5.30.

An abundant supply of drinking water that has been twice filtered conduces to the health of the employees.

The toilet room facilities are exceptionally good. One entire floor, the ninth, is devoted to the interests of employees.

There is a large lunch room where they may eat their luncheons brought from home, or may be served at the lowest possible cost.

An adjoining room is fitted with individual wire lockers.

A hospital, also on this floor, affords speedy relief for any one who has met with an accident or who has been taken ill suddenly.

There is a boys' gymnasium with shower baths, and also a gymnasium for the girls. This serves as a playroom for the young girls, who thus do not disturb the more mature, when occupying the resting and music room adjoining the gymnasium.

There is a library and reading room, with writing desks, for the use of all employees. All the daily papers are on file, as well as magazines selected because of their probable interest to the readers, and there are two cases filled with books. The firm signs slips which entitle the employees to the use of all books which they desire to draw from the Chicago Public

individual wash bowls are provided with special cans made to granulate the soap.

There are drinking fountains throughout the store, the water being filtered and cool.

Special elevators are provided for the use of the employees.

Fire apparatus is placed throughout the building. Drills are held upon short notice to ensure their efficiency in the event of an actual emergency.

Three rooms are set apart as hospitals on different floors in the store. In attendance are two doctors, one of them a woman, and there is a trained nurse to assist. One of the hospital rooms is adjacent to the recreation room, where the Secretary of the Relief Association is in constant attendance. She refers all cases requiring treatment to the physicians. The man doctor visits the homes of all who are ill, and is required to make a formal report upon every case. From five to seven thousand cases a year are treated. Sometimes the physicians will have from fifty to one hundred cases a day, perhaps for a week, and then there will be fewer for a period.

Improvident employees were generally the ones who failed to join the relief association when membership was voluntary, and it has recently been made compulsory. When urged, the employees were glad to join, because they have known so many who have been helped through the association. The dues are nominal.

The mechanism of the association is such that no employee can be ill without the fact becoming known and immediate relief being extended. Every employee has a postal card, addressed to the company, which must be mailed as soon as illness occurs. If an employee is absent for a single day, the company sends a representative to see the absentee.

Under the former system a case occurred where an employee was very ill and unattended in a lodging house for three days. She did not belong to the relief association, but the company sent to inquire the reason for her absence, and learned that she had been entirely alone and that, consequently, nothing had been done to provide relief or food.

A recreation room accommodating three hundred at one time is set apart. The four tables in the room are well filled with reading matter. The floor is covered with large rugs, and there are comfortable chairs.

Upon the top floor there is a beautiful exhibit hall where the company contemplates giving employees' dances.

In the summer the company entertains all of the junior help—the cash girls, stock girls, bundlers, and packers—in the country. It makes arrangements with churches of the various denominations represented by the affiliations of the employees, maintaining summer recreation homes, such as Sea Cliff, and others on the Hudson. The company pays the board of each for one week. It also bears the cost of transportation and cares for their baggage from the time of departure from home until their return. When these parties start on their vacations, a luncheon, an orange, and a box of candy are provided for each traveler.

From three to four hundred go each year in parties of from twenty to fifty between July 1 and September 1.

Every employee who has been with the firm for a year is entitled to a vacation of one week with pay.

The company presents to every married employee a Thanksgiving turkey weighing from twelve to fifteen pounds.

Each of the junior help receives a Christmas remembrance of one dollar and a box of candy.

Every three and every six months premiums are paid, in addition to the regular salaries, upon all sales exceeding the amounts of sales by the individuals concerned in the previous year. This distribution of time brings one of these premium payments at the Christmas season and one at vacation time. An interesting illustration of its operation shows one sales girl who was quite overwhelmed with joy at Christmas when she found \$35 in her envelope, and another starting on her vacation with \$116.

Twice each week at 9.30 a. m. one of the superintendents gives a talk of twenty minutes to employees from the various departments. Sometimes as many as three hundred are in attendance. A notice is sent to each head of a department requesting that as many of the employees as can be spared shall be present on

a certain morning. In the course of a few weeks every employee in the store will have had the benefit of one of the talks. The superintendent, who delivers them, discusses all complaints that have been received from customers, and makes special reference to such topics as the appearance of the employees, tardiness in arrival, courtesy to customers, how to keep stock in good condition, and the requirements for successful salesmanship.

Other talks are given frequently to the floor-walkers and the heads of departments. They are delivered in the recreation room at 6.30 p. m., lasting ten minutes. Included are such topics as attention to customers, discipline, personal appearance, leaving counters or floors without permission, and other defects in service and their remedies.

The hours of work are from 8 a. m. to 6 p. m. Upon a stormy morning the company does not insist that every employee must arrive exactly at 8 o'clock. Any one in the store may have permission to go home at four o'clock, upon application, for any reasonable cause, without loss of wages.

The company believes that good discipline can be maintained without fines. The only fine inflicted is for lost checks, if occurring twice. For losing checks a third time the penalty is dismissal. The money collected from these fines goes into a fund for

of all ratings is the "store average," and misconduct marks reckon so much off. Upon the store average depends promotion and increase of salary. If the first upward step is not taken within two months, the conclusion is reached that the boy is unfitted for the business and dropped from the ranks.

These record cards secure discipline without the harsh word and impulsive discharge. They are carried home for inspection and signature by parents and guardians.

The six hundred young people which include the cash boys and cadet corps are assigned to duty in the various divisions of the business, according to their natural aptitude and fitness, and are under the direction of their respective department heads; but always, also, and until graduation from the cadet corps, they are under the care and discipline of the chief of the corps and a woman assistant. The young people are not lost sight of individually, but are known and studied by the managers with view to advancement.

They are placed as early as possible where some distinct branch of the business or class of merchandise will be learned thoroughly. Stock boy, salesman, stock-head, buyer's assistant, is the usual line of advancement. Development in clerical lines makes the bookkeeper, the auditor, the office assistant, the stenographer. In trades lines grow up, for example, the milliner, the dressmaker, the paper shade and flower worker, the plate engraver and printer, the designer, show-card painter, draftsman, decorator, and the mechanic to repair bicycles. Exceedingly numerous and varied are the paths open, and, in so far as possible, an early and definite selection and patient, reasonable progress along some one of them is insisted upon. Their natural abilities, however, are not found sufficient to bring about normal development, unless trained and added to by knowledge in the common branches of education. It has been found practicable, therefore, to bring into the business lives of the young people most of the activities usual in the schools.

The smaller boys are organized into school and military companies. Each company assembles in the school room on the fifth of the store building two mornings in the week, where regular instruction is given in arithmetic, grammar, spelling, writing, composition, and singing. On two other mornings they have setting-up exercises and military drill, with some other features of

physical culture. The boys elect their own military officers, except their chief, and these officers become successful disciplinarians. A fife, bugle and drum corps of these boys has been pronounced the best junior organization of the kind in the city.

The girls also have a school organization, each division being taught two mornings in the week. In addition to the branches taught to the boys, the girls are instructed in business correspondence, stenography and typewriting and bookkeeping. Attention is given to singing and physical culture. An elocution class and a mandolin club are successful outgrowths of this branch of the store school.

The older boys, numbering about three hundred, have supper in the store, and remain for their school two evenings in each week. The branches taught are arithmetic, spelling, writing, commercial correspondence, English, stenography, bookkeeping, the metric system, mechanical and free hand drawing, and rapid calculation. Military and gymnastic training is given. Among these boys are a club for debate and literary exercises, an orchestra, a field music band, a mandolin club, a glee club, an elocution and dramatic class and a minstrel troupe.

A monthly report of the standing and progress of each pupil is made to the parents.

Each of the three branches of the school has its separate annual commencement. The graduates receive certificates which have a double significance. They testify to the attainment of a certain standard in the school work proper, and also to the actual number of years of satisfactory service in the business with promotion from the cadet corps to positions in the regular ranks of the store's departments.

Thus there has grown up in practice a system of civil service promotion. The higher positions are being filled continually with those who have grown up in the business from childhood. It sometimes happens

the bundlers, used to make up losses. While such losses are charged against the employees for the moral effect, they are never obliged to pay.

A PHILADELPHIA EXPERIENCE.

In the Philadelphia establishment of John Wanamaker, emphasis is placed on commercial education.

The young people in the store are organized into three classes which, united, are known as the John Wanamaker Commercial Institute. These classes typify a systematic effort to meet responsibility for the future of the junior employees.

What is styled "The Cadet Corps" includes girls, up to about seventeen years of age, and boys, other than cash boys, from sixteen to eighteen. Into this corps cash boys go by promotion. With the exception of the Christmas season, the cash boys average two hundred in number and the cadets four hundred, of whom about one hundred are girls.

Besides excellence in school work, cultivation of good manners, neatness, elevated personal habits, and efficiency in store service are elements considered in promotion, and are emphasized by a system of monthly averages. To illustrate: Each of the cash boys has his record card which he must carry for a month and keep in a state of cleanliness. A sign of progress is an increased average whiteness. The boy reverences and guards this card. On one side are rules to be committed to memory. On the other is an array of spaces to be filled with weekly ratings by his department manager for neatness, promptness, truthfulness, etc.; a weekly rating at morning "inspection" by his general chief; daily strokes of the pencil for misconduct or neglected duty, called by the boys, without levity or disrespect, "bluies"; and the monthly figures for school work. Protest against an undeserved "bluie" is accorded a patient hearing. The average

EDUCATIONAL CLUB, CHRISTMAS.

VACATION COTTAGE.

that a young man fits himself for a high position before there is an opening here, and assumes one elsewhere, with the approval of the firm; but a faithful worker need not look outside for a business future.

The graduates of the school have organized alumnae and alumni associations which maintain, in addition to their social features, a debating and literary club, a dramatic club, and a mandolin class.

Other features in the Welfare Work are separate lunch rooms and resting rooms for women and men.

In the lunch rooms, besides service a la carte at low rates, a special luncheon is served each day for ten cents, consisting of meat, one vegetable, bread and butter, coffee, tea or milk, and dessert.

A porch connecting with each of the lunch rooms gives opportunity for rest in the open air, where the men may smoke.

The resting room for women is fitted with numerous couches, easy chairs, and a piano.

There is a private room for the sick in charge of a matron, with a trained nurse, who can be called if required.

A beneficial association provides for the care of those who are ill, and it includes death benefits.

Two savings funds are conducted, one for men and women, and the other for boys and girls of the establishment.

The library for the employes, in charge of a librarian, contains about five thousand volumes.

A "Women's League," composed of a large number of the women employes, was organized for social and educational purposes. It carries on classes for chorus singing, physical culture, dancing, sewing, and instruction in English, German, French, and the mandolin.

There is a baseball club consisting of young men.

The firm maintains at Island Heights, N. J., camping grounds and a headquarters house. The boys enjoy an annual encampment at this place, and the house is used by such of the women employes as care to arrange club outings there during their vacation.

All employes receive two weeks' vacation with pay.

WHAT HAS BEEN DONE AT KANSAS CITY, MO.

The George B. Peck Dry Goods Company, at Kansas City, Mo., maintains a lunch room for employes, in charge of a competent man and woman, with a force of assistants. An abundance of wholesome food is served at the lowest possible cost.

The store is equipped with an ample number of wash rooms. There are provided also lockers for the employes' wraps.

A physician is regularly employed at a fixed salary to attend any employes when ill, either at the store, at their homes, or at his office. The firm furnishes the greater part of the medicines used.

A rest room and a library adjoin the lunch room. Books are taken from the library without fee on a ticket and retained for two weeks, or renewed, as desired. This library contains all the standard works of fiction, and is supplied from day to day with current publications as they are received.

The cash boys and girls are organized in an "Educational Club." Its members attend a school each morning, where they are instructed in the regular elementary branches by a competent teacher. All books and supplies are furnished free.

Every summer the cash girls and boys and all the younger help are sent for a vacation, with pay, to a

camp in one of the large suburban parks. The camp contains a cottage, in charge of a competent matron, which is equipped with conveniences for comfortable and happy summer life. This camp is highly appreciated by the employes, and has proved of great benefit to them.

The sales people and other employes, who are not sent to this camp, are allowed vacations with pay, according to the number of years they have been in the company's service.

There are also various summer excursions.

WOMEN'S RESTING ROOM AND LIBRARY.

Every Christmas there is a Christmas tree for the cash girls and boys' educational club.

SACRAMENTO AND SAN FRANCISCO.

In the stores of Weinstock, Lubin & Company, at Sacramento and San Francisco, there are good lunch rooms and rest rooms, the latter being provided with magazines, newspapers, and small libraries.

There are modern wash and toilet rooms.

EMPLOYEES' RESTING ROOM.

All work rooms are well lighted, have plenty of window space, are well ventilated, and are thoroughly sanitary.

Above the San Francisco store there is a roof garden.

All employes between fourteen and eighteen years of age are organized into classes for systematic instruction in the usual common school branches.

There is a savings plan for employes. The firm

allows interest at four per cent. on ordinary deposits, which the depositor may withdraw at any time. Upon term deposits, requiring a notice of six months before they can be withdrawn, six per cent. is allowed. There is a profit-sharing plan which applies to all heads of departments.

THIRTY YEARS OF WELFARE WORK.

In the establishment of Bloomingdale Brothers, New York, Welfare Work has been developing continually since the formation of the firm thirty years ago. Its distinctive feature is the education of the employes with a view to their promotion in accordance with demonstrated merit. This difficult task is met by constant instruction in their respective duties. Upon a large blackboard are written, daily, instructions, rules and regulations, alternately addressed to sales clerks, floor walkers and others. There is ample proof that these notices are productive of good results. They are the subject of conversation each day among the employes, who often make suggestions of new topics to be placed upon the blackboard.

Prominently placed and accessible to all employes is a box wherein they may drop suggestions. It is labeled "Suggestion Box to Encourage Suggestions from Employes." It is a medium through which injustice may be righted, while those who are thoughtful and ingenious enough to make useful suggestions may thereby receive their first and immediate introduction to the firm and secure early recognition.

An employes' merchandise department enables them to purchase goods and pay for them in weekly instalments. The weekly payments required are determined by the amount of the purchase and the salary received. This has proved a blessing to hundreds who have been in the employ of the firm a reasonable time, and were thus entitled to make necessary purchases, upon easy payments, avoiding instalment houses which extend credit, but charge exorbitantly. This convenient method also saves the time necessary to make trips, in the limited leisure of employes, to the instalment houses.

The firm encourages employes to save, beginning with pennies. There is in the store a branch of the "Penny Provident Fund." The clerk required by this branch and the necessary space is furnished the Provident Association without charge by the firm. Any employe who has saved one hundred pennies may begin making deposits with the banking department, receiving 4 per cent. interest. Occasionally texts are written upon the blackboard to encourage saving for "rainy days."

The "Bloomingdale Brothers Employes' Mutual Aid Society" was instituted in 1881 and incorporated in 1888. Its officers are the heads of various departments throughout the store. Before the formation of this Society, it was necessary to bring all cases of sickness and distress to a member of the firm for financial aid, always generously extended, but now these cases are cared for through the machinery of the Society.

All employes are members. There are three grades of membership: Employes in the first grade pay monthly dues of ten cents, entitling them to \$2.50 per week sick benefit, and \$30.00 death benefit.

In the second grade dues of thirty cents entitle them to \$4.00 a week sick benefit and \$40.00 death benefit.

(Concluded on page 20.)

THE IMMIGRATION PROBLEM.

(Continued from page 9.)

lected because it is the best, and by those who want the best. A head-tax of twenty-five dollars was not desirable years ago. It becomes more and more necessary as the increasing facilities of land and water transportation make it easier and cheaper to come here. The tax would not act as a permanent and insuperable barrier to desirable aliens, for a hard-working and ambitious man or woman who wanted to come here could earn the extra money. It would doubtless deter many of the shiftless and incompetent, and it would prevent such shipments of paupers and criminals as are now known to have been made with the connivance, if not at the expense, of the authorities abroad.

2. *"Assisted" immigration should be further restricted.* * * * Congress some years ago very properly recognized the danger in "assisted" immigration when it debarred from landing "any person whose ticket or passage is paid for with the money of another, or who is assisted by others to come." But in order to make it possible for the members of a family to send for one another, the following words were added: "But this section shall not be held to prevent persons living in the United States from sending for a relative or friend, who is not of the * * * excluded classes." The motive of Congress was excellent, but the phrasing of the law is too loose to meet present conditions. At present about fifty per cent. of our total immigration is "assisted," and, for an "assisted" immigrant, any one is a "friend," and any one up to a fifth or sixth cousin several times removed is a "relative." The time has come, with our present enormous immigration, to restrict to the immediate family the privilege of "assisting" other aliens. As a rule, it is safe to say that the less desirable immigrants are those who can not pay their own passage. We should certainly allow fathers and mothers, and brothers and sisters, and husbands and wives and children to prepay each other's passage. Beyond that, "assisted" immigration should be stopped. Therefore, the clause concerning "assisted" immigration should be followed by some such words as these: "But this section shall not be held to prevent citizens of the United States from sending for their fathers or mothers, wives, sisters or brothers, or minor children who are not of the excluded classes." A bill introduced by Senator Lodge into the Fifty-eighth Congress (S. 1376) embodied an amendment along these same lines. In his last annual report as Commissioner of Immigration at the port of New York, Hon. William Williams said on this matter: "I believe that assisted immigration should be prohibited, subject to reasonable exceptions in cases of very close and otherwise eligible relatives, such as fathers, mothers, children, brothers and sisters of responsible aliens who have already resided here a sufficient length of time." There would be no permanent hardship in such a provision, because any alien, otherwise admissible, could come as soon as he had been able to pay his own passage money.

3. *We should debar immigrants of poor physique.* The immigration question is racial, rather than economic. One of the most potent factors in decreasing the American birth-rate has been the immigration of aliens of lower standards of living. American fathers and mothers, as the late Gen. Francis A. Walker pointed out, and as leading authorities have since reiterated, naturally shrink from exposing their sons and daughters to competition with those who are contented with lower wages and lower standards of living, and therefore these sons and daughters are never born. The stronger the competition, the greater the effort to maintain and raise the standard of living and the social position, and the greater the effort, the greater is the voluntary check on population. * * * It is of the utmost importance that we should keep the new blood pure, and that we should keep up the American race standard.

One of the essential points in regard to our recent immigration is that much of it is not voluntary in the true meaning of that word. It is an artificial selection by the steamship companies of many of the worst elements of European and Asiatic populations. Steamship managers and agents deny this most emphatically, but those who have had to do with immigration matters have learned to be very cautious about accepting any evidence which is given by steamship people, railroad officials, and other "interested" persons. In such matters the statements of our own Government officers are the sole evidence which is trustworthy. The social responsibility which rests upon this country in this matter is overwhelming. We may decide upon what merits, physical, intellectual, or moral, the fathers and mothers of American children shall be selected. But we have left the choice almost altogether to the selfish interests which do not care whether we want the immigrants they bring, or whether the immigrants will be the better for coming. Steamship agents and brokers all over Europe and eastern Asia are to-day deciding for us the character of the American race of the future. * * *

4. *The Illiteracy Test.* No plan for further selecting immigration has had more general support than the illiteracy test. This requires that adult immigrants,

with exceptions in favor of wives, minor children and parents, shall be able to read a few lines in their own language. * * *

There is no danger that the exclusion of illiterates would cause a scarcity of labor in this country. If there is a demand for laborers, the supply will be forthcoming from Europe. If the steamship companies can not bring illiterates, they will fill their steerage with aliens who can read. And with the stimulus thus put upon education, the illiteracy in many of the countries of Europe would soon show a notable decline. There is plenty of labor now in our cities which would be better off in the country, where there is great need of farm "help." But the cities attract, and the farmer waits for his help. So it would be under the illiteracy test.

It is urged that our native population, as well as the better class of immigrants, will not do the hard work needed to build our railroads and develop our mines, and hence we must continually import lower grades of aliens to do this work. The usual course of reasoning in this matter is fallacious. Americans abandoned the harder kinds of manual labor, not because they despised these occupations, but because they found that these occupations brought them into competition with aliens whose standards of living were much lower than their own. The same is now true of the Irish, who have largely been replaced by the Italians, and will later be true of the Italians, when other newer immigrants come in whose standards of living are so low that the Italians will not wish to associate with them. But meanwhile,

G. GUNBY JORDAN,
Cotton Manufacturer.

if we continue to admit lower and lower grades of immigrants in this fashion, the general standards of living of the whole community must inevitably also be lowered. It is often said that the crowding out of native Americans and of the older nationalities of immigrants is all for the best; that they all go up into higher occupations. This is not so. While some doubtless do rise in the social scale as the result of being displaced, some are crowded out and move elsewhere, and many are crowded down, becoming paupers and swelling the army of American tramps. * * *

To sum up: We need intelligent distribution from our congested districts of physically fit aliens over the country districts, where these aliens are wanted, and where they will be given work which they are physically and mentally qualified to perform. We need a public backing for our immigration officials in enforcing the laws we now have. We need new legislation to sift the immigrants whom we receive. We need a higher head-tax: a restriction of the privilege of "assisting" immigrants to come here; a physical test. And we need that limit to the present unwieldy numbers of immigrants which would be best furnished by an illiteracy test.

THE SOUTHERN NEED OF LABOR.

Several Governors Propose Concerted Action to Divert the Tide of Immigration.

(From an Address by G. Gunby Jordan, before the Georgia Industrial Association.)

I AM aware of the fact that very many of the older mills are making large and important improvements in their properties, adding more, and substituting new for old machinery. But in thoroughly new textile enterprises, the South seems to be now at a standstill.

The main cause of all this is that we have exhausted the available labor of the South which is capacitated by birth and adaptation for textile work. Hence there is in several of the Southern States much idle machinery. A telegram from New Bedford, Mass., in the last few days conveys the intelligence that the Mississippi Mills, at Wesson, Miss., has just made a contract with one hundred or more weavers at New Bedford, and is moving them to Wesson because weavers could not be found in Mississippi.

This telegram further vouchsafes the information that these weavers are under a contract for a year at \$2 each for each working day.

Speaking solely for our corporation, as a matter of certainty I can truthfully say that there are now, and have been for some months, a good many openings unfilled for competent mill help. Information which I believe to be reliable convinces me that practically all other mills South are in like condition. We, therefore, are to-day discussing a condition, not a theory.

No investment in manufacturing can ever prove attractive so long as there is any large portion of the machinery idle. It is a fact beyond controversy that idle machinery in the South at the present time is caused solely by the lack of competent labor.

I have just read in a New York newspaper under a headline which says: "Louisiana calls for 100,000 men," a communication saying that there is an absolute labor famine in Louisiana, and that there is employment enough waiting now for 100,000 men who are able and willing to work.

Clerks, bookkeepers, and people seeking for soft jobs, wholly within the shade, are not needed there, as probably they are not needed at any place, because there always seems to be a large surplus of people willing to work at such vocations in the South and North, the East and the West. But people who are willing to go into the fields, the factories and the mines to do manual labor, are needed in Louisiana and in Georgia as well.

South Carolina, recognizing this condition of affairs, has established a Bureau of Immigration, and has an actual office in New York looking toward the movement of immigrants to that State.

A cablegram from London, April 30, says that Donald Rose, General European Representative of the Illinois Central Railroad, has just returned from a trip to Austria and Italy, where he met the governmental authorities, with whom he discussed the possible diversion of Italian and Austrian settlers in the United States from the Eastern to the Southern States.

Mr. Rose states that he does not represent his railroad in this matter, but the governors of the States of Louisiana and Alabama.

The Italian government has thought sufficiently of this matter to have her Ambassador make a personal visit of investigation into the Southern States for the purpose of reporting upon the welfare of forty settlements of Italians already in the South, and asking for his recommendation as to the further movement of Italians to that section.

His report has been quite favorable, and with very few exceptions, advises that Italians do better by going on lands in the South than in Eastern States as miners and as laborers. This is upon the theory largely that in the South the Italian becomes a permanent land owner where land is cheap.

It is understood from high authority that the governors of several of the Southern States propose to carry on a propaganda of education respecting their several States, with a view to inviting European immigrants to them.

We learn that the manufacturers of South Carolina have met together and resolved for their own protection, and for the purpose of starting up idle machinery, that they will furnish representatives of their own to try to divert some of the immense hordes of immigrants now landing in this country to their own State.

Recently in interviews with the representatives of the Southern railway lines, Commissioner Sargent expressed himself as anxious to distribute the immense throngs of immigrants which are reaching our shores in a scientific and sensible manner, and that he believed, with the representatives of the Southern roads, that very many of these immigrants, so badly needed by it, could be diverted to the South.

Among his recommendations, which he will urge before Congress, is an appropriation sufficient to have attractive buildings on Ellis Island arranged so that each State in the Union can have a display of the products of the soil, of the manufactories and the mines, and, if desired, a capable representative to explain these and the other attractions of the respective States to immigrants, so that they can intelligently make up their minds as to the point that they may eventually choose as a permanent home.

As it is now, the ports of Alaska receive scores more of people than do all the important ports in the State of Georgia, and we certainly have two very important ports in this State—one of them sufficiently so to receive this year about 1,750,000 bales of cotton.

In the five years since the last Federal census was taken there has been an increase of the population of this country, as shown by the monthly estimates of

the Treasury Department, of 6,613,000 people, for on May 1, 1905, the estimated population of this country was 83,026,000.

Of this increase during the past five years over one-half, say 3,255,000, came from Europe.

By 1910 it is easy to see that this country will have 90,000,000 of population.

We need not anticipate; but taking what has already occurred during the past five years, we see that the gain is 8.7 per cent.

Even as discerning and conservative men as manufacturers generally are do not take sufficient account of the increased population when estimates are made of the business outlook, for every addition to our population adds just so much to the consumptive demand upon every productive industry.

It is a fair estimate to presume that the average amount needed by every person to maintain life in this country is about \$200 a year. Then, the actual increase in the United States, as based upon the last five years, means an annual increase of the consumptive demand of \$264,000,000.

This fact alone sufficiently explains the enormous vitality displayed by this country, its immense power of recuperation and the constantly growing and intense pressure upon its producing energy.

It may interest you to know that either Michigan or Minnesota, in this good year of 1905, has more foreign horn population than fourteen Southern States combined; that either Pennsylvania or Illinois has twice as many as these fourteen States, and that New York alone has four times as many as the whole of the fourteen States named. That in the State of Massachusetts there are forty-five cities of 10,000 inhabitants or more, and that the entire Southern States have only thirty-eight; that it would take several Southern States in population to equal that of New York City or Chicago alone.

There were 23,000,000 immigrants in round figures received in this country up to the year 1905, and these all, or nearly all, went to the Northern, Eastern, and Western States. This has been one of the great underlying causes of the failure of the South to develop in an adequate way.

For comparison let us take for a moment our own State of Georgia and that of Iowa. In selecting Iowa for an object lesson, it is done mainly because the area is almost identical with that of Georgia, Georgia being larger, however.

First, Georgia was one of the original colonies, and hence one of the original thirteen States.

Iowa was not admitted to the Union until 1846. In the census just prior she had 43,112 people within her borders. Georgia at that time had 691,000 people, of which 407,695 were white. To-day Iowa has outstripped Georgia in population, and hence in all other commercial and financial advantages.

To emphasize this fact, let us compare Georgia with Illinois:

	Georgia.	Illinois.
Square miles	58,980	56,000
Population	2,216,331	4,821,550
Density	37.6	86.1
Agricultural products, value.....	\$104,304,476	\$345,649,611
Agriculture, per capita, value.....	\$47	\$72
Manufactured products, value.....	\$106,654,527	\$259,730,168
Manufacturers, per capita value.....	\$48	\$261
Engaged in agriculture.....	522,848	462,781
Engaged in manufacturing.....	85,385	481,550

In other words, if Georgia had as many persons to the square mile as Illinois, its population would be now 5,080,000, or about twice the present population.

But this comparison is valuable in that it shows how rapidly this large population in Illinois has increased the agricultural products instead of decreasing their values, as some of our misguided friends fear. In other words: In Georgia we receive \$47 per capita and Illinois \$72 per capita for the value of agricultural products.

The contrast in manufacturing products is still more intense, being \$48 in Georgia and \$261 in Illinois.

There are, with all this immigration into Illinois, 60,000 more people engaged in agriculture in Georgia than there are in the State of Illinois, and on the other hand nearly 400,000 more engaged in manufacturing in Illinois than in Georgia.

There can be no race question in any country where the intelligent race is largely in numerical excess. If no other incentive existed than this, every white man in Georgia should be desirous of bringing into his State good, sound, white immigrants from any section and from any country.

Let us then take up the two decades beginning in 1880 and ending in 1900. In that time in agriculture, the balance of this country increased 65 per cent., the South 72 per cent.; in manufactories the balance of the country 242 per cent., the South 348 per cent.; in the value of manufactured products the balance of the country 135 per cent., the South 219 per cent.

In mining, lumbering, railroad building, and general industries the South stood much higher than did the balance of the country. And to-day West Virginia mines more coal than does Belgium, nearly as much as France, and these two European countries have the reputation of being great mining countries.

To-day Alabama is showing a vitality and growth in the production of iron, steel, and coal which pro-

phesies that in the next twenty-five years she will exceed the Pittsburg district in this regard.

In 1880 the South consumed one-seventh only of the cotton spun in this country. In 1900 and since she has consumed 50 per cent. of it. All of this in the face of the fact that the Southern States were increasing in population, and hence in human energy, only through the natural birth rate.

Let us take our own State for example. Where 46.7 percentage of the population is negro or of negro origin, it is a lamentable fact that the last census shows that during the preceding ten years the population of Georgia increased at a less rate than the birth rate in the State. Out of the American born population of 2,203,928, only 193,520 were natives of other parts of the country, while at the same time 412,453 natives of Georgia were living in other States, 78,000 Georgians being in Texas alone.

Thus there was a balance in the exchange of 218,933 against Georgia, which was diminished but very slightly by the incoming of only 12,403 persons born in foreign countries.

So that it is true that we are not holding our own, even from the increase that nature gives us.

Adam Smith says there are only two factors known to produce wealth—land and labor. Within our State there are millions of unused acres of land. What we need is the labor to till them.

The South has grown rich from enormous crops, so that the prodigality of nature has left much for

JOHN WILLIS BAER,
Secretary Presbyterian Board of Missions.

investment in banks, in manufactories, in opening mines and developing the wonderful natural resources in the Southern States.

Now we have reached the apex of that development, unless we bring in people sufficient to continue the work. Machinery can not operate itself. Mines are not automatic in their development. People are needed, and from some source and from somewhere they must come.

If we continue to progress, these people must be brought within our borders. Cotton consumption has doubled in the world in the past fifteen years. By 1920, if things remain in a normal condition and the peace of the world is assured, the annual consumption of cotton should be equal to twenty-five millions of bales.

The thinking men of the South have long ago concluded that it was suicidal for the bulk of this crop to leave our shores in its crude condition. The markets of the world are open to us, and manufactures should increase in the South more rapidly than in any other section of the world.

OUR GREAT ALIEN INVASION.

Its Regulation, Distribution and Evangelization Measures of High Interest and Duty.

(By John Willis Baer, Assistant Secretary Presbyterian Board of Home Missions, in the *Christian Herald*.)

"Breathes there a man with soul so dead,
Who never to himself hath said:
This is my own, my native land?"

THERE may have been a time when men who could not give a hearty "Amen" to that sentiment were called men "without a country." If ever true in its full meaning, and I doubt it, it is not true to-day. Let me remind you that there are loyal and royal citizens of the United States who gladly give full allegiance to the Stars and Stripes, who are not "to the hanner born." America is not their native land; it is the land of their adoption.

Let us together look into this subject of Emigration and Immigration. It is now an international problem. That man who views the situation from an exclusively national aspect needs to broaden his horizon. Don't you remember the old truth familiar to our boyhood days—"What goes up must come down, upon the head or the ground"? By the same natural law the tide of migration must find its level. The tide goes up in one place, it goes down in another. I believe that nationally we are too selfishly concerned about what comes upon our head and upon our ground. We give too little constructive thought to the other fellow's head, and the other fellow's ground.

Let me at the beginning declare my position on Immigration from our own national standpoint. I am with President Roosevelt, who said in one of his messages to Congress: "We can not have too much immigration of the right kind, and we want none of the wrong kind." I had occasion to write that sentence in a letter recently to Mr. Jacob A. Riis, and in reply by letter, among other things, he said:

I agree with you thoroughly, and further, the "wrong kind" of immigration is in my mind easily identified with the kind that wants to do wrong, not with any class or race. I know no better material for the true American than the one who came from abroad, but with appreciation of what freedom may be made to mean for the race.

Jacob A. Riis is such a one, and Jacob A. Riis is right. Now go back in our thoughts to this great restless force moving upon the map of the world. Let us consider some facts, some figures, some fears.

Whelpley, in his new book just from the press, *The Problem of Immigration*, says:

Like a mighty stream it finds its source in a hundred rivulets largely in Northern, Southern, and Eastern Europe. It's an army moving at the rate of nearly two millions each year, and is invading the civilized world. Its tongue is polyglot; in dress all climes, from pole to equator, are indicated; all religions and beliefs enlist. There is no age limit; young and old alike travel side by side. There is no sex limitation, for the women are as keen, if not more so than the men. The army carries its equipment on its back. Throughout Europe the word America is synonymous in all classes with freedom, prosperity, and happiness. The desire to reach America is the first sign of awakened ambition; the first signal of revolt against harsh environment; the dream of age and youth alike.

Gaining in volume and momentum each year, without apparent regard for the law of supply and demand, the pressure of this army has already made itself felt upon communities in which it finds its destination. The cry of protest has gone up from those who find themselves crowded from their occupations and their homes by the new arrivals, and the peoples are asking also, What steps are to be taken to check this alien invasion?

Personally, I should be glad to see this whole question taken up seriously and constructively by the governments of the world. Would that President Roosevelt, the great international policeman and peace-compelling executive, might take the initiative in calling together such an international conference.

A writer in the *Fortnightly Review* has suggested some such programme as this for such a conference. Give it careful thought:

First, To encourage a high moral, physical, political, and educational standard of admission into any country.

Second, To guard against the spread of disease from one country to another.

Third, To check undue activity on the part of transportation agents.

Fourth, To maintain a world-wide system of police identification and restraint of criminals.

Fifth, To persuade each nation to live up to its full responsibilities in the care of its dependents.

Sixth, To induce the amelioration of political or economic wrongs in given areas. Such influences are driving people from one country to another to the discomfort of the latter.

By all means let us have such a conference. This great question of migration is viewed by some with too much alarm, when they consider it purely from a selfish and national standpoint. It demands "team work" by the nations of the world. The people of the United States gladly welcome the choice of Europe; Europe desires to retain its worthy sons. Europe, however, is willing to miss from among its numbers its undesirable citizens. The United States very properly objects to receiving them, and vice versa. At present it is a great game of chance—a game of give and take. Many of the world's governments are aroused—some are passing laws restricting immigration, others making laws restraining emigration.

Now for some figures. This ever restless moving from one land to another; this apparent all too easy snapping of national ties—let us view it from our own shores. The United States received during the fiscal year ending June, 1904, a total of 812,870 aliens, 30,000 of these came to us through Canadian ports—a decrease of 80,600 over 1903, which was the year registering the largest number of immigrants ever received into our country. You ask very naturally, "From whence did these aliens come?" Let me quote from the government's official report as follows:

A striking and significant feature of these figures is that the chief diminution in immigration for the year was shown in the arrivals from Austria-Hungary amounting to 28,855, and from Italy to 37,326. These two countries aggregating 66,181, or twenty odd thousand more than the total net decrease of the fiscal year, 1904. The countries of Northern and Western Europe, with one notable exception, show increases, Great Britain's increase being 18,643. The one exception to the foregoing statement is shown by the decrease of 18,265 in the arrivals from Sweden.

It appears that during the year there arrived 549,100 males and 263,770 females, an increase in the females as compared with last year of 19,870, and a decrease in the males of 64,046. As respects age, 109,150 were under 14 years; 657,155 were between 14 and 45, and 46,565 were 45 or over. 3,953 could read but not write; 168,903 could neither read nor write. It

is presumed the remainder, 640,014, could both read and write. It also appears that 103,750 of these aliens had already been to this country. That 95,575 brought with them fifty dollars or more each, while 501,530 brought each less than fifty dollars. The total amount of money shown to officers by these 812,000 aliens was \$20,894,383, or \$4,776,870 more than was brought by the 857,000 of the year before. This fact, taken in connection with the circumstance already referred to as to countries from which the increase of the year under consideration came, furnishes assurance of a marked improvement in the character and thrift of the more recent immigration. The 28,451 English immigrants brought with them, in 1903, \$1,405,000. This year the 41,479 of the same race brought \$2,736,000. The 35,366 Irish had \$796,000, while the 37,000 Irish this year showed \$1,920,000. 71,700 German immigrants last year had \$2,480,000, this year, 74,790 possessed in hand \$3,622,000.

It is further shown that there were excluded at the seaports of the United States during the year a total of 7,994, indicated as follows:

Idiots	16	Women for immoral purposes	9
Insane	33	Assisted aliens	38
Paupers	4,798	Contract laborers	1,501
Diseased persons	1,560	Anarchists	1
Convicts	35	Procurers	3

While considering our own national immigration statistics, let us have in mind the movement to and from Canada. Keep in mind, too, that Canada has more land than the United States, though we still have millions of acres to be occupied by the immigrant after irrigation has done its necessary work of transforming the desert into a garden. Canada now has a population of about six millions, and more than three millions and a half square miles of area. Canada has more area than the United States, but we have a population of more than eighty millions. I am informed from good authority that the emigration from Canada during the last one hundred years or less has been one million. Her immigration last year was 100,000, fully half of it going across the imaginary line from the United States. Seventy-five per cent. of her total immigration is from the agricultural classes of foreign countries.

Now, what are the real reasons for this great movement of peoples from our shores to North America? The reasons are very well stated by Whelpley, to whom I have already referred.

Leaving out of consideration the movement of all undesirable people, such as criminals and paupers, Whelpley refers to four distinct causes of migration.

First, the natural cause which arises from the restlessness and ambition of youth and middle age, apparent in all peoples. As a rule, these people make acceptable citizens.

Second, the economic wrongs that are causing the exodus from Italy, and in a less degree from Austria-Hungary. Sicily is practically depopulated. From some of the Italian villages over eighty per cent. of the people have come to the United States, to escape what really amounts to slavery and mental and bodily starvation.

Third, the political cause is best illustrated in the case of the Hebrews of Russia (permit me to say, however, that we can afford to drop the curtain over Russia at this time. It's as bad to hit a nation as it is to hit a man, when that nation is down.)

Fourth, the artificial cause is the abnormal activity of Transportation Companies to secure business.

Now, for some fears viewed also from our own national standpoint. I prefer to state them in the language of Commissioner Sargent. He says:

It is impossible for any but the most recklessly and foolishly optimistic to view the situation without realizing very seriously its bearing upon our well being. It is not alone that virtually nearly a million aliens have been added to our population within the short space of one year. I think that fact is one of large dimensions. All the constituent elements of this great army of invasion are to be considered—their individuality, character, and capacity for useful work, their respect for law and order and their ability to stand the strain, moral, physical, and mental, of the life of their new surroundings. In other words, the power to assimilate with people of this country, and thus become a source of strength for the support of American institutions and civilization, instead of a danger in periods of strain and trial. To doubt that they possess such ability is to discredit unvarying human experiences. The problem presented, therefore, to enlighten intelligence for solution is, how may the possibility—nay, probability—of danger from an enormous and miscellaneous influx of aliens be converted by a wise provision and provision into a power of stability and security?

Now for some remedies, to be summed up in two good words, distribution and evangelization.

First.—As to the practical question of distribution, take in the words of an expert. "These congested alien centers within our cities and States become a menace to physical, social, moral, and political security." As Commissioner Sargent has said, "These colonies become hotbeds for the propagation and growth of those false ideas of political and personal freedom whose germs have been vitalized by ages of oppression under unequal and partial laws, which find their first concrete expression in resistance to constituted authority, even the occasional assassination of lawful agents of that authority. Above all, they are congested places in the industrial body which check the free circulation of labor to those parts where it is most needed, and where it can be most benefited. Do away with them, and the greatest peril of immigration will be removed."

The problem of the distribution of immigration must be carefully thought out. Commissioner Sargent suggests that the government establish a Bureau of Information. A splendid suggestion, when we take into consideration that thirty-two per cent. of the immigrants remain in New York. This problem of distribution is not, however, to be easily settled at the seaport where the immigrant lands. It must be handled at the point of his debarcation. Thus, again, I believe I am proving that the whole general question is one of international importance, and demands

most careful consideration by accredited representatives from various governments.

The question of evangelization, thank God, is now being taken up by many of the evangelical denominations and societies having headquarters in our own land. We must keep in mind, however, the fact that a very large proportion of this alien population, whatever their life may have been politically or socially, as compared with our own, is composed of loyal adherents of Christianity as expressed in various forms. The steerage of many a ship contains devout Christian men and women, loyal to the work of God, whose motive power is swayed by the deep fundamental truths of Christianity. My heart often burns with indignation when many a speaker unconsciously, in his appeal, which often seems self-righteous eloquence, urges that the Gospel of Christ be carried to these immigrants as they come to us, assuming that they are pagan, and that Christianity is unknown to them. We must give the Gospel to those who do not have it, and we must surround with proper influences those who have already espoused it in their home lands, and thus strengthen and deepen their faith.

Unless the question is thoughtfully considered and the problem solved, the alien invasion into this country of ours "may be the rift within the lute which, slowly widening, will make the American music mute." Instead, however, of placing undue emphasis on the menace of this invasion, I consider it a mission, not only for the loyal disciple of Christianity,

WILLIAM S. WAUDBY,
Special Agent U. S. Bureau of Labor.

but a mission for every loyal American. We must Americanize the immigrant, or he may Europeanize us. We must lift him up, or he may pull us down.

SHALL THE UNITED STATES SUSPEND IMMIGRATION?

(By William S. Waudby, Special Agent U. S. Bureau of Labor.)

Nearly two-thirds of the entire immigration of the world is directed to the United States!

The invasion and successful capture of the United States has been accomplished. None of the horrors of war were visible, and we provided the means of transporting the millions of invaders to our hospitable shores during the past decades. These invaders are very skillfully disguised under the form of "immigrants," and the railroad and steamship companies make a profit of \$50,000,000 per annum in landing them.

Financial and industrial depressions in Europe, and prosperity in the United States, increases year by year the number of these invaders.

"Restriction" has been tried for twenty years, and still the immigration increases year by year, until it has arrived at that period in the country's history when it becomes not a question of "restriction" that confronts this nation, but the question of exclusion (for a term of years at least) of these immigrants. It is now the question of self-preservation.

The influence of immigration upon wages is large and complex, and there is no doubt at all that wages have fallen since the great tide of immigration set in; the only thing that has acted as a counterbalance being the solidarity of the labor organizations in resisting wholesale reductions in wage rates. Immigrants do make, and have made, first-class trades unionists, but in too many instances these migratory personages have been brought into the country for the purpose of taking the places of native labor, and are without trades union affiliations.

The first immigration law was passed by Congress in 1864, and was for the purpose of encouraging immigration—being entitled "An Act to Encourage Immi-

gration." This act was repealed in 1868. From that time until 1882 (August 3) there was no statute bearing upon immigration.

After much discussion and agitation upon the part of the labor organizations then in existence, the local Federation of Labor of the District of Columbia (Washington City) succeeded in having a bill passed by Congress, which took effect February 26, 1885, and was the first step taken for protection against the "pauper labor" of Europe, and was known generally as the law "to prevent the importation of foreign labor under contract to perform labor or service of any kind in the United States."

Under this law it has been almost impossible to apprehend contract laborers in the casual examination to which they are subjected at the various ports of entry—and they are only arrested after they are actually engaged in the labor for which they have contracted to perform. The law has never been sufficient to accomplish the object of its enactment.

The United States has full power to exclude aliens altogether, as the Supreme Court has decided that question beyond all controversy. In May, 1895, Justice Harlan delivered this opinion of the Court: "The power of Congress to exclude aliens altogether from the United States, or to prescribe the terms and conditions upon which they may come to this country, and to have its declared policy in that regard enforced exclusively through executive officers, without judicial intervention, is settled by our previous adjudications."

Each of the leading steamship lines has several thousand agents engaged in working up immigration traffic.

In one of the Senate committee investigations it was shown that the Italian bankers of New York City send to Italy in an average year from \$25,000,000 to \$30,000,000. This is a permanent injury to the labor and capital of the United States surely.

The Italians were the first to be exploited by the "padrone system"—now all nationalities are fair spoils: employment agencies (?) now take the place of the padrone in the large cities. It is possible for a contractor to secure any number of Italians or other laborers, at short notice, at about one-half the wages of the American standard, for sewer, railroad, mining, clothing trades, etc. Thus native labor suffers many hardships by this displacement. This system exists among the Poles, Hungarians, Greeks, Armenians, Russian Jews, and others. Many Armenians and Greeks are employed in the cotton mills of New England, especially in Massachusetts, having been brought in to break strikes and to reduce wages.

The immigration question is a national one.

"Immigration" is an economic as well as a political question.

In one day in May (the 8th) ten steamship companies landed 12,039 immigrants at Ellis Island. Never before have so many steerage passengers come into this port. During the month of March, 1904, the total number of immigrants was 78,225—or an average per day of 2,523. For the month of March, 1905, the number was increased to 126,932—or an average daily number of 4,094.

Where do they all find work? The labor market can not expand rapidly enough to provide for all of these new arrivals, so that the labor already here must either be displaced or compete with this daily influx and at pauper labor rates.

The monthly statements issued by the Bureau of Immigration are well worth the careful study of every class of our citizen voters, and especially that of every workingman. The statistics therein are clearly set forth as to the nationalities represented, and it is readily observable how few are the English-speaking arrivals. These reports also indicate the occupations and probable destination of the immigrants, and give a mass of information that is of great value to the student, as well as to the investigator after knowledge.

In the March (1905) report of this bureau, out of 126,932 arrivals for the month, there were 97,786 from Austria-Hungary, Italy, and the Russian Empire alone. Norway, Sweden, and Denmark threw in 7,334, with 1,433 from Finland as good measure. Greece contributed 349, and Bulgaria, Serbia, and Montenegro's quota was 295. Should the March average hold out we will have a record for 1905 of a million and one-half immigrants, or double that of the highest period (1903), with its score of 857,046 arrivals.

By decades the problem stands as follows:

1820-1830	128,392
1830-1840	539,351
1840-1850	1,423,337
1850-1860	2,799,423
1860-1870	1,964,061
1870-1880	2,834,040
1880-1890	5,246,613
1890-1900	3,694,298
1900-1904	3,255,149

It will be noticed that in the first half of the last decade the immigration nearly approaches that of the entire 1890-1900 decade.

At a recent meeting of the patrons and members of the Home for Aged and Infirm Hebrews, New York City, Edward Lauterbach made the statement that 90,000 Russian Jews were preparing to emigrate to the United States, "turning their backs on tyranny and persecution, and coming to the land of freedom and liberty. The time is coming, and you engaged in charity work necessarily must face it, when the care of

thousands of your Russian brethren will be in your keeping."

Is it not time for the nation to take serious thought over this vital matter? Why waste so much time over trifles like "tainted money" or "frenzied finance," when questions like this immigration problem confront us?

AN INTERNATIONAL CONFERENCE.

Departures and Arrivals Should be Regulated by Countries of Origin and Destination.

(By Gino C. Speranza, Lecturer on Italian Immigration.)

IT has been justly said that the United States immigration law is "the most far-reaching measure of its kind in force in any country," and a most competent foreign observer has recently declared that "it is thoroughly and intelligently enforced."

Why then, despite such severe statutory provisions and their strict enforcement, do our immigration laws fall short of their purpose and leave much to be desired? The answer seems simple enough, yet it appears to have escaped many of our sociologists and legislators. *Our immigration laws fall short of their purpose because they seek to control by national means such a movement of population as can be disciplined only by international action.*

It has been generally recognized that the *source of supply* is the strategic point for the control of immigration; yet we have centered our efforts in pushing back the migratory tide *after* it reaches our shores; in other words, after it has reached this point where it is hardest to check it, and where, at times, we must resort to methods savoring of cruelty in order to enforce the letter of the law.

But it will be argued that our laws can have no extra-territorial application; that we can not legislate for people not subjects of our government and outside of our jurisdiction. This is true, as far as it goes. But to-day the old international demarcations are becoming obliterated. Commercial interests and improved methods of transportation and communication are not only drawing countries into a closer community of interests, but increasing the causes and occasions for international action. Shipping has been, from ancient times, regulated by international agreement. The apprehension of fugitives from justice has necessarily been the subject for international conventions or treaties. To-day international cooperation is resorted to not only where commercial interests are involved, such as posts, telegraphs and patents, but in the interest of health, such as quarantine regulations and the enforcement of laws against the adulteration of certain food stuffs.

Why, then, recognizing that the problem of the immigrant is an international one, and having many striking precedents for joint action among different countries, have we made little, if any, attempt to reach some international agreement?

I say it with the utmost respect, but with no less serious conviction, that it is because we have allowed certain preconceived notions and prejudices to blind our judgment and our powers of observation. We have allowed the notion to gain currency that foreign governments were using our land as a dumping ground for the worst elements of their population, and that they were, directly or indirectly, encouraging such noisome exodus for their benefit and to our detriment. With such notion firmly established in the popular mind, we approached the problem of the immigrant in a spirit, if not of prejudice, certainly of narrowness. Our legislators sought legislative measures which savored more of *defense* against an invading horde than of adjustment of what is, in its essentials, a natural phenomenon; so, likewise, our officials enforced those provisions more in a spirit of suspicion against probable evaders of our statutes than as impartial magistrates.

This is not said in a spirit of criticism. It is set forth rather as showing one of the causes that have prevented international action. For, obviously, if we think, for instance, that Austro-Hungary or Italy is dumping her refuse here, how can we even propose that those countries agree to certain regulations to be mutually enforced? So we send Secret Service men to spy on officials of friendly Powers to get at their "plots" for exporting their *Mafiosi* and their incapables, instead of sending or inviting delegates in an open, frank, businesslike manner *as we should do if we wished to arrange about our postal rates, or the protection of our trade marks.*

I plead in all earnestness for a juster attitude, and one more in harmony with the facts, toward the problem of the immigrant, as only thus can we pave the way for that international action which alone can be effective in the solution of such a problem. More in harmony with the facts I say, for we must free ourselves of the idea that the problem of the immigrant is a problem only for us, and not for the country of the immigrant's origin. We must recognize the fact that any large movement of population, such as that represented by the annual flow of aliens to our shores, is not, and can not be, looked upon with pleasure, still less encouraged by the countries of origin. Italy, for

instance, can not well afford, in the long run, to lose thousands of her able-bodied sons every year. Sicilian wheat fields are becoming pasture land from lack of hands to till them; the old men left at home can not take care of the farms. Italy needs strong men in her factories, in her fields, and for her army.

Looking upon the problem in this light, What are the chances for international action?

I can only speak as regards Italy, and yet the example of Italy may be most instructive. Even to-day the Italian government allows American medical examiners at Italian ports of departure. This of itself is some evidence against the popular belief that that country seeks to evade our laws on immigration. Her Emigration Department, about which so little is known here, exercises a positive check rather than an encouragement to emigration. The Italian emigration law has been called the finest example of modern social legislation, and if it were better known here many popular ideas regarding governmental encouragement to emigration would be quickly disposed of. Official documents are on record showing a serious desire on the part of the Italian government to have our immigration laws respected. The annual reports of its emigration department, and its official instructions to the mayors of Italian cities, might be cited. A circular of the Minister of Foreign Affairs, issued last April at Rome, reaffirms an earlier provision that no passport be issued to an intending emigrant who would be excluded by the laws of the country to which he intends going. "It is in the public interest," reads the circular, "that a

GINO C. SPERANZA.
Lectures on Italian Immigration.

migratory current should not be tainted by elements considered undesirable by the country of destination." The last annual report of the Italian Emigration Department makes a strong appeal to Italian emigrants against crowding in American cities, and urges their settling in agricultural States. Recently, while in Italy, I had many interviews with political men and leaders of thought, such as journalists, writers, professors, and magistrates. Their opinion was practically unanimous that Italy would consent to cooperate with us in the regulation of her emigration, provided the subject were approached in the proper way.

In that last statement lies, in my opinion, the secret of successful international action. If we approach a foreign government in a spirit of suspicion, treating it as an inferior who is trying to evade our laws or as a poor cousin who wants to burden us with its numerous and incapable children, our endeavors are foredoomed to failure.

But let us call an international conference as between political equals, inviting delegates and asking for suggestions and frank discussion; let us bring together men really cognizant with existing conditions and laws, instead of relying on peripatetic observers who give us picturesque but superficial observations, and we can be tolerably sure of achieving some substantial results regarding the regulation of immigration.

In conclusion I would suggest:

First—That foreign legislation regarding emigration, and its enforcement, be more carefully studied with a view to reaching a juster idea of the attitude of foreign countries toward emigration, its regulation, and control.

Second—That an international conference on immigration be called by our government, to which delegates from every European country be invited to discuss international regulations of the movement of population between different countries.

Third—That, in the meanwhile, as regards Italy, closer direct relations be established between our immigration department and the Italian emigration department, looking especially to the possibility of a rational distribution of Italian immigration.

As regards this last suggestion, the Italian government is officially on record as desirous of cooperating with Commissioner General Frank S. Sargent in his plans to induce Italians to settle in our Southern States, where there is a great demand for farm hands. This would be an excellent beginning in that cooperation which would result in benefit both to ourselves and to the strangers within our gates.

CHINESE BOYCOTTS AND EXCLUSION.

An Historical Review of our Legislation against Asiatic Immigration.

(By Earle Ashley Walcott, in *Collier's Weekly*.)

ON both sides of the Pacific there appears to have arisen an organized attempt to break down the exclusion policy that shuts out the Chinese from free admission to the United States.

"Boycott American goods," or the Chinese equivalent, has been raised as the war-cry of China's commercial leaders, if we may believe the despatches from China, and under official encouragement has united the dealers and consumers in a non-importation league for the punishment of America. Even the Chinese Chamber of Commerce of Manila passed the boycott resolution, but on second thoughts rescinded it. The reason for this attempt to cut off America's growing trade in the Orient is said to be the indignation roused by the American policy of excluding certain classes of Chinese.

Simultaneously with the boycott agitation in China, a chorus of complaints has been raised in the American press against the harshness with which the exclusion laws are administered. The examination of merchants, students, and travelers of Chinese birth has been criticised as on a level with the examination of a suspected criminal seeking to enter the country. The case of a Chinese, claiming to have been born in this country, denied admission by the immigration bureau, and refused relief by the Supreme Court of the United States as a matter outside its jurisdiction, has also been used to excite sympathy for the excluded Chinese and to cast discredit upon the exclusion policy.

The demand for the exclusion of the Chinese took its rise in the hard times that followed the panic of 1873. There had been sporadic agitations before, but they had no force. With the hard times, employment became scarce and business suffered. The pinch came, as usual, hardest on the laboring man. He looked about him for a cause of his troubles, and saw the Chinese, employed, prosperous, growing in numbers. Every steamer from the Orient brought a thousand or more immigrants from China. In 1872, 10,642 came; in 1873, 18,154; in 1874, 16,651; in 1875, 19,033; in 1876, 16,879. These added to a city whose population was less than 200,000, and to a State whose population was less than 800,000, produced industrial disturbance. Chinatown grew and prospered while the white men were in distress, because the Chinaman could live and thrive on wages that would not support a white man.

The workmen of California, having decided upon the cause of their woes, promptly organized to demand the exclusion of their competitors. They made such a noise about it that Congress sent out investigating committees, who took much testimony that is buried in the cellars of the Capitol. The committees found that the Chinese roused hostility by both their virtues and their vices—the virtues being a little ahead in the competition.

The testimony of both friends and foes of the Chinese justified the following conclusions: The Chinaman is of extraordinary industry, docile, faithful to a bargain, not addicted to intoxicating liquors. He worked for low wages, lived in quarters that a white man could not occupy, was content with a little boiled rice and a cup of tea when he could get nothing better, and was able to master any industry known to the white man. Hence the Chinaman was employed while the white man was left idle.

Possibly the difficulties of the white laboring man under Chinese competition would have excited but indifferent sympathy had it not developed that the competition of the Chinese against the American employer was quite as keen and successful as that against the American workman. The American shoe manufacturer, for instance, who filled his factory with Chinese workmen to cut down the wage bill, presently found that a Chinese manufacturer had learned the business from him and was running a plant on a closer margin than he himself could afford. Having taught the business to the Chinese, a Chinese capitalist, with Chinese foremen, Chinese laborers, and a Chinese office force, was underselling him in his own market. The same was found to be the case in a number of other lines—notably ready-made clothing and cigar making, which were largely controlled by Chinese. It was evident that under the operation of the natural laws of trade a large part of the manufacturing and commercial business of the city would eventually pass to the yellow man as the one best fitted to survive in the struggle for existence. There-

fore employers as well as employed became vigorous opponents of Chinese immigration.

Besides economic objections there were others. The large Chinese population of the Pacific Slope was formed almost exclusively of young men; and these men, removed from the influence of home ties and traditional public sentiment, developed a combination of Oriental and Western vices demoralizing to the communities about them. The importation of women for immoral purposes early became a recognized traffic that forty years of vigorous effort on the part of the officers of the law has scarce sufficed to stamp out. Gambling and opium-smoking are ineradicable vices of the race, and they have introduced the opium habit among the white people with lamentable results. Blackmail and murder are a recognized business in Chinatown. Large organizations live by collecting money from merchants, gambling houses, and haunts of vice. They enforce their contributions by the knife, the hatchet, and the revolver. Private disputes are also settled by murder, the Highbinders, so-called, attending to the business for a cash payment. The price for killing a man runs from \$50 to \$2,500, according to his social or business position. These crimes have the saving grace that they are committed by Chinese upon Chinese for Chinese. It is rare for them to attack a white person. But within their own quarters they have a large number of bold and desperate criminals, requiring an extraordinary police service to maintain order.

Thus, from all causes, the friends of the open door policy in California were reduced in numbers to those inspired by the duty of saving the Chinaman's soul, and the large landholders who found Chinese labor, which could be hired in gangs for a few months in the year and turned off to shift for itself for the rest of the time, the only labor that could make the great ranches profitable. So when it was put to a vote in California, in 1879, only 883 voted for Chinese immigration, while 154,638 voted against it.

All these matters were laid before Congress, and Congress sympathized. Impressed by the deadly earnestness of the Pacific Slope, the legislative body became dimly conscious that there was a real danger to white supremacy in the outposts of our own land. So in 1878 both Houses passed the Fifteen Passenger bill, limiting the number of Chinese that could be brought by any one vessel to fifteen. President Hayes vetoed it, and advised a treaty with China as the first step in restricting immigration.

In 1880, James B. Angell, John F. Swift, and William H. Trescott were sent to China and negotiated a treaty agreeing that the United States might limit or suspend the coming of Chinese, but might not prohibit it.

Then in 1882 Congress passed a bill suspending the coming of the Chinese for twenty years. President Arthur vetoed it on the ground that the twenty-year limit was prohibition, not suspension. Congress cut down the limit to ten years, and Arthur signed the bill. The act forbade Chinese to enter after ninety days from the passage of the act, but permitted the Chinese in America to re-enter the country after returning to China. They were required merely to take out return certificates on leaving the United States, and present them on re-entering.

The act came up against a hostile court and was punched as full of holes as a sieve. It was held that the act applied to those who left the country between the adoption of the treaty of 1880 and the ninety days after the passage of the act, when it went into effect; and as it was impossible for these to have obtained return certificates, they should be permitted to enter upon parol evidence of prior residence. Court procedure became wonderfully simplified. Chinese seeking to enter the country without certificates were denied landing by the customs officers. A writ of habeas corpus was thereupon issued by the Federal Court, returnable before a court commissioner. The Chinese were thereupon landed, taken before the commissioner in express wagons without guard. A few questions were asked as to the geography of San Francisco and the time they had lived here. The coaching was not very good, and the answers were often ridiculous, but the commissioner usually reported to the court that they were prior residents. The District-Attorney would protest, and the court would sign an order turning them loose. Under this procedure 8,031 were admitted in 1883. It was a source of bubbling indignation to San Francisco. The press roared. The United States District-Attorney said to me one day with tears of anger in his eyes: "Every day I go to the limits of contempt of court, but nothing I can say will move those men to enforce the law." The three judges were kept busy ordering discharges under habeas corpus writs.

The protest reached Congress, and in 1884 the law was amended to make the return certificate "the sole evidence" on which a Chinese laborer could establish his right to land. The Federal Courts paid no attention to this enactment. The act by its terms admitted the right of all who had left after the ratification of the treaty of 1880 to return, and the judges held that the provision that the certificate should be the only evidence to entitle laborers to land did not apply to

those who left before certificates were issued. Therefore they continued to hear parol evidence, and to land Chinese on testimony that was for the most part flat perjury.

But the perjury of the bogus "prior resident" was not the only ground of complaint. It soon became evident that the certificate business itself was being overdone. Investigation showed that certificates were articles of merchandise. Every Chinese who left America took out an authorization to return, and promptly sold it to some one who wanted to cross the water to make his fortune. Brokers bought up certificates, schools were maintained in Hong Kong and even on shipboard to teach the Chinese immigrant to answer the few questions that were asked by the customs officers. Then a "ring" was uncovered in the custom house itself that had been issuing forged certificates by the thousand, and selling them to the Chinese brokers. Some of the gang were sent to prison. The others fled. With "prior residents," forged certificates, and other devices for evading the law, coolie immigration grew rapidly—7,704 in 1885-86, 11,162 in 1886-87, 12,816 in 1887-88.

The indignation roused by these exposures brought the passage of the Scott act of 1888. The circumstances were these: In March, 1888, the Senate requested the President to negotiate a treaty with China, providing that no Chinese laborer should thereafter enter the United States. The treaty was negotiated through the Chinese Minister and sent to the Senate on the 17th of March. The Senate added a provision that Chinese laborers who had left this country and had not then returned should not be permitted to return, even though they held return certificates. The treaty was sent to China for ratification, and on the report that it had been rejected by China a bill carrying out substantially the same provisions was brought into the House on September 3, passed at once without division, and sent to the Senate, passed by that body on September 7, and was signed by the President when official confirmation of the rejection of the treaty was received.

This measure cut off all the frauds of the "prior resident" testimony, the sale of certificates, and the forgery of certificates. The pleas under which a laborer could make his way into the country by sufficient perjury were reduced to two—the first being to swear that he was a "native born," who, under the court rulings, could establish his birth in San Francisco by parol evidence and enter as an American citizen, and the second was to play successfully the part of a merchant. Some hundreds dribbled in by these chinks in the exclusion wall.

Then in 1892 the whole subject was opened afresh. The Restriction Act of 1882, on which all subsequent legislation hung, expired by limitation in May of that year, and fresh legislation was sought. The famous Geary Act was framed by a Congressman from California, and in modified form was accepted by the Senate. It continued all former legislation for another period of ten years, made illegal entry into the United States a crime punishable by imprisonment and deportation, ordered all Chinese lawfully within the United States to take out certificates of identification, and made failure to produce such certificate a cause for deportation. The intent of these severe provisions was to make it easy to identify the smuggled Chinese who were drifting across the northern and southern borders in large numbers, lack of a certificate being presumptive evidence of unlawful entry into the country. Bail was by this act forbidden in habeas corpus cases. Congress modified the act in 1893 to permit the Chinese to comply more readily with the provisions for registration, and to strengthen the administrative features of the act.

This legislation ended most of the abuses against which the upholders of the exclusion law had contended. By the successive acts the handling of the Chinese seeking admission had become committed almost exclusively to administrative officers. The grounds on which a landing could be sought by the habeas corpus route had been so cut away by the successive enactments that the courts found little opportunity to interfere.

China, however, was not satisfied with this final legislation, and in 1894 sought a modification of the restrictions that had been thrown about the movements of her subjects. A treaty was framed permitting a Chinese having wife, child, or parent in the United States, or owning property to the amount of \$1,000, or having solvent credits to the same amount, to take out a certificate, giving him the privilege of return within one year after leaving the United States. This treaty was made for the period of ten years, and at the end of that time China signified her wish to abrogate it.

In 1902 the Geary Act expired by limitation, and was re-enacted with a few additional provisions to strengthen its administrative features. It extended the restrictions of the law to the island possessions of the United States, required the Chinese in the Philippines to register, and provided that the island Chinese should not be permitted to come to the mainland. Then, in 1904, when China denounced the treaty, it became necessary to re-enact all prior legislation,

and this was done without change. Here the legislative history ends, with China seeking a new treaty that shall reopen the doors to her people.

If the Chinese stand firm in their reported resolve to forego the advantage of buying the goods they want in the cheapest market, and shall decline to sell their products to Americans, no part of the United States will regret their policy more than the Pacific Slope. We are counting on the development of Oriental commerce as one of the chief elements in the future growth of our cities and the establishment of our manufactures. But if we must choose between the loss of this valuable trade and the surrender of white to yellow civilization in the Western seaboard States, we will relinquish the trade rather than sacrifice the ultimate interests of our land and our race.

THE IMMIGRATION PROBLEM IS SERIOUS.

But Serious for the Foreign Countries, Not for Us.

(Editorial in New York Evening Journal, June 8.)

Small-sized Americans, so much excited about the arrival of immigrants in this country, would be enlightened if they knew the attitude of the foreign countries toward emigration to America.

Every one of the foreign countries is doing its best to PREVENT such emigration.

Years ago, in South Germany, the newspapers printed dark and gloomy warnings, inspired by the government and intended to frighten the peasants.

These warnings told how emigrants to America were lured into barber shops here and had their throats cut—the chair and the murdered one subsequently sinking through the floor. Much ingenuity was used to convince the would-be emigrant that a trip to America was suicide.

In Spain, whence emigration has increased very rapidly, the newspapers and the government are much disturbed and are making every effort to keep the population from moving to America.

A similar crusade is made in Hungary, in Austria—in fact, everywhere throughout Europe.

The European nations, who lose the citizens that come here, are well aware that EMIGRANTS TO AMERICA ARE AMONG THE BEST CITIZENS OF THE VARIOUS COUNTRIES.

The emigrant has imagination, enterprise, and will power—otherwise he could not make up his mind to tear up his home, however humble, and move to an unknown country.

It is the character of the immigrants who reach this shore that has made the character of the American people.

If we are a nation of inventors, a nation of nervous activity, working on new lines—IT IS BECAUSE THE OLD COUNTRIES HAVE SENT THOSE QUALITIES TO US, giving us the best of their citizenship.

The Americans that oppose immigration are narrow-minded and ill-informed. It is proper to keep out professional criminals, diseased classes and idiots, since selfishness is the first law of "civilization."

But practically the entire body of immigrants add to the wealth of the country, the wealth of everybody in it.

We have untold millions of acres of land uncultivated. We need people to cultivate them.

All the people of the United States could live in comfort in the single State of Texas—and there would be room and food there for eighty millions more, even under our inferior processes of agriculture.

The United States needs a thousand millions of inhabitants. It needs more HUMAN BEINGS, as a great farm of the West needs horses and agricultural implements.

The country is lucky in having the enterprise, courage and manhood of the Old World to draw upon.

Remember that we get from Europe not only some of our best workers, some of our men of strongest ideas and personality, but also men BEST FITTED TO LIVE IN A REPUBLIC AND MAINTAIN A REPUBLIC.

Europe sends millions of men who know by experience what it is to live in a land where men are not free. These immigrants know by experience what the ballot means and what it should be worth.

Their influence is needed in a country where already republicanism is becoming a matter of course and the ballot more or less of a joke, a mere question of partisanship or financial advantage.

The European countries know that every immigrant arriving here is a loss to them and a gain for us. And we should be intelligent enough to realize that also.

But leaving out all question of gain, what right has the United States to act like a great international dog in the manger and presume to reserve this great section of the earth's surface for a small population, less than one-tenth of the number it can comfortably support?

LABOR AND THE ISTHMIAN CANAL.

(Concluded from page 8.)

President to discuss with him the possibility of Chinese reprisals or of possible Chinese animosity toward us, the danger to American manufactures and American commerce if this policy of ours of excluding Chinese labor is not changed in some way or other. I don't believe they mentioned the possibility of the repeal of the exclusion law, but it was openly hinted at in the newspaper interviews immediately following, and was so known to every observer.

We all know our very genial Ambassador from China to the United States, who returned to that country about a year ago, Mr. Wu Ting Fang. He was said to be very "charming" in his way in cajoling Americans, in telling them funny stories, and in trying to impress on the people of the United States that all the Chinese were of the mental caliber of the Ambassador. That Mr. Wu was a clever man, all the Americans who talked with him say. He judged the temper of some of our American methods at the first glance. And there is not a particle of doubt in my mind that this bright heathen Chinese, when he went back to China, carefully planned this scheme of a pretense to boycott American goods with the end to secure first, action such as is indicated by the issuance of the President's recent order, and second, to stimulate an agitation with the view of the repeal of the Chinese exclusion law.

In an address delivered recently by the Secretary of Commerce and Labor, he referred to an increase in the exportation of American manufactures and mechanical and agricultural implements to China of nine millions of dollars in the last year. I ask any candid man, with this fact in view, whether there is good ground, even taking the dollar as the only consideration, to change the policy of our country in regard to Chinese immigration and exclusion? There is not even that semblance of an excuse. I deny that this is sufficient ground, even if China should cut off every dollar of Chinese business. American manhood and American civilization are too dear to us, too sacred to us, even to take a chance at what Mongolian immigration into our country would mean.

You and I in New York can not tell what Chinese immigration is, in spite of the fact of Pell Street and that little district there. They say that comparisons are odious under any circumstances. It is impossible to make a comparison between Chinatown in New York and Chinatown in San Francisco. The Chinatown of New York and the Chinatown on the Pacific Coast stand in direct opposition to each other. Can you imagine for a whole mile around in the heart of the city, three stories underground, people living, living there the whole day and night, the whole night long, some of them never coming up to the surface at all? The entire place is unlike what we have here. Thousands are living there—not living, but existing. But even that could be endured if there were a possibility of their ever becoming Americanized. But to understand Chinese life and Chinese immigration, you have to understand this fact, that the Chinaman regards himself as possessing an entirely higher civilization than ours; that what we have is what they call barbarism, and our commercialism is entirely at variance with their considerations of human life. I shall not undertake to discuss whether ours is ideal or perfect. Every man agrees that it is not; but they think that their civilization is far above and beyond ours. I take it we don't want to become Chinaized, no matter how much more they may believe in their civilization than in ours.

The settled policy of the American people is that Chinese laborers, whether skilled or unskilled, must not come to the United States. Inasmuch as the Federal Government has by solemn treaty declared that the canal strip in the Isthmus of Panama belongs to the United States, the Chinaman must not come to Panama to build the canal. The danger of their coming by millions to the United States and undermining or overwhelming our civilization, not in my time—well, think what it means for others outside of you and me. We love our children; we love our country; we hope to perpetuate and improve this civilization which our forefathers have developed, and which we have brought to its present stage, and hope to make the conditions such that our children and our children's children shall make of this fair land of ours a haven for life and liberty and right and justice and humanity, which shall be manifest to every people everywhere.

The Executive Council of the American Federation of Labor has discussed this very question, and we have had several interviews with the Panama Canal and other Federal authorities. I want to say that you, of course, know—at any rate some of our enemies make it quite conspicuous—that I am a member of the Civic Federation. It is my pleasure to help in the suggestion of things that may be useful to the interests of labor. Those representing other interests have able men enough to look after their own interests. Whenever there is anything that can be said, or done, or suggested, in the interests of labor, that is my chance; and I have never permitted it to pass without taking advantage of it and turning it to the account of labor.

We all know that Brother Moffett is a splendid

fellows. We are all proud of his friendship, his sterling qualities, and character; and we all have the feeling that his appointment to visit the Canal district and make an investigation and suggest improvements will be productive of great good; will convey useful knowledge to laborers all over the United States, as well as to the workmen who shall go to Panama. We shall learn the truth from him. He will be helpful to us and to the Commission. He is going to tell them what he believes to be true, and he will have wonderful opportunities of observation. He goes with the good will of organized labor everywhere.

I may say that the appointment of Mr. Moffett and the appointment of Mr. Nazro is the result of an idea of the welfare of labor in industrial plants wherein we have been helped whenever that idea came to the front.

We want the Canal built and built well, under American conceptions of right, justice, and humanity. So that when completed without tears or wails it may stand as another perpetual monument to the skill, the genius of American science, American labor, American manhood and grit.

STATE MEDIATOR R. W. HAWTHORNE.

Robert W. Hawthorne, recently appointed the New York State Mediator of Industrial Disputes by Commissioner of Labor P. Tecumseh Sherman, is a native of New York City, where he has been actively employed

ROBERT W. HAWTHORNE,
N. Y. State Mediator of Industrial Disputes.

since leaving school. After valuable experience as Executive Secretary to Judge Greenbaum, he was for several years engaged in reporting important cases in the courts. Three years ago he became Assistant Secretary of the National Civic Federation and Secretary of the Conciliation Committee of the Civic Federation of New York. In those capacities he developed unusual tact and readiness in averting and settling disputes between labor and capital, participating in several important negotiations. Commissioner Sherman selected him for his present public position entirely because of these qualifications.

WELFARE WORK.

(Concluded from page 14.)

In the third grade dues of fifty cents entitle them to \$6.00 a week sick benefit and \$50.00 death benefit. All fines, the total never amounting to more than \$200 a year, are turned over to the Society.

The regular sick benefits are paid upon receipt of the attending doctor's certificate.

To all members living in Manhattan the services of a physician are free.

The physician employed by the Society devotes two hours daily to medical attendance of the employees in the store. He is provided with a well equipped office for immediate dispensary work. This is proving of great benefit. Prompt attention to illness in its first stage often prevents its serious development.

To any member in urgent need the president of the Society may give outright a sum not exceeding \$25.00. Thus everyone throughout the establishment knows that any honest case of genuine want can be immediately relieved without red tape or delay.

The Society loans to a member when pecuniarily embarrassed, temporarily, an amount not exceeding \$50.00. This loan, without interest, must be paid back in weekly instalments.

The benefits of the Mutual Aid Society extend, under its by-laws, only to members in good standing, but the Society administers the "Fannie Myers Fund,"

which is devoted to the assistance of the families of employees who are not members, and, therefore, are not entitled to aid from the Society. Its beneficiaries include ex-employees and members of the Society, who have received all the benefits to which the by-laws entitle them.

Thanksgiving Eve, every employee who desires it is presented by the Society with a fine turkey.

The restaurant for employees has ample space, air and light. Moderate prices are charged to enable the lowest as well as the highest paid employees to secure luncheon, and the restaurant is used each year by an increasing number. It is conducted at a loss to the firm.

An annual ball, with a special entertainment, is given by the Mutual Aid Society. This ball is one of the prominent features of the winter season, and is highly popular.

The junior help is not permitted to attend the annual ball. For the entertainment of the juniors and of their friends, the firm gives a May Party on Decoration Day. This party is in charge of about one hundred chaperons, women and men employees, selected because of their fitness. The young people who attended the last May Party consumed one thousand quarts of milk, five thousand sandwiches, four barrels of sweet crackers, and three hundred and fifty quarts of ice cream. To add to their enjoyment, there were distributed five hundred bean bags, two gross of rubber balls and two gross jumping ropes.

Women employees who have been with the firm for one year or longer are sent every summer for a week's vacation to a hotel at Far Rockaway, L. I. Sometimes in the case of girls of more delicate physique, this vacation is extended to two weeks. They are paid their full salary; receive their transportation to and from Far Rockaway, and their board is paid, while many amusements are provided free of expense. Among these is a weekly Tally-Ho ride through the beautiful surrounding country. The increasing popularity of these free vacations is shown by the fact that three hundred and fifty are listed for this year, while two hundred and fifty enjoyed the trip to the country last year.

The chaperons who gave up a day of rest and pleasure to attend and entertain the junior employees at the May Party on Decoration Day are remembered with a special outing on Labor Day. They are then the guests of the firm at Far Rockaway, where they are entertained at breakfast, dinner and luncheon and enjoy a ride in the Tally-Ho.

The term "Welfare Work," in the view of the firm, has proved most happy, in that it conveys no suggestion of charity. Many employees avail themselves of advantages offered who would never accept them in the form of personal charity, which was the only method of rendering benefit before the present system was organized.

"INTERCOLLEGIATE SOCIALIST SOCIETY."

(Concluded from page 11.)

persuade himself and his perturbed friends is a wholly innocuous form of mental culture. In its systematic treachery, the plan is in thorough accordance with the Socialist plot to scuttle the ship of organized labor by "boring from within." Socialist students are to be stimulated to "enter the people's universities" for spreading their propaganda in dark and devious ways that will "excite the least antagonism," just as Socialist workmen are urged to join the unions of their crafts, there to promote, in the phrase of one of Mr. Higginson's fellow-signers, their "insidious propaganda." Teachers are to imitate the example of Prof. Ferri, who does not "frighten" his listeners with frank, plain language; who does not whisper before timid youth the startling word "Socialism," but subtly instills into their ears all the poison of its creed of revolution.

We think that Mr. Higginson can no longer complain that the editor of *Harper's Weekly* overstated the case in saying that the Intercollegiate Socialist Society "aims to imbue the minds of the rising generation with Socialist doctrines."

Assuredly, Mr. Higginson can no longer plead ignorance of the facts as an excuse for his surprising association with an organization whose purposes and whose origin are utterly at variance with his distinguished record as an American soldier and patriot.

The Civic Federation of New England has issued a bulletin setting forth its scope and purposes. This association, although an independent body, is patterned after the National Civic Federation, and hope to be of assistance in settling industrial disputes in its particular locality. Frank K. Foster, of Boston, one of the International Typographical Union delegates to the American Federation of Labor, is a member of the executive committee of the federation.—*Typographical Journal*.

Under the agreement system the best judgment each side will control the situation; under the rough and tumble system the most pugnacious element will control.—*Coast Seamen's Journal*.

VOL. II. No. 5

NEW YORK, SEPTEMBER-OCTOBER, 1905

TEN CENTS

CONCILIATION'S GREATEST VICTORY.

ITS SUCCESS IN PRODUCING THE PEACE OF PORTSMOUTH STRENGTHENS ITS POTENCY
IN THE ADJUSTMENT OF GREAT INDUSTRIAL DISPUTES.

THE principle of conciliation and conference has received the most profoundly impressive exercise that the world has ever seen in the signing of the treaty of peace by the plenipotentiaries of Russia and Japan.

The historic event at Portsmouth, N. H., on September 5, was the successful culmination of an effort, pronounced without precedent, to end war and restore peace through their employment. This effort was made in the name of civilization and humanity. The race has been incalculably benefited, and its moral and material progress has been immensely forwarded by the cessation of the "terrible and lamentable conflict" between Russia and Japan, brought about through the initiative and dignified endeavor of the President of the United States.

The results to humanity and civilization are not only of immediate but of cumulative benefit. Not only are the waste of blood and treasure and the interruption to economic production brought to an end, but it has been demonstrated to every government on this planet that it is practicable to adjust international disputes amicably, through frank discussion between their authorized representatives around the conference table, instead of upon the battlefield. The demonstration has all the lasting force and weight, not only of the theories of students of international relations, but of practical execution. This concrete result appeals to the imagination of the world and impresses itself as a fact accomplished that must influence all the future evolution of human history.

The lesson goes even further. If war, with all its grim enginery in full activity, with all its passions fiercely inflamed, with all its energies at their most intense strain, can thus be ended; if armies can be halted in the very midst of murderous combat, if their guns can be silenced and their charges checked with hand upon lanyard and with sabers in air, if the bristling area of carnage can be converted into a smiling region of peace, all through a verbal process between plenipotentiaries, then

surely the peoples of the world, upon whose productive capacity the burdens of all wars fall, should be increasingly open to the conviction that it is possible to settle industrial wars through similar processes of negotiation.

International diplomacy thus points the way that industrial diplomacy should tread. As humanity has paid in the blood and tears of centuries the frightful cost of the "last argument of kings," so have "count-

less thousands" mourned because of the inhuman elements enlisted upon either side in the perennial dispute between capital and labor over their just shares in the product of their united efforts. If national conciliation and conference can lessen the red stain of battles upon the pages of history, it is an irresistible inference that the application of the same sane methods can lessen in increasing ratio the friction attending the incessant readjustments between employer and employed, and that the progress of civilization, which must include simultaneously greater economy of production and a higher standard of living, can be carried forward with fewer of those industrial battles known as the lockout and the strike.

In the world of industry, when capital and labor are at war, it has been demonstrated repeatedly that personal, face-to-face conference between their representatives, when duly authorized and clothed with power to treat, has no equal for establishing mutual respect and confidence and bringing about a settlement which, without such a conference, would have seemed impossible. The terms of such a settlement are often formulated in a trade agreement, which thus may be entitled an industrial treaty, which representatives of both capital and labor declare should be held sacredly inviolate.

In the world of international politics, diplomacy has for centuries striven to prevent or to provoke wars, as the policy of sovereigns might dictate; but diplomacy has been always the channel through which war was prevented or peace restored. The foundation of diplomacy is communication or conference between the direct representatives of sovereign powers; and its most pacific results are embodied in treaties, which are the highest law in the participating countries.

When conflict actually exists between capital and labor in an industry, there is

THEODORE ROOSEVELT
THE GREAT CONCILIATOR.

as much opportunity for the exercise of methods of conference as there is in war between nations. The opportunity in each case is strikingly similar. Who is to act as conciliator? Who is to persuade the belligerents, whether national or industrial, to consent to a conference, with a view to the cessation of hostilities and the restoration of peace? Obviously, if neither party to the war is crushed, it must be some outsider; and that outsider must be possessed of certain qualities. The outsider, if his attempted mediation is not to be rejected peremptorily and resentfully by one or the other or by both the combatants, must first of all be disinterested. His motive must be above suspicion. He must also possess a dignity and prestige that entitle him to the most distinguished consideration of each side. He must command respect as well as confidence.

These were precisely and essentially the conditions that surrounded the action of the President of the United States which resulted in the cessation of the war between Russia and Japan. He impersonated a government of strict neutrality. It could not be suspected of self-interest. There was historic warrant for confidence in the disinterested and sincere friendship of that government for each of the warring powers. Simultaneously, the Government of the United States commanded the respect of each. Its intervention was in behalf of the largest "general public," that is, of humanity and civilization. All this was represented in the identical note of the President to Russia and Japan:

"The President feels that the time has come when in the interest of all mankind he must endeavor to see if it is not possible to bring to an end the terrible and lamentable conflict now being waged. With both Russia and Japan the United States has inherited ties of friendship and goodwill. It hopes for the prosperity and welfare of each, and it feels that the progress of the world is set back by the war between these two great nations.

"The President accordingly urges the Russian and Japanese Governments, not only for their own sake, but in the interest of the whole civilized world, to open direct negotiations for peace with one another.

"The President suggests that these peace negotiations be conducted directly and exclusively between the belligerents; in other words, that there be a meeting of Russian and Japanese plenipotentiaries or delegates without any intermediary, in order to see if it is not possible for these representatives of the two powers to agree to terms of peace. The President earnestly asks [the two governments] to agree to such meeting. While the President does not feel that any intermediary should be called in in respect to peace negotiations themselves, he is willing to do what he properly can if the two powers concerned feel that his services will be of aid in arranging the preliminaries to the time and place of meeting.

"But even if these preliminaries can be arranged directly between the two powers, or in any other way, the President will be glad, as his whole purpose is to bring about a meeting which the whole civilized world will pray may result in peace."

The student of industrial economics and the student of international relations may read this letter with the same eyes and may read it above, below and between its lines with the same conclusion. That conclusion is that there has been applied, with a success without precedent, but with a success that establishes a precedent, the identical methods of conciliation and conference between warring states that have been proved to be most efficient when invoked to end conflicts between capital and labor. These mighty forces within the boundaries of any country should find in

the President's illustrious achievement the inspiration to infuse renewed energy into efforts for just reconciliation of industrial differences through mediation.

ADVANTAGEOUS TO LABOR OFFICIALS.

Their Participation in Civic Federation Gathering Conduces to the Interests of Unionism.

(The Shoe Workers' Journal.)

There isn't a class of men in the country to-day whose duties bring them into public prominence whose actions are more closely scrutinized than so called labor officials. This is especially true of those officers

and presence of labor's ablest advocates. It is to the interests of the workers that their friends and advocates be heard at the meetings of this organization, and it is in the interests of the workers that they are there.

Where the cause of labor is given every opportunity to be heard it never suffers, and it has been ably defended and advanced by its representatives in the National Civic Federation and at its meetings. However, the unreasonable element within trades unions takes occasion after each one of these meetings to raise the utterly nonsensical cry that labor officials attended a non-union meeting. Labor officials attend non-union churches, walk on non-union streets, and drink non-union water, and breathe non-union air. Non-union conditions demand the presence of labor's advocates;

it is there that their greatest and best work is done. It is from the non-union places, the non-union conditions and situations and the non-union workers that the ranks of unionism are recruited. The duties of labor officials take them into non-union factories and work places fully as much as into union shops. They can not preach or teach the doctrines of trades unionism from afar, but must carry it to the non-union places. If it could be shown that their presence in those places was opposed to or not in the interests of unionism, there would be some sense in criticizing their union principles. At a recent dinner of the National Civic Federation the question, practically, of the relations of organizations of labor or capital to individual liberty was discussed. Employers, unionists, lawyers, educators, and publicists took part in the discussion. It would be to the advantage of the unreasonable to devote considerable time to reading and pondering over the addresses delivered on the above question.

The labor officials who attended that dinner accomplished then and there more in the interests of unionism and the workers than the unreasonable element of objectors.

UNIONISM AND ITS MERITS.

(Chicago Chronicle.)

Without abating in the slightest degree the opposition which is due to lawlessness under the cloak of trades unionism it is fair and proper to concede the advantages of unionism without lawlessness.

The business houses which are taking back their old teamsters are doing so because the old men are more efficient than the temporary substitutes who were hired during the strike. There can be no doubt of that.

Membership in a union involves a certain sense of responsibility, and while this responsibility has been disregarded by a proportion of

unionists it is recognized by a larger proportion of them.

Union men are, as a general thing, actual citizens and permanent residents of the places where they are employed. Non-union men are more likely to be unsettled in their habitation and consequently less to be relied upon in the long run.

This is a free country, and every man is entitled to earn his living whether he is a union man or a non-union man. There is no reason why the open shop principle should not be accepted by unionists because, other things being equal, the unionist will always enjoy an advantage over the non-unionist in securing and retaining work.

This is one of the benefits of organization. The average employer will prefer union labor because, if the union be wisely and honestly conducted, he has to deal with a centralized, responsible authority instead of with individual workmen who are responsible to no one save themselves.

M. Witte. Baron Rosen. The President. Baron Komura. Minister Takahira.
FIRST MEETING OF THE PEACE NEGOTIATORS ON BOARD THE MAYFLOWER.

of labor organizations whose unswerving fidelity to the workingman's cause for years has given them national prominence. They have been pilloried by the opponents of trades unionism and emissaries and hirelings, but by none more severely than the unreasoning and unreasonable element within the ranks of unionism. The objects of the labor movement are the same, but changed conditions and changed sentiment change its direction.

The change in sentiment is most notably illustrated in the formation of such an organization as the National Civic Federation. These changes, so closely related to the labor movement, naturally introduce changes in the work and duties of or adds new work and duties to prominent labor men. In the opinion of the writer a most profitable work in the interests of the trades union movement is the thorough education of the public to its real work and objects. The National Civic Federation is promoting this work, and an organization of this nature demands the membership

THE DIGNITY OF LABOR ESSENTIAL TO NATIONAL MORALITY.

ITS ORGANIZATION NEEDED TO SECURE REASONABLE HOURS, JUST WAGES AND ADJUSTMENT OF RELATIONS WITH CAPITAL.

(ADDRESS BY WILLIAM J. BRYAN, AT OMAHA, ON LABOR DAY.)

INSTEAD of delivering a set speech, I desire to submit a few suggestions which seem to me appropriate to the day. In the first place, I am glad to participate in a labor day celebration because I believe it to be the duty of all of us to emphasize in every possible way the dignity of labor. No sentiment is more dangerous to the nation or more destructive to the morals of the people generally than the belief that labor is a dishonorable thing from which men should seek to divorce themselves and their families. We should lose no opportunity to propagate the idea that labor is respectable, and that idleness ought to be despised. The young man who, with brain and muscle, adds something to the wealth of the country and contributes to the welfare of his fellows is engaged in a worthier work than the young man whose only ambition is to spend the money that some one else has left him. Our schools have sometimes lent themselves to the theory that education ought to lead one away from manual labor. The result has been that many have gone out from school ashamed to come into contact with dirt and dust, and have sought only that kind of work which enables them to wear good clothes all the time. A contempt for manual labor is naturally followed by indifference toward those who engage in manual labor. The establishment of classes in society is largely due to this antipathy toward labor. Carl Hilty, an eminent Swiss statesman, in a book recently published, presents the theory that labor is necessary to health; and Tolstoy is a champion of the doctrine that bread labor—actual contact with the soil—is necessary to restore sympathy between man and man. The first suggestion, therefore, that I desire to leave with you is that the doing of something useful ought to be the ambition of every life and that the idler should be shunned rather than envied.

I am also glad to take part in your exercises to-day because I believe in organized labor. I do not mean to say that organized labor will always abstain from mistakes or will always be wise in its decisions. To expect that would be to expect perfection, and perfection is not within the reach of any of us. But I believe that organization is not only necessary for the protection of labor's rights, but useful for the advancement of the interests of those who toil. While it may be the primary object of members of labor organizations to secure benefits for themselves, it is impossible for them to confine the benefits of their organization to themselves. Those outside of the labor organization, even those laboring men who most bitterly oppose the labor organization, profit by the organization. When organized laboring men secure better wages, shorter hours or improved conditions for themselves, they secure them, as a rule, for those engaged in the same work outside of the organization. This point was brought out in the Chicago street car strike. The union men insisted that only union men should be employed and the employers insisted that they ought to be allowed to employ non-union men. The union men replied that they would consent to the employment of non-union men provided the non-union men were employed at the former rate of wages, while the union men received the advanced rate which the strike had secured. The employers said that that was impossible, because they could not get non-union men to work at a less rate than that received by the union workers.

There are certain things which the laboring man has a right to ask of society. Let me enumerate a few of these. First, he has the right to ask for reasonable hours, and I believe that the eight-hour day is a reasonable request. When we remember that eight hours are required for sleep and something like an hour and a half for eating, and a considerable time for going to and from labor and removing from the person the stains of labor, it will be seen that an eight-hour day does not, after all, give a man an unreasonable amount of time with his family. The wage-earner is not a heast of burden; he is a human being. He has his family, and time must be given for association with his family. Besides, he is an intelligent being, and time must be allowed for mental recreation. He is a political factor also, and time must be allowed him for preparation for the proper discharge of his political duties. He is also a moral being and a member of society, and he has the right to claim a sufficient time for the discharge of his obligations to his fellow man and to his Creator. We can not expect the laboring man to be what he ought to be physically, mentally, morally, socially, and politically if he is driven from his couch to the shop and from the shop back to his couch. While this question primarily affects the laboring man, it, in a broader sense, affects us all, for we are so knit together that we can not separate ourselves from each other or, without danger to ourselves, subject any portion of the community to injustice.

The laboring man has the right to ask for arbitration of differences between labor and capital. This phase of the labor question is not fully appreciated on the farms and in the smaller towns, for the reason that there is a sympathy between employer and employe which regulates the conduct of both, where the number of employed is so small that there can be personal acquaintance. But where one man employs a thousand, or ten thousand, personal acquaintance is impossible, and the sympathy that rests upon acquaintance is likely to be absent. There must be some way of establishing justice between employer and employe, and arbitration is the only method that has been proposed. The employer who arbitrarily insists that he has the right to run his own business without consulting his employes does not state all of the case. So long as in running his business he does not attempt to regulate the lives and the conditions that shall surround his employes, nobody will question his right, but when he includes in the

WILLIAM J. BRYAN.
Editor of *The Commoner*.

running of his business the right to determine the material, the social, the intellectual, and the political standing of his employes, he is claiming that which he can not defend. There ought to be in every city, in every State and in the nation a permanent arbitration board with power to investigate and report upon any labor trouble at the request of either party or upon its own initiative. The compulsory investigation of a labor trouble must be distinguished from the compulsory enforcement of the finding of the board. It is far more important that the investigation shall be compulsory when either party desires it than that the finding shall be binding, because public opinion will surely enforce a fair and impartial finding.

I believe that this plan can be applied to differences between nations. We are all rejoicing that our nation has, through the efforts of the President, been instrumental in bringing peace between Russia and Japan. We have won more moral prestige by playing the rôle of peacemaker than we could have won in a generation by wars of conquest. If we had an international board of arbitration, with an agreement that all the leading countries would submit their differences to the board for an impartial investigation before entering upon war, nearly if not all wars would be avoided.

The laboring man also has a right to ask for reasonable compensation, and the reasonableness of compensation must depend upon the conditions which surround him. When the cost of living increases he has a right to expect increased wages; if his business requires a high order of skill, he has the right to expect a larger pay than when engaged in work that requires less skill. The longer the preparation for work, the higher the compensation as a rule. Then, too, a business in which one can engage but a portion of the time must furnish a larger per diem than a business in which the work is constant. These are only a few of the conditions that enter into the determination of wages.

Having mentioned some of the things which the laboring man has a right to demand, let me add that society also makes demands upon the laborer. Our obligations in this life are mutual ones. None of us stand

in a position where we can demand without making return. The laboring man owes faithful services to his employer, and the labor organization will commend itself to the employers in proportion as its influence upon the members tends to increase their efficiency.

As public opinion is the all-controlling force in this country and the powerful factor in any country, the members of any labor organization will find the public inclined toward them in proportion as the organization proves its claim to the public confidence and respect. While a man's right to a reasonable wage and to reasonable hours is a legal one that ought to be recognized no matter what use a man makes of his money or of his time, still the laboring men will find that their claims will be reinforced in proportion as they demonstrate the usefulness of the organization in promoting virtue and character among its members. A few members who make a bad use of surplus money or surplus time throw discredit upon the order, and such waste of time and money will be used to answer the demand for increase of wages or more leisure.

The members of the labor organizations also owe to society a respect for law. No one can afford to be lawless, and no one can long expect public sympathy who attempts to substitute force and violence for reason and persuasion in any controversy. The labor organization ought to be swift to punish violations of the law among its members, for such violations, when unpunished, bring odium upon the entire body. The laboring men might point to some distinguished instances of lawlessness on the part of men who are quick to find fault with labor organizations. For instance, the Chicago Board of Trade recently repealed a rule which provided for the expulsion of a member who violated the law against grain gambling. If a labor organization were to announce, as the Chicago Board of Trade virtually did, that it would not require the expulsion of a member for the violation of the criminal law, there would be a loud outcry against the lawlessness of the labor organization, and there will be an outcry against the lawlessness of the Chicago Board of Trade. A bad example like that is better rebuked than followed.

It is natural that the members of a labor union, who tax themselves and contribute from their earnings to improve the conditions of labor, should complain if the very ones who profit by their action act as strike-breakers and attempt to defeat the plans and purposes of organized labor. And yet, irritating as this is, the laboring man must remember that he is not the only one who is sometimes thwarted by the persons whom they try to benefit. That is the common lot of those who try to improve the world, and the laboring man must content himself with making such progress as he can by the use of moral suasion. Force may seem attractive to one who is angry, but the peaceful methods of example and argument commend themselves to those who will consult their better natures and take time for reflection. Progress is often slow. Those who are most eager to do good are apt to be most impatient. Satisfied of the righteousness of their own efforts, it is hard to understand how others can be indifferent or even antagonistic. But patience and persistent effort accomplish much. The labor organization has contributed mightily to the welfare of the wage earner. It has won him the confidence of the public generally, and in its coming contests it can count upon increasing support as it proves itself a worthy champion of worthy men and women.

LABOR DAY DISTINCTIVE.

(*American Federationist*.)

The trade union movement may well look to it that the first Monday in September be maintained with its distinctive characteristics of demonstration and power, protesting against wrong, and agitation in the demand for right. Otherwise it, like many other holidays, will lose its distinctive characteristic and simply become a holiday for jollification without other purpose or design.

The newspapers of the country for several days in advance of Labor Day, Labor Day itself, and particularly the day following, devoted pages concerning local and general demonstrations and observances of Labor Day, and, incidentally, discussions of the aims and purposes of organized labor. If Labor Day was observed simply by holding meetings at which addresses were made, does any one imagine that so much space and attention would be given it?

The Sabbath preceding Labor Day is becoming more and more devoted by ministers of the different denominations to preaching sermons upon the significance of Labor Day, the rights and wrongs of labor, and the purposes of the labor movement.

WHAT JOHN MITCHELL REALLY SAID TO ANTHRACITE MINERS.

AN ACCURATE REPORT OF A TYPICAL ADDRESS WHICH HAS RECEIVED MISINTERPRETATION AND CAUSED UNWARRANTED APPREHENSION.

Many of the reports published in the daily press of the speeches delivered by John Mitchell, President of the United Mine Workers of America, during his tour of the anthracite fields, have represented him as either predicting or urging a strike, and as appealing to the mine workers to present to the operators an "ultimatum." In order that our readers may know exactly what Mr. Mitchell is saying to the miners, THE REVIEW presents the following verbatim report of an address which he made to a mass meeting of miners at Shamokin, Pa., September 16:

You are, of course, aware that I have been in the anthracite region for the past three months, assisting your district officers and our international representatives in the work of perfecting the union and making preparation for any contingency that may arise upon the expiration of the award of the Anthracite Coal Strike Commission. During these months I have addressed fifty-three meetings in various parts of the anthracite field, at which I have spoken to approximately 190,000 people. It is a pleasure to report that, largely as a result of these meetings, the organization has increased in numbers, and that the prospects are that before the close of the year our membership will be greater than at any previous time in the history of coal mining in the anthracite regions.

It is, of course, a source of keen regret to me, as I know it is to every loyal and constant member of the union, that so many of our fellow-workers who sacrificed and suffered uncomplainingly during the long, weary strike of 1902, should at its termination, when victory had been achieved, disconnect themselves from their organization, and abandon the movement which had done so much to raise to a decent standard of life the multitudes of people dependent upon the coal industry.

I have sought in every manner possible to ascertain the cause which prompted the wholesale desertions that followed the strike and continued up to the middle of this year, but, so far, I have been utterly unable to find a man who could give good reason for his action, and, indeed, very few offered any defense at all.

I have tried constantly to inculcate the world-wide accepted principle enunciated by the immortal Washington, that "To be prepared for war is the most effectual means of preserving peace;" and in the elucidation of this idea I have consistently announced my earnest desire to see such a relationship established between the workmen and their employers as would insure peace and tranquillity in these anthracite fields. But I have discovered that owing to misconstruction of the arguments I have presented, the press of the country has interpreted my language to mean that an ultimatum was delivered, and that we would refuse to maintain peace except upon terms dictated by ourselves.

I have no hesitancy in saying that those who are familiar with my views, or those who know the policies I advocate, have given little credence to the erroneous reports sent broadcast through the country by the public press. I am now—as I always have been—unalterably opposed to the issuance of an ultimatum until every reasonable effort has been made to reach an agreement and to adjust relations by conference, conciliation, or other honorable and peaceful means.

It is true that I have presented the conditions upon which I believe a permanent peace to be possible. I have said that, in my judgment, permanent industrial tranquillity could not be maintained until the union is recognized as a contracting party with the employers and until an eight-hour workday is established in these fields. I repeat and reiterate these views now, but by no fair construction of language can these views and expressions be interpreted to mean that an ultimatum as to our position has been delivered. Both of these principles are fundamental to trade unionism; they are not exclusively the desires of the men in the mines; they are the demands of the workers of the entire civilized world. And so far as I am concerned, I shall continue to advocate their adoption so long as I am connected with the United Mine Workers of America.

I, of course, recognize the fact that we can not hope in a few short years to remove all the wrongs and correct all the abuses which have accumulated during the past half century; but I hope that we shall be able to present such arguments to our employers, when we meet them again, as will convince them of the justice and equity of our position.

In some of my addresses I have called attention to the fact that labor is practically the only commodity on the market upon which the purchaser names the price. In drawing the analogy between labor and other commodities, I have used this illustration: If a man went to Mr. Baer and said to him, "Mr. Baer, I desire to purchase a hundred (or a thousand or a million) tons of coal," Mr. Baer would very courteously say, "All right. The price is \$4.50 a ton on the first day of April; \$4.60 a ton on the first day of May. It will increase ten cents per ton per month until it reaches

\$5, where it will remain stationary for six months. How many tons shall I send you?" If the purchaser were disinclined to pay the price named by Mr. Baer, he would be told that coal was for sale only at a fixed figure; he could take it or leave it. In my arguments to the miners, I have said that if labor were as well organized as capital it could, with equal consistency, say to the employers, "Here's our labor, it's worth so much. We've fixed a price upon it just as you fix a price upon coal. If you want it at our price it will be sold to you, if not, we shall keep it until you need it badly enough to pay our price for it."

In using this illustration of the difference between labor and other commodities, I have simply sought to demonstrate the idea that human labor is entitled to at least as much consideration as coal or other inanimate products. But either through misunderstanding or design, the impression has been conveyed to the public that we were going to New York next spring, and walk up to Mr. Baer and his colleagues and defiantly assert: "Here, Mr. Baer, we have the labor of 150,000 men to sell; we want so much wages for it; you can take it

JOHN MITCHELL,
President United Mine Workers of America.

at our price or leave it alone; we'll keep it until you need it badly enough to pay our price for it;" while, as a matter of fact, our whole ambition is to be able—when we do meet the anthracite operators for the purpose of negotiating a new agreement—to say, "We are here as the spokesmen and representatives of all the men and boys employed in the anthracite mines; we wish to confer with you upon the question of our joint relations. We are desirous of entering into an agreement fixing wages, hours of labor, and other conditions of employment. We have certain claims which we desire to present, among them the recognition of our union as a contracting party and the establishment of a maximum eight-hour workday." If we are in a position to speak for all the employees of the various coal companies, I am quite sure we shall be able to negotiate a better agreement than if we represent only a portion of the men.

Now, ladies and gentlemen, I have gone into this matter in detail, not because I care particularly for the criticisms of myself, but because I am desirous that the cause of organized labor shall not suffer through misunderstanding or through misrepresentation.

At no time in my life have I felt so keenly the gravity of the labor situation in the anthracite fields. While it is true that I hope for an adjustment of our relations with the anthracite operators upon a basis that will be satisfactory to us and at the same time fair to them, there are, nevertheless, many evidences that the employers are preparing either for an aggressive movement against us or to resist any reasonable demands we may make upon them. Our organization in these fields is honeycombed with spies employed by the Thiel Detective Agency. In the early part of last month fifty of these emissaries were shipped from Chicago and have been distributed among the local unions of the entire region. These men were supplied with transfer cards fraudulently obtained from our locals in various States in the Central West. We know where they are located and we know the work they are doing.

The operators have also attempted to nullify the mine certificate law. This law was enacted by the legislature

some years ago, and was intended to protect the life and limb of the man in the mines. It is indicative of their lack of regard for the welfare of their employees when the operators seek by subterfuge to remove this safeguard, which affords us some small protection against the hazard of our employment. It may be important at this time to say that there is no employment in America more dangerous than that of mining coal. And if the operators are permitted to employ the careless and incompetent to fill the responsible positions now held by those who have demonstrated their ability by passing a rigid examination, it will result in a further increase in the number of men who shall be killed and maimed in the anthracite mines.

It is my earnest hope that the coal mine workers of America will unite in one solid phalanx, being prepared to defend what they have gained, and, when opportunity presents itself, constantly to ask for more.

To those unfamiliar with the conditions of our life and labor, it may appear that we are unnecessarily or unreasonably extravagant in the demands we make, but, my fellow workmen, we should not cease our efforts until the coal mine workers of our country are in such a position that their earnings shall be sufficient to enable them, by the exercise of reasonable frugality, to supply themselves and their families with all the necessities of life, to live in comfortable homes, properly to educate their children, and to make provision for their own declining years. There is nothing that I can imagine so sad as to see an old man, after a whole life of industry, and when he is no longer able to work, cast adrift to become an inmate of the almshouse or a burden upon his friends.

The task we have before us may seem stupendous, but if each man will do his part I have no fear as to the final result. It is, of course, unreasonable to suppose that at times we shall not meet with repulses; there have been and there will ever be victories and defeats, recessions and progressions; but we must see to it that every forward movement carries us further on than the preceding or the succeeding step may carry us back. We should ever keep in mind those two well-known Americanisms, "Eternal vigilance is the price of liberty," and "An injury to one is the concern of all."

The trade union movement has proved itself to be the greatest institution ever founded among men. It has raised wages, reduced hours of labor, taken the child from the mill and the factory and sent it to school. It has elevated the manhood and the womanhood of the working people of the world; it has raised the standard of citizenship, sobriety and integrity of the workmen of our own country.

(Concluded from page 16.)

population of either. Yet Wisconsin and Minnesota have been largely settled by what are known as the "desirable" Germans and Swedes. New York is preeminent for the large number of "undesirable" Italians and Russians; but the "undesirables" seem to be more fond of and better able to grasp the English language.

Now, the final generalization is an appeal to racial pride. The Germans and the Irish who came over in the '40s and '50s were of "our" Anglo-Saxon stock, or kin to it. But the Italian and Slav are entirely foreign elements. Moreover, they come from conditions at home which are so miserable that they are unfit for our social and industrial life! But, alas for the argument, the conditions from which the Irish came in the days of their great immigration were infinitely worse than those of the Slav and Italian of to-day. Descriptions of Ireland during the days of the famine show that the people were living at the very lowest possible level of existence. And still more striking is the fact that the Know Nothings of the '40s and '50s made the same arguments against the Germans and Irish that are now being made against the Slav and the Italian; yet to-day the German and the Irish are "desirable" and the Slav and Italian are said to be "undesirable."

The truth is that modern ethnologists do not recognize the racial differences made by the opponents of immigration, and in fact they say that these so-called races have been so blended in Europe that the racial influence is very difficult of discovery or determination. But, above all, as was so tersely said by M. Taine, the three great influences in history have been environment, epoch, and race. Whatever racial traits are brought to us are so strongly molded and modified by our environment and the spirit of our times, by the influence of our political institutions, by the effect of individual manhood and self-reliance which these institutions have created, that year by year the immigrant is swallowed up in the body politic. After a while he becomes an American, that American who has been made up out of the blend of all Europeans, and who will continue to grow greater and greater as the new blood constantly filters through his veins.

"MUTUAL GOVERNMENT" OF INDUSTRY BY ORGANIZED EMPLOYERS AND EMPLOYED.

EQUAL POWER IN CONFERENCE ENABLES CAPITAL AND LABOR TO ADJUST DIFFERENCES WITH RARE RESORT TO ARBITRATION.

(BY A. BEVERLY SMITH, SECRETARY LITHOGRAPHERS EMPLOYERS' ASSOCIATION.)

THE history of industrial conflicts shows that there are three methods by which the contending parties reach a conclusion. These are (1) abject surrender by one side or the other, without an open rupture; (2) opposition leading to open conflict, which continues until one side is exhausted; (3) preventive measures, which derive their effectiveness from equality and fairness.

The first of these methods usually and logically leads to the second, which has resulted in the many upheavals in business and checks to general prosperity which have occurred in the past. The conclusion reached by either the first or the second method is never permanent, but is always upset by a recurrence of hostilities as soon as the losses of conflict have been recouped. This statement applies equally to the forces of capital and labor.

Efforts to regulate the relations between capital and labor have lacked a practical plan of execution. These efforts, when exerted on the part of individual employers and individual unions, have, indeed, wrought betterment, but not as generally as could be wished. Arbitration has appealed for approval as a universal method of settling industrial disputes. But trials of arbitration have found it wanting, because arbitration as heretofore practiced almost always results in compromise; and no one respects compromise, especially of questions of right and wrong. Arbitration is a last resort, and it should be preceded by the exercise of mutual and equal power by capital and labor in an organized process of adjusting industrial conditions. It is this process that is termed Mutual Government.

Mutual Government involves: *first*, joint action between capital and labor upon any disputed question, in which each has equal representation, influence, and power; this joint action being broader in scope, as will appear, than a trade agreement; *second*, arbitration, to be employed only when joint action has failed to solve the difficulty. Both of these actions are to be employed **before any difference between capital and labor has developed into strained relations**; it being trite, but none the less true, that prevention is better than cure.

In the practical application of this theory in any industry, both capital and labor reach a preliminary agreement that during a certain period the conditions of the trade shall be determined equally by both parties. For this purpose, business offices are established on the part of the employers, who must have an organization with power to enforce its policies and decisions upon members; and on the part of unions organized with corresponding power. To these offices are committed the enforcement and administration of all agreements, so as to prevent any difference from growing into open war, or even disturbing friendly relations; it being kept in mind, above all, that in the adjustment of every question capital and labor are accorded equal weight and power.

Under this system an individual or local question is taken up at once by the business representatives with equal representation from those concerned. If the effort to adjust the difficulty is successful, the subject is considered by the organizations of both capital and labor to be finally settled.

Should a question arise between the two organizations, or of paramount interest to the industry at large, even though of individual or local origin, a joint commission is formed, consisting of an equal delegation from the organizations of employers and of workmen. No one is eligible for membership in this commission who is personally or directly interested in its decision, other than in its general relations to capital and labor. The business agents of the two organizations, as attorneys, present their sides of the case, with evidence and arguments. The commission decides the issue by vote. Usually this vote is unanimous, although provision may be made that a majority vote shall be decisive. In the practice of Mutual Government in the lithographic industry, into which it has been progressively introduced during more than three years, there have been less than six cases which were not decided by a unanimous vote of the joint commission.

Should the joint commission fail to reach a decision, the case is referred to a board of arbitration, consisting of three arbitrators, one selected by each organization, and these two selecting the third. The arbitrators selected by the organizations of employers and of workmen are not connected with the industry, although they may be employers or workers in another industry. Either side may refuse to accept an arbitrator selected by the other, if there has been any attempt to make such arbitrator a partisan. The decisions of a board of arbitration thus constituted are not compromises. It decides the question upon the arguments and evidence presented upon a purely business basis, all sentiment

being excluded upon the principle that the object sought is the conservation of an industry which affords the means of livelihood to both employers and employed.

In 1902, the employing lithographers of the East and of the Pacific coast, representing about 75 per cent. of the entire industry, formed an organization to carry into effect this plan of Mutual Government. The seven unions then in the trade had for ten years dominated the industry, having met with only sporadic or individual opposition. The employing lithographers began a campaign of education, which resulted in the establishment of Mutual Government early in 1904.

As showing the conservative power and force of Mutual Government in the handling of delicate or important questions the experience of the trade in meeting the question of the shorter work week is valuable. In the lithographic trade the organizations of employers and of unions have agreed that this is a question to be presented to a national joint commission, its deci-

A. BEVERLY SMITH,
Secretary Lithographers Employers' Association.

sion is to be final and binding on both parties. Thus this question, which has disturbed other trades, is well in hand in the lithographic industry. While decided opinions upon the advisability and practicability of the shorter work week are held by each side, the question is not to be allowed to interfere with the livelihood of all concerned. It is probable that a national joint commission will decide this question this year or early in 1906. Meanwhile, the lithographic industry, under Mutual Government, is undisturbed by the turmoil surrounding it. Thus in San Francisco, during a typographers' strike, in July, 1903, for a shorter work week, the lithographic departments of the printing establishments were entirely unaffected. This was in accordance with the unanimous decision of a joint commission for the lithographic trade, sitting for San Francisco, that this question was national, not local, and should not be taken up at that time. This experience was repeated in a strike of the typographical unions in San Francisco in July, 1905.

Hundreds of cases in the lithographic industry are decided every year. Nearly all individual grievances are readily adjusted by face to face conferences between those immediately concerned, aided by the business representatives of the two organizations. Of the questions that have been brought before joint commissions since May 1, 1904, only one failed of settlement there and went to arbitration. The decision in that case was against the employers, who put the decision into effect immediately upon its verbal announcement, without waiting for its receipt in written, official form.

Convincing evidence of the success of Mutual Government is found in the fact that no question decided under its methods of procedure has ever again become a source of contention. Moreover, all parties concerned have not only abided by every decision, but have uniformly expressed satisfaction with its results.

The millennium has not arrived, but common sense is always with us. The unanimous judgment of a body, equally representative of both sides, on any question

must be closer to the truest interest of all concerned than can be the opinion of any individual or group arrayed on one side alone. The way to see both sides of the shield is to reach a point of view whence both sides are visible.

Such are the general results of Mutual Government in the lithographic industry. One of its applications, not originally contemplated, is to the education of apprentices, a question that lies at the root of any trade.

The apprentice left entirely to the control of the employer is too often a subject of exploitation for profit. Although all employers are deeply concerned in the evolution of workmen of good ability, but few interest themselves in this aspect of apprenticeship, and workmen's organizations have not attempted to interfere. Thus, in every line of trade, skilled craftsmen are scarce, the great bulk of apprentices becoming most commonplace artisans.

The apprentice left to the control of workingmen, whether individual or organized, is too often treated as an interloper, and his development hindered under the mistaken idea that he will rob the workingman of his livelihood. This has a deleterious effect upon the ability of the apprentice when he becomes a workingman.

These two adverse influences have hindered the progress and increase of many industries.

In lithography, Mutual Government has established a joint apprentice system. A joint apprentice board, with subordinate local boards, controls the apprentice during his entire term. It is the prerogative of the employer to nominate the apprentice. After his nomination, the apprentice belongs to the entire trade that must support him and in turn derive from him its continuance.

The nominated apprentice must present to the joint board a physician's certificate as to general health and an oculist's certificate as to eyesight, with particular reference to the branch of the industry he elects to pursue. This being satisfactory, he is admitted to a probationary period, at the end of which he is again examined as to progress. If that comes up to the standard, he is indentured, with the proviso that the joint board may cancel the indenture at any time. During his entire term, the relations between apprentice, employer and workmen are under the control of the joint board, whose object is to secure for him full instruction and protection, and for the employer willing service and due diligence. Under this system, future lithographic workers will be both skilled artisans and good citizens; for lukewarmness, laziness, and bad personal habits in the apprentice are not tolerated by the joint board. This one result alone more than repays to the trade all the expense and trouble of Mutual Government.

PRESBYTERIAN INTEREST IN ORGANIZED LABOR.

The new Department of Church and Labor, of the Presbyterian Church, of whose formation and purposes *The Review* has published an account, now represents over seven thousand ministers and over one million members. There was manifested special interest in the work of this new department during the recent General Assembly of the Presbyterian Church in the United States, at Winona Lake, Ind., which adopted unanimously the following resolution:

"Appreciating the increasing importance of the industrial problem, and realizing that the labor question is fundamentally a moral and a religious question, and that it will never be settled upon any other basis, we recommend that the Presbyterian Home Mission Committees appoint subcommittees for the purpose of making a systematic study of the entire problem in their respective localities.

"These committees shall cooperate with the newly-organized 'Workingmen's Department' of the Board of Home Missions, thus establishing, in connection with the organized Presbyterianism of every city in America, a Board of Experts, who may be able to inform the churches with respect to the aims of organized labor, and to inform the workingmen concerning the mission of the Church.

"These committees shall also assist in the already successfully inaugurated plan of securing for the churches fraternal relationships with workingmen in their organizations; become responsible for the distribution of the literature issued by the board for the membership of the Church and for the great mass of workingmen outside of the Church, and to push aggressively whatever methods may bring about a more cordial relationship between the Church and labor."

SOME CURIOSITIES OF THE SOCIALIST PROPAGANDA.

EXCERPTS FROM ITS LITERATURE, WHICH "THE INTERCOLLEGIATE SOCIALIST SOCIETY" WOULD DISTRIBUTE, RANGE FROM REVOLUTION TO INANITY.

(BY THE EDITOR.)

Thomas Wentworth Higginson, whose name among the signers to the call to form an Intercollegiate Socialist Society excited surprise among the admirers of his distinguished and patriotic career, was conspicuously absent from a recent meeting at which some of his fellow signers and a group of sympathizers with that call, representing even more than "fifty-seven varieties" of socialism, formed an organization. It is reasonable to attribute to his absence a certain significance. He may be representative of others who have innocently lent the weight of their names to a movement of whose sinister origin and unpatriotic purpose they had been ignorant.

It was quite fitting that this aggregation of "impossibilists," "revolutionists" and all-round economic freaks should elect "eat-en-alive" Jack London as their president. He is the "barker" who invites the crowd to walk inside and feast upon garish cataclysms eclipsing "The Fall of Babylon" or "The Destruction of Pompeii." Hear him at the gate:

Socialism is distinctly revolutionary and in scope and depth is vastly more tremendous than any revolution that has ever occurred in the history of the world.

I know that anarchy, civil war, death and crime will be the results of the revolution I prophesy; but what are you going to do about it?

The rest of the official staff of this organization are: First vice-president, Upton Sinclair, newspaper writer; second vice-president, J. G. Phelps Stokes, settlement worker; secretary, M. R. Holbrook, secretary of the Collectivist Society; treasurer, Owen R. Lovejoy, secretary of the National Child Labor Committee.

It has been shown in a previous article that the origin of this dilettante cult of revolution is foreign. Its sinister source lies among those who plot in European cities to overthrow governments. The chief activity of this imported school finds vent in printed matter. This constitutes the "literature suitable for college men," which it is the purpose of the new society to distribute. It will be interesting to look at a few samples of this literature, of which these disciples aspire to become collegiate apostles. It ranges from violence to inanity, and of its making there seems no end.

Few persons outside the circles of avowed socialism are aware of the zeal and ingenuity exerted to multiply the productions of its pens and presses. The *International Socialist Review*, the most pretentious periodical of the movement in this country, is published monthly by a cooperative house. The same house publishes much other Socialist literature, including a series of more than forty booklets. The house is in debt, and each issue of its *International Review* contains an appeal for stock subscriptions, together with an acknowledgment of subscriptions received. Some of the names in the list are of well-known persons, who, as have been the friends of Mr. Higginson, may be surprised to learn to what end their subscriptions are devoted. One of the recent appeals reads:

America is ripe for Socialism. Whether genuine international Socialism is to come at once to the front, or whether we are to have a long and painful siege of opportunism, depends largely on the amount and the kind of Socialist literature circulated in the near future, and this again depends to a very considerable extent on the financial position of this publishing house. Comrade, it rests with you to say whether the growth of our work shall be rapid or slow.

A few extracts from the literature provided by this cooperative house will suffice to indicate its character, which the Intercollegiate Socialist Society would consider "suitable for college men." The editor of the *International Review*, in the course of an address to the Socialist convention held in Chicago last June, to form an organization to fight the American Federation of Labor, said:

The proletariat of America stands ready to grasp any weapon, the ballot, the strike, the boycott and the bullet, if necessary.

The cheers that greeted this outburst encouraged him to add:

This is the beginning of the greatest battle in history.

The following are some excerpts from issues of the *International Review*:

The Socialist movement differs from Trades Unionism in this, that per se it has nothing whatever to do with anything short of the Revolutionary solution of the labor or industrial problem.

The only hope of an adequate representation of the Socialist movement in the field of journalism is the establishment of a Socialist press, frankly revolutionary.

While Tolstoi would have peace even at the price of liberty, Socialists prefer war for freedom to the peace of slavery.

The Social tinder now on hand needs only some violent clash of classes to strike the spark to ignite it, and with the ruling classes ready to fan the flame, we have all the elements essential to a Social conflagration.

The coming revolution will be much less of a sudden uprising against the authorities than a long drawn out civil war.

All indications point to the probability that American Socialism will be the champion who will batter down the walls of capitalism.

The Socialist party of America stands in the most intelligently revolutionary and uncompromising position of any Socialist party in the world.

Three interesting epochs in the story of the world are the English revolution of the 17th century, the French revolution

of the 18th century, and the approaching World Revolution of the 20th century. The third will see the final overthrow of the autocratic, aristocratic and plutocratic forces of government.

There is no Socialism that is not Revolutionary Socialism. This is a Revolutionary Ideal to be attained by a Revolutionary Class, preaching a Revolutionary Propaganda, through the agency of a Revolutionary Party, and by which the workers are to secure the general ownership of the means of production and distribution for all the people.

Interspersed through some of the other literature distributed by publishers of the *International Review* are such gems as the following:

From Ferdinand Lasalle: The revolutionary method, terrible as are the drawbacks with which it is accompanied, has in spite of them the one advantage of attaining speedily and energetically a practical result.

The Rev. T. McGrady, of Kentucky: The assassin of Humbert is an angel of innocence compared with those who elect Bryan or McKinley.

From Eugene V. Debs: The day of crisis is drawing near and Socialists are doing all in their power to prepare the people for it.

From the *Communist Manifesto*: The Communists everywhere support every revolutionary movement against the existing social and political order.

The Communists openly declare that their ends can be attained only by the aforesaid overthrow of existing social conditions. Let the ruling classes tremble at the Communist revolution.

When the reader has ceased trembling at these fulminations, it will be a diversion to turn to the other extreme of grand and lofty tumbling. The most freakish of Socialistic publications, which would possibly add to the gaiety of the moments of relaxation in Socialist classrooms, is *Wilshire's Magazine*. This periodical attempts to increase its circulation through making its subscription price ten cents a year, twenty-five cents for three years. This low price, its editor frankly explains, is only possible through receipts from advertisers, and its advertisements are, of course, solicited from the abhorred capitalists. In a recent issue, the editor publishes a page advertisement of his own headed: "Have you Money to Invest? 17 per cent. and Socialism." He announces that the advertising receipts will be such as to promise this highly capitalistic return to all who will buy stock, and makes this delicious argument:

What better can a Socialist do than to invest his money in a Socialist magazine that is paying a profit? Every dollar invested in a capital concern helps perpetuate capitalism. Every dollar invested in *Wilshire's Magazine* helps to kill capitalism.

The editor makes, of course, the quantity of his circulation the basis of the advertising rates, which are to furnish the sinews of war against capitalism. As a highly finished "nerve proposition," this may be said to merit a medal. "Kindly give me your gun and I will use it to blow off your head" would be a parallel proposition.

This extraordinary phase of a Socialist business policy leads to some amusing and embarrassing complications. One of the advertising supporters of this organ of Socialism is the president of the Citizens' Industrial Association of America, an organization formed to destroy trade unionism. As Socialism also plans to destroy the movement of organized labor, there is a natural alliance between the two in their common hatred of a force of industrial conservatism and progress. Just how the president of the Citizens' Industrial Association squares his avowed detestation of Socialism with his financial support of a Socialist publication is not clear, unless it be the result of their common enmity to organized labor. But this alliance places the editor of *Wilshire's* in a ludicrous position, whence his efforts to extricate himself form one of the most amusing exhibits in the Socialist performance.

In order to sow the seeds of Socialism among the unions, this editor seeks subscribers among their members. Some of these subscribers complained at his publication of the advertisements of a foe to labor unions. The editor thus explains:

I replied to the complaints that it must be taken for granted that all our advertisers are advertising with us to make money out of our subscribers, and not to subsidize *Wilshire's* in order to advance Socialism. If I should attempt to look into the politics of our advertisers and only insert their advertisements upon the result of such investigations, I would probably find that every one was dead against Socialism, and, therefore, would be compelled to either stop the publication of *Wilshire's* altogether or run it at a very heavy loss, for it can only be published at the present price by running the advertisements of capitalists, who are logically naturally averse to Socialism.

Everybody should know that Mr. Post is the most violent opponent of trade unionism in the United States, so there is no danger of any one buying his goods under any misapprehension of his politics. Therefore, when we run his advertisement in this journal, no one can make a mistake in the matter. However, as before stated, we must have the money of capitalist advertisers in order to run this journal at the present price of 10c. per year. The question to decide is whether it is better to advertise capitalist goods and propagate Socialism or refrain from such advertising and give little or no propaganda, remembering always that the people of the United States are mostly bound to buy goods made by capitalists because nobody else can make them. We ourselves think it would be foolish to stop the publication of this journal for any such silly sentimentality.

Another Socialist writer whose essays its advocates would spread before college students is Clarence S. Darrow, himself one of the signers of the call for the Intercollegiate Socialist Society. He teaches:

To violate law is often the highest, most sacred duty, that can devolve upon the citizen.

Some of you people are perhaps plying the profession which is called burglary. . . . It always requires experience and education for this profession, and people who fit themselves for it are no more to blame than I am for being a lawyer.

All prosecutions are malicious, and all judgments are meted out in anger and hatred. Our own judges are constantly showing this.

Such statements as these are in accordance with the broad assertion by George Bernard Shaw, a Socialist author whose works the new society would present to collegiate students, in one of his plays that the convicted criminal, when listening in court to his sentence, may regard the judge as guilty as himself. The same play, Mr. Shaw himself defiantly states, "contains an explicit attack on marriage as the most licentious of human institutions."

The ingenuous mind of youth might leap to the conclusion that it is the mission of juvenile chivalry to save society from the slavery of wrongful statutes by constituting itself a generic John Brown. Similarly, the clever flippancy of a Shaw might pervert a callow mind into indiscriminate disrespect for the entire judicial system; or his wanton attack upon the domestic unit of civilized society, revolting though it be, might shake the faith of youth in the sanctity of the home and impugn the divine command to "honor thy father and thy mother."

The keynote of most Socialist literature is that of despair. It leaps from individual cases of social wrong to general denunciation of the entire social system, and advances revolution as the only remedy. The evil and impractical theories favored by the Intercollegiate Socialist Society may appropriately be relegated to the shelves sought only by explorers into the esoteric curiosities of literature or the imaginative ingenuities of the fourth dimension.

EXPERT ECONOMISTS APPRECIATED.

Rochester, N. Y., *Times*.

The trend toward municipal ownership is interestingly evinced in the determination of the executive council of the National Civic Federation to investigate the movement. If the declared purpose of the Federation in examining the subject is fulfilled to the letter, a valuable contribution to economic progress will have been made.

It is encouraging to find in the list of members of the commission appointed to investigate the subject such able, sincere, and thorough political economists as Professor Frank Parsons, of Boston; Professor Edward W. Bemis, of Cleveland; Professor John R. Commons, of the University of Wisconsin, who occupies the only trades unionism pedagogical chair in the United States, and Albert Shaw, editor of the *Arena*. They have a valuable especial knowledge on the subject which ought to make a strong impression upon the prominent corporation lawyers, business men, and conspicuous captains of industry on the commission, naturally against limiting private enterprise, if the latter sincerely seek for light and are capable of a broad conception of public interest.

EVERY INTEREST REPRESENTED.

Scranton, Pa., *Scrantonian*.

The Civic Federation, recognizing the widespread interest now manifested in the problem of municipal ownership, has decided to investigate the whole subject, and with that end in view has appointed a large, representative commission, which will begin work early in the fall. The commission consists of capitalists, manufacturers, labor leaders, lawyers, educationalists, engineers, etc., and that the subject will be probed to the bottom and thoroughly discussed from every point of view, may be taken for granted, as every conceivable interest is represented on the committee by men who are both able and willing to express opinions.

Municipal ownership is an easy and pleasant thing to talk about, but in the United States its adoption involves so many other considerations that it is well to look before we leap.

Samuel Gompers, John Mitchell and other noted labor leaders have been appointed on the commission to look after the industrial interests, and nothing that is worth while considering is likely to escape their notice.

A man is morally bound to waste no time and to do his work right whether the boss is looking or not. To shirk or to do work wrong is stealing, though the wrong he undiscovered.—*The Carpenter*.

Trade unionism nowadays can take no harm in the broadest of economic discussions. The full and free presentation of the truth is what the best friends of trade unions desire most.—*Labor World*, Pittsburg.

THE SMASH-THE-UNION MOVEMENT OFFERS TO SAVE THE NATION.

IT ASSUMES MONOPOLY OF PATRIOTISM, LIBERTY, ET CETERA, AND MAGNANIMOUSLY VOLUNTEERS TO RUN THE GOVERNMENT.

(BY THE EDITOR.)

What is generally termed the smash-the-union element in the employing world has been indulging of late in a series of manifestoes designed to prejudice public opinion through misinformation. No economic doctrine can flourish, however persistently advocated and however strong its financial backing, which is based upon misstatements of fact, and whose purpose is not for the greatest good of the greatest number. The group of writers who assail the movement of organized labor tacitly recognizes this truism in its attempts to make it appear that the admitted misdeeds of members of labor unions are universal instead of exceptional; that all labor leaders are radical advocates of violence; and, above all, that the trade agreement, the most practical device that modern industrialism has evolved for peaceful relations between capital and labor, is destructive of the constitutional rights of the individual citizen. While asserting that they favor organizations of wage-earners that are "properly conducted," these writers betray the fact that their idea of "proper conduct" is absolute surrender to the will of the employer, and that they would deprive the labor union of all power to elevate the condition of its members by dealing with employees only as individuals, and never in a body. They oppose violently the closed shop, but they reveal that their conception of the open shop is a place where no union men can work and live.

This anti-union school of writers puts forth its literature in its own periodicals and in the form of addresses and advertisements in the daily press.

A characteristic of this type of literature is its brazenly complacent appropriation of all the virtues of patriotism and all the glories of American history.

To the great number of economists, divines, publicists and editors who encourage and seek to guide the self-helpful efforts of wage-earners to elevate themselves through organization; to the largest employers in the United States, who make collective contracts with organized employees—to all these, this literature would deny any of those virtues and glories, while it accuses organized labor itself, not merely of a lack of patriotism, but of downright treason.

The typical writer of this literature wraps himself in the American flag, asserts exclusive possession of the Constitution, if not of the Decalogue, and claims to have a monopoly of that spirit of liberty which maintained with arms the Declaration of Independence, freed the slaves while saving the Union and expelled Spanish oppression from Cuba. He would pose as a Washington, a Lincoln and a McKinley all concentrated in a living model of perfect Americanism. By contrast, he would have the reader infer that the 2,500,000 citizens who are enrolled in the American Federation of Labor and the great railway Brotherhoods are composed of Arnolds, Booths and Weylers; that they are enemies of their country and foes of civilization. He would deny to them all patriotism, all love, not only of country, but of humanity; all allegiance to the Flag and all respect for the organic law framed by the fathers of the Republic.

This extravagance should defeat its own purpose. If there were a scintilla of truth in these charges or insinuations, the entire movement of organized labor would have been withered in its infancy by the burning blast of public condemnation. It could have no more chance of survival and growth in a land of self-government than has anarchy or polygamy. The very progress of organized labor in both strength of numbers and intelligence of policy, the very respect which it has won from the largest and best-informed employers, the very consideration it receives from economic scholars and writers form a body of convincing evidence that the movement is recognized as an important social force, meriting critical study, to be credited with having accomplished much in uplifting the mass of wage-earners and capable of increasing both the producing and consuming capacity of the nation. It is because the malicious and indiscriminate verbal assaults upon this movement could not find entrance into the news or editorial columns of reputable journals that they are frequently forced into the advertising columns, when they are paid for at so much a line.

These smash-the-union writers attempt to class the labor organizations with the most unpopular trusts, and accuse them with being conspiracies to increase the cost of living. They collate with an industry worthy of a better cause the most remote, abnormal and exceptional misdeeds of individual members of labor unions. They claim that the purpose of "citizens' alliances" is to create "a national power for general peace." But they would establish the peace of extermination. The Socialists say, "We have nothing to arbitrate with the employer; we would abolish the employer." So these writers say in effect: "We would not negotiate or arbitrate with the unions, but destroy

them." And this program they seek to justify by such exaggerated statements as these:

Tens of thousands of American citizens have been assaulted and hundreds have been murdered by these labor trusts in their bloodthirsty efforts to force all the rest of humanity to implicitly obey their orders.

What about the thousands of decent white men and women, tied hand and foot, unable to work, move or act, except by contribution to and with consent of the trust? Human liberty and constitutional rights of an American citizen are denied them.

Men who have regard for the sacred mantle of liberty fought for, won and handed down to us, are patriots enough to stand together and save this fair America from chaos.

This is not the proper time to talk conciliation. Neither is it the time to talk arbitration or joint agreement. To arbitrate questions of wages and hours is to introduce artificial methods of determining what they shall be. Arbitration is only putting off the day of reckoning.

No organization of men, not excepting the Ku Klux Klan, the Mafia, or the Black Hand societies, has ever produced such a record of barbarism as has this so-called labor society.

The labor leaders are trying to force upon the American people a universal system of slavery even more degrading and more damnable than that to which the negro was subjected.

An official journal of one of the organizations that would thus promote peace by invective and misrepresentation is not content with arrogating to itself all the patriotism and achievements of American history. It assumes that the functions of the American Government have now been paralyzed by the labor unions, and it magnanimously proposes that this anti-union organization shall take to itself all executive, legislative and judicial functions. It calmly announces:

This association is composed of citizens of the United States, organized for mutual protection of person and property.

It is based upon the same fundamentals [as the United States Government] and seeks to insure the personal liberty of the individual guaranteed by the Constitution.

This subsidiary organization of the people has been made necessary by the impotence of many local municipalities to furnish adequate protection and make good the constitutional guarantee.

This publication, after incidentally charging the "labor trust" with "setting up much actual slavery and robbing vast numbers of people of their liberties," naively remarks:

The judicial mind will inquire why the people are not now thus protected by the Government set up and maintained for their protection.

Theoretically they should be, but bitter experience proves that they are not, for the machinery of the Government is slow, inert and clumsy and its movements interfered with by the manipulations of the [labor] trusts until we see great damage done before its machinery gets into operation.

"All of the 780 citizens out of every 800 who are not members of any trust" are invited by this custodian of our liberties to join his would-be substitute for the political machinery that has been running since George Washington took his first inaugural oath. It must be news to 779 out of these 780 citizens that the Government at Washington does not still live, or that the State, municipal and township systems have broken down. Is it then possible that the nation has been plunged into anarchy by the labor unions and is all unconscious of its state of woe? Is the United States a lawless mining camp, in need of this proposed national vigilance committee to save its women and children from butchery and its property from destruction?

The attempt thus to inflame class hatred reaches the height of absurdity, when it does not sound the depths of misrepresentation and malice.

For instance, one of the stock charges of these assailants of organized labor is that the labor leaders and the labor press continually incite the unions to acts of violence. This is a libel, pure and simple. There is not a labor leader of any standing in this country, nor is there a labor journal, outside of the Socialist organs that are apparently acting in alliance with the anti-union agitators, that does not persistently exhort union wage-earners against the employment of force in strikes and advance earnest arguments to prove the folly of that criminal policy.

As an illustration of a labor lecture to labor, the *Typographical Journal*, the official paper of the International Typographical Union of North America, published a long article upon the lessons of the teamsters' strike in Chicago, of which it said the principal one is:

It is unwise, inadvisable and dangerous to pin faith in the outcome of a strike by relying on force and outlawry. . . . The attempt to win a strike by the pugnacious arguments of educational committees who rely on brick throwing and pop-bottle suasion as a method of demonstrating that the striker is right and the employer wrong, will sooner or later come to grief. . . . When a union declares no other man can work under penalty of death, it assumes a position that sooner or later will become its undoing. . . . Life, liberty and the pursuit of happiness can be as well applied in union constitutions as in the Declaration of Independence. This is good unionism enough for a true American citizen by birth or adoption. . . . Unions that devote their energies to making union men instead of killing off the non-union ones are the organizations that are doing business with greater results and less trouble.

Another way in which organized labor has formally and collectively arrayed itself in the ranks of law and order is through its action as to membership in the militia. Great publicity has been given to a few iso-

lated cases where local and ignorant unions have forbidden members to belong to military organizations. A convention of one of the anti-union societies even went so far as to adopt and publish this declaration:

Whereas, Organized labor throughout the country seeks to discourage and practically prohibits membership in the militia.

This was in face of the fact that the convention of the American Federation of Labor at San Francisco, only two weeks before the anti-union convention rejected by an overwhelming majority a resolution opposing membership in the militia; and in face of the further fact that President Gompers of that Federation, which exults in its title "American," has emphatically declared it to be the duty of every able-bodied wage-earner to encourage the citizen militia. Both this action and this utterance were published broadcast. The resolution of the anti-union convention, therefore, could not have originated in ignorance but must have been founded in malice.

Another example of the wise counsel against all forms of coercion that organized labor is receiving from its own ranks is the contribution by Frank K. Foster, of the Typographical Union, to a symposium upon Labor Day, which we reproduce upon another page from the *American Federationist*, the official magazine of the American Federation of Labor, whose President, Samuel Gompers, is its editor.

The object of these vigilantes is the dissolution of organized labor and the reduction of wages to the lowest point consistent with the continuance of the race. Poverty, discontent, ignorance and crime would be the inevitable fruit of their propaganda, which is therefore unpatriotic as well as unphilanthropic.

The inspiration of the movement of organized labor is the elevation of the physical, mental and moral condition of the great mass of wage-earners. The movement has progressed from the medieval days and nights when workingmen were forced to meet in secret, subject to penalties for "conspiracy," up to the present time, when labor's right to organize for its betterment has undisputed legal status and when the unions make technical and general education, not violence and law-breaking, a part of their regular usages. This great advance has been long and tedious. Those who have done the marching have had to discover their leaders among themselves. Their progress has hitherto been made in the face of discouragement, derision, denunciation and even persecution. Until within a few years they have encountered the solid opposition of employers. If their aim be recognized as one for the benefit of all society, surely it behooves every element of society to stretch out a guiding and a helping hand to those who halt and stumble in their struggle upward. This is a duty that impresses itself with growing force upon educated employers, whose larger opportunities imply greater responsibilities toward the welfare of the mass. Labor should not be left to uplift itself alone and unaided. Yet more should it not be subjected to the rebuffs of would-be oppressors.

Organized labor is here and there guilty of law-breaking. Yet in every case its sins of violence react upon its own head. The lessons taught by its most advanced leaders are thus reenforced by bitter experience. There can be no doubt that labor is learning respect for the law. No one need doubt that it will use with growing wisdom the larger liberty, including just wages and proper leisure, for which its organization strives.

Assuredly, it is more in accordance with the spirit and the principles of American institutions to encourage than to repress an organized movement whose growth depends upon the development of individual character, including the qualities of self-control, self-improvement, fraternal aid and the care and elevation of the home. If organized labor makes for all these desirable ends, it is a factor for good citizenship. For wholesale denunciation of the movement because of errors incident to its progress, it would be more patriotic to substitute efforts looking to the correction of those errors, leading to a lessening of their repetition, and to guidance in the direction of those just and enlightened relations between capital and labor which experience has proved to be of most benefit to both and to the community at large.

A HEAD TAX DESIRED.

Poughkeepsie, N. Y., Eagle.

As we read the report of the debates upon immigration, initiated by the Civic Federation, we are more and more impressed with the value and importance of our own pet suggestion, namely, the imposition of a head tax upon the immigrants. It seems to us that that will furnish restriction of the undesirable. It will furnish a fund to be expended in the care of the dependent, in the distribution of useful information, and in the general supervision of the work.

TRADE ASSOCIATIONS AND THEIR REGULATION OF PRICES.

HOW EFFORTS TO PREVENT DESTRUCTIVE COMPETITION LEAD TO PARALLEL METHODS IN LABOR UNIONS AND MERCANTILE COMBINATIONS.

(BY THE EDITOR.)

Much is said nowadays about the monopolistic tendencies of labor unions. Their critics charge that they are arbitrary and even tyrannical in their enforcement of such methods as placing restriction upon output; limiting the number of apprentices in a given craft; demanding the minimum wage; opposing the introduction of labor-saving machinery; boycotting employers who resist their demands; refusing to work or to have any relations with brother workmen who do not subscribe to their doctrines and conform to their practices.

It is not our purpose here to deny the truth of any of these general allegations, or to discuss the measure in which they may be defended or should be condemned. Accepting them, for the sake of argument, as facts, we would point out that each of them is the symptom of an underlying fear—the fear that excessive competition may impair for all or destroy for some the living wages or the steadiness of employment. The root of this fear of destructive competition lies as deep as the instinct of self-preservation. The limitation of apprentices arises from the fear that a craft may become overcrowded, inciting mutually destructive underbidding of wages to obtain work. The underlying motive becomes equally obvious upon scrutiny of each of the union practices of which complaint is made.

There is much less current comment upon the manifestations by capital of this same underlying motive—the fear of destructive competition. Nevertheless, precisely the same principle reveals itself in the proceedings of capitalists, large and small, who seek to regulate the market, both as to supply and price, in practically every branch of industry and trade in the United States. These methods vary widely in their details and their operation in practice, which are modified to meet the requirements and conditions peculiar to various markets and products. But they are all alike in their common object—the prevention of destructive competition. Their avowed purpose is to insure living profits (the union's "living wage") to manufacturer, wholesaler and retailer. Their evolution involves the formation of pools, "gentlemen's agreements," trade associations and other combinations. Here and there is involved resistance, through artificial devices, to the simplification of the machinery of trade on the ground that it would decrease or destroy the business of middlemen, such as jobbers. This corresponds to union opposition to the introduction of labor-saving machinery. Combinations to maintain prices through agreement between manufacturer and wholesaler to furnish goods only to retailers who belong to the organization, correspond in many respects to the union demand for the closed shop. The boycott to punish those who do not subscribe to such agreements is employed freely and openly by mercantile associations. There is little or no concealment of these operations, and their wisdom or legality need not concern us here. They are facts of economic importance, analogous to the corresponding set of facts manifested by some organizations of labor.

Examples of these systematic efforts to prevent destructive competition in business can be found in the press almost daily, and to describe them in detail would require more than a complete issue of this REVIEW. But there are here grouped, as illustrative of the general principle, brief accounts of the methods of regulating prices in use in the drug, the hardware, the dry goods and the grocery trades:

PROPRIETARY DRUGS.

The most persistent efforts are made and the most elaborate machinery is devised to maintain the prices of proprietary drugs, or so-called "patent medicines." The total sales of these goods in the United States in one year amount to between \$80,000,000 and \$100,000,000. They constitute from 60 to 65 per cent. of the drug trade. Three organizations undertake to regulate prices. These are the National Wholesale Druggists' Association, organized in 1882, representing 90 per cent. of the wholesale jobbing trade; the Proprietary Association of America, composed of the manufacturers; and the National Association of Retail Druggists, composed of delegates from affiliated State associations and local branches. The retailers' organization has been greatly extended, the most recent local branch formed being that in New York City. It now embraces 516 associations, comprising 39,915 druggists.

The three organizations named cooperate in their efforts to prevent price cutting through agreement to cut off supplies of goods from any cut-rate house.

A recent example of the rigor with which cutting of prices is disciplined is the case of McKesson & Robbins, a wholesale drug firm of New York. The case illustrates both the working of the plan and its frank and open recognition. The National Association of Retail Druggists placed the firm upon its "cut-off list," in other words, boycotted the firm. This was openly announced in the newspapers of May 26, and was admitted by the firm. This process resulted in a

complete and costly surrender by the firm, which was announced in the *New York Commercial* on August 14 under the headlines: "Big Drug Firm Makes Amends—McKesson & Robbins Pay for Error. Result of Bad Sale. On the Black List for a Time, but is Again in Good Standing—Explains to Trade. Carload of Patent Medicine Shipped to One House but Destined for Another Known as a Cut-Rate Concern—Goods Recovered After a Hot Fight and Expensive Litigation. Retailers with the Manufacturers of the Medicine Win a Notable Victory. Cordial Business Relations Resumed Between the Innocent Parties."

All this is stated in the most matter-of-fact way, implying the tacit recognition that the boycott is an every-day weapon in the mercantile world to compel adherence to prices, just as unions strike against or boycott employers who cut wages. The article goes on to explain that a contract existed in this case between the manufacturers, the wholesale firm, and a retail firm, C. H. Loveland & Co., of Binghamton, N. Y., which bound the parties to sell no goods to any druggist who cuts prices.

It appears that McKesson & Robbins shipped a carload of medicine to Loveland & Co. The size of the shipment aroused the suspicion of the manufacturer. Investigation revealed that the medicine was really intended for another and a cut-rate firm. The boycott and surrender followed. The terms of settlement showed the completeness of the surrender. They included the return of the goods, the repayment of cost of shipment, the payment of costs of litigation and expenses of storage, the payment of a fine to the Retail Druggists' Association, and the publication of a most contrite apology by the boycotted firm.

The most ingenious device in the drug trade for maintaining prices is called the Serial Contract or Serial Numbering plan. This plan involves an exclusive system of distribution. Only authorized wholesale houses handle the goods, and they are under contract to sell only to the retail agents of the company. Every retail dealer, before he can purchase the goods, must sign a contract by which he becomes an agent of the manufacturer, and agrees not to sell the medicines to any other dealer who is not an agent at any price whatever, and to sell to others only at the authorized retail price. Each dozen of bottles sent by the manufacturer to the wholesaler is numbered, and is accompanied by a postal card bearing the same number. When the wholesaler sells that dozen bottles, he mails the card to the manufacturer, with the name and address of the retailer to whom sold. The retailer must not dispose of a bottle until his firm name has been written or printed upon each wrapper. Thus the sale of a bottle anywhere at less than regular prices can be traced, and the cutter, by the terms of the contract, makes himself liable to the manufacturer for specified liquidated damages.

The *Pharmaceutical Era* of May 11, 1905, declared:

The plan has shown its ability to accomplish the purpose for which it was designed, i. e., the prevention of price demoralization. The more of these proprietary goods that are placed upon the market with the restrictions embodied in the plan, the better it will be for the retailers, for they are thereby assured of a profit on their sales, and consequently all branches of the trade are benefited.

No more effective plan has been devised for the enforcement of the minimum wage.

A pending suit has been brought by A. G. Loder, a retail druggist in Philadelphia, for \$100,000 damages against the National Association of Retail Druggists. The complainant avers that he has been blacklisted by the association for cutting prices, and that his business has been damaged by the boycott. He states that he is not even able to keep books, lest the association learn the names of those who sell him drugs, and boycott them also. This allegation could hardly be exceeded by any union boycott against an "unfair" employer, nor could any union carry further a system of espionage.

THE HARDWARE TRADE.

Especially efforts are made to control the price of products in the hardware industry by means of pools or "gentlemen's agreements." Estimates of the amount of the output of the entire industry, whose prices are thus controlled, vary from 60 to 95 per cent. This is remarkable, when it is considered that there are at least 500 different lines of goods in this trade.

"Price Restriction" was the subject of keenest interest at the joint meeting, early in June, at Hot Springs, Va., of the Southern Hardware Jobbers' Association and the American Hardware Manufacturers' Association. Coupled with this topic was the effect upon prices of manufacturers' selling goods directly to retailers, instead of through jobbers. The report of the proceedings of these two bodies, published in the *Iron Age* of June 15, shows that not only per-

suasion, but the more drastic method of the boycott is to be employed to prevent cutting prices in the hardware trade.

As to direct selling from manufacturers to retailers, the Southern Association took the position, conveying the threat of a boycott, that:

If the manufacturer thus ignores the legitimate channel of distribution through the jobber to the retailer and the consumer, the jobbers should hesitate about distributing the products of such manufacturer, even though he be not a distributing factor in their immediate locality. It was pointed out that when unoccupied territory has thus been taken possession of and the manufacturer becomes well established as his own distributor, it will be more difficult to correct the disturbance than if action were taken in time. The spirit of the suggestion was that if the manufacturers ignore the jobbers, they could hardly expect the active support of the jobbing trade.

The same report said:

A strong sentiment apparently pervaded the meetings of the Southern jobbers in favor of manufacturers extending the system of restricted prices with a view to not only permitting, but it might almost be said, **constraining the jobbers to market goods at a profit.**

A joint meeting of the two associations was addressed by W. W. Webber, on behalf of the jobbers, who said:

All of you are advised that we want you, where it is at all feasible, to arrange your methods of handling your product to the end that the jobber will be compelled to make a reasonable margin when he makes a sale. . . . Those of us who have no desire to make money should be compelled to cease our hush-whacking tactics to the end that those who do want to succeed may do so with some degree of comfort and pleasure and to an extent commensurate with the energy and annoyance required. Some of us have no more conception of commercial ethics or of the correct principles of money-making than has a hog of a holiday or a Senegambian of "Paradise Lost," and these are the fellows for you to handle. You will not be able to do so by any milk and water policy, but must make up your minds that nothing short of a *lignum vitae* club, loaded to scatter, will suffice in some cases. . . . To embark on the restricted system you must give all concerned to understand that there are to be no subterfuges, that you intend to be alert and firm in policing your plan, and that we all look alike to you; that you will not play any favorites, nor condone offenses, but that he who strays from the straight and narrow path in this particular will wander into the hogs and bric patches of your displeasure to the tune of the exact amount of rebate due him, plus a good, stiff fine. The fine might consist of a stated amount of "Uncle Sam's Illuminated Anguish Plaster" or, better still, drop the offender from your list.

The report of the executive committee of the Southern Jobbers' Association, as summarized by the *Iron Age*, said that:

One of the most important subjects was a satisfactory arrangement between the manufacturer and the jobber for the **enforced maintenance of stipulated prices upon a profitable basis.**

A joint convention of these two associations was held last year at Atlantic City, when an article upon the subject of "Price Maintenance" was read by T. W. Williams, Vice-President of the Bissell Carpet Sweeper Company. He defined "Price Maintenance" as meaning:

An honest, equitable system of uniform prices, that is based upon the sound principle that the manufacturer, the jobber, the retailer, are justly entitled to a fair margin of profit on the sale of any article and that the quality of an article can only be maintained so long as all parties concerned in its sale cooperate and rigidly maintain uniform prices.

The system of price maintenance carried out in this particular line depends for its legality upon the right of a manufacturer of a patented article to fix the retail price on his product. This right has been sustained by judicial decisions in both the United States and England.

Mr. Williams further said:

I want to point out a significant virtue of an honest system of Price Maintenance, namely: that while protecting and conserving the best interests of the manufacturer, the jobber, and retailer, it reaches out and fully protects the consumer by insuring to the purchaser a high standard of quality in the article, and a reasonable price. On the contrary, price cutting is a species of commercial dechauchery that rests upon the relentless doctrine of the survival of the fittest; upon the narrow, cold-blooded principle that merchandising is a sort of commercial warfare; that "all's fair in war" and "the devil take the hindmost." Price cutting lowers the commercial standing of the manufacturer, jobber, or retailer who practices it, destroys profits, breeds distrust, fosters prevarication, and finally robs the consumer by debasing the quality of the commodities, upon which prices are cut, if not actually driving many of them from the market.

Could any union leader make a stronger argument in favor of the closed shop?

DRY GOODS JOBBING TRADE.

The National Dry Goods Association is also fighting to preserve the business of the jobbers from extinction through direct sales from manufacturers and commission houses to retailers. Its executive committee has declared that if these direct dealings are permitted, the business of the jobber "will not be worth continuing."

The semi-annual meeting of this association was held in New York City on June 8, behind closed doors. No manufacturers nor commission merchants were present. After the adjournment, the official announce-

(Concluded on page 11.)

LABOR LEADERS DISCUSS THE SIGNIFICANCE OF LABOR DAY.

THEY CONTRIBUTE A SYMPOSIUM TO THE "AMERICAN FEDERATIONIST," PRAISING WAGE-EARNERS' ACHIEVEMENTS AND URGING CONSERVATISM.

The official magazine of the American Federation of Labor, the *American Federationist*, published in its September number a symposium of articles upon the significance of Labor Day, which has now been made a legal holiday in practically every State in the Union, and which is recognized by the National Government in its dealings with wage-earners. Extracts from this symposium are here republished, as examples of the kind of literature that the thoughtful, conservative leaders of labor are producing for the guidance of their readers:

WORLD-WIDE TRADE AGREEMENTS.

(By James Duncan, First Vice-President American Federation of Labor.)

LABOR DAY is an American product; yea, it is of trade union origin, and therefore abiding and utilitarian.

There is a semblance of a May day demonstration in a portion of continental Europe, but it too often takes the form of discussing political vagaries some of them similar to the expressions heard on Sunday afternoons on Boston Common, week nights on "Growlers' Corner," Washington, and almost perpetually in "Bug House Row," San Francisco. Invariably the European celebrations take place at night or on the nearest Sunday to May 1, and have not the importance or prestige of our Labor Day. Our date is logical. May 1 is associated with heated discussions incidental to introduction to new trade agreements, which suggest partisan or technical debate. The first Monday in September calls for mature, cool-headed reasoning in which the speakers are untrammelled from ordinary shop talk, and by inspiration rise to the sublime in setting forth the philosophy of the economic evolution we are well into and in suggesting practical methods to be used for the betterment of mankind.

If this point is clear the suggestion follows—as night follows day—that at the coming convention of the American Federation of Labor next November in Pittsburgh, action should be taken to send a message to organized labor of the world to adopt the first Monday in September as Labor Day, the same to be a holiday set apart for the dissemination of economic instruction, to the end that a correct entering wedge can be instituted to hasten and direct the way to the brotherhood of man.

To associate a universal holiday with one of the tenets of trade unionism would forever keep the purpose in healthy thought channels. The sequence, therefore, suggests "the trade agreement," and particularly that part of it which, when entered into provides the way for pacific adjustment by conference or arbitration of disputed points as a modus operandi for the ultimate reduction of strikes to a minimum. This subject would serve two purposes: First, suggesting constructive procedure, and second, disabusing the international mind of a bugaboo that unions are formed to cause strikes. Here, then, we have concrete material with which to greet labor everywhere, and the coming convention can do no better thing than to vitalize this spark and set in motion the universal labor movement, through and because of which the organized workers can become acquainted and the unorganized may be shown a development of their true interests, from which they could not long remain aloof.

When history is written our "trade agreement" idea will be given place in importance alongside of the Magna Charta and the Declaration of Independence. It partakes of the best in both without the shortcomings of either. It aims at getting the best possible conditions with the least possible injury to either employer or employee. It is sufficiently elastic to move with the times, so will not become obsolete or hamper progressive thought and action. It does not eliminate striking, for that would be a species of slavery, but it comes near doing so in that by voluntary action disputes can be settled by conciliation and arbitration which would otherwise require force, ending in favor of those best able to resist, whether or not they were in the right.

In this direction the American Federation of Labor—that is, trades unionism—leads the world. The Hague notion of settling international ruptures is copied from the adjustment clause of our trade agreements, only that we do the trick minus red tape, while The Hague machine is yet red tape, plus what they copied from our trade agreements. We agree to give disputes arising under a trade contract to five or seven practical men, with assurance we will abide the result, and we place in the paragraph a proviso that pending adjustment there shall neither be a lockout, strike, or suspension of work. Practice crowds the fact upon us that settlement of disputes can sooner be reached, and with better results, if all hands are working than during a suspension.

If these suggestions mature, our next international circular should be top-heavy with universal eight-hour workday propaganda. Watch for action along those lines by the Pittsburg convention.

COERCION CONDEMNED.

(By Frank K. Foster, of the International Typographical Union, Boston.)

THE recent decision of the Supreme Court of Massachusetts in the case of *Berry vs. Donovan*, which decrees that the agent of a trade union is personally liable in a suit for damages for his action in securing the discharge of a non-unionist working under contract, brings up the question as to whether the permanence of unionism is necessarily dependent upon what may be called a physically coercive policy against non-unionists.

Personally, I do not believe that such is the case, and my opinion is not based upon consideration of any theoretical injustice which may be done the industrial non-conformist, whose moral obligation, we all concede, is to join with his fellow craftsmen in their endeavors for craft betterment, but solely upon the question of the best general policy for the unions themselves.

If we are to maintain our own legal "right to work how, when, and where we please," and voluntarily choose to submit to the dicta of collective bargaining for the determination of this how, when, and where, does not the inevitable logic of our position appear to be that we should concede the non-unionist an equal legal right to do the same thing? If, as in the case above cited, the particular non-union man is working under contract, and does not choose to be a party to the collective bargain for labor, how, without inconsistency, can we demand that he be forcibly deprived of that right which we insist upon for our own members?

It is a truism that a man convinced against his will is of the same opinion still, and the trade union movement has had ample opportunity of observing that the mere possession of a union card by no means makes its holder a genuine unionist. It is also true that in war times forced drafts are sometimes necessary, and the forced recruit is all too numerous in the union ranks, where he is apt to mutiny on the firing line, as did the unhappy conscripts of the Russian Czar during the battle of the Japan Sea.

There has been of late an unfortunate increase of the custom of compelling employers to act as union organizers, using them as agents for driving men into unions, a custom as reprehensible in principle as that practiced by other employers who instruct their foremen to disorganize unions by discharging union men. The unions have asked, and in many States have obtained, legislation for preventing discrimination of this latter kind. If we really believe in equality before the law, how are we to consistently object if the courts decree that what is sauce for the goose is sauce for the gander?

So much for the purely legal aspect of the question. As an economic policy the coercive method has injured unionism in two ways: It has been the prolific source of the sympathetic strike on the part of the workmen, and the cause of much of the outcry raised against the union shop, or the so-called closed shop, on the part of the employers.

Whatever sentimental virtue the advocates of the sympathetic strike may claim for it, as a practical instrument of economic warfare it has proven itself woefully deficient as a means for achieving practical results. It would, perhaps, be an extreme statement to say that the sympathetic strike is never justified, but most impartial unionists must confess that the history of the sympathetic strikes which have taken place in this country is not such as to warrant the expectation that this method can be safely relied upon as an efficient way by which to accomplish the purposes of trades unionism. The recoil of this industrial blunderbuss has commonly kicked over the man behind the gun, while the humming-bird aimed at has gotten away unscathed.

The label shop or union shop is one of the proper and rightful objective points of trade union endeavor. Its stable establishment must rest upon its business feasibility. The argument for the union shop, however, can be made sufficiently strong without compelling the employer to violate contracts with his employees. The trade agreement follows naturally in the wake of efficient organization of the sellers of labor commodity, and it is up to the wage earner himself to bring about this organization.

There may be those among us who hold that the attitude of the public toward trade unionism is a matter of slight moment and not worth bothering about. This opinion may be correct as applied to some specific instance in trade union activity, but is not true as a general proposition. The organization of labor has won a

wide public recognition for its useful industrial and social service, and won it, moreover, in the face of an early prejudice against it. It is idle to say that either individuals or associations can afford to disregard the way in which they are looked upon by the great mass of the people. The union has a character to maintain as well as the individual, and there is always weight to be attached to the criticism of unbiased observers.

But the main point after all is as to whether the dependence of trade unionists upon coercive methods of propaganda does not weaken the moral fibre of the movement. Our liberalized age has repudiated the coercive policy in theology and politics. We no longer approve of the practice of burning people at the stake for non-conformity in religious belief. We protest vigorously against employers of labor who attempt to coerce their employes into voting for a certain party. Why not carry this same principle of freedom into our own movement, and rely upon moral suasion rather than upon the big stick for our converts? It may be possible that a slight numerical loss would result from the adoption of this plan, but numbers are not everything, in unionism as elsewhere. The ideal trade unionism, therefore, appears to me to be a purely voluntary association composed of members who are unionists because they believe in unionism, and who have been enrolled by appeal to their judgment and their enlightened self-interest, rather than by pressure upon their selfish fears.

SOME UNION ACHIEVEMENTS.

(By George W. Perkins, President Cigarmakers' International Union.)

IN contemplating the progress of labor in the past twenty-five years, we find wonderful improvement, which, under the circumstances with which we have had to contend, makes its splendid achievements the most remarkable accomplishments in the annals of human effort in this or any other country. Go to Ellis Island, N. Y., or any other large port of entry, and watch the never-ending rushing flow of immigrants which sweep the country like an avalanche, and deny this statement if you can; consider the habits and customs of people coming from all quarters of the globe, some with a low and inferior standard of life; some with ideas entirely at variance with the trade union movement of our country; some with anarchistic ideas, others with socialistic leanings, and others with ideas peculiar to all points of the globe, and all at variance with ours, with no knowledge of the hopes, ambition, and aspirations of our trade union movement of this country, knowing little and caring less for our institutions and standard of life, and you have some idea of the heroic effort of the past and the stupendous task that lies before us and the effort made and to be made to organize the workers.

The task of organizing the raw recruits of the world into trade unions has been and is a stupendous one, and deserves the highest commendation of all lovers of freedom, and a better and higher social and economic state.

The obstacles, the obstructions, failures, and disappointments have been many and trying, but, despite them all, the movement under the leadership and guidance of the American Federation of Labor has grown in the time mentioned from 13 small national and international unions to its present magnificent proportions of 117 national and international unions.

This wonderful growth has no parallel in the history of the civilized world in this line or any other human endeavor, and should challenge the admiration of all students of economic endeavor.

Wages have been increased and hours reduced, the truck system and shop tyranny abolished, better sanitary conditions and more independence of the workers achieved in keeping with the onward march of our movement; in short, the whole world and the workers have been made better by the success of the trade union movement.

The splendid results and success of the American Federation of Labor and the trade unions affiliated therewith is not due to mere chance, but rather to the indomitable will and pluck of those who first had faith in the trade union movement, and, secondly, the courage of their convictions.

It is indeed fortunate for the workers and the future of our movement that those intrusted with its destinies and guidance have resolutely stood by the good old ship of trade unionism, and always kept its course in the channel of pure trade unionism and free from the rock of partisan politics and other isms upon which so many movements have been dashed to destruction.

Marcus M. Marks, President National Association of Clothing Manufacturers, New York City.
Otto M. Eidlitz, Chairman Board of Governors, Building Trades Employers' Association, New York City.
William H. Pfahler, former President National Founders' Association, Philadelphia.

On the Part of Wage Earners.

Samuel Gompers, President American Federation of Labor, Washington.
John Mitchell, President United Mine Workers of America, Indianapolis.
E. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' National Union, Quincy, Mass.
Daniel J. Keefe, President International Longshoremen, Marine and Transportworkers' Association, Detroit, Mich.
Warren S. Stone, Grand Chief International Brotherhood of Locomotive Engineers, Cleveland.
P. H. Morrissey, Grand Master Brotherhood Railroad Trainmen, Cleveland.
William D. Mahon, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
Theodore J. Shaffer, President Amalgamated Association of Iron, Steel and Tin Workers, Pittsburgh.
J. J. Hannahan, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
James O'Connell, President International Association of Machinists, Washington.
John Tobin, General President Boot and Shoe Workers' Union, Boston.
Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of United States and Canada, Philadelphia.
William Huber, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.

METHODS OF INTERNATIONAL AND INDUSTRIAL PEACE.

The rulers and peoples of the world have paid adequate tribute to the broad statesmanship exercised by the President of the United States, with the beneficent result of ending, through conference, a most destructive war. They have all recognized both the present and the future importance to peace in international relations of this brilliantly successful employment of mediation. To the realm of industry, this great event conveys a lesson as important as that which it introduces into world politics. The potency of face-to-face conference in adjusting the relations between capital and labor could receive no more emphatic illustration than in the same principle put into practice in the negotiations culminating in the treaty signed at Portsmouth.

It is not to sound a note of discord in the joyous acclaim that greets this achievement, to point out that the probability of future international wars is not entirely ended, even though it be greatly diminished; and, correspondingly, that the more frequent employment of conciliation between representatives of employers and employed cannot wholly eliminate conflicts from the world of industry.

It is natural that enthusiasts who cherish visions of permanent, world-girdling peace should hail the successful issue of the Portsmouth conference as a substantial basis for the realization of their beatific aspiration. But it should not be forgotten that this world is stern and practical. It is no discouragement to the increasing employment of conciliation and arbitration, to direct attention to the fact that their compulsory establishment, in either international or industrial relations, is but a dream. There are questions that cannot be arbitrated. So high an authority as John Bassett Moore, Professor of International Law in Columbia University, has written in this Review that "vital interests" and "national independence" may properly be excepted from an international agreement of arbitration." The latest example of agreement through conference, which averted the threatened war between Norway and Sweden, explicitly excepts from arbitration matters of dispute which affect the independence, integrity or vital interests of either. Similarly, there are in the industrial world subjects which neither capital nor labor could submit to arbitration without incurring the surrender of matters of principle that are involved in the successful conduct of business or in the elevation of the standard of living.

It would not tend to strengthen the human race, either physically or morally, if all possibility of conflict between nations, or between capital and labor, were removed. All progress involves struggle. The ability to struggle is commensurate with the ability to fight. To relieve humanity from the stern necessity of eternal vigilance would be to cast away the price of liberty. The discipline of resistance to aggression is essential to advancement. The blood of martyrs is the seed of every righteous cause.

The capacity to fight, even when latent, is an essential element to national progress, just as it is to the advancement toward the adjustment of the relations of capital and labor which shall be most advantageous to civilization. The very statesman who receives the plaudits of the world for restoring peace between Russia and Japan is a most persistent advocate of a powerful navy and army, trained to meet the emergency of any moment. There is in this no inconsistency, since the known effectiveness of armies and navies is the surest guarantee of peace and the strongest moral support of diplomacy. In a similar way, those who are most prominent in advocating industrial peace are the most ardent in encouraging the organization of both capital and labor, so that negotiations between them may have the greater prospect of success through mutual respect. Upon that basis, the incessant readjustment of their shares in production can proceed with the best assurance of that equity without which there can be no peace. The demonstration of approximate equality of power upon each side, coupled with confidence in mutual good faith, will forward the settlement of any issue. Despite the hard logic of the fact that all life involves contest, such an achievement as that of Portsmouth tends to lessen the asperities of conflict and to convey far-reaching moral encouragement to common-sense methods of conciliation.

REGULATION OF OUTPUT AND OF PRICES.

"Regulation and Restriction of Output" is the subject of a special report of the Commissioner of Labor, just published and prepared during the incumbency of Carroll D. Wright. This report is of great importance and value to students of industrial phenomena, and is unique in that no other official inquiry into its subject has been made, either in this or in other countries. The materials for the report as to the United States were in the main collected and prepared by Professor John R. Commons, now of the University of Wisconsin; while the portion relating to Great Britain was prepared by John H. Gray, Ph.D.

Now that this exposition of restrictions imposed by labor has been made, it would be appropriate for the Department of Commerce and Labor to make an investigation of the restrictive methods in use by combinations of capital and of employers. Like the restriction of output, the regulation of price has its origin in the desire to prevent destructive competition. There is a wide field for such an inquiry, for the practice exists, in one form or another, and is accepted as an every-day familiar fact, in practically every branch of trade and transportation. In an article upon another page, we have collated some illustrative examples of this practice. These might be multiplied indefinitely. The examples we cite in the drug, the hardware, the dry goods and the grocery trades could be amplified, for instance, by the traffic agreements between railroads; the anthracite railway pool; the iron and steel pools; the restriction of acreage in cotton-growing and the effort to maintain a maximum price for that material; the attempt by associated publishers to prevent the sale of books at cut prices; the farmers' organizations formed to force upward prices of the great staples; and all the list of conspicuous trusts. An investigation of these phenomena, widely variant in their manifestations but all alike in their purpose, would throw light upon the interesting question, How far is it economically wise to employ artificial methods to regulate competition in trade, as well as in production?

THE COAL SITUATION.

A portion of the newspaper press is sounding a note of alarm as to the probability of a great coal strike next spring, for which we find no warrant in present conditions. It is represented that John Mitchell, President of the United Mine Workers of America, has been making a series of fire-brand speeches throughout the anthracite fields, and that the mine operators, on the other side, are collecting vast stores of fuel so as to be prepared for a suspension of production. These are cited as omens of war. Rather are they to be interpreted as preparations essential to negotiations for peace. This is not a prediction but an interpretation of the present.

A perusal of the correct report of the address delivered by Mr. Mitchell at Shamokin, which we publish upon another page and which is in effect a summary of the motives and the utterances of his tour, will show that its tone, if firm, is most temperate. He advances a straightforward business proposition, for which his effort is to gain the practically unanimous support, in their own interest, of the anthracite wage-earners. That support can be given only through organization. If President Mitchell should be a silent and inactive leader, and if the union should thereby contain only a tenth of the mine workers, he would be in no position to appear as their representative before the operators. But if he represents nine-tenths of the workers, the operators could not refuse to consider his presentation of their demands. His recruiting of the union membership, from the miners' standpoint, is a necessary preliminary to negotiation.

Conversely, the operators would be acting with equal wisdom if they were accumulating stores of fuel. They, too, must be in a position to present with firmness whatever agreements they may have as to the relation between the union demands and the prosperity of the industry of producing, transporting and marketing fuel. Equality of position is a condition precedent to any fair bargain; and in no industry has the principle of collective bargaining been carried into effect with more

far-reaching benefit and with more signal examples of good faith maintained under strong temptation to violate agreements than in that of mining coal.

PUBLIC OWNERSHIP INVESTIGATION.

The announcement that a Commission upon Public Ownership and Operation, under the auspices of the National Civic Federation and composed of experts and representatives of all interests, would make a thorough investigation of that subject, both at home and abroad, has been received with many public expressions of approval. This approval, moreover, is accompanied with evidences of confidence that the findings of the Commission will clear up many disputed questions of fact that now confuse the current debate upon this many-sided and far-reaching question of public policy. The organization of this Commission and the allotment of its work are assurances that the inquiry will be pursued with system and vigor, and that it will be animated by an impartial determination to ascertain the whole truth.

The first meeting of the Commission will be held Thursday, October 5, at 10:30 a. m., in Earl Hall, Columbia University. An informal preliminary meeting at the headquarters of the National Civic Federation, on September 18, to discuss tentatively the scope of inquiry and the method of procedure, was attended by seventeen members. The fact that practically every shade of thought in the general Commission was represented at this meeting, gave it peculiar interest. This preliminary discussion brought out such questions as: Shall the foreign inquiry confine itself to such public utilities as gas, water, electric power and lighting and street railways? Shall it include Government ownership of railroads, telegraph, telephone, parcel post, postal savings banks, etc.? Shall it further include what comes under the general head of "municipal trading," such as municipal markets, abattoirs, bakeries, laundries, playhouses, and tenements?

A unanimous sentiment was reached that it would be unwise to undertake to cover so many topics with one sub-Commission; that those subjects, however, should all be taken up eventually, but by different sub-Commissions; and that the first sub-Commission should confine itself mainly to municipal ownership and operation of gas, water, electric power and lighting and street railways. A report of this informal non-committal discussion was sent to the entire Commission.

NATIONAL IMMIGRATION CONFERENCE.

The representative character of the Conference upon Immigration, to be held in New York City on December 6 and 7, under the auspices of the National Civic Federation, is indicated in advance by the number and the nature of the responses to the invitations. The Governors of all the States are appointing delegates, with a view both to their acquaintance with the general subject and to their particular knowledge of the needs and the desires of their own localities and industries in connection with the problems growing out of the admission of alien labor. The replies have disclosed an interest as wide and as diversified as the continent, and the personnel of the delegations is such as to ensure illuminating discussions and conclusions of value to the entire country and of international consequence. One phase of the immigration problem, the agitation for and against the exclusion of Asiatic labor, is of such growing importance that the Committee on Arrangements proposes to assign to its consideration one entire day, which may have the effect of continuing the conference upon December 8.

Ten copies of No. 1, Vol. I. of THE NATIONAL CIVIC FEDERATION REVIEW are desired at this office. Twenty-five cents per copy will be paid.

The unions which have a decent regard for the rights and opinions of employers and the general public are the ones which make the greatest and most permanent headway.—*Cigar Makers' Official Journal*.

There is no difference between the man who "kills time" the moment his employer's back is turned and the man who steals a dollar from the cash drawer.—*Clothing Trades Bulletin*.

ADVICE TO MACHINISTS.

Their President Upholds Agreements, Deprecates Strikes and Tells How to secure the Union Shop.

(From the Biennial Report of James O'Connell, President International Association of Machinists.)

WE should see to it that our organization is not made the tail to anybody's kite, political or otherwise, neither should it be allowed to be used as the stepping stone for impracticable ideas, wild theories, or unsound, unbusinesslike methods. The trade union principles as promulgated by our association should be first and foremost in all things, and the deliberations of those assembled at our conventions should be practical, not theoretical, real, not phantom.

The success of our organization up to date can be largely accredited to the splendid discipline throughout our ranks, but there is still improvement to be made in this direction.

First of all our members must be taught to respect to the full letter every agreement made by our organization. We must be in a position at all times to prove that violations of agreements are not made by our members. Where charges of violations have been made heretofore, we have been able to prove that they were the result of a misconception placed upon the agreement, and upon closer investigation it has been proven to my satisfaction that the employers are more liable to take advantage of a technicality, and thus create dissension, resulting in the best interests of both parties being lost sight of.

JAMES O'CONNELL,
President International Association of Machinists.

Our local lodges must see to it that our members obey the constitution in every particular, and those who wilfully or maliciously violate the principles for which our association stands should be summarily dealt with.

The willingness with which our members enter into strikes is a question of more than passing importance to this convention. It is, therefore, necessary, in order to secure the highest type of discipline among our members, that the laws governing strikes, etc., etc., must be more fully observed by our membership at large, and it is even the duty of the delegates to this convention to strengthen the position of the Grand Lodge by amending our laws so that trivial and unnecessary strikes will be avoided.

The employers' associations are leaving no stone unturned to misrepresent the position of the trade unions relative to what is commonly known as the union shop. They insist upon reserving the right to be the judges of all applications for employment, but refuse a similar right to the wage workers to say whom they shall work with. The open shop is purely a bugaboo. There is nothing to it but the imaginary restrictions thrown around the so-called union shop by the trade unions.

We do not interfere with the right of any individual mechanic to seek employment where he will, but we do reserve the right to say with whom we shall work. If we secure, through our efforts, better conditions of employment, we have a right to say that mechanics enjoying the results of our labors should contribute to the success of our organization in maintaining the improved conditions secured by us.

If the machinists throughout our jurisdiction would organize as they should, the open shop proposition would rapidly disappear, because the employer would quickly realize that the best mechanics, the most intelligent workmen, and the most industrious citizens could only be secured through the union. Thus we would protect our rights as union men, strengthen our position as an organization, and prove to those

who have given little thought to the question, that the trade union stands for the best interests of the wage workers of our country.

There is absolutely no fear from the so-called open shop. It is only the unfair employer who is advocating the open shop and the abolition of the union, because the open shop, as the employer understands it, means that the union must go out of existence. I am pleased to report that, notwithstanding the persistent effort on the part of the employers' associations to enforce the so-called open shop, the trade union movement is growing more powerful and influential day by day.

(Concluded from page 8.)

ment was made that there had been a discussion of the evils of direct selling. The ominous statement was added:

Everything possible will be done to arrange matters amicably, and not until conciliatory methods have been exhausted will aggressive action be taken. The Association puts its purchasing power at \$400,000,000, and this lever may ultimately have to be used in self-protection, although it is hoped that any action of this kind will not be necessary.

In other words, a boycott is threatened by this "purchasing power."

GROCERY JOBBING TRADE.

A special effort has been made this year to prevent price-cutting in groceries to save the business of jobbers, by discouraging direct sales from manufacturers to retailers. "To condemn the practice of some manufacturers going directly to the retailer with a portion of their business" was the expressed purpose of the first National Convention of Wholesale Grocers, held in Milwaukee, June 29 and 30. This convention appointed an executive committee, which was instructed to use "all legal means to induce the manufacturers of food products to refrain from selling the retail trade except through jobbers." Upon occasion, this committee is to call in additional members and resolve itself into "a Special Action Committee for any particular service in this line."

This convention, it was estimated, represented an annual business in the United States of \$1,000,000,000. It applauded, however, as if it were a labor convention listening to a union leader, such remarks as the following by its chairman, William Jordan, of Grand Rapids:

Merchants and retailers will respect a rational unionism among merchants for purposes of mutual improvement. We must not indulge in excuses, but we must firmly hold on to the just habit of insisting upon maintaining our rights as legitimate distributors.

It should be the wish of every wholesale grocer to strongly condemn the practice of some manufacturers going directly to the retailers with a portion of their business.

Rational unionism is no mean part of the whole human movement, industrial, social and intellectual, and I believe it will surely carry us forward and upward.

In the course of an address to this convention, J. A. Van Hoose, President of the Southern Wholesale Grocers' Association, related amid applause the following narrative of the penalty of the black list, inflicted upon a salesman who had dared to cut a price:

There was a complaint made to me that a man had cut the price on cottonseed. The investigation developed that that salesman sent in a sworn affidavit to the effect that he had not. He lied to his house, lied to his God, lied to his conscience. When it was proven that he had, under the czar, dictatorial power given me, I decided that only one of two things was permissible: dismissal without recommendation or that he should pay \$50 out of his own pocket. The house replied that they would take the first and not the second; that no man should take a grip out of that establishment for them who thought no more of the honor of that house than to trample it into the mire of the State of Arkansas.

That man to-day is a wanderer on the face of this earth, without a job, because he has no recommendation; and the pathos is that he lost the home which he had paid for. It had to be done. There were 5,000 other salesmen in that territory who were trying to make their living like men and gentlemen; and for their honor and protection, and the safety of their own integrity in business, it had to be done.

Compare the plight of this salesman with the grievance of the non-union man who is discharged at the demand of a union having a contract for the exclusive employment of its members.

TEAMSTERS' BENEFIT ASSOCIATION.

The "Liberty Dawn Association" is the title of the beneficial feature of the New York local of the International Brotherhood of Teamsters. It is the maxim of the parent body, "United to Protect, not Combined to Injure." Its benefit feature provides through moderate dues for the free services of a physician and for sick benefits, for benefit to dependents in case of death of a member and for benefit to a member in case of the death of a wife. The report of President James Kenney and of Secretary-Treasurer Edward Gould shows the financial condition of this Association to be prosperous. Its official leaflet contains some worthy exhortations to the members, such as:

Be faithful to your employers; Be courteous to their customers; Be kind to their horses; Be kind one to another; Don't report late in the morning; Don't patronize saloons.

 Miss Gertrude Becks, Secretary.

WELFARE WORK.

A Comprehensive, Compact and Philosophic Review of Its Growth and Practice.

(By H. H. Vreeland.)

H. H. Vreeland, Chairman of the Welfare Department of the National Civic Federation and President of the New York City Railway Company, delivered an address upon Welfare Work before the New England Cotton Manufacturers' Association, at Atlantic City, September 20.

Mr. Vreeland opened his address with the statement that there had been no time for fifteen years when there were less than 15,000 men on his pay-roll directly, and indirectly 15,000 more, and that, therefore, he had nothing theoretical to present, but appeared as a practical man with a message to practical men.

He spoke of the necessity of carrying on Welfare Work in a cooperative way with the employees, making them a part of it, and said that the mistake which had been made in the past was the placing of Welfare Work on a charity basis, when it would never succeed.

Mr. Vreeland continued:

It is encouraging to those who are giving their thought and time to the promotion of Welfare Work to have that cause recognized by an invitation to present an argument in its favor before so influential a body as the New England Cotton Manufacturers' Association. A membership which is not only national but international presents a channel through which it may be possible to attract the attention of employers to the value of Welfare Work to a degree that may be of incalculable benefit. It is with a full realization of the opportunity presented to the Welfare Department of the National Civic Federation that I shall attempt to enlist your deep interest in the work which we are promoting.

The Welfare Department is a branch of the National Civic Federation, devoted entirely to efforts to interest employers in giving especial consideration to

HERBERT H. VREELAND.

the physical, mental, and moral welfare of employees in all industries. Membership in the Welfare Department is confined to employers.

In extending the practice of Welfare Work, the department has found of especial value conferences of employers, held under its auspices in different sections of the country, for the interchange of experiences. Successful Welfare Work, when pictured by practical business men in connection with their own industries, exerts an influence toward gaining the application of similar ideas by other employers. Thus you will see that through our organization, Welfare Work is not advocated by theorists.

Care for the welfare of employees is by no means novel, although its exercise is becoming more and more scientifically understood and extensively practiced. One of the earliest problems in the development of factory life was that of the housing and of the social environment of the inhabitants of mill towns. Such towns were, at the outset, of artificial creation. Their location was determined by that of the new factory, which was, in turn, dependent upon circumstances of power and transportation. Nearly a century ago, therefore, the management of such a mill was confronted with the question of how to build houses for the workers at a cost which would afford

a return for the investment while keeping the rent within its proportion of the cost of living of the wage earners. This question of housing was accompanied by the correlative necessity of providing for these communities schools for the children, and churches, which should in some measure be the social centers of the towns, in addition to their moral influence and training.

Indeed, some of the first efforts in the United States to introduce Welfare Work were begun by manufacturers of cotton goods. One "corporation boarding house," as it was called, at Lowell, Mass., afforded evidence, not only of the employers' interest in regulating the price of board, but of the necessity of housing in order to secure the necessary operatives.

The growth of the municipality and the introduction of electric rapid transit, making possible homes in the country, have now rendered unnecessary some of these corporation boarding houses. The five corporations that manufacture cotton goods in Lowell still contribute toward the maintenance of a hospital and a technical school.

One of the members of our Welfare Department, and one who must be closely associated with you, Mr. Arthur T. Lyman, of Boston, should be listed among the pioneer Welfare Workers in this country, not only in caring for the needs of employees at Lowell but also at Waltham. The Welfare Work at Waltham has been persistently maintained and developed. Aside from the well-lighted, well-ventilated watch factory, with good cloak rooms and an emergency room for those who may be ill or exhausted, and seats for women workers who were previously supposed to hold "walking jobs," the company still maintains an interest in the social life of the employees, even though the town has grown into a municipality. The company joins the community in maintaining the band, which is now a private enterprise. The company still supervises the women's boarding house, although that for the men has been sold. There is a benefit association, and the company lends money to employees in times of stress to prevent the "money shark" evil. These do not exhaust the list of Welfare activities.

As the manufacture of cotton goods has extended to the South, mill villages in several notable instances have there been developed along broader lines than in the cotton mill towns of New England. The surroundings of the mills and the houses are beautified, flower seeds are distributed annually, and prizes are awarded for the most attractive and best kept gardens. There are kindergartens and classes in domestic science to teach the proper preparation and serving of food, how to buy groceries, the desirability of cleanliness in the home, and how to make comfortable and economical clothing. It goes without saying that a good, wholesome meal will make a more contented and efficient worker, and that the disappearance of slovenliness from the household will make the fireside an attractive and winning competitor to the saloon when the day's work is over.

The question of recreation also receives consideration, and opportunities for enjoyment, through athletic sports, indoor games, stereopticon lectures, and other methods, are opened to the operatives.

Before leaving the subject of the mill village, I would invite your attention to one of the finest examples in the United States of Welfare Work in an isolated community. This is to be found at Vandergrift, Pa., a town wholly sustained by the steel industry. Here the drainage system, piping for gas, paving, curbing, and pure water supply, were installed before the great shop was completed. A system for saving and lending money was promoted by the employer, to enable the men to own their homes. The several religious beliefs were recognized by the erection of eight churches—each with its pipe organ—and there were built school houses, an inn and a social hall. An athletic field was also supplied. In the works, there was installed the most complete emergency hospital to be found in any shop in this country; while retail stores satisfy the material needs and meet the tastes of local trade.

A more recent development of Welfare Work is its application in factories, employing both large and small numbers, in cities. Here the conditions are reversed. The factory, instead of being the creator of the city, is one of its many adjuncts and constituents. Here the problem in its beginning relates more directly to the factory itself, and to the immediate surroundings of the daily work. Physical welfare, in the stress and strain of city life and in the toil of the factory itself, becomes of initial importance. The providing of facilities for bathing, the furnishing of toilet rooms, the supplying of pure drinking water, are all elementary steps toward the health and comfort, as well as the efficiency of the workers. Many details, such as seeing that these facilities are easily available, and that they are not abused by the careless or indifferent, are involved in even these primary applications of Welfare Work.

STATIONARY FIREMEN'S SHOWER BATHS, WASH AND LOCKER ROOM, BOSTON.

THE OLD WAY OF HEATING COFFEE, DAYTON.

In the work rooms themselves, ventilation and light are of first importance. These, of course, can best be secured when a new plant is built.

Another forward step in the city factory would be the furnishing of a place for the midday meal. This may be merely a room where the employees may eat in the midst of comfort and cleanliness the luncheons they have brought from their homes, or it

My own experience as a wage earner having taught me that the unmarried man has no place to go evenings, except a hall bedroom cold in winter, led me to establish club rooms for the men employed on the street railways in New York City. A large percentage of the ten thousand men employed by our company lives in boarding houses. Many are from the country. Thirty years ago, as a brakeman on a steam railway, I was in the same position, away from home and forced to live in a boarding house, such as the railroad terminals and my wages could afford. There was absolutely no place for me in the evenings, where it was warm, except the saloon and the pool room. I said to myself, "Here my own experience shows me something our men need." The club rooms we established include an auditorium, where monthly entertainments are given, a library, a pool room, and a physician's office. They were used immediately and extensively, and a chance visitor will find the rooms filled every night in the week.

In another city and in another industry, in Chicago and in a factory where there are seven thousand employees, entrance into the home life of the employees has been successfully accomplished by having a trained nurse visit the workers when injured or ill. The superintendent of a large rolling mill in Cleveland is chairman of the visiting committee of the Relief Association, and, by visiting the homes every Sunday morn-

GIRLS' LUNCH ROOM, DAYTON.

may be a lunch room where the midday meal is prepared and served.

Some other considerations will be seats for women, elevator service for women, rest rooms or emergency hospitals, fire protection, transportation facilities, relief associations, pensions, and employees' banks for savings and loans.

Welfare Work in large cities may be extended also to careful, sympathetic and unobtrusive efforts to brighten the homes of the workers. It has been said that it is impossible to extend the influence of Welfare Work into the homes of employees in cities. My own experience refutes that assertion. When I installed a library in the club rooms of our Employees' Association, it was my purpose to reach the families. I stated at a meeting where there were 6,000 of our employees with their families, that it was the desire of the management that the catalogues of the library should go into the home of every married employee. I made it clear that we wanted the wives and sons and daughters of the employees to read the books. I also announced that if there were a man who had a son or a daughter working for an education—technical education, perhaps—and special textbooks or books of reference were needed, the books would be bought and put in the library upon application. The library is, so to speak, a family concern, and it was turned over at least twenty-five times the first winter we had it. It was astonishing, too, to see the high grade of literature that was taken out.

Our Relief Association provides for a man in case of illness or accident, a pension in old age and at the time of death a fund for burial. I have found that the wife of the average laboring man will always land on her feet, if she is tided over for a few weeks, when the husband dies suddenly. All these benefits lead us into the home life again.

OLD AND NEW WAY OF EATING LUNCH AT A CHICAGO FACTORY.

ing with the other members of the committee, it has been possible to vastly improve the sanitary conditions. The superintendent has

ployer may advantageously initiate for new employees courses of instruction relating to the work to be performed, a portion of each day being devoted to this purpose. If the hours are not so long as to weary the worker to a degree which will render it impossible for study after the day's toil, evening classes may be conducted for older employees.

With philanthropists making donations and voluntary organizations giving consideration to the solution of the tenement house problem, the city employer has not found it necessary to house those who work for him. This is a question, however, which should be given more consideration by employers in cities. In Philadelphia and New York, at least, there is need for the establishment of good boarding houses, particularly for women workers, where both sleeping rooms and good food should be furnished at reasonable rates. The custom obtaining in the women's boarding house at Wal-

tham which permits the use of the several sitting-rooms without compromise, by the young women to entertain privately their men friends should be adopted.

While it is not necessary in a city for an employer to initiate each individual effort to meet the social needs of employees, he may contribute to their satisfaction by aiding in the promotion of such movements as social centers in connection with public schools.

Indeed, the Welfare Manager in a large Chicago establishment has found one of her chief duties to be the creation of a bureau through which employees could be informed of the existence of gymnasiums in connection with public schools, domestic science classes, night schools, and art museums. The employees not only did not know of the possibility of using these opportunities, but did not feel free to do so without some form of invitation which would make them feel

gained much information through these visits which has been beneficial to the business as well.

It is, of course, impossible, in a large city where the employees live in widely distributed districts, to promote frequent evening entertainments, but the plan of taking a large hall, which is pursued by many large employers in New York and other cities, for an annual entertainment or ball, has become quite customary. These entertainments are much enjoyed by the employees, their sweethearts, and families. In my own experience I have never been able to secure a hall large enough to accommodate all who desire to attend. Several companies in large cities maintain club rooms which are not only patronized nightly by employees who desire to use the game rooms or library, but the auditoriums are used frequently for dancing parties by the different sets or cliques. It goes without saying that this is a decided improvement upon the saloon dance hall.

A notable instance in Pittsburg shows an auditorium in the center of the factory where the employees are taken once a week at the noon time, which is extended for the purpose, to enjoy a vaudeville performance, which is often supplemented by an educational course of instruction relating to the work to be performed by employees in the evenings, for Christmas entertainments for them and their families, and for other methods of enjoyment.

With the exception of the establishment of primary schools, which will be unnecessary in a city, the em-

STREET RAILWAY EMPLOYEES' LIBRARY, NEW YORK CITY.

STREET RAILWAY EMPLOYEES' POOL ROOM, NEW YORK CITY.

WOMEN'S REST ROOM, BOSTON.

welcome. City employers will find it especially advisable to provide for summer outings, and many already maintain vacation homes for that purpose. One city factory has adopted the unique plan of giving the employees two weeks' vacation with pay.

All the Welfare activities enumerated for the city factory are applicable to the mill village. It is also possible to secure helpful suggestions through Welfare Work for railroad men. They are the largest single class of workmen, and it is not too much to say that some of the railway corporations are in the front rank of employers who are giving consideration to the welfare of their employees. Here you will find rest rooms for trainmen, containing clean beds for use during the hours of uncertainty at the end of their runs while they are waiting for the return of their trains; baths, game rooms, libraries, etc., and in the engine cabs cans for drinking water. The Relief Department of railroad companies has been initiated by some manufacturing concerns.

But the needs of the employees of a railroad, a department store, or a mining camp may not entirely coincide with those of manufacturing plants, and the needs of the latter may vary greatly.

There will have to be considered the nationality of the employees, whether they are skilled or unskilled workers, as well as many other contingencies.

One may take two manufacturing establishments in the same line of work in a city but located in different districts, and find a luncheon room, for instance, required in one but not in the other. The reason is that, with an hour for luncheon in one instance the employees may go to their nearby homes and become much rested by their outing, while in the other district, the employees' homes are so remote that a luncheon room is an absolute necessity.

This brings me to a point which I desire to emphasize. This is a day of specialization. To meet this problem of what shall be done for the welfare of employees under different conditions, our Welfare Department has established a bureau which has enabled us to supply experts, who may study such conditions and recommend efforts for the benefit of the employees. A notable example of the recognition of the need of such specialized effort has been the call upon us by the Isthmian Canal Commission for two men to investigate the needs and opportunities for recreation of the employees of the Government en-

gaged in the construction of the Panama Canal, and to make definite recommendations. The Government found it essential to provide recreation for the men in addition to sanitary measures. It was discovered that, with nothing of interest to occupy their leisure time, the men become lonely and depressed, and subject to the diseases of the tropical climate. To secure a happy, contented, permanent set of men, the Government sought the advice of experts upon plans for recreation. Our force gives constant thought to this subject of Welfare Work in different industries, and, by concentrating the attention upon this one great subject and constantly studying the experiences of employees in different industries, employers may initiate Welfare Work with our assistance with less likelihood of making mistakes than has been possible in the past.

It is not possible in a talk of this nature to enter into a discussion of methods. A special essay would be required for any one of the subdivisions of Welfare Work.

It may be stated generally that employees will welcome all efforts properly introduced to provide for their physical, mental, and moral welfare. An employer who is noted among his employees for fair dealing need have no fear in introducing Welfare Work after a careful study of conditions has been made. That is to say, after recognizing the first needs of employees to be steady work, an equitable wage, and hours as short as competitive conditions will permit, the employer may successfully install Welfare Work, if proper attention is given to its introduction. A clean, attractive lunch room with wholesome food at prices within the reach of the employees, will succeed; its opposite will not. Shower baths for molders in a basement room where the temperature is lower than

AUDITORIUM, MEN'S CLUB, HOMESTEAD, PA.

in the foundry will not be utilized. On the other hand, shower baths easily accessible to the molding room with a temperature which will not be a shock to the system, kept in cleanly condition, and supplied with towels and soap and an attendant, will be not only a great comfort to the men, but an advantage to the employer, as the health of the men will thus be promoted and skilled workmen will seek employment where such comforts are provided.

An employer who gives no attention to the elimination of inequality in wages, but constantly cuts piece prices, without studying their fair adjustment, will find the employees unwilling to patronize a club house, which should afford much enjoyment, because of their suspicion that its cost has been taken from their wages.

This was well illustrated when, by the merest chance, the president of an overall manufacturing concern in Iowa found it necessary to cut the wages the very day of the opening of a lunch room which he had equipped. It is scarcely necessary to say that the employees would not go near it.

The successful prosecution of Welfare Work once installed depends upon its constant supervision. The employer and his executive force in the average concern is too much engaged with the routine business to study the needs of the employees or to oversee the conduct of the work which must receive constant attention to ensure interest in its continuance. And so, there has appeared what is called in different institutions the "Welfare Manager," "Welfare Superintendent," and "Welfare Secretary," who serves as an intermediary and helps to secure the personal touch which otherwise would be lost in our large business organizations of the present day.

One of the obstacles to the successful prosecution

PHYSICAL CULTURE ON ROOF DEPARTMENT STORE NEW YORK CITY.

of Welfare Work is the tendency of the average foreman to "knock" all such efforts. Naturally, the foreman, whose especial business is to turn out manufactured material at the lowest possible cost, is not impressed with the value of what may have appeared to be sentimental propositions. Recently the president of a company with 25,000 employees asked us to supply a stereopticon exhibit of efforts of other employers, to secure the cooperation of his foremen. He invited them to a dinner at one of the principal hotels, after which this subject was presented, when their minds were free from business cares. The evening was opened

by the employer, who expressed his interest in the general subject of Welfare Work—and let me say that the active participation of the employer is essential to its success. It was astonishing to note the surprise and interest of these men when they observed views of efforts promoted by many employers throughout the country, and found that Welfare Work is not a fad, but that it includes practical features, with good sanitary conditions as the first object. Naturally, foremen can not be expected to give a great deal of their time to Welfare Work, but they can, if not in sympathy, prevent its forwarding.

Foremen's meetings held periodically constitute one of the most valuable features of Welfare Work. The education of the foreman is essential to peace in the industrial establishment. There is nothing which causes so much disturbance as the narrow, overhearing, martinet foreman. Justice and fair dealing must be the basis of all Welfare Work.

The motive of the employer is one which comes before us constantly. While the economic value of Welfare Work must be admitted, it is pleasant to find that the average employer promotes Welfare Work from the humanitarian standpoint. It is not difficult to prove that it is desirable from a mercenary point of view. One may enumerate such advantages as the attracting of skilled employees who will seek work

where the conditions are best; good discipline and self-respect, which may be secured through opportunities for cleanliness; a permanent set of employees as against a constantly changing force which requires effort to train, and necessitates the loss of much material wasted; and a happy, contented class of workers.

May I close by quoting Dr. Eliot, who has stated: "Happiness is a state of mind much more than a state of body, provided that the elementary necessities for the well-being of the body are at hand."

HOMES RENTED TO EMPLOYEES IN LUDLOW, MASS.

PROPERTY OUTSIDE COMPANY'S CONTROL, LUDLOW, MASS.

THE CIVIC FEDERATION OF NEW ENGLAND.

MANY REPRESENTATIVES OF ITS THREE ELEMENTS EXPRESS THEIR REASONS FOR SUPPORTING ITS METHODS OF PROMOTING INDUSTRIAL PEACE.

(FROM THE BULLETIN OF THE CIVIC FEDERATION OF NEW ENGLAND.)

THE membership roll of the Civic Federation of New England, including officers and members of general committees, now numbers within a very few names of three hundred. New members are being steadily added, but it has seemed desirable to publish the acceptances received thus far, together with as many as possible of the voluntary expressions accompanying such acceptances, both as evidence that the Civic Federation is not a secret organization, whose members are taking a position they do not dare reveal, and for the further reason that a list representing, as this does, a large portion of the strongest and most influential employers and labor interests of New England can not fail to give genuine encouragement to all friends of sane and just methods of industrial peace.

This membership plan is one of the most important factors in the educational work the Federation is carrying on. It brings a definite body of representative men to the support of the ideas and methods for which the movement stands, and every addition to the list strengthens the influences that are going out through the industrial community in behalf of fair-minded and reasonable methods of dealing between employers and employees. The object in view is to build up a "prevailing sentiment" of this kind, to the point where the instinctive first step in case of a threatened dispute will be to seek a peaceable adjustment of the trouble, through whatever particular methods the special conditions may suggest, rather than to rush into hostilities at once, as has so often been the custom.

By this it is not implied that a member is committed to some fixed, specific position in this or that dispute or delicate complication that may arise, but simply that he stands, so far as may be practicable, for the just and rational methods of conference and direct agreement in industrial dealing. New members, brought into closer touch through the conferences, reviews, and bulletins of the work, with others of similar views successfully applied, find that whatever is being done is on the lines of common-sense, practical experience, and as far as possible from any visionary or theoretical "panacea" plan of social or industrial upheaval.

Much of this influence is necessarily indirect and impossible to trace or make exact record of, but the value of efforts on these lines, from whatever sources, is to be seen in the increasing tendency to adjust labor difficulties by the conference and agreement method, without special intervention or suggestion from mediating agencies of any kind. It is to promote just this habit or practice, in advance, rather than to interfere in local disputes that have passed into the stage of open conflict, that the Civic Federation devotes its principal efforts in the field of relations between employers and employees.

Typical paragraphs from letters of acceptance follow:

I beg to assure you that as far as time will permit I shall cooperate to carry out the noble objects and purposes of the Federation.—WILLIAM STANG, Bishop of Fall River.

It will give me great pleasure to join the Civic Federation of New England, and to have you use my name in support of the principles and practical aims for which the movement stands.—ALBERT A. POPE, Pres't Pope Manfg. Co., Boston.

I am willing to do anything that will tend to push forward the work of the Civic Federation, and the principles to which it is committed.—JOHN GOLDEN, Gen'l Pres. United Textile Workers of America, Fall River.

I believe any movement which will bring labor and capital to understand intelligently the position which one must assume to the other is a movement which will be conducive to good in the future.—FREDERICK C. FLETCHER, Treas'r Pocasset Worsted Company, Boston.

I shall be very glad to be counted one of your members.—CURTIS GUILD, JR., Lieut.-Governor of Massachusetts.

I feel assured that there is no more potent force in the community of greater value than the Civic Federation, and the work it will be possible to accomplish, under its wise and careful supervision will be inestimable.—PETER W. COLLINS, Pres't Central Labor Union and Agent Bro. of Electrical Workers, Boston.

It is certain that the true relations between the employer and the employed must be those of mutual respect, mutual confidence, consideration, and good will. I am heartily in accord with the principles for which the Federation stands, that the industrial system based on individual enterprise and free labor is inherently sound, and that differences between employers and employees should, and in most cases can, be settled directly between the parties themselves.—THOMAS SHEARIN, Pres't N. E. Tel. & Tel. Co., Boston.

Anything that I can do to bring the relations between the employer and the employee closer together I shall be more than happy to do.—WILLIAM H. FRAZIER, Sec'y-Treas'r International Seamen's Union of America, Boston.

I believe both employers and employees will benefit by such a campaign of education as you propose.—L. H. CARROLL, Commissioner of Labor, Concord, N. H.

I believe that all the strikes, lockouts, etc., of which I have an intimate knowledge, were unnecessary and could have been avoided if both parties to the controversy could have gotten together in a proper spirit and talked matters over, each being willing to concede that the other had rights and interests which were entitled to consideration. I have known employers of labor to use language to committees, delegated by their unions to visit them, that turned naturally conservative men into pronounced radicals who returned to their unions and advocated

a strike, when at the beginning they were opposed to a strike—had actually been chosen by the union to represent it because they were known to be reasonable, conservative men.—ARTHUR G. DAVIS, Typographical Union, Boston.

My experience has been very limited, and I have had an opportunity of testing my theories, which accord with yours, but once, on which occasion they seemed to work very satisfactorily, and I feel sure you will, in your larger field, find the same principles hold good.—S. PARKER BREMER, Treas'r Monadnock Mills, Boston.

It is perhaps too much to expect that strikes, lockouts, and other kindred evils will be eliminated altogether, but that there is room for improvement in the relations of employer and employee at the present day is a matter of common knowledge. Both have problems to face, and should be equally tolerant of each other; ready to give and take, and to respect mutual trade agreements above all things. In accepting your offer of membership, I may add that any service I can render to help the good work along, no matter how slight, will be cheerfully given.—THOMAS TAYLOR, Sec'y Loom Fixers' Ass'n, Fall River.

I shall be glad to assist in the work of the Federation, so far as I am able to.—SAMUEL BOWLES, Editor Springfield Republican.

I should be glad to be of assistance where possible in the matter of forwarding the work of the Federation.—CHARLES H. WILSON (Woolen Manufacturer), Pittsfield.

In time I look to see great results come from your body, provided you can keep men with brains and hearts at the head of the organization, and I guess you have got about the right people at present. Of course some of us "agitators" hear about all the good, bad, and indifferent qualifications of an employer, but up to date I have heard of nothing but good words for President Tuttle, and I know hundreds of men who quietly look to him, feeling they will get justice if they have any reasonable grievance.

Everywhere I have been so far I have explained the aims and objects of the Civic Federation, and you can read the expression of approval in about 99 per cent. of all the countenances. It is really the mediator between capital and labor.—PARK MITCHELL, Pres't New Hampshire State Federation of Labor.

I am in hearty sympathy with your aims and tendencies.—EDWARD MOLL, Managing Director American Oak Leather Company, Boston.

The purpose of the Federation meets with my hearty approval, as I believe it should and will with the people at large. I believe it will tend to the better understanding between the public and the buyers and sellers of labor.—LLOYD J. SMITH, Sec'y Bro. of Carpenters, Brookline.

Of course I shall be glad to be numbered among the friends of your great movement in any way you consider helpful to the cause.—E. H. CLEMENT, Editor Boston Transcript.

The *Traveler* will be pleased to do what it can at all times to forward this good work.—JOHN H. FAHEY, Editor Boston Traveler.

I feel sure that such an organization as the Civic Federation can do the greatest amount of good, and if its object is attained will leave its mark in the history of the world. I am anxious to see the unsettled condition of the industrial system change so there may be a reign of peace and safety in its stead. The movement will have the support of the Maine State Federation and its affiliated bodies.—EUGENE BRANN, Pres't Maine State Federation of Labor, Ellsworth, Me.

I am in sympathy with the purpose which the Federation represents, namely, to prevent, so far as possible, strife between labor and capital.—SAMUEL B. CAPEN, Torrey, Bright & Capen Co., Boston.

It seems to me that the Civic Federation is something to which every man of sense ought to lend his favorable influence. If you see anything that I can do to advance the interests of the association, please let me know what it is and I will cooperate.—GORDON WOODBURY, Editor the Union, Manchester, N. H.

I am most heartily in accord with the purposes and the methods of the Federation.—HENRY HOPKINS, Pres't Williams College.

It would be impossible for a man situated as I am, brought in contact with the engineer, the contractor, and the laborer, not to be interested in the solution of the industrial problems which confront us. I can ill spare the time for a new organization, but I feel that I cannot well stay out of this one.—HENRY S. PRITCHETT, Pres't Mass. Institute of Technology.

I am and have been heartily in accord with its object.—J. E. FRENNING, Pres't The S. M. Howe Company, Boston.

I freely admit that too much of an arbitrary spirit is shown by both sides at times; simply because in the narrow minds of some, labor and capital should be opposed to each other in all things. This idea is wrong and should not be tolerated, and I believe, through the good offices of the Federation, a great deal of this feeling can be removed, and both sides brought into the path that will lead to industrial peace.—THOMAS O'DONNELL, Sec'y Cotton Mule Spinners' Ass'n, Fall River.

I believe in its principles, and what little I can do to aid the cause I shall be glad to do.—LOUIS P. HOWE, Vice-Pres't The S. H. Howe Shoe Company, Marlboro.

Its principles and aims indicate that it will accomplish much.—CHARLES K. FOX (Shoe Manufacturer), Haverhill.

I believe in an organization such as you represent, where employer and employee can meet. Many times, if both parties could meet, trouble would be avoided.—A. M. HUONELL, Steam Engineers' Union, Boston.

The purposes of the Federation which, I know, are intended to bring about better relations between capital and labor and to improve industrial conditions, appeal to me very strongly, and I am most happy to become a member.—HENRY CAROT LOOGE, United States Senator.

If I had no other motive, I should wish to be identified with your work in order to show the workmen that the church is not only not indifferent to their interests, but intensely eager to serve them in all peace-making, uplifting ways. Equally does the Christian Church desire justice for employers.—DANIEL A. GOONSELL, Resident Bishop, Methodist Episcopal Church, Brookline.

I am in hearty sympathy with the aim of the Federation.—EDWARD A. TAFT, Pres't New York and Boston Despatch Express Company.

You are creating the public sentiment which will one day hold capitalists accountable to their duties to the state. On the other hand, the working class must be brought to an intelligent understanding of the immorality of intensifying class antagonisms, and to the danger of propagating demagogic utterances that, if persisted in, would ultimately undermine the industrial foundations of society.

The moral import of the work you are doing far exceeds in value the immediate benefits to employers in enhanced profits or the economic benefits to employees in increased wages.—DAVID GOLDSTEIN, Economic Writer, formerly Socialist Advocate, Boston.

I can not express my views better than to quote your circular.—EDWARD P. MASON, Pres't Mason & Hamlin Company, Cambridge.

I deem it a great privilege to become associated with a movement which I believe marks a distinct epoch in this twentieth century, and which can not but redound to the ultimate advantage and greater happiness and prosperity of all the people of our great country.—THOMAS M. NOLAN, Typographical Union, Boston.

It is a noble work, and it will be a gratification to have even an humble part in it.—A. E. WINSHIP, Editor, *Journal of Education*, Boston.

Having read the aims and objects of the Federation, and knowing something of its work, I would not be true to myself as a trades unionist and workman if I did not endorse them.

I believe in conciliation rather than in arbitration as a means of settling disputes. I believe that much more can be accomplished by conference between employers and employees, provided both meet in an open, straightforward spirit, with the aim to settle disputes and avoid an outbreak of trouble. But I believe that arbitration is vastly preferable to strikes and lockouts. In its proper place, as a court of last resort, it has much to commend it.—HERBERT W. COOKE, Typographical Union, Boston.

I believe in the sort of work which is being attempted, from my experience both as a wage earner and employer; for if wisely done it must result in the common good, which we are all after.—B. PRESTON CLARK (Trustee), Boston.

I am convinced that the association is approaching great questions at issue between capital and labor, in a reasonable and practical manner, and that through the means advocated by it, these questions will gradually form less of a barrier to the continuous prosperity of this country. I take pleasure in pledging to the association my earnest endeavors to contribute in every possible manner toward the measure which we so much desire.—ROBERT B. TREAT, President, Manufacturers' Fuel Company of Rhode Island, Providence, R. I.

A grand feature you have, that all fair-minded men will accept, is the conciliation part. This is a vital point to organized labor, as it has a tendency to avert strikes and lockouts, and does away with a good deal of the radical ideas that do and will exist in all bodies of men, whether employers or employees.—J. E. POTTS, Agent United Brotherhood of Carpenters and Joiners, Boston.

If I can be of any service in the general good proposed by your organization, I am glad to have my name proposed for membership.—SAMUEL N. BROWN, Pres't Fairbanks Co., Boston.

It is a privilege to be identified with those who are broad enough to have devoted themselves to the development of the idea for which the Civic Federation stands.—PRESTON POWO, Dennison Manufacturing Company, Boston.

Were the workers, through their representatives, allowed to approach their employers, with the thought that their requests would be listened to, without jeopardizing their livelihood, better results would be attained, and less friction would occur.

In referring to your honorable body's existence, I believe that it is a step in the right direction in bringing about such conditions, and a possibility of showing to all parties concerned a probability of bringing about the desired ultimatum.—EDWARD COHEN, 3d Vice Pres't Mass. State Branch, American Federation of Labor, Lynn.

We are heartily in sympathy with any movement which will bring capital and labor in closer touch and promote general harmony and welfare.—W. S. FORBES, Forbes Lithograph Manufacturing Co., Forbes.

The lines of work which you have laid down ought to be productive of a better feeling than has been the case up to this time.—F. B. TOWNE, National Blank Book Co., Holyoke.

It is a well known fact that if the employers and employees could be brought closer together it would do away with a good many strikes and lockouts, and it would do away with the annoyance to the public in general, who are, as a general rule, the greatest sufferers when war is raging between employer and employee.—MAX B. THORNER, Delegate Atlantic Coast Seamen's Union, Boston.

That something must be done to better the relations of employer and employee is admitted by all who give the subject any thought, and I am surely in sympathy with any rational movement with that object in view.—T. M. PERRY, Pres't Massachusetts Pink Granite Co., Milford.

I have always believed it to be an organization that was very necessary to help in bringing about industrial peace. I can not do better than endorse its purposes.—WILLIAM STANOCUMAE, Cigarmakers' Union, Boston.

We think the object of your Federation a worthy one, and we hereby apply for membership in the Civic Federation of New England.—J. E. FULLER, Manager George A. Fuller Company, Boston.

I am in hearty sympathy with your work.—J. R. MACCOLL, Lorraine Manufacturing Co., Pawtucket, R. I.

I fully agree with the plan as I understand it, and regard the idea as wise and worthy of support.—CHARLES B. ROCKWELL, Treas'r Cranston Worsted Mills, Bristol, R. I.

It seems to me easily one of the most important influences now acting to lessen the friction in industry.—JOHN GRAHAM BROOKS, Pres't American Social Science Association, Cambridge.

In my experience in labor organizations I believe many times troubles could have been avoided if we could only have got in touch with the people who really employ us, and laid before them our grievances, and talked the matter over with them in a businesslike manner. Therefore, I am willing to lend a hand to bring about an amicable settlement of the various vexed questions.—PHILIP H. SWEET, 4th Vice-Pres't Mass. State Branch, A. F. of L., Boston.

I should be very glad indeed to become a member of the New England Civic Federation, and to support its good work to the best of my ability.—HENRY I. HARRIMAN (Cotton Machinery), Readville.

I am now and have been a firm believer in the method laid down by the Civic Federation, in establishing an organization made up of representatives of all the elements who may be affected by any industrial upheaval, by creating a common meeting ground, where employer and employee may interchange ideas, thus giving all a clearer understanding of this great question of labor, the result of which must naturally greatly diminish the probability of industrial strife.—CHARLES R. STIRLING, International Ass'n of Machinists, Boston.

My feelings are that industrial peace is something well worth the serious attention of both the employers and employees; that business should be carried on with a broad spirit of fairness and justice, and with the interest of all considered; that better results are obtained by the acknowledgment and consideration of the rights of each and every person connected with any business.—HARTLEY L. LORD, Agent Chicopee Manufacturing Co., Chicopee Falls.

ARGUMENTS FOR AND AGAINST THE RESTRICTION OF IMMIGRATION.

TWO OPPOSING VIEWS FORCIBLY PRESENTED BEFORE THE NATIONAL CONGRESS OF FARMERS—THE RELATION BETWEEN ALIEN LABOR AND AGRICULTURE.

The following addresses before the Farmers' National Congress, at Richmond, were delivered on September 14 by two recognized experts upon the question of Immigration. They are cogent summaries of phases of the current discussion of the topic to be considered more exhaustively at the National Immigration Conference, to be held in New York on December 6 and 7, under the auspices of the National Civic Federation:

IMMIGRATION AND FARM LABOR.

(Address by Robert De C. Ward, of Cambridge, Mass.)

The large cities of the North and East find themselves greatly overburdened with the many problems which have grown out of the enormous and very indiscriminate alien immigration of recent years. It has become perfectly clear that the only remedies for existing conditions are, first, a considerable restriction of immigration, so that only the more desirable aliens shall be admitted; and, second, the distribution of the present congested slum populations throughout the less thickly settled parts of the country, in the West and South. While the philanthropic people of these great cities are thus preparing to unload some of their alien burdens upon the farming districts, and in this effort are naturally receiving every possible assistance from the railroads, which see in this scheme of distribution a large source of revenue to themselves, the farmers in some parts of our country are in need of farm help, and are asking that some of this great tide of inflowing aliens be turned away from the cities and out over the fields and farms.

The American farmers at present hold the key to the immigration problem. If they say: "We want anybody we can get to work for us; if we can not have an honest, strong, intelligent, skilled laborer, we will take one of low vitality, poor physique, mentally deficient, unused to outdoor work, dishonest," then the charity workers in our cities and our railroad companies will send all sorts of aliens who are generally regarded as "undesirable" into the farming districts.

If, on the other hand, American farmers clearly recognize the fact that our present immigration laws make it possible for thousands of aliens to land here every year who are not likely to be a benefit, but an injury; who are weak and sickly; who have come because they were inveigled into buying a passage ticket by a steamship agent, or were given the ticket by a charitable society, in order that they might become a charge upon the United States rather than upon the home country. If American farmers regard the welfare of their own country instead of considering only their own financial gain, then they will insist on having none but honest, industrious, healthy, and fit immigrants. Such aliens there are in abundance in the large cities, who would be far better off in the country. These are the ones whom the farmer wants. Dishonest, shiftless, sickly, and unfit immigrants there are also in abundance in our large Northern cities. These the farmer does not want. Neither do the Northern cities want them. Yet they continue to pour in on us because Congress has not yet properly dammed the flood. To send out from the large cities of the North thousands of aliens who are not desired in the country districts, simply because charitable agencies think they can thus relieve themselves of an unpleasant burden, is much like throwing one's weeds over one's neighbor's fence into his garden.

Such a wholesale distribution of aliens who are not desired on the farm would prove a burden to the country districts, and would not relieve the pressure in the cities. "To relieve the pressure in the cities without restricting the number admitted only opens the way for a still larger immigration." Europe has ten persons ready to fill each place thus vacated in our city slums.

It is evident that much of our present immigration is as unfit on the farm as in the city; that it is of low vitality, poor physique, very ignorant, often diseased, mentally deficient and of criminal tendencies, by reason of its much lower standard of living entering into unhealthy competition with American labor. The immigration which we most need to check is made up of people who are not fitted for an agricultural life. Long generations in the ghettos of Europe have unfitted the Jews for farming, and they are singularly unsuccessful at it. Armenians take naturally to certain kinds of indoor labor; Greeks become peddlers of fruit or work in factories; Syrians are oftenest peddlers. And so it is with many other races who now make up a large part of our immigration. Further, our farming interests, whenever they have been asked their opinion, have not desired a wholesale and indiscriminate invasion of Slav, Latin, Hebrew, and Asiatic immigrants, but have expressed very distinct preferences for people from northern and western Europe. And, finally, it is clear that the immigrants whom we are now getting in such large numbers from the cities of Russia, and from other coun-

tries of eastern and southern Europe, are crowding out the better classes of immigrants who used to be in the majority, and who went readily of their own choice into the farming districts. The United States Industrial Commission, only three or four years ago, made a careful study of the need of farm labor in all sections of the United States, sending out many letters of inquiry to representative farmers, and found that the most successful immigrants were those who are skilled in intensive farming. The nationalities noted as the best along these lines were the Scandinavians and Germans; also the Dutch and Bohemians. Of the races from southern and eastern Europe, the Italians alone were mentioned in this list of the more successful. Considerable numbers of Italians have proved satisfactory as laborers on the large sugar and cotton plantations of Louisiana, Mississippi, Texas and other Southern States, and also in truck farming, but there are many Southern planters who are not satisfied with Italians, and it is reported that large numbers of these farm laborers are already flocking to the Southern cities. A recent canvas of many representative State officials of the South showed a decided preference for farmers and farm laborers of Scandinavian, German, and British origin. These are the people who have the energy, skill, intelligence, and industry needed on an American farm to-day. Immigrants from southern and eastern Europe and from Asia, as a rule, crowd into the large cities, and huddle together in the tenement districts. They do not go out on to the farms, and I believe they are not wanted there, certainly not in large numbers, because of their low standards of living and of their foreign habits and tendencies, which do not improve the tone of a healthy, educated, and self-respecting American rural community. I have recently had the pleasure of reading an admirable letter from a gentleman who is an honored member and an officer of this organization. In this letter the case is put so clearly that I can not do better than quote, as follows:

"Farming, especially in the upper Mississippi valley and beyond, has been revolutionized during the past fifteen years. The successful farmer must now be a man of unusual intelligence, one able to grasp the meaning of such terms as bacteriology of the soil, feeding coefficients, protein compounds, etc., and it is safe to say that a very small percentage of the immigrants from southern Europe are capable of this. Their immediate descendants will be little more capable."

The American farmer is now in a position to exercise a determining influence upon the character of the future American race. The railroads are ready to distribute over our agricultural districts many unhealthy, shiftless and unfit aliens from our Northern city slums, and are planning to carry on this distribution on a vastly larger scale, by taking the newly arrived immigrants directly from the steamships. If such a wholesale and indiscriminate distribution is allowed to go on without a protest on the part of the farming communities, our railroads and trans-Atlantic steamship lines and European governments will have good reason to congratulate themselves. But you must realize that such a distribution of undesirable aliens will not give you the labor you need; will injure the quality of the American race of the future; will spread more widely the evils which result from exposing our own people to competition with the lower classes of aliens. Hence this congress should become a strong supporter of any reasonable measure of further selection of immigration, for it can not fail to see that the continued influx of hundreds of thousands of unhealthy, shiftless, and unfit immigrants is a burden upon, and a detriment to, the whole country. We need and want none but honest, industrious, intelligent, healthy, and fit immigrants. Any reasonable legislation which shall improve the quality, physical as well as mental, of our immigration, and reduce the quantity to the point of proper assimilation, should be supported. I believe that American farmers have everything to gain and practically nothing to lose by advocating a higher head-tax, the exclusion of aliens of poor physique, and an illiteracy test.

ARGUMENT AGAINST RESTRICTION.

(Substance of address by Nathan Bijur, of New York.)

The opponents of immigration have for a number of years relied on statistics, but unfortunately for them these statistics do not seem to have stood careful analysis. A set of figures prepared in Massachusetts indicated a high rate of criminality among the Italians and Russians and a low rate among the Irish and English. This was cited to show that the Irish and English were desirable immigrants and the Russians and Italians undesirable, but when it was pointed out that in these statistics all crimes arising from intoxication had been omitted, and that the inclusion of these crimes reversed the order, the argument turned in favor of the present immigrant.

This is but an example.

Then when accurate statistics seemed to fail, resort was had to the citation of large figures. The public was to be startled by learning that the number of immigrants had grown from, say 200,000 in the '50s and 400,000 in the '70s to 800,000 in recent years, and the cry was "How shall we absorb these strangers?" But again the analyst came forward and showed that in proportion to the total population of the United States at the various periods named, the immigration had actually fallen off, and that while the ratio of immigration to the thousand of initial population between 1840 and 1860 was from 100 to 110 per thousand, in 1891-1900 it has been but 59.

This, however, is not all. The opponents of immigration have talked only of the number who came. They have never told of the numbers who return every year. While something like 800,000 immigrants came to this country in 1904, some 325,000 steerage passengers left our ports, so that the net immigration is not a very startling figure.

Then we were told that statistics gathered by the Bureau of Immigration had shown that there were 45,000 aliens in the penal, reformatory and charitable institutions of the United States, and that their care was a great burden. Further examination, however, developed the fact that only 21 per cent. of these 45,000 had been in this country less than five years, 50 per cent. had been here from five to thirty years, and 22 per cent. over thirty years. The recent and "undesirable" arrivals, therefore, could not be responsible for this "burden on the community."

Moreover, finally, people began to ask what was meant by the term "alien" in these statistics, and as yet that question is unanswered. Is it an alien as opposed to a naturalized citizen, and if so does the taking out of naturalization papers render a man less likely to disease or accident or insanity? And how about women and children? When are they aliens and when do they cease to be such? Thus, again, the talking in big figures came to nothing.

When it is remembered that the "alien" must necessarily be a foreigner, and the foreigner, therefore, a comparatively recent immigrant, and that the immigrant is the man who takes the hard and laboring oar in the production of wealth in the community, and engages in the arduous and dangerous occupations, it is no wonder that there should be a greater proportion of sickness and incapacity in that class of the community than in any other, but that has nothing to do with the problem of immigration. It is the result of poverty, and so long as we have poor people we shall find a greater proportion of incapacitated individuals among them.

The latest phase of opposition is appeal to generalization. Gen. Francis A. Walker is cited as having said that the arrival of so many immigrants willing to work at comparatively low wages has rendered native parents unwilling to have children to compete at these wages, and that therefore the immigration is responsible for the decrease in the birth-rate. A reference to Gen. Walker's own articles shows that he admitted that the reverse might be true, namely, that the decrease in the birth-rate had made a place for immigrants, only he said that he thought it more reasonable and likely that the immigration had been the cause of the decrease in the birth-rate, rather than the result.

Of course, any one is entitled to the opposite view. In trying to reach a conclusion I am led strongly to believe that Gen. Walker's opinion is unwarranted, when I recall the notoriously low and declining birth-rate in France, which certainly can not have been brought about by immigration, since there is none there.

Then we are told that an illiteracy test should be applied. That this would exclude "undesirable" people. But since the immigrant comes here to labor, the exact connection between valuable manual work and literacy does not appear. In fact, even the advocates of this test admit that a man may be a most excellent laborer and still may be illiterate. On the other hand he may be a consummate scoundrel and be able to read and write many languages.

Moreover, illiteracy is not confined to the immigrant. Any citizen who refers to the census of 1900 will be astounded at the number of illiterates among native Americans. When it comes to the children, they are the ones that interest us. The census shows us that the children of native born parents are illiterate to the extent of 5.7 per cent., while the children of foreign born parents are illiterate only to the extent of 1.6 per cent. It is evident that the illiterate foreign parent learns quickly the advantage of education, and sees to it that his children enjoy it.

There are twice as many native born children of foreign parents in each of the States of Wisconsin and Minnesota who can not speak English as there are in the State of New York, which has nearly four times the

(Concluded on page 4.)

NEWSPAPER COMMENTS UPON THE NATIONAL IMMIGRATION CONFERENCE.

THE PRESS UNANIMOUSLY COMMENDS THE ACTION OF THE CIVIC FEDERATION AND ANTICIPATES CONCLUSIONS BENEFICIAL TO SOUND PUBLIC POLICY.

IMMIGRATION CLIPPINGS.

A GUIDE TO CONGRESS.

Chicago Chronicle.

We have to confront the problem of keeping out the undesirable without working an injustice to the desirables. It is this which worries Congress. The average Congressman naturally is disinclined to take the initiative, and thus the matter rests.

In such a situation it is possible that outside suggestion may prove acceptable, and there is consequently reason to hope that the immigration conference called by the National Civic Federation may start Congress on the right road. If the conference proposes a reasonable and feasible plan for the regulation of immigration, Congress can adopt it without placing the responsibility for it upon any individual legislators.

In that direction, at any rate, seems to lie the only immediate hope of dealing with the problem.

THE BEST BLOOD WANTED.

Boston Transcript.

The National Civic Federation will undertake an investigation of the immigrant problem and its bearing on the industrial conditions of the country. It is not always the best blood of the nations that we are now getting, whatever may have been the case in the past. It is the only purpose of our vigilance to prevent some of the very worst from flowing in. Our standards are not so high or our tests so severe, when applied in accordance with the spirit of our institutions, that those crushed at home by hunger or demoralized by tyranny can not pass the gates. We are not anxious to press toward the limits of population in this country with the kind of human ballast that we are now getting in an almost alarming measure. There is one country, which is a generous contributor to the influx into the United States, that encourages emigration, but it does not direct this encouragement toward the best blood. There is no occasion to become hysterical over this matter. On the other hand, it is poor service to befool the facts and minimize the actual dangers.

MEN AND MERCHANDISE.

New York Times.

The conference upon immigration called by the National Civic Federation will have a text its promoters did not anticipate. The arrivals of men and women during the fiscal year just closed for the first time exceeded one million, being 1,027,421. Concurrently our exports of merchandise surpassed all records by \$30,000,000, for the first time exceeding a billion and a half. We thus received the largest reinforcements of bone and sinew and parted with the largest quantity of goods produced by human labor for the first time in the same fiscal year. It is a singular coincidence, and not harmonious with much current comment.

Congestion of immigrants in the cities, deterioration in quality, artificial stimulation, disturbance of domestic industries, and other attendant evils are uppermost in the thoughts of most publicists. And there is reason for disquiet in the fact that the assimilable arrivals from our kindred nation, England, are only in the fourth rank instead of its ancient first, and that the refugees from poverty in Italy are now surpassed by those from Austria, Russia ranking third. It is indeed a pity that the British, Scotch, and Irish are substituted by Huns and Slavs, but does it follow that there is not room for them?

On September 1 Texas offered for sale 6,000,000 acres of public lands at \$1 per acre, and retains for future sale an area equal to fourteen Rhode Islands. On August 28, according to President Roosevelt's proclamation, 1,000,000 acres of the Uintah Reservation in Utah will be disposed of at \$1.25 per acre, by precedence according to lottery. With such items in the current news, it is idle to argue that the empty West does not need peopling. And the East needs labor as badly as the West needs population, as witness the cry for 50,000 harvest laborers sent out from Albany the other day.

The usual comment is that we need these reinforcements for our producing forces. This is more true regarding agriculture than manufactures. During the past decade population has increased only 21 per cent., but the consumption of iron, copper, coal, and oil has doubled, and our exports of manufactures increased \$91,000,000. But the consumption of agricultural products has so increased that our exports of breadstuffs decreased last year forty-one millions of dollars. The million of population we gained last year would have been welcomed if they came by birth. They are no less welcome as producers and consumers alike than a similar number of natives. It is only from political and moral considerations that the income of able-bodied immigrants need be doubtfully regarded. We need them economically to till our idle soil and to man our humming factories for that foreign trade which is coming to us despite many discouragements.

WOULD EXCLUDE ILLITERACY.

Philadelphia Press.

An interesting debate precedes the forthcoming Conference on Immigration, under the auspices of the National Civic Federation. The difficulty with the position of the steamship companies is that their representatives always talk in public of a readiness to obey the law, and exclude undesirable immigration, and always work in Congress to prevent any restriction. Nor is the matter much helped by the return of some 335,000 persons yearly. The worst feature of the present conditions is the tide of people moving back and forth over the Atlantic, equal to the population of a big city, earning money here and spending it abroad—mere birds of passage, tools for the contractor, with no settled relations anywhere.

Illiteracy ought to be absolutely excluded. No one can doubt this. What is really taking place just at present is that a vast group of public and railroad works—over nearly \$100,000,000 are being spent on such around New York alone—has given a great market for labor. This is being filled by drawing over a mass of indigent and ignorant immigration. Part of them will return. One of the worst evils of immigration to-day is the large number of persons who come like locusts, working for a short time, and then returning.

When this rush of railroad work is over it will suddenly be discovered that the country has half a million or so of men and women, illiterate, without resources, seeking work and finding none, alien to American restraint and American law. It is too late to deal with the three years that are past, of 1,000,000 immigrants each, less returns, but it is possible, when Congress meets, to make it at least as difficult, by high head money, for any immigrant to come to this country as to go to any other vacant region, to exclude the illiterate, and to require a high physical standard, since immigration is more and more coming from regions of a low physical standard, whose incapacity for self-government is being made visible in the colossal collapse of Russia.

NEW JERSEY WELCOMES NEW COMERS.

Trenton, N. J., True American.

The National Civic Federation has called a national convention upon immigration. The *True American* has frequently called attention to the fact that this State, with Ellis Island at her door, offers to a certain class of immigrants opportunities of the highest importance. Governor Stokes has given especial attention to the matter of reclamation of waste land, particularly in South Jersey, is acquainted with the local phase of the problem of irrigation, and has been a close student of the subject of forestry.

Among the mass of immigrants there are undoubtedly those who could aid in clearing and developing the thousands of good upland and lowland in the "Pines," and who would become wage earners and income producers within a zone whose southern radius would not extend over one hundred miles from New York City.

The object lesson is not wanting. In Governor Stokes' home county of Cumberland, Italians have established their berry farms at Vineland; in the adjoining county of Cape May, the Baron de Hirsch settlement of Hebrews, at Woodbine, has converted a desert into a paradise. The Germans of Egg Harbor make wines rivaling those of France, for the product of which nation, under other labels, they are frequently sold. The German and Italian market gardens near Camden are famous far beyond Philadelphia.

The New Jersey problem presents nothing of spectacular interest to the foreigner newly landed on our shores, and it will therefore be somewhat difficult to divert a south-flowing stream of immigration. As suggested, only a class of new comers will be useful in this State, being those having special aptitude, or a willingness to learn. A certain amount of stability will also be required on the part of the immigrants.

Of such New Jersey can assimilate all that can be induced to remain within her borders. It is, however, to be hoped that this State will be represented at the immigration convention, and that Governor Stokes will see the wisdom of appointing men or women, as delegates, who understand the purposes of the convention, and recognize the special needs of the State.

A VITAL AND PREGNANT TOPIC.

Brooklyn Daily Eagle.

The National Civic Federation in all the period of its great usefulness never dealt with a more vital and pregnant topic than this same question of immigration. That fact will be duly recognized in the approaching conference. Recognition of it by newspapers and by the public generally will prevent intemperate denunciation of laws which Congress would have amended long ago if Congress could have seen its way clear to do so. In considering the immigration problem it is well to recollect that this government is hampered in its treatment of aliens by the apprehension of that which other governments may undertake in retaliation. Frankly, we believe that the net gain to the United States would be incalculably large if nine-tenths of the immigration from Naples, Palermo, and Trieste could be shut out. But just as frankly we admit that any such wholesale exclusion is beyond the will while not beyond the power of Congress to decree and to enforce.

But between the present practically unrestricted admission and the impossible policy of rigorous exclusion there must be some mean in adopting which we may protect ourselves while not offending foreign nations. It may be found in a more careful supervision of the methods pursued by steamship companies in soliciting emigrant traffic abroad, by discouraging governmental assistance of emigration, by establishing a more rigid medical inspection, and by insisting upon the deportation to their native land of those immigrants who develop insanity or relapse into indigence within two years of their arrival here. We do not undertake to suggest the line of investigation that the Federation shall pursue nor to forecast any of its conclusions or recommendations. It comprises men intellectually eminent and socially and politically influential. Some of them are familiar through close contact both here and abroad with the conditions they will be called upon to discuss. All of them may be trusted to approach the question in the large spirit which its importance and delicacy demands and to draw from their deliberations only such deductions as are likely to be of practical value to the new Congress.

A TOPIC FOR CAPITAL AND LABOR.

Boston Advertiser.

The National Civic Federation has accomplished so much in bringing about good feeling between capital and labor that its offshoots in New York and Boston do not feel afraid to take up at the start the big problem of immigration. All phases of the subject, no matter whose toes are trodden upon, are to be discussed, not with the idea of one side forcing the other to abandon its position, but to effect a compromise. The capitalist employer is opposed to drastic rules harring out emigrants because he feels that the labor union wishes to close and to control the labor market. The union man has an idea that the employer favors immigration to keep down wages and to keep up the supply of help. Probably what keeps labor and capital apart on this question are unjust fears and suspicions on both sides. Let capital and labor talk on this subject. Let them get together on any subject, even if they do not settle the world's destiny instantly. The main point is for them to get together. The oftener they stretch their legs under the same table the fewer troubles the industrial life will know.

DISTRIBUTION RATHER THAN RESTRICTION.

Wall Street Journal.

It must be confessed that the advocates of exclusion of immigration made a very poor argument before the Civic Federation. The debate was unquestionably a victory for those who favor a continuance of our time honored national policy of keeping an open door to the people of the earth. It was shown, in the first place, that while the immigration is very large, as a matter of fact the number of immigrants per capita of population is less now than it was fifty years ago. It was shown, in the second place, that the immigrants do not all remain in the city, and that the great growth of the municipalities in the United States is not altogether due to immigration. It must be accounted for, in large part, to the crowding of country folk into the city. It was shown, in the third place, that the quality of immigration is by no means as poor as has been depicted, that it is not made up of criminals and depraved persons or the offscouring of the earth. It was shown, in the fourth place, that there is plenty of room in this country for all the immigrants who come, and that there is a real demand for their labor in many parts of the land.

It seems to us that the solution of this problem, to be discussed at the coming conference, like the solution of most other problems, lies midway between the two extremes. We should keep the door as wide open as possible. We should welcome immigration, excluding only those who are criminals or diseased,

and therefore likely to become a burden upon the people. The discrimination should be made more strict. We should endeavor to divert the immigration to those parts of the country where it is most needed. It seems to us that the problem of immigration is more one of distribution than of restriction.

THE PRESIDENT INTERESTED.

Pittsburg Press.

It is an encouraging sign that the National Civic Federation is to take up the immigration problem and endeavor to find a solution. Not only the federation, but President Roosevelt, is said to be deeply concerned by the character of our immigration during the past years and by its improper distribution. The question of the distribution of immigrants is perhaps the most perplexing of all. The restriction of immigration until such time as we shall be better able to absorb it is one of the most important responsibilities devolving upon Congress. Not until President Roosevelt takes the matter up with his characteristic energy is Congress likely to act, although the National Civic Federation's intervention will not be without influence.

A PUBLIC SPIRITED EFFORT.

Providence, R. I., Bulletin.

The Civic Federation has chosen an admirable field for its public-spirited efforts in the investigation of the great problem of immigration. The myriads of unlettered foreigners who come to our shores bring to us questions that we have long been anxiously asking but have not yet even begun to answer.

The reason why Congress has allowed this whole problem of immigration a chance to settle itself is probably that until recently American cities have needed a great amount of unskilled labor. There was comparatively little danger in immigration when almost every arrival was assured of work that he needed no training to do. But there is danger in the unchecked inflow of Europeans now that the old centers desire them no longer. Fortunately there are hopeful signs of a better regulation of the course of immigration. The South is making a great effort to secure immigrants, and it seems to be particularly eager to receive those that the North has long regarded as the least desirable, the hordes that are pouring into New York and Boston from southern Europe. These people would find a congenial climate in the tobacco and cotton belts, and the industry and frugality for which they are noted are qualities that Southerners, so long handicapped by the shiftless negro, have been praising to extravagance.

The whole great problem of immigration, then, is reduced to surprisingly low terms. The cities of the North are suffering from too many immigrants; the planter and manufacturers of the rural districts and towns of the South can not get enough of them. The remaining factor in the question is simply one of distribution. Can the South attract a large number of immigrants? If it can, will the number be sufficiently great to relieve the North of all the danger from this sort of invasion? Upon the answer to these questions depends the welfare of both sections of the country and therefore of the nation at large.

SEEK ROOM AND OPPORTUNITY.

Albany, N. Y., Journal.

The one problem that calls for speedy solution in this matter of immigration, which the National Civic Federation is to discuss, is how to induce immigrants to seek those parts of the country where the most room and the best opportunities await them. Their inclination is to remain in or near the great centers of population which are already crowded and where not only their presence is somewhat a detriment to the wage workers who are already there, but also they are unable to reap the best reward for their efforts.

Lately the various railroad companies whose lines extend into the yet sparsely settled regions of the West and South have undertaken the solution of this problem. They are making known the advantages to be found in the country along their lines, and offering inducements to settlers.

For many years to come, if only the immigrants who come from the old world each year are distributed over the parts of the country where there is yet abundance of room and of opportunity for honest toil to find ample reward, there will be no serious immigration question confronting the people of the United States.

AN ILLUMINATING CONVENTION.

Portland, Ore., Telegram.

The National Civic Federation is doing good work for the country when it takes up this subject for serious and practical discussion, as it proposes to do. In this labor it asks for the cooperation of the labor unions of the country, the chambers of commerce in all the large cities, societies that have to do with the restriction or regulation of immigration, and the various church organizations and other bodies interested in the subject.

It is readily perceivable that there is a great deal of work to be done in this field. To the average man it appears that a two days' session is altogether too short a time for the proper discussion of the many phases of immigration that will be taken up. But after all a convention such as this is but the initiative for the real work that brings results. The deliberations of the Civic Federation next December will be watched by the public in a spirit of more than ordinary interest.

EUROPEAN ECONOMISTS INTERESTED.

Chicago Evening Post.

Announcement that the National Civic Federation of the United States, prompted by the New York Civic Federation, will consider at its autumn convention the question of immigration, having special reference not to restriction but to a more intelligent distribution of immigrants, has aroused wide interest among European economists. They assume that the Washington government is satisfied, on the whole, with the existing laws affecting the immigrant and is also undergoing a reaction from the idea that the old world of late has been dumping its "undesirables" upon American shores.

DISTRIBUTION THE PRACTICAL PROBLEM.

Chicago Herald.

Much interest having been shown by various interests throughout the country in the recent conference on immigration held at New York under the auspices of the State Civic Federation, the executive council of the National Civic Federation, at the suggestion of the former body, has decided to issue a call for a national convention to discuss the whole subject of immigration, particularly the better distribution of aliens admitted into the country under the existing laws.

At the conference named some interesting statistics were produced by speakers who were not in sympathy with the agitation for further restriction of immigration either by a high head tax or by an arbitrary statutory limitation upon the number annually

(Concluded on page 20.)

SOME GREETINGS TO THE NATIONAL IMMIGRATION CONFERENCE.

HOW REPRESENTATIVE JOURNALS REGARD THE SYSTEMATIC ELUCIDATION OF
A QUESTION IMPORTANT TO SOCIAL AND INDUSTRIAL WELFARE.

PUBLIC OWNERSHIP A QUESTION OF EAGER CURRENT DISCUSSION.

NEWSPAPERS WELCOME THE INVESTIGATION, AT HOME AND ABROAD, OF A SUBJECT NOW ACUTE IN MANY MUNICIPALITIES.

(Concluded from page 17.)

admitted. The present rate of immigration is generally regarded as unprecedented, and in an absolute sense it is; but these speakers dwell on the fact "in proportion to the population immigration has been decreasing." The vast majority of the new comers, it was argued, were in every way desirable people, and there is no foundation for the statements so often made regarding the "emptying of old-world poorhouses and jails" to dump the inmates on American soil.

The convention to be called will, therefore, direct its attention chiefly to the practical question of the distribution of our immigration, while giving an opportunity to those who believe that restriction is quite as essential as proper provision for the meeting of supply and demand of alien labor.

A BUREAU OF INFORMATION.*Omaha Bee.*

The National Civic Federation has brought out the statement, preliminary to its coming conference on immigration, that there is a serious scarcity of labor in some industrial centers. Is it practicable to effect such a distribution of immigrants as is manifestly desirable? The Commissioner of Immigration has suggested a plan which very many believe would have good results and it ought to receive the careful consideration of Congress. It is simply to provide for giving trustworthy information to immigrants as to where there is a demand for labor and where the most favorable opportunities for settlement are to be found. Such information could be supplied by the government without very much expense, as the States would undoubtedly supply a great deal of it. That it would prove of very great value is not to be doubted. Having such information, thousands who now congregate in the large cities would go into the country places, to the material benefit of the latter.

Additional restrictions upon immigration are not needed. The existing regulations are ample if properly enforced. The real question is to effect a distribution of the immigrants where labor is in demand and they can be most useful.

SEND ARRIVALS WHERE NEEDED.*Pittsburg Gazette.*

The National Civic Federation will discuss from various points of view the question of the distribution of immigrants. Commissioner Watchorn earnestly declares that the law is being rigidly enforced, but the law is not stringent enough to keep out many who are undesirable to any part of the country. However, the question to be discussed by the Federation is distribution, not restriction, as it is felt that under present conditions the only thing to be done is to guide the tide of immigration so that those unsettled portions of the country will get what benefit there is to come from an added population. It is hardly necessary to say that no hard and fast rule has been discovered that will coax the new comers into those sections of the country where they are needed. That may come later, however, when the government decides to take it up.

A FRIEND OF RESTRICTION.*Rochester, N. Y., Chronicle.*

The Civic Federation's conference on immigration, no doubt, will throw a flood of light upon this question. The reports of

consular officers, of State and municipal institutions—penal and charitable, of steamship companies and of the Immigration Bureau of the government, will be focused on that gathering and discussed intelligently and systematically. The results can not fail of affording great assistance to Congress in formulating a plan for the better regulation and control of immigration.

This country would not suffer in its material development—on the contrary, it would be benefited—if the great bulk of immigration now pouring in on it like a mighty tide of turbid and polluted water should be restrained and turned back for years, if not permanently. The population we now have is fully equal to the further material development of the continent, and what it would lose in quantity by restricting immigration would be more than counterbalanced by the quality of our people after a few years of normal growth under American influences.

PROBATION BEFORE NATURALIZATION.*Brooklyn Standard Union.*

The discussion upon immigration, under the auspices of the National Civic Federation, is proving both educational and valuable. One point brought out is that a large percentage of immigrants, amounting to something like 40 or 45 per cent., return to their native lands after remaining here for a while, so that the apparent increase, based solely on the figures of arrivals at our various ports, is far from being a permanent one. But there is plenty of room here for the healthy, virile, industrious immigrant, whose intent is to be self-supporting, law-abiding, and finally to become a loyal American citizen. Only he must not remain in the already overcrowded cities. The farms, the wheat fields, and the mining camps will welcome his presence, and a thousand other occupations invite his activities. Distribution of immigrants, however, is a prime essential, while concentration is a menace. There must be manifest sympathy with American civilization and ideals before the alien can be safely admitted to citizenship. It is the potentiality of a foreign education and environment that constitutes the real peril in permitting millions of men to vote on questions which it is impossible they can properly understand. The present law should be promptly and radically amended. While permitting all immigrants now here to be admitted to citizenship as soon as they shall have complied with existing regulations, a time ought to be fixed after which no alien should be allowed to take out final papers unless he shall have resided here for at least ten years—fifteen years would be better. Also, after a certain prescribed period, no foreigner should be admitted to citizenship unless he can read and write the English language. With these safeguards, the danger involved in large annual additions to our population from foreign lands would be reduced to a minimum. The public schools and an American environment would do the rest.

SOME MISAPPREHENSIONS CORRECTED.*Pittsburg Post.*

The information sought by the Civic Federation is most desirable and enters largely into the repeated discussion of the immigration subject by citizens generally, and serves to correct much popular misapprehension, that a majority of the arrivals are from jails, asylums, and poorhouses. This is far from being

the case, and the information will be received with satisfaction and contentment.

There are many poor people in the United States and in New York City, but this does not imply, by any means, that a majority of the immigrants are outcasts and unfortunates. There were always poor people in the country. We have had poor among us since the first immigrant landed here in the person of Columbus, or with the Pilgrim fathers, or the Cavaliers at Jamestown. There has been a tremendous rush of immigrants at different periods in our history, but it is very small in its relative figures to the general population of the United States. The State of Texas is larger than Germany, and is capable alone of feeding a population very much larger than that of Germany, which is some fifty-five millions.

It is fallacious to attribute the great increase of the population of cities and towns in the United States to immigration. Statistics show that the great increase of the urban population in this country is due to the fact that the people have come from the country to the cities because they like the life and opportunities of the city best. We arrogate very much when we attempt to shut them out from the cities, and besides that it is impracticable and un-American.

The immigrants for the first ten or twenty years, until the new generation is on its feet, take what may be called the laboring oar of the population. They are poor and industrious. If more immigrants are found in hospitals than natives, it is because they are more pressed into hazardous occupations.

Allegheny County maintains well on to a hundred thousand immigrants, and they are certainly the most industrial and frugal of the population. Compare them with the negroes! What would our mills and furnaces and mines do if deprived of their willing hands and great labor capacity? The United States is great and this industrial hive is great not because of any one class of population, but because it represents an amalgamation of various types. In the form of immigration there has come to us all the forms of activity that have made modern civilization. Immigration of the past hundred years has been the basis and source of our prosperity and advancement in science, industry, and invention. No sensible or observing man or woman can vote or declare immigration a peril. The wars of the Republic have declared it otherwise, and the progress of the country proves it the reverse day by day.

GOOD RESULTS ANTICIPATED.*Los Angeles, Cal., Herald.*

That there is a decided trend of sentiment in favor of a general overhauling of the immigration laws is shown clearly in the call which has been issued by President August Belmont, of the National Civic Federation, for a general and quasi-official conference on the subject, to be held December 6 and 7 in this city.

The conference will be under the auspices of the Civic Federation, and the Governor of each State in the Union has been requested to name ten delegates to represent his State at the meeting. In addition to this, the call for the meeting includes a set of questions which the various delegates are expected to answer for their respective States.

With an organization such as the National Civic Federation taking hold of this great problem, and at a time when the sessions of Congress are about to be resumed, it is believed much general good can be accomplished.

INVESTIGATION OF PUBLIC OWNERSHIP AND OPERATION APPROVED.

EDITORIAL OPINIONS INDICATE WIDE INTEREST IN THE SUBJECT AND UNANIMOUS CONFIDENCE IN THE WORK OF THE COMMISSION.

A NON-PARTISAN INQUIRY.*Washington Post.*

The announcement that the National Civic Federation proposed to collect accurate data concerning municipal ownership in Europe and the United States will be accepted as indicating an honest and non-partisan effort to obtain facts upon an important subject. The question of the wisdom and practical advantage of municipal ownership is one that is just now thoroughly engaging public attention. It is true that the skyrocket which ascended when Judge Dunne was elected mayor of Chicago has come down as a stick, but the advocates of the alleged reform do not seem to be discouraged. On the contrary, they assert that the failure of their ideas to materialize in Chicago is merely a temporary and not a permanent setback to their cause.

The names of the distinguished gentlemen who are to represent the National Civic Federation in its inquiries are a sufficient guarantee that practical results will be obtained. It is worth while, however, to note that during the past three or four years there have been no more active propagandists of the municipal ownership idea than a coterie of United States consuls in England and Germany. If the suggestion did not seem absurd, it could easily be intimated that these officials were acting under instructions. They have written industriously and enthusiastically upon the subject, and their reports have been given wide circulation through government agencies. Within the past few weeks the Bureau of Statistics has issued another volume of consular reports, devoted entirely to details of experiments in municipal ownership in Austria, France, Germany, England, and Canada, and the consuls, in nearly every case, take occasion to express their hearty approval of what has been accomplished. It is, at least, a curious coincidence to find these consuls sounding the praises of the new system.

What is the meaning of this sudden and universal chorus of acclaim regarding municipal ownership? Why are these consuls, in every part of the world, viewing the new system through rose-colored spectacles? We are loth to believe that society is being revolutionized, despite the mass of evidence officially promulgated, and for this reason we are glad to see the inquiry undertaken by the National Civic Federation. If it shall be found that the United States consuls are reporting facts and that a long step toward governmental millennium has been taken, a great work will have been accomplished. Up to the present time, however, we must be content to express our surprise that our consuls, for some reasons or other, have failed to discover a single fly in the ointment of municipal ownership.

MAKE THE INQUIRY THOROUGH.*Chicago Tribune.*

The agitation in behalf of municipal ownership has attracted the attention of the National Civic Federation. It has decided to appoint a committee to investigate thoroughly the national and municipal ownership and operation of public utilities. This is no summer vacation job. If the committee be thorough and go over the entire ground in Europe and America, it will have to put in many months of hard work.

If the committee of the Civic Federation will investigate all the elements of the question and present in bold relief the essential differences between municipal government at home and abroad it may do some good. The incorrigible municipal owner-ites will not be convinced. They will say that the report is the work of a "capitalistic organization." Mr. August Belmont, who is at the head of the federation, is identified with corpora-

tions controlling some of the public utilities the municipal owner-ites would like to lay hands on. They will fall back on their solitary argument, that an American city can do anything a European city does.

There are many men who have not waded deeply into the swamps of municipal ownership and operation and whose brains are still above water. A searching, complete inquiry into the boasted virtues of municipal ownership would do them good. It would show them why there are some things which European cities can do and American cities can not. It might lead them to the conclusion that the greatest need of American communities is the divorcement of politics from local administration. If English cities can do that and thrive because of it, why can not American cities?

A STUDY OF MUNICIPAL PROBLEMS.*Boston Transcript.*

Whether inspired by that evangel of municipal ownership, Mayor Dunne, or whether acting on its own unprompted initiative, we know not, but the National Civic Federation has been making elaborate plans to collect accurate data bearing on that problem, both in Europe and America. To this end it has selected a commission of about seventy-five members, including some of the best known lawyers, scholars, and business men in the country, to meet early the coming fall and outline methods for pursuing the work. It is intended, according to the purpose stated in its circular, that this investigation shall disclose actual results of public ownership and operation, so far as they have been determined not only in this country, but in all countries.

UTILITIES AND TAXATION.*Cincinnati Enquirer.*

The National Civic Federation has appointed a commission of seventy-five members to collect data on municipal ownership in this country and in Europe. This is a subject on which there is now a great need of reliable and well digested information. Those who have gone mad in the United States on the subject of municipal ownership have relied on a few European examples which have been apparently successful, but have failed entirely to consider the differences in form of government. Because street cars are run by the municipalities in Europe the conclusion is quietly drawn that all municipalities in the United States can do the same thing—that all they have to do is to do it on the same general plan that Horace Greeley proposed for resumption of specie payments. The information should be thoroughly digested, and especial trouble should be taken to learn how the public is to acquire the utilities without overwhelming the people with taxation.

A WELCOME MOVEMENT.*Boston Globe.*

There are so many contradictory and unsatisfactory statements concerning municipal ownership of public utilities it is gratifying to learn that the executive council of the National Civic Federation is formulating plans to collate accurate data on this subject here and abroad. This plan of the federation will give great satisfaction to the officials of municipalities, as well as to all citizens. All people desire their local government conducted in the most economical manner, but they are bewildered by all the current arguments for and against municipal ownership.

Nor is it strange they are puzzled because most speakers say more about the theory of municipal ownership than they do relative to its practical workings abroad.

Municipal ownership works well in some foreign communities, chiefly because the conditions there are favorable. In many parts of Europe where this system is established it is satisfactory and successful because the national or imperial government is behind it, having more to say about the management of cities than do the state governments of the United States.

In some foreign cities most of the local officials, from the mayor down, are unpaid, and the national government has so much power over the finances of the communities that local difficulties are reduced. Hence it is easy to utilize the cheapest methods of conducting the affairs of a municipality.

Most of the public utilities can be and are managed by those foreign cities because there are no outside corporations interested in them. The general government, and not corporations, deals directly with the cities.

Glowing accounts reach America of the success of municipal ownership abroad, but this commission of the Civic Federation can ascertain the actual facts in each case.

It can investigate and inform us concerning wages, hours, and conditions of labor, collective bargaining, the cost and character of services, political conditions, civic service, the spoils system and municipal corruption, and, most important of all, the financial results and taxation. This data will be of vast importance and settle all doubts as to the actual financial value of municipal ownership methods.

SEEKING LIGHT SENSIBLY.*Pittsburg Dispatch.*

It will prove gratifying to those who have for years felt that municipal ownership of public utilities would solve city franchise problems to learn that an exhaustive investigation of the subject, both in this country and abroad, is being undertaken by the executive council of the National Civic Federation at the instigation of its departments of Industrial Economics and Trade Agreements.

There are few in this country who have given the subject any study who are convinced that municipal ownership will not result in an expansion of present evils rather than a solution of them. Political conditions are so different in the United States compared with European municipalities that even those who have placed in successful operation abroad public utilities under municipal and even government guidance, have been forced to admit after an American investigation that political machines and the opportunity for graft would be strengthened by the addition of municipal corporations with their heavy revenues and their armies of employees who would add to the campaigning strength of the rings and bosses.

The National Civic Federation, however, is seeking light in the most sensible way. It has selected a committee whose report will be above reproach and whose conclusions can be regarded in no other light than that of wise conservatism. Nothing of tangible and practical worth to the various municipalities may result from the investigation, but the careful study of the great and growing question by men of such ability and standing as those selected can not but result in a wider knowledge of the subject and of undoubted good. It is certainly a step forward in reaching a practical understanding of a problem which has threatened for some time to become a national issue.

Special Public Ownership Number.

The National Civic Federation Review

VOL. II. No. 6

NEW YORK, NOVEMBER 1, 1905

TEN CENTS

ALL THE FACTS OF PUBLIC OWNERSHIP.

A COMMISSION, REPRESENTATIVE OF ALL INTERESTS AND OPINIONS, APPOINTED BY THE NATIONAL CIVIC FEDERATION, WILL INVESTIGATE HERE AND ABROAD.

THE Commission on Public Ownership and Operation, selected by the National Civic Federation, which is to investigate the several phases of that subject in America and abroad, held its first meeting in Earl Hall, Columbia University, New York, October 5. The meeting was devoted exclusively to a discussion of the scope and the method of the investigation. The impartial attitude of the National Civic Federation toward the investigation, as a purely scientific inquiry of great anticipated value to the entire country, was made clear in a letter written by President August Belmont, who was unable to be present on account of serious illness.

The full Commission elected the following officers:

Chairman, Melville E. Ingalls, Chairman Board of Directors Big Four Railroad, Cincinnati;

First Vice-Chairman, John Mitchell, President United Mine Workers of America, Indianapolis;

Second Vice-Chairman, John G. Agar, President Reform Club, New York City;

Secretary Edward A. Moffett, Editor *Bricklayer and Mason*, New York City.

The Commission elected an Executive Committee and a sub-Commission. The latter was authorized to make an investigation, in America and abroad, into the comparative results of private and public ownership and operation of gas, water, electric power and light, and street railways. This sub-Commission may add to its numbers and may divide itself and allot its work as it sees fit, and is to report its final conclusions to the full Commission.

The membership of the general commission was originally selected in August by the Executive Council of the National Civic Federation, upon request of its Departments of Industrial Economics and of Trade Agreements, to make a thorough investigation, in this country and Europe, of National and Municipal Ownership and Operation of public utilities. A statement issued from the headquarters of the Civic Federation at that time said: "The current discussion and acute agitation of this sub-

ject indicate its hold upon the popular mind and the necessity for its analytical and comprehensive examination. Its present debate is often inconclusive because

of contradictory or unsatisfactory statements of fact. It is intended, therefore, that this investigation shall disclose the actual results of public ownership and

operation, as far as they have been undertaken in the United States, and of their more extensive practice in foreign countries. The ascertainment of these facts will afford a solid basis upon which to found discussion and conclusions for the guidance of future policy.

"The scope of this inquiry will cover the relative advantages of Public Ownership and Operation, as compared with Public Ownership and Private Operation, and Private Ownership and Operation. Each system will be examined with regard to its effect upon, among other topics:

"Wages, hours, and conditions of labor;

"Collective bargaining;

"Cost and character of service.

"Political conditions, civil service, spoils system, and municipal corruption;

"Financial results;

"Taxation."

A list of the membership of the general Commission is appended to this account of its organization. An informal preliminary conference between as many of its members as could attend was held in the headquarters of the National Civic Federation on September 18. Its proceedings were reported to the general Commission, as will appear in the following account.

A verbatim report of the meeting of October 5 follows:

The meeting was called to order by Samuel Gompers, Vice-President of the National Civic Federation and President of the American Federation of Labor.

Mr. Gompers, upon taking the chair, said:

You are all acquainted with the purposes for which this conference was called. The question of the municipalization of public utilities has been a subject that has grown in interest for two or more decades. It has come specifically to the attention of an increasing number of people within the past few years. With the general

MELVILLE E. INGALLS,
Chairman Commission on Public Ownership
and Operation.

JOHN MITCHELL,
1st Vice-Chairman Commission on Public
Ownership and Operation.

2d Vice-Chairman Commission on Public
Ownership and Operation.

EDWARD A. MOFFETT,
Secretary Commission on Public Ownership
and Operation.

discussion of this subject, its various features have been brought to the attention of students and thinkers and practical men. In the minds of some, doubts have arisen as to the practicability of such ownership; as to its wisdom; as to its advantages; as to its possibility of introduction in our American industrial and city life, and its effect upon the cost and comfort of living. On the other hand, the earnest advocates of that proposition assert that it will be an efficient method by which corruption in our municipal affairs may be practically rooted out.

It is not my purpose to discuss the proposition from either standpoint. There is one question, however, to which I would desire that some attention be given; and that is the statement, made and repeated, that the municipal ownership of street railways, for example, is inconsistent with the recognition of the workers as an organized entity; in other words, as organized bodies. I am not quite sure whether this hypothesis is correct; I am not willing to have my mind persuaded into the belief that it is true, or that any condition of affairs could arise, in either our Federal or State or municipal governments that, under any duties or functions that they may desire to undertake, would be inconsistent with the recognition of the working people in the only agency—that of organization—that they can use as a potent factor in protecting and promoting their rights and their interests. But this is a question that must be considered in order that we may have a full understanding of what the general proposition involves.

The municipal ownership of our street railroads and other public utilities is a great impending question occupying the attention of the people of the cities of our country; and it is well that it does. I am sure the advocates of municipal ownership will have no cause of complaint if a rigid, full, and analytical investiga-

will be compelled to subject myself to their treatment. Therefore it is a matter of personal satisfaction to me that you are here in New York to take my place.

The subject of municipal ownership and operation of public utilities is forcing itself upon the attention of all thoughtful persons. Unfortunately, the very lack

ALEXANDER H. REVELL,
Merchant and Manufacturer.

of comprehensive and authoritative data and information leaves the discussion to theorists on both sides who often advance arguments which can neither be accepted nor rejected, for the very reason that no authoritative data exist. The National Civic Federation, through this Commission, will now try to obtain true and reliable facts to guide the student and legislator in seeking the best means to establish peace and maintain co-operation between capital and labor. To the accomplishment of this purpose, I have encouraged this movement and advocated the missions of the sub-committees.

The relations of capital and labor are vital to the prosperity of the individual and to the State. It is proper, therefore, that arguments should be based on correct facts and known conditions. The Civic Federation has no greater work among its varied duties than to secure these data. The committee, which this Commission purposes to send abroad, will represent every shade of thought and opinion on the subject. This committee, when it returns, will report to a larger commission of men at home, likewise drawn from every part of the country and representing every phase of life. The Civic Federation has no interests to serve and no arguments to make on the subject, but to present the facts and conditions as they may exist abroad and at home, for the use and benefit of the entire country, without respect to party and without respect to special interests.

E. E. CLARK,
Grand Chief Brotherhood of Railway Conductors.

Believe me, had I been able to attend the meeting, I would certainly have been present, and I trust that I may regain my health and strength at an early date, in order that I may cooperate in every way in the furtherance of the great object of the gathering over which you are to preside to-morrow.

I remain, yours very truly,
SAMUEL GOMPERS, Esq.

AUGUST BELMONT.

THE CHAIRMAN:—It is because of the regrettable and unforeseen absence of our President that I preside over your deliberations this morning.

It has been suggested to me that the gentleman who acted as the secretary of the preliminary conference be requested to act in that capacity this morning, Mr. Edward Moffett, editor of the *Bricklayer and Mason*, New York. If there be no objection to that appointment, Mr. Moffett will be requested to act.

Mr. Moffett was unanimously made Secretary.

Mr. MITCHELL, President of the United Mine Workers of America, Indianapolis:—I move, Mr. Chairman, that a letter of acknowledgment be sent to President Belmont, of the National Civic Federation, expressing regret for his illness and earnest wishes for his speedy recovery.

Prof. FRANK PARSONS, President of the National Public Ownership League, Boston:—I move that the letter also state the Commission's appreciation of the impartial spirit, breadth of view and desire to bring out the facts manifested by President Belmont and the Civic Federation, throughout the organization of this Commission.

The motion, so amended, was unanimously adopted.

The Secretary read a report of the informal meeting of September 18. This report showed that the preliminary discussion brought out such questions as:

Shall the foreign inquiry confine itself to such public utilities as gas, water, electric power and lighting, and street railways?

Shall it include Government ownership of railroads, telegraph, telephone, parcel post, postal savings banks, etc.?

Shall it further include what comes under the general head in England of "Municipal Trading," such as municipal markets, abattoirs, bakeries, laundries, opera houses and tenements?

EDWARD ROSEWATER,
Editor Omaha Bee.

Every one expressed himself freely and a unanimous sentiment was reached that it would be unwise to undertake to cover so much territory with one sub-commission; that those subjects, however, should all be taken up eventually, but by different sub-commissions. As municipal ownership and operation of gas, water, electric power and lighting, and street railways are now uppermost in the public mind, it was thought that the first sub-commission should confine itself mainly to these subjects. It was the consensus of opinion that there should be a single sub-commission, rather than two, for the domestic and foreign investigations. According to this plan, one portion of a sub-commission would pursue its investigations in this country and the other abroad. They could then embody their conclusions, should they agree, in a single, unified report.

The following members of the general Commission attended this informal preliminary meeting:

Frank J. Goodnow, Columbia University, New York City.
John H. Gray, Northwestern University, Chicago.
Frank Parsons, President National Public Ownership League, Boston.
James P. Archibald, Brotherhood of Painters, New York City.
Walton Clark, United Gas Improvement Co., Philadelphia.
J. W. Sullivan, Editor *Garment Workers' Bulletin*, New York City.
Milo R. Maltbie, Franchise Expert and former Editor *Municipal Affairs*, New York City.
S. W. Meek, Editor *Cleveland Leader*, Cleveland.
William J. Clark, Foreign Manager General Electric Co., Schenectady.
J. B. Cahoon, Consulting Engineer, New York City.
T. C. Martin, Editor *Electrical World and Engineer*, New York City.
Ralph M. Easley, Chairman Executive Council, National Civic Federation, New York City.
Timothy Healy, International President Stationary Firemen, New York City.
W. D. P. Bliss, Sociological Author, New York City.
C. B. Firestone, *Evening Mail*, New York City.
John Bancroft Devins, Editor *New York Observer*, New York City.
Edward A. Moffett, Editor *Bricklayer and Mason*, New York City.

DR. ALBERT SHAW,
Editor Review of Reviews.

tion is undertaken, so that the real facts may be ascertained and clearly, impartially, and without bias presented to the people of our country in such form that they may understand that the truth is before them, unvarnished and untarnished by individual predilections. I am sure that those who may be opposed to municipal ownership should have their minds in such a receptive condition, that when the presentation of facts is made, these facts will find a ready lodgment.

At a preliminary meeting on September 18, there was some tentative, informal preparation for the first meeting, this morning, of the full Commission upon Public Ownership and Operation. I regret very much that the President of the National Civic Federation, Mr. August Belmont, is not able to be with us this morning, for regardless of what position you may take upon this question in concrete form, he has evidenced, so far as its investigation is concerned, in the most frank and open manner, his desire to have ascertained all the facts. I have a letter here, which I shall ask the Secretary to read, which will give the reason why Mr. Belmont cannot be present.

The Secretary read the following letter:

NEW YORK, October 4, 1905.

My dear Mr. Gompers:

It is with profound regret that I am compelled to notify you of my enforced absence to-morrow.

There is no function which it has ever been my privilege to exercise, and no duty I ever more desired to perform, than that of presiding at the first meeting of the Public Ownership Commission, which is entrusted by the National Civic Federation with the duty of selecting committees to seek abroad and at home information on the subject of municipal ownership and operation of public utilities.

My physicians have forbidden me to postpone an operation which they have prescribed for me, and I

Mr. R. M. EASLEY, Chairman Executive Council, National Civic Federation:—I would like to read a few letters from members of the Commission who are unable to be present to-day, for some suggestions that they contain. Prof. J. W. Jenks, of Cornell University, Ithaca, N. Y., writes:

"Your note regarding the preliminary meeting of the Committee on Public Ownership and Operation received yesterday. I am sure that the right conclusion was reached regarding the scope of the investigation. I am not entirely sure that the single sub-committee which undertakes the domestic and foreign investigations would not do better to work as a whole, instead of dividing itself into two parts. Of course it would take more time, but it is more likely to secure unanimity of opinion or, at any rate, substantial agreement on most of the points; and it seems to me that it is extremely important, under the circumstances that this report of the committee be, as far as possible, a unanimous report. I should think as regards the facts, there ought to be no difficulty about agreement. As regards recommendations for action, if any are given, there naturally would be disagreement, and even as regards the interpretation of some of the facts. The likelihood of agreement and the extent of agreement would certainly be increased if the committee can keep together through all its work."

President Carroll D. Wright, President of Clark College, Worcester, Mass., writes:

"I should say that the inquiry ought, at present at least, to be confined to public utilities which would naturally include government ownership of railroads, telegraph, telephone, parcel post, postal savings banks, etc.; but I would leave these until the public utilities, such as gas, water, electric power and lighting, and street railways, have been investigated, and I would not immediately take up municipal trading."

which the subject was then considered, I would suggest that the same plan of discussion be followed here this morning, that is to say, that each member give his view upon the questions—What subjects shall we take up, and how shall we proceed to their examination?

THE CHAIRMAN:—If the suggestion made by Mr.

FRANKLIN MAC VEAUGH,
Wholesale Merchant.

Easley commends itself to the conference we will pursue that course. The subject is now open for discussion; not necessarily as to the advisability or inadvisability of municipal ownership, but as to whether a Commission shall be appointed to investigate the various projects for the municipalization of utilities, or whether its inquiry shall be confined to the ownership and control of street railroads or street lighting and railroads, or the ownership of water works; and also as to whether this Commission should be divided, so that one part of the Commission may make its investigation in Europe or elsewhere, and another in our own country; or whether the Commission shall make its inquiry as an entity, each of its members seeing the same thing at the same time, and hearing questions and answers at the same time; thus ascertaining the facts when all may hear or see them, each drawing his own inferences from the answers or statements. We shall be pleased to hear any gentleman of the conference upon these subjects.

Mr. EDWARD ROSEWATER, editor of the *Bee*, Omaha, Nebraska:—I was not at the preliminary conference and am not familiar with the arguments or suggestions that have been made. But it strikes me that there could be a proper division of the Commission. All questions relating to water and public lighting can be solved here, without reference to European countries. We have in

GEORGE HARVEY,
Editor *North American Review*.

The following is from Prof. F. W. Taussig, of Harvard University:

"I believe it is wise that the Commission should confine itself to the question of Municipal Ownership and Operation. Even for this limited field the subject is a large and intricate one, and I hope there will be no hurry in getting a report. The sub-commission, which will doubtless have charge, should have ample time for its operations."

Prof. John A. Fairlie, of the University of Michigan, writes:

"The value of the report will depend very largely on the men who do the detailed investigation; and it seems to me that it is very important that they should not be men who have committed themselves already to either extreme side of the question. The suggestion made to limit the investigation at first to water, gas, electricity, and street railways seems to me advisable."

The following comes from William D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees of America:

"As our annual convention will be in session on the day of the meeting of the Public Ownership Commission, it will be impossible for me to attend. Only important work would have kept me away from the meeting, as I am deeply interested in the investigation which the Civic Federation is going to make. What we want are the facts! We have had theories enough upon all sides of this question to do us for fifty years. Give us the facts, facts, facts, and then we will decide whether or not we want Municipal Ownership."

Mr. EASLEY:—I want to state that at the preliminary meeting, on September 18, nearly every possible phase bearing on the scope and procedure of the Commission was touched upon. Every member present expressed himself freely. Having seen the thoroughness with

CARROLL D. WRIGHT,
President Clark College.

this country abundant experience with water, gas, and electricity, and a sufficient number of cities to enable any one Commission to get clear ideas. Of course we all know that a great number of American cities already operate their own water works; a few operate their gas works, and a great number of smaller towns operate electric lighting plants. The Commission that would investigate those subjects only would confine it-

self to this country. I would say, however, in my judgment, that the question of street railways or tramways would be one that would require a different investigation altogether, because we have practically no experience in this country with public ownership of street railways. The only place is across the Canadian border. In Toronto they operate street railways. But in order to know how the municipal and private operation of street railways works in practice, we would have to have one investigation abroad and one in this country.

Prof. PARSONS:—It seems to me that there is an opportunity to do something that has never yet been done. We have had a number of investigations along the line of municipal ownership, but in reference to each one I think you will agree with this suggestion: In respect to one side, it is possible for an advocate of municipal ownership to say that reports do not count very much, because we cannot think there is any man upon that Commission who was so fully acquainted with the facts and the philosophy of municipal ownership as to bring out in adequate shape the facts and arguments which point in that direction. Or in reference to another side, a man who does not believe in municipal ownership has, in all instances that I can think of, been able to say: We don't admit the validity of that report because there was no man on that Commission who was so fully acquainted with the facts that work against municipal ownership, in our judgment, as to bring them out fully. There is no instance, so far as I know, where there has resulted an agreed statement of facts between men representing the different views on this great subject. Lawyers often, when they are going to try a case before the Supreme Court, get together and make what is called an agreed statement of facts, and then they argue the case. Now, if we could get an agreed statement of facts, signed by men who represent municipal ownership ideas fully,

D. L. CEASE,
Editor *Railroad Trainmen's Journal*.

and men who represent the opposite ideas, and men who have not taken any stand at all, one way or the other, we could then go before the people of the United States, who constitute the Supreme Court in this case, with that agreed statement of facts. If a commission of fair-minded men would go to a city like Glasgow or Birmingham or Liverpool—if those men go right to the spot and investigate their street railways and call on people of all classes and get the records, and then try to make up their ideas—the man who believes in municipal ownership would draw up his ideas based upon the facts; and the man who represents the opposite view would bring out the facts as he sees them, and the man who has no fixed ideas of his own, the philosopher, would present his views. They could draw up a report on those facts. If they could not agree they could go to the authorities before they leave the city—not leave the fact unsettled until they return across the ocean. I believe if some such method as that were adopted we could get a definite, valuable result. In conversation, a few days ago, a merchant of Boston told me that he would give twenty-five dollars for a copy of such a report as that.

The first specific proposition is that it would not be wise to take up now the questions of railroads, telegraphs, and telephones; leave those to a later investigation, and concentrate attention now upon the issue of municipal ownership and operation. But the separation that Mr. Rosewater would make does not appeal to me strongly. It seems to me that we could perhaps get a great deal of light about the cost of electricity from England and Germany, and other countries, and that therefore the commission that goes across the ocean should consider all those municipal monopolies, water, lighting, and transportation, and that another Commission should examine the facts here.

The suggestion was made at our meeting a little while ago that a Commission of twenty-one be appointed to examine municipal monopolies abroad and in this country, and that that Commission should itself appoint sub-commissions; one commission to go to Europe, and another one to work here, and then they should come together with their results and try to unify a report. In that way it seems to me we could get two great advantages: First, we would have two separate sets of facts procured by two different Commissions, and then we would have the combined ideas of the whole Commission on those reports. That plan appeals to me very strongly, and I hope that it may appeal to others. But a separation of the subject is to me still more clearly desirable, for several reasons; geographical reasons in the first place. The countries that we would wish to have investigated are quite different, and they ought to be investigated in reference to getting different facts in regard to private and municipal ownership. On the other hand, the personality of a Commission to study national monopolies should probably be different from that of a Commission that might study municipal monopolies. For those reasons, and for the length of time required to study the complexities of the subject—and we can all do better work if we sacrifice ourselves to the study of one subject—I hope that a division of the subject may be made, and that we may take up first municipal ownership.

Mr. JOHN BANCROFT DEVINS, editor the *Observer*, New York City:—To bring up the question definitely, I move that twenty-one members be appointed on the question of municipal ownership and operation affecting water, electrical lighting, and street railways in this country and in Europe.

Prof. PARSONS:—I second the motion.

Mr. WALTER L. FISHER, Secretary Municipal Voters' League, Chicago:—I would like to offer an amendment.

we shall so proceed. We would like to hear from Mr. Revell, of Chicago.

Mr. ALEXANDER H. REVELL, manufacturer and merchant, Chicago:—It does not seem to me that there is any material difference of opinion regarding what ought to be done. It seems to me that the preliminary con-

W. D. MAHON,
President Amalgamated Association Street Railway Employees.

ference settled some things for this meeting to do. I do not quite agree with my friend, Mr. Thompson, that the Commission should be a small one. I think twenty-one is about the right number, because the chances are that from that number, many for business and other reasons may not be able to participate in the work done abroad, or in the work done in this country. I am like Mr. Parsons in disagreeing somewhat with our good friend, Mr. Rosewater, in regard to the work that the Commission should take up when it goes to Europe.

I think that all the utilities known as municipal monopolies should be investigated by the Commission. If you don't do this, you might find yourself in some such situation as this: That the commission appointed for this country might find, we will say—they might find on either side—but they might find that the municipal monopolies in this country were a failure by reason of deficiencies and other things. You will see immediately that if we did not have results from the work abroad, we would not be in any better shape than we are now.

If it is possible to have successful municipal monopolies abroad, I see no just reason why it might not be fair, under certain conditions, to have them successful in this country. There are no very great reasons why.

other words, I hope that the work of this Commission will reflect a certain strength of ascertained results. I hope that every one, whether he is on the Commission in its total sense as organized here to-day, or whether he is on a smaller Commission—a sub-Committee of twenty-one—will sink all his individual prejudices on one side or the other, will have no opinions on this matter, as indicated along the lines of Mr. Belmont's letter, and the other letters read by the Secretary, but shall go out after the facts, pure and simple.

The American people deserve to have these facts, free and pure. They will be of rare value to the individual, and the poorer the individual the greater value these facts will have. As the Chairman well said, we are groping in the dark to-day, and many plausible statements are made about municipal ownership and operation, some in favor, and some against. When one is stated, it looks plausible and feasible; and when the other is stated it looks just the same way, and no one seems able to contradict either successfully. We want these statements and these truths in this country. I am not thinking of the rich or of those who control monopolies, I am thinking more of the people who are the workers—of the men who use these public utilities—the street cars, gas, who use any of the public conveniences. They are the ones who are affected. If the facts shall show that it is wise to have our municipalities throughout the country manage these things, then for the benefit of the workers of the country, they should be adopted. On the other hand, it may be shown that there are good reasons why, for the interests of the working people of the country, public ownership should not be adopted. So you see, bringing it right down to the basis of the working masses, who use these utilities, we want to find whether the facts show for or against the proposition. This country needs a settlement of the question very badly, and I am delighted

FRANK A. VANDERLIP,
Vice-President National City Bank.

I think there should be a division of the Commission upon the lines of Mr. Rosewater's suggestion. If we leave the Commission as it stands it would divide itself if it so pleased. I think the entire Commission ought to provide for two sub-committees, which can then unify their report. I think that is essential for the reason that it is, at least with us in Chicago—the hot bed of municipal ownership—it is essential and of vast importance to get such a report at the earliest possible moment; and unless the Commission does divide and each take up one part—one the matter in this country and the other the question in Europe, too much time would be consumed. I would like to offer an amendment stating that the Commission be directed to appoint two sub-commissions to take up the questions in this country and abroad.

Prof. PARSONS:—My motion was to have one commission appointed and have its duties outlined.

Mr. SLASON THOMPSON, Railway Managers' Association, Chicago:—I suggest that the appointment of twenty-one members would require the attendance of the Commission from different parts of the country; therefore I would move to substitute nine instead of twenty-one.

Mr. EASLEY:—We will have lunch served at one o'clock in a room near here, provided for the convenience of the conference; that will give us an hour and a half for further discussion. I would like to make the suggestion that we do not undertake to settle any of these questions off hand. Every gentleman ought to express himself, and we have plenty of time.

Prof. PARSONS:—I would like to move that the suggestions made by Mr. Easley be adopted as the order of business; that the morning be spent in discussion, and that no formal vote be taken until the afternoon.

THE CHAIRMAN:—If that be the prevailing opinion,

J. W. JENKS,
Professor Political Economy, Cornell University.

if municipal monopolies can be successful in the old country, they cannot be successful in this country to-day; but with the information that this Commission will glean abroad, we will then want to take up the question whether the conditions in this country might not be changed so as to make them successful—if they are successful abroad. Of course I am aware that we are not here to give opinions on these matters. In

ISAAC N. SELIGMAN,
Banker.

and honored to be a member of this Commission when I realize to the full the great good these facts will bring.

Mr. ROSEWATER:—This is an age of centralization. If a great corporation, operating street railways, wanted to know how they were operated abroad and what advantages it might derive from foreign inquiry, it would not send twenty-one men, it would send probably five men, or three men. In 1891 I made an inquiry of the foreign Postal Telegraph Companies, and I think I got a sufficient number of facts in investigating the British and French and Austrian and German systems to show what there was about postal telegraph. I delivered an address on my return, and I think my hearers got about as much information as I had. If you want to give the American people information within reasonable time on water, electric light, and gas, you can get it just as well in this country. It is not necessary to consider what the price of gas is in Liverpool. These things must necessarily be governed by local conditions—the source of the supply. Natural gas will sell for fifty cents per thousand, or even thirty cents in the natural gas fields, but no fabricated gas can be sold at that price. Is the municipal ownership of gas and water absolutely essential to the people, and is it best that the people should control them? That can be best learned, it seems to me, or as well learned by a commission of ten or twelve gentlemen in this country, as in any other way. The question of railroads you cannot determine without investigating practically abroad, because no example can be found here in this country. And for that reason I think that a select committee of, say, nine men going abroad would accomplish all that this conference would desire. A committee of say fifteen men or twelve men could investigate the condition of water supply and gas and

electric lights in this country and make a report; and I will say in advance that there will be some diversities of opinion any way, but their report would be valuable information.

Upon the main issue of whether you want municipal ownership, I am sure that many people will differ by reason of direct interest one way or the other. The American people want to be enlightened, and if we can give them all the facts it should be done as soon as possible.

Prof. PARSONS:—I would like to ask Mr. Rosewater whether the Western Union accepted his report as an authority?

Mr. ROSEWATER:—My report was given, of course, in favor of the government ownership of telegraphs.

Prof. PARSONS:—No commission of one or two or any small number, no matter how able and honest it may be, can command the respect of all the interests and classes concerned in this great question. It is a physical impossibility for any man to see the facts in the same light as a man of different ideas and interests. If an architect, an artist and an entomologist walk through city and country together, the architect will see buildings, the artist will see beauty, and the entomologist will see things from the bug standpoint. Each man has a mass of thoughts and impressions, which, by the law of intellectual gravitation, draws into his consciousness and gives predominant weight to the facts and inferences that harmonize best with the impressions he already possesses. If a number of men representing different ideas, interests and classes come together in presence of the facts and compare their impressions, the statement they agree upon is more likely to be true and to command confidence than the statement of any one or any partial group.

Mr. WALTON CLARK, Vice-President Traction Company, Philadelphia:—I think that what we are after is

come to my attention. But there is very great interest in the question of municipal ownership of gas, electric, and railway plants, and I think the sooner we can get reliable information on those subjects the better it will be for the monopolies of the United States and its citizens.

H. B. F. MACFARLAND,
President Board of Commissioners, District of Columbia.

Mr. EDWARD W. BEMIS, Superintendent Water Works, Cleveland:—It certainly is an evidence of great progress of thought in this country, that such a conference as this can meet with such a purpose as it has. I doubt if it could have been possible five years ago to have gotten together such a body of men as this, who would have thought it worth while to come here for such a purpose. With regard to the general subjects spoken of this morning, there does not seem to be very much difference of opinion. I think the sentiment of nearly all is in favor of the body that goes abroad taking up the consideration, not only of street railways, but lighting and possibly water. I am somewhat inclined to agree with Mr. Clark that the question of municipal water works is not a serious question in this country; that the movement towards municipalization has gone so far that there are no very large private plants left. There are a few, but the fact is that the question has not agitated the public as much is lighting and street railways. I can see great reason why the body that goes abroad should take up the lighting question, in order that we may dispel certain fallacies that are often found on both sides of the question among those who favor and oppose any given policy. I can understand how such a body could go to some English city for its price of gas. It does not make any difference for the moment whether it is

question that Mr. Gompers has raised is very important, as to the policy of labor unions, and as to the terms of labor generally, the matter of wages and public comfort and social matters, etc., and I can see that we can get great help in this country from the experience of Great Britain; I am not so sure that we can get so much from the Continent. I am inclined to think that there are not a dozen cities upon the Continent that it would pay to investigate, but there are a large number in Great Britain. The chief purpose now is to select the main body. I am not so sure that we are in a position, at this meeting, to determine for all time the membership of that main body. Perhaps we would be in a position to determine a dozen, fifteen or twenty. It may be that that body should have a little discretion in adding four or five more members. It may be that it should engage expert talent, which might not be in the Commission. So I think a certain degree of latitude should be left to that body. I can see that the investigation, in one way, would be much easier abroad than here, because the books and accounts are much better kept abroad. Of course there are certain phases of the work that would not be a matter of figures. When the question of municipal ownership develops a political complexion, I can hardly see how the commission can agree; but it can get information of definite value. It certainly can come to an agreement on a great many matters of financial statistics. I think in visiting different cities it will be necessary to analyze the local government bodies, and there will have to be a very careful examination made by one or two or more accountants and assistants who will work up the data.

I see no reason to differ from the idea that after the two bodies, the foreign and the main body, shall have studied the question, they should not get together and consider whether they can agree upon some

WALTER L. FISHER,
Secretary Chicago Municipal Voters' League.

to gather and present information which shall be of value to the people of this country in making up their minds, or in changing their minds, on the question of the advisability of municipal ownership of certain industries. I think our report will be of little value unless we report on those interests in different localities. I do not think a committee of seven could represent the interests from the different points of view, and make a report that would meet the difficulty of the people who are interested in the question of municipal ownership. I think twenty-one is the smallest number the Commission should contain to include all the interests that should be represented.

As to the division of the work among those twenty-one when appointed, I think that can reasonably be left to that Commission. I do not agree with some of the details suggested. I think, however, that the Commission should be instructed on one point, and that is as to the extent of this investigation. As it appears to me, the immediate interest in this country, so far as it affects public monopolies, is in the question of the municipal ownership and operation of gas, electric plants, and street railways. I should think there could be given sufficient time to investigate all the questions to be disposed of by this Commission; I think the work, to be well done, would have to be done by men who have been most actively engaged in one enterprise or another; if it were done by any others, they would not be able to collect facts sufficient—for they would have no requisite knowledge and would not probably be able to give up time to the study. Therefore I think the Commission had better be confined in this investigation to the question of municipal ownership and operation of gas, electric, and street railway plants, with perhaps water. I do not understand that there is any great interest at present in this country on the question of municipal ownership of water works; if there is, it has not

WILLIAM J. CLARK,
Foreign Manager General Electric Company.

a public or a private plant, but the cost should be analyzed. Then go to a plant which adopts an opposite policy of management, and analyze the cost of its product, and see if there is any explanation, connected with either municipal or private management, of the difference in price. There will naturally arise such questions as the relative progression of municipal and private plants in the use of new machinery. The

TIMOTHY HEALY,
International President Stationary Firemen.

joint matters affecting the different parts of the world. While there can be no unanimity of opinion in such a body upon all subjects, it would be well if it could agree upon many facts. If it can agree upon what are the facts of the financial reports of certain cities and certain countries, public and private, it would furnish data which we do not now have.

Mr. ALEXANDER HUMPHREY, Stevens Institute, Hoboken, N. J.:—The first thought is the sense of responsibility that such a body as this must feel in connection with this work. Such responsibility should limit, to a large extent, the lines of our work, if it is to be thorough. I should be, therefore, very strongly in favor of limiting it to the three or four utilities that have been repeatedly mentioned, and it seems to me if we are to be thorough we must go abroad. The terms of the resolution that has been offered would cut out Canada. I think that Canada, too, appreciates the difficulty of getting the facts that we are after. We can vary the opinions after we get the facts, but it is not an easy matter to get the facts. Mr. Bemis has stated that he thinks in Europe we can rely upon the accounts as better kept than in this country. I beg to differ with him. I can point out in a number of cases where the accounts as kept of certain utilities in Europe, if interpreted without technical knowledge outside of the accountant's knowledge, would lead to an absolute misinterpretation of the facts. Cases have been brought, and are still being brought, to our attention here in New York, where the books do not show the facts. That does not apply to only one line of work, but very often it is absolutely true where every effort is being made on the part of the management to represent the facts. It is an extremely difficult matter, as all of us who have managed large properties and properties scattered over a large area well know—it is extremely difficult to get the facts in regard to those various

properties on lines where they can be fairly compared. If that is so within the range of properties where an individual can manage them, how much harder it must be with regard to properties managed by different people who have no desire to come into accord. I think I would follow the suggestion of Mr. Rosewater, not to concentrate the investigation in one or two men. No matter what might be the actual value of the report, it would be stamped as insufficient, because the American people are not going to rely upon the capacity or fairness of any one, two or three men.

Gen. GEORGE H. HARRIES, Vice-President Railway and Electric Company, Washington, D. C.:—I came here looking rather for information than for the purpose of exploiting any opinion I might have. Some of the opinions stated here have been good opinions, especially in reference to international bookkeeping. I had occasion last year when abroad to look into some bookkeeping methods, and I am more satisfied with the bookkeeping we have in this country.

With reference to the organization of the Commission, I believe the larger number would be all right—in a multitude of counsel there is wisdom. I heard somebody say once that too many cooks spoil the broth, but we can get from twenty-one men, or some such number, a variety of views; and there will be many, and it would be better than to come down to a smaller Commission. It seems to me that a Commission of say twenty-one would not be an extraordinarily large one, if divided, part of it doing its work in the United States. It will be a great task. There should be many facts called for and a great deal of thought given before you can come to any conclusion. We want to prepare for it with knowledge of all the facts. Then it will be for us, after we have the facts, to reach conclusions.

may be, is of much less importance than the facts that it is going to get together. It may be quite possible for a committee of any number to agree upon the general propositions; it may reach substantial unanimity up to a certain point. It seems to me that it is essential that this investigation should include the question of

not the men who accept the work done, but the men who are responsible. If those men be competent, and if they are agreed, it will not make so much difference what the number of the committee is. If there are three men who represent the main lines—if we can get three, five, seven or nine men, and the fewer the better—if we can get that number of men who have standing and reputation and character and ability, who will command the respect of the community, who will assume the responsibility of this investigation, the principal work we can do is done, in my opinion. I think the smaller number of men, provided we get men of the right character, the better they will do the work.

If we have twenty-one men going to European cities to look into questions of this sort, it is inevitable that some of them will pay less attention than the others. That would cause a feeling on the part of the public, that, after all, it is an omnibus investigation. I don't know what the financial arrangements are back of this matter—or what arrangements have been made in regard to taking care of the expenses of this investigation. I assume that it is entirely adequate—that the means will be forthcoming to carry it out. It seems to me the wise thing to do in this matter is, first to select the smallest commission by means of which you can get a representation of men of character. I think seven men can be found who will fully represent the diversities of opinion on this question and who will command the confidence of the community, and it will be better than to increase it to nine or any other number. But I do think that these seven or nine men should have the assistance of experts who are outside of their number; men who are perhaps committed to one side or the other; who, perhaps, have been in the employment of these public utility corporations,

D. J. KEEFE,
President International Longshoremen's Association.

WALTON CLARK,
Vice-President United Gas Improvement Company.

water as well as gas, electric light and street railways. It may be that we will agree readily upon the fundamental question of water. Why has it been true that water plants in municipalities have proceeded by an evolution from private ownership to municipal ownership? Is there any relation between that and the public utilities of gas, electricity or street railways?

This Commission may develop the fact that there is no real relation. The most important argument used in many quarters, and we are accustomed to having it said repeatedly over and over again, in Chicago, is, that as we have come to municipalization of water works, so we must come to it with gas, electricity and street railways. On the other hand, other people say: "Look at the water works; how much better they would be in private hands." There is no conclusion about the matter. The men on the one side adduce their arguments and say "Look at this!" and the men on the other side produce their arguments, and neither of them are able to point out any conclusion of fact.

There is no authoritative statement of any kind, as to the facts, nor any conclusion to be deduced from facts. It seems to me that in investigating water works it may be possible to get a satisfactory unanimity of opinion as to the facts themselves. That would be a very useful preliminary to the discussion of gas, elec-

EDWARD W. BEMIS,
Superintendent Cleveland Water Works.

Mr. CHARLES L. EDGAR, President Edison Electric and Illuminating Company, Boston:—There are one or two things that are quite clear to my mind. I think we ought to confine ourselves to such monopolies as electric lighting, water, and gas; we ought to include street railways with the electric lighting and gas, and we ought to make the investigation broad. As to the size of the Commission, it seems to me we must either appoint a Commission of nine, or even less, who will do all the work both in this country and abroad, and report, or else we will have to have twenty-one, who will appoint sub-Commissions. It seems to me you will have to decide how you are going to do the work before you appoint the Commission. It seems to me a body of twenty or thirty men, with power to make sub-Committees of five or ten to go abroad, and study in this country, and then to report to them would be well.

Mr. FISHER:—The last speaker has struck the keynote to this proposition. The crucial test must be the relation of this investigation to this body. I don't know of any reason why a sub-Commission of thirty can be gotten together any more easily than this full Commission can be gotten together. We have gotten together between sixty and one hundred men, whose attention is now called to this particular subject. If we proceed to delegate our business to a sub-Commission of half this body, there would be less likelihood of getting a quorum than with this full Commission, particularly if a sub-Committee is going to do the work. It seems to me the first question to be settled is, What is the relation of this conference to this investigation? Are the nine or twenty-one, or whatever the number may be, to report back to this body? Is it the object of this conference merely to select that other committee? I see no usefulness in that. It seems to me fundamentally that the conclusions that are going to be reached by any commission, no matter what its number

FRANK J. GOODNOW,
Professor Administrative Law, Columbia University.

tricity or traction. If the Commission would agree upon the substantial details, it would take very little time. I think that the question of importance is, not so much the number of the Commission as it is the people who compose it. The significance of the facts that it gathers will depend first, last and all the time upon the personal characteristics of the men who are on the Commission—the men who actually do the work;

but who are expert men in that connection to represent that side, and who will lay before this Commission the facts that ought to be represented from that side. And there are men in the employment of municipalities whose particular relations to these matters may represent entirely the other side, who are known to be committed to the cause of municipal ownership. If such men can be attached to such a Commission, I assume that they probably would have to be compensated for their services. Such men as that will have to do more work than the members of the Commission themselves.

If men of that kind, one or more, as many more as may be necessary, be attached to such a smaller Commission as I suggest, and can be compensated for their time on a proper basis, they will be the most effective men who will investigate this whole subject. That is my emphatic opinion, and I think that will be the outcome of the selection of a Commission of Twenty-one or any other number. No Commission of that size is going to go abroad to investigate these things; they are going to appoint a sub-Commission. It may be first most expedient to select a committee of twenty-one, but when it comes down to the real issue the smaller Commission is going to do the work.

Mr. J. W. SULLIVAN, Editor *Clothing Trades Bulletin*, New York City:—I can heartily join in the expressions of satisfaction at the spirit shown in this convention. We all, I feel sure, want to get at the bottom facts.

The labor men, while looking squarely at the question as a whole, as it affects all elements of society, are prone to inquire into labor matters a little more closely than into other phases. It seems to me desirable to investigate labor conditions, the relations of labor to employers or municipalities, in the industries to be inquired into. We should pay attention to water works as well as the others. A newspaper, in recently publishing some account of the situation in the water depart-

ment of one of our neighboring cities, declared that the clerks in the water bureau spent much of their time in reading for their amusement. The New York public has been repeatedly told that a very large percentage of the water brought down through the aqueducts was wasted because of inefficiency in the department. A friend of mine in the water bureau of a somewhat municipalized city has written me that he and others hold their positions because of their membership in a certain reform ring. Our humorous local statesman, Col. Gruber, has asserted that in some branches of the New York water department the clerks were wont to go to work at 12 o'clock noon, immediately adjourn to luncheon for one hour, and at one o'clock stop work for the day. If such statements reflect the views of newspaper men and politicians relative to an agency municipalized in many communities, what is to come with the municipalizing of several other agencies each having a numerous force on the pay-roll? Do some of the employes of municipalities have too little to do, while others are overworked?

And the question of civil service. Mr. Bellamy, manager of the Liverpool surface car lines, who gave us his experiences three years ago at the Reform Club conference, said that, under the civil service law of his city, in engaging street-car men only those are selected who are between the ages of twenty-one and twenty-three, and in height between five feet six and five feet ten. That rule might result in the road having a fine force of men, to make an excellent showing for municipal operation. But would it not bar from their rights to employment a very large number of the community's wageworkers? So-called civil service has very largely so resulted in some branches of government employment in this country that the average wage-worker does not have the same opportunity to labor

ber is too unwieldy. This idea of twenty-one is the result of the discussion by the informal meeting, September 18. It was not the intention, however, that the whole twenty-one were to either go abroad or make investigations in this country. The idea was that having one sub-Committee of Twenty-one to take in charge the

JOHN H. GRAY,
Professor Political and Social Science, Northwestern University.

whole investigation, it could lay out a uniform method, subdividing itself to make the actual investigations. For instance, in this country we have a great many municipally owned electric light plants. The men who investigate their operation should be working on the same lines as those who are investigating the municipally owned electric light plants in Europe. This uniformity might not be assured were there two independent committees. While this committee of twenty-one should thoroughly represent all the different phases of thought upon the subjects to be investigated, it must be remembered that these investigations will demand time and hard work, and it will be useless to name men who are so situated that they can not give to the inquiry the requisite attention.

We also, I think, should have an executive committee, composed of men thoroughly interested in the question, but who can not give personal attention to the details of the investigations. This committee would name a finance committee and would perform the customary administrative functions of such a body.

Mr. JOHN GREENE, Editor *Bradstreet's Journal*, New York:—Inasmuch as the question has been raised as to the relations of the Commission to the investigation, and that the reports of whatever sub-Commission is appointed shall come back to this Commission for final action, it has been pointed out that it is not only

the preliminaries to such a consideration by the Commission as a whole, a very useful service would be performed by the appointment of a small sub-Committee familiar with the literature, official and otherwise, on this question; familiar with the localities in which municipal ownership has been tried, to present to the Commission a statement of the psychological and topographical matters pertaining to this whole municipal question—to consider what is actually so, and how it came to be there. In other words, we have to consider historical as well as present phenomena. I suggest that such a committee, headed by perhaps such a man as Professor Goodnow, would be of great aid in determining the question.

Prof. FRANK J. GOODNOW, Columbia University, New York City:—It seems to me that we ought to confine our work as far as possible to the things which it seems to be generally agreed are in question here, and that the sub-Commission ought to be as small as is consistent with the representation desirable. I should deplore if the resolution before us were regarded as confining any Commission to the mere consideration of municipal ownership and operation. As I understood, the purpose of this Commission is to endeavor to find out what were the best methods of attending to our public functions. Therefore, if the granting of franchises in France, which is rather peculiar, were omitted from consideration, I should regard it as a misfortune. So I think if the resolution were amended so as to have it embrace the questions whether municipal ownership had been successful in many cities, whether it was in private hands or municipal hands, you might find in some places that under private management it was very successful.

Rev. W. D. P. BLISS, sociological author, New York:—It seems to me there are two practical questions be-

GEORGE H. HARRIES,
Vice-President Washington Railway and Electric Company.

for the government as when he depends upon the ordinary employer. He can go to the employer, and say, "Here is my work; take it or leave it." He can't do that with the government. How far would that disadvantage extend in municipalized industries? That is an important thing to find out.

I believe I have fifty questions in my note-book under this heading of labor alone.

I am of opinion that the Commission should be large; that in its membership the public, and employers, and labor should be represented. Certain cities in the United States, and in England, France, and Germany, have distinctive features. As many as possible of these ought to be investigated. The undertaking thus becomes a large one. With full publicity as to the scope of the inquiry, as to its thoroughness, and as to its findings, the work of the Commission will mark a long step on the way to truth, and be of service to the civilized world.

Mr. EASLEY:—Mr. Fisher raises a question that I think has not been thoroughly discussed: What should be the relation between this body and the agencies that it creates? If we name sub-Commissions, does this body practically go out of existence? You will notice that President Belmont, in his letter, assumes that this body will continue. It is a common practise to organize "committees of one hundred," delegating all the power to an executive committee and never calling the parent body together again. I think we do not want to follow that custom. As to whether this parent body could do anything more with the reports of the sub-Commissions than to discuss them and make recommendations of its own, is another matter entirely. The general Commission certainly would not have power to change one word of the reports of the sub-Commissions.

There seems to be some confusion about the "twenty-one idea." Some of the speakers think that that num-

TALCOTT WILLIAMS,
Editorial Writer Philadelphia Press.

important that an agreed statement of facts should be arrived at as the result of a careful investigation, but also that some attention should be given to the significance of those facts in relation to our institutions here. If the Commission, as a whole, is to consider the facts reported by its sub-Commission, it should be in a position to express such conclusions as it may arrive at upon the general question. I imagine that as one of

JAMES O'CONNELL,
President International Association of Machinists.

fore us, one as to the composition of the committee, the other as to the nature and scope of the investigation. Practically I agree, and I think most of us do, that it will largely depend upon the personnel of the committee. We have got to have fair men. I agree that we must have the sub-Commission as small as may insure fair representation. We must admit that it is almost impossible to get men who are absolutely unprejudiced. It is impossible to get any man who is worth anything on a commission to serve absolutely without bias. I believe that the only way to get an approximately fair statement is to get men on the Commission avowedly in favor and avowedly opposed to public ownership. As to those who are opposed, I think they should be men who are experts in the meaning of accounts. A very large portion of this investigation will be the honest and exact interpretation of apparent figures. Those who are opposed to municipal ownership would want to know very closely how the books are kept, and they ought to know, and you ought to have on the sub-Commission a man who knows the ins and outs of practical bookkeeping in this question. On the other hand, those in favor of public ownership would feel that they were not represented if you did not have on the sub-Commission some people who are experts, and who are admittedly in favor of public ownership. Secondly, we have got to have men who are known to be honest men in whom the public have confidence. If we have representatives of labor, and of capital, and of what is called the community, it would be well.

With the subjects to be handled it seems to me you would be compelled to have at least twenty or twenty-one who should make a uniform report so far as possible, to this larger body who are to remain in existence. It is impossible for sixty to go over the

THE PUBLIC OWNERSHIP COMMISSION.

One of the most phenomenal developments in American municipal politics within the last decade has been the agitation for "municipal ownership." Its most sanguine advocate, ten years ago, would not have ventured to predict that in 1905, in the second and fourth cities in the world, this idea would so have taken hold of the public mind, that all of the political parties, eager to anticipate the drift of popular sentiment, would hasten to approve "municipal ownership" and make it a leading issue in their several campaigns. The recognition of its strength by the politicians is shown in the fact that there is little or no appreciable difference between the party platforms or the utterances of candidates upon this question. Their several opinions differ radically as to the particular public utility that a municipality should first exercise, as to the method of its exercise and as to divers other details. But as to the main object to be attained, there is a unanimity among the advocates of public ownership that reflects the common origin of the agitation and frequently indicates impulse rather than discriminating analysis. Entirely aside from the merits of the question, the very existence of this agitation is ample warrant for the action of the National Civic Federation in creating the Public Ownership Commission, representative of all shades of opinion, to make a thorough and exhaustive investigation of this subject at home and abroad.

This remarkable accord was illustrated in the municipal campaign in Chicago last spring, as it is illustrated again in the present campaign in New York City. In Chicago, the two parties were at one upon the general proposition; the differences between John M. Harlan, the Republican candidate, and Judge Edward F. Dunne, the Democratic candidate, were as to the time and the manner of taking over the property of the street railway corporations. It was mainly a question between acquiring and operating them "immediately" or "as soon as possible." Here in New York, the three platforms cannot be widely differentiated in respect of public ownership.

The Democratic platform declares:

Municipal ownership of important public utilities has long been accepted Democratic doctrine. . . . Public ownership is no longer a campaign catch-word, but a principle applied and in operation in this, the greatest of American cities.

In support of this statement, the Democratic platform cites the ownership and operation of the Staten Island ferry and the proposed purchase by the city of other ferries, and the plans for a municipal electric light plant.

The Republican platform declares:

Light is as much a public necessity as water, and it is the duty of the city government to see to it that the people are supplied with lighting accommodation at the lowest possible price. In view of the fact that the Lighting Trust is an absolute monopoly, and of its failure to render to the people fair service at fair rates, we are in favor of the establishment of a municipal lighting plant, for the use of the municipality and of its citizens, and of its operation by the city.

The platform of the Municipal Ownership League states:

The League is absolutely and permanently committed to the advocacy of municipal ownership. Public necessities and public values created by the people should be owned by the people.

Specifically, the same platform demands "the immediate establishment and operation by the city of a plant for the sale and distribution of gas to all the citizens; and that the city-made gas shall be sold at a price that will make heating by gas in the humblest homes cheaper than heating with coal at the present extortionate coal prices." As to rapid transit, this platform demands the construction of future subways by the city and also "their operation by the city, as soon as the city shall be financially and legally able to undertake their operation;" to which end various amendments to the Rapid Transit act are recommended.

What is the meaning of all this? In every case, only a casual examination is needed to perceive that the particular form which the outcry for public ownership takes is determined by whatever grievance against private ownership is most acute. In Chicago, for reasons that do not concern us here, the public was most offended with the equipment and management of the street-car lines. Hence, the demand for public ownership there was directed by both parties toward that specific utility. In New York City, there has been most

complaint about the cost and quality of gas. Hence, in two of the platforms the demand for a municipal gas plant is made most prominent and definite, while all three platforms employ language almost interchangeable as to the general principle of public ownership.

Plainly, then, popular resentment against corporate ownership and operation of public utilities, when for any reason they have failed to render service satisfactory to the mass of citizens, is the primary origin of the various forms of the agitation for public ownership. For example, this was true of Glasgow, where unsatisfactory service by the tramway corporations and their refusal to adopt improvements impelled public opinion to the policy of municipal ownership and operation. The origin of most, if not all, municipal undertakings abroad is similar. The question presents itself whether this experience is to be duplicated in this country, where the agitation is active in many cities and concerns many services that affect immediately the public health and comfort and ultimately the industrial and social progress of the nation.

Discontent may manifest itself with either corporate or municipal service. It may underlie a movement in either direction. Philadelphia affords an example in this country of how public feeling may swing to opposite extremes of policy. Its municipal gas plant, operated through a board of trustees, became the center of a political machine. A revolt against its dictation, coupled with charges of wasteful and corrupt administration, resulted in a lease of the plant to a corporation; and only recently there has been an extraordinary public protest against the terms on which it was proposed to renew that lease. In either case, the evolution of a policy based upon knowledge of the facts, ascertained through the experience of others, would be more judicious than action whose mainspring is a smarting sense of wrong, without adequate perception of the wisest and most effective permanent remedy.

The action of the Public Ownership Commission of the National Civic Federation in restricting the scope of the initial inquiry to water, gas, electric light and power and street railways, grew out of the perception that these are the forms of public ownership now most frequently proposed and actively discussed. The sub-Commission has sufficient discretion in dividing its work, in determining who shall carry on the foreign investigation and in adding to its membership to ensure its adaptability; while its relief from burdens of administration, through a separate Executive Committee, further conduces to its efficiency. The sub-Commission will be aided by the work of a special committee now engaged in preparing lists of questions for the investigation.

(Continued from page 7.)

details as honest and fair men would have to go over them. Twenty-one can do a great deal more than sixty. I think the original motion for twenty-one, with their subdivision, is about the right number. It seems to me desirable that their inquiry should be limited, as far as possible, and yet I believe it should include water. A great many people want to know what America has been doing, and what America can and will do. I think it would be a great mistake to leave out public water works, because there, more than in any other matter, we have the experience of municipal ownership and operation. It seems to me that the sphere of inquiry should be limited as much as possible, but that we must have water works included; that the Commission should be as small as possible, but there cannot be less than ten on the work abroad, and ten on the work here. It seems to me those are the absolute necessities of the situation. But far more important even than this is to see that we have men who are all fair and honest and open-minded.

Mr. HORACE E. ANDREWS, President Cleveland Electric Company:—I believe in having a sub-Commission of twenty-one, and in giving them complete authority over the investigation. I don't believe in hampering them; and I think that after full determination they should determine the character of the investigation themselves.

Regarding the different men who would be on this sub-Commission, and the great desire to have some who would represent municipal ownership, and those who oppose, I see no other way than to suggest that the members of the Commission going to Europe go with the opposing intentions of doing the best they can to show that municipal ownership is desirable, and to show that it is not. Could we not arrange primarily a

list of queries that would eliminate many of these theoretical propositions that sometimes come up in connection with labor and social and other matters—eliminate all those non-essential things and bring it right down to a list of queries pertaining to facts? What we want are the facts; we want figures and we want

HENRY W. FARNAM,
Professor Political Economy, Yale University.

other matters that are facts. Could not a list of queries be prepared which could be adapted to each place that is to be investigated? A certain number of queries are attachable to certain places, and with those the Commission could find facts.

Prof. L. S. ROWE, University of Pennsylvania:—The problem that confronts this Commission is one of the most difficult as well as one of the most delicate within the whole range of industrial and social investigation. The responsibilities resting upon the Commission are increased by reason of the prevailing confusion of ideas as to the significance of municipal ownership. This question has become a storm center in which individual ignorance, personal interest and class prejudice are doing their best to befog the issue. To overcome these influences, to hold a just balance between the antagonistic interests involved, to inspire confidence in the community in the results of the Commission's investigations, involve difficulties worthy of the best efforts of both the practical business man and the expert investigator. The possibility of service to the country through an efficient performance of these duties can only be measured by the evil results which must ensue if the present feeling of distrust between our American communities and the public service corporations is not allayed.

HAMILTON HOLT,
Editor New York Independent.

The function of this Commission, as I understand it, will be to present the facts with reference to municipal ownership both in Europe and in America, rather than to make formal recommendations as to the plan best adapted to our American conditions.

The study of the quasi-public industries, whether in Europe or in the United States, naturally falls into three great sub-divisions:

First, TECHNICAL EQUIPMENT;
Second, FINANCIAL SYSTEM AND METHOD OF ACCOUNTING;

Third, THE RELATION OF THE SERVICE TO THE PEOPLE, WITH SPECIAL REFERENCE TO ITS SOCIAL EFFECTS.

The first division of the inquiry will require a group of technical experts, who are able to pass on the technical equipment of gas and electric light works, street railway systems, etc. The second division will involve an inquiry into municipal and corporate accounts, and will probably offer greater difficulties than any other portion of the investigation. For this work a number of expert accountants will be necessary.

The third portion of the investigation has, as yet, received but little attention. The discussions with reference to the relative merits of public and private ownership and operation have been grouped about purely financial considerations. The relation between the public service corporations and the municipalities has been studied mainly with reference to the payments made by corporations for the franchises which they enjoy. The success or failure of municipal ownership has been judged by the net profits of each enterprise. In these discussions the larger problem of the relation of these services to the industrial and social life of the community has been lost sight of. This will be one of the most important branches of the investigation and will clear up many existing misconceptions as to the principles which should obtain in the adjustment of the relations between the municipality and the public service industries.

Mr. MILO R. MALTBIÉ, franchise expert and former editor *Municipal Affairs*, New York City:—It seems to be the unanimous opinion that the Commission should for the present confine its work to municipal monopolies—an opinion with which I heartily agree.

JOHN F. TOBIN,
General President Boot and Shoe Workers' Union.

But it occurs to me that consideration should not be confined to the question of municipal ownership alone for the purpose of finding out whether it has been a success or failure. The relation of the public to these services should be considered in all its aspects. The content and methods of granting franchises to private corporations, the character and extent of public control, and the ways in which municipalities are supervised by higher governmental authorities should also be thoroughly examined. I take it that we all agree that these questions will not be decided by theoretical considerations or preconceived notions of what ought to be the functions of government, but rather by a careful determination of whether this method or that method has proved and is likely to prove more beneficial to the people.

All sorts of experiments have been tried in the United States and Europe, and no investigation will be complete, nor will the best solution of the problem be evolved if all systems of governmental supervision and regulation are not investigated as well as that of municipal operation. Indeed, it is very likely that certain methods will be found to be more conducive to certain results; and if such is the case, this fact should be pointed out, so that each community may be free to select that system which will best secure for it the results it wishes to achieve.

The inquiry, both at home and abroad, should be conducted on the broadest possible lines. One swallow does not make a summer, and the demonstration that private or municipal operation has been a success or a failure in one city or in several cities does not prove that either system is to be generally approved or condemned. Further, it is possible by shrewd selection of a few cities apparently to prove either great success or great failure. It is necessary, therefore, that a large number of cities be examined and their local conditions carefully investigated to eliminate as far as

possible all peculiarities. This means, also, that not only will the best instances of municipal and private operations be compared, but that those most unfavorable to each will be investigated.

The most important work of the committee, it seems to me, will be devoted to the collection and analysis

JOHN BANCROFT DEVINS,
Editor New York Observer.

of the facts, and especially in those directions in which it is possible to get a fair quantitative standard of comparison. It matters comparatively little what the opinions of any five, ten, twenty or one hundred persons may be, unless these opinions are fully backed up by documentary evidence; that this Commission finds certain specified things to be true, and produces evidence to prove it, will constitute a great social service and help to place the discussion, now uppermost in so many cities, upon the high plane of fact and social expediency—where it ought always to have been.

As to the size of the Committee to investigate and prepare the report, it should neither be too small nor too large. That every phase of the subject may be fully considered, it should be thoroughly representative and left to adopt its own plan for the appointment of sub-committees, the organization of the work and the preparation of reports.

Prof. JOHN H. GRAY, Northwestern University, Evanston, Ill.:—We have made great progress. Everyone who has spoken has suggested something of importance. We believe in democracy, and in the majority rule. The National Civic Federation is founded to bring classes together. There are two things to be accomplished in this investigation, two very widely different things, requiring different talents and different kinds of minds. It seems to me we should have a

MILO R. MALTBIÉ,
Franchise Expert.

reasonably large sub-Commission, representing labor and capital and the other interests. It seems to me equally plain—and my remarks apply themselves directly to the remarks of two or three other gentlemen—that there is expert information required and expert services needed upon two or three different lines. I don't know what the financial arrangements are, as Mr. Fisher says, but I do know that there is a great deal of

expert work to be done, and a great deal of expert work will have to be paid for. You cannot get a large Commission to go abroad even if you want to pay them for it. Most of the members of this Commission are engaged in other occupations. The Chairman spoke of the possibility of having all the witnesses together and cross-examining them, if that is the right term.

FREDERICK N. JUDSON,
Attorney at Law.

That would be desirable, but you have got to have an expert investigator who is reasonably familiar with the subject, who has read and studied it; you have got to have some man who will dig out the facts. It will take a great many months to do that—more months than a large Commission would remain abroad. I assume that has got to be paid for. There are two other kinds of expert services that are absolutely essential, and which I assume will have to be paid for. For an expert investigator, take for instance Dr. Goodnow. He may have more experience than I know. But I question whether he would feel competent to do engineering work, or to go into a gas plant and tell whether it was thoroughly up to date or not.

He certainly wouldn't have the time to do the long and arduous work of an accountant. It seems to me that in an investigation like this, both in Europe and in this country, some expert services, some in the form of accountants, would be necessary, and some in the form of engineering, who would have to be paid, and that would take a great deal more time than a large commission of competent persons could stay abroad. I assume that whatever is done in this matter would be reported back to the Executive Committee or to the full Commission. I assume, too, that during the investigation the work of the experts would be part by

CHARLES L. EDGAR,
President Boston Electric Illuminating Company.

part submitted to the sub-Commission. The sub-Commission, made up of members of this body, would have an important part to perform, but its members could not do the work of experts. Much of its work, probably, would be performed with less expense and within a shorter time by experts. I think that all our discussion has been coming down to this: We need a large sub-Commission to go abroad; that we need three

men as experts; and, especially for accounting and engineering, we need experts to go abroad.

Mr. FISHER:—I move that a committee of seven be appointed by the Chairman, of which he shall himself serve as chairman, to present to the meeting this afternoon a plan of procedure and recommend names for an Executive Committee and for a sub-Commission of Investigation.

Prof. PARSONS:—I second the motion.

The motion was put for Chairman Gompers by Mr. Easley and was unanimously carried.

THE CHAIRMAN:—We have two gentlemen with us, one of whom has been five weeks in Glasgow, and has made some investigation on this subject, and another, an Englishman, who is not a stranger among us, who has participated in a previous conference of the National Civic Federation. One is Mr. Angus Sinclair; the other is Mr. Alfred Moseley.

Mr. ANGUS SINCLAIR, editor *Locomotive Engineering*, New York:—Before saying what I think can be found out about Glasgow affairs, I wish to make a few remarks about the size of this committee. It has been my fortune to have had the appointing and supervising of a great many investigating committees, and it was usual to select the men who were most familiar with subjects to be investigated. Yet in the course of fifteen years I have found it almost invariably the case that the work fell upon one member.

I favor small sub-committees for the investigation by this body. When I went away last summer, there was a great deal of discussion going on about the municipal ownership of railroads by Chicago. I had very good opportunities in Manchester and Glasgow to find out what they were doing there, and why they had changed from private to municipal control. Those who have studied commercial affairs much have always been im-

LOUIS D. BRANDEIS,
Lawyer.

pressed with the fact that where great enterprise is required, it must be done by individual effort or by private effort and by private capital. Municipal governments have not been noted for enterprise and push. The progress of nations has been due to individual effort and not to collective effort. On that account I was surprised at the agitation several years ago in Manchester in favor of municipal control and ownership of the street railways. But when it was examined closely, it was found that the street railway corporations had ceased to be enterprising; they had a good thing, and they did not want to spend any more money in giving better facilities to the public. It was the same case in Glasgow—the street railways would spend nothing. They knew what they were receiving in the way of fares, and they would invest nothing more. As a result, public sentiment grew in favor of municipal management, which is quite foreign to Great Britain, and especially to Scotchmen. In this country you will find a great deal of socialistic ten—

THE CHAIRMAN:—The Chair dislikes to interrupt any gentleman addressing this conference, but we are not called together to hear either a discussion or the presentation of an argument in favor of or against municipal ownership. We are here for the purpose of devising ways and means for the selection of a competent Commission to make that investigation and to present the facts. I do not know whether I express the sentiments of the gentlemen here assembled, but it appears to me that we should be pleased to hear from you upon any salient point, or any suggestion that would help us to an intelligent solution and conclusion of the question that is before us as a conference. But as to the merits of the question, the Chair suggests that the gentlemen refrain from discussing them.

Mr. SINCLAIR:—I am sure I don't know how I can talk about them, without violating the order of the Chair.

THE CHAIRMAN:—It is not an order, it is a mere sug-

gestion. It may be the fault of the Chair that I have not made myself understood. But I think it is only fair on all sides of this question that we do not discuss the merits of the proposition of municipal ownership, for that would certainly call for a rejoinder, and that is what we want to avoid now.

I now call upon Mr. Alfred Moseley, who did us the

F. J. MCNULTY,
President International Brotherhood Electrical Workers.

honor of bringing to the United States two Commissions, at different periods, for the investigation of certain questions; one of the industrial conditions of the United States and methods for the conduct of industry; and another of our system of education. Mr. Moseley is well known and one of the best thinkers and successful men in his own country and is highly esteemed in our country among those who have known of his work. We should be glad to hear from Mr. Moseley, and to hear any suggestions he may offer.

Mr. ALFRED MOSELEY:—I came here to-day rather as a listener than to be a speaker on this all important question. You are passing through in this country the same phase we are at home: that of a discussion as to whether it is wise that such essential matters as water, lighting, gas, etc., should be owned by the public, or whether they should be under the direction and in the hands of private enterprise. I am perfectly aware that there is much to be argued and much to be said on both sides. But it is not for me, certainly after the remarks that I have just heard, to enter in any way upon the pros and cons. We are here largely, I take it, to decide upon a Commission; the pros and cons do not enter into it; that would rather be for the Commission itself to emphasize when they bring in their report. As one who has been actively engaged and associated with Commissions, allow me to congratulate you upon your desire and determination to investigate

JOHN R. COMMONS,
Professor Political Economy, University of Wisconsin.

these important matters from an international standpoint. I might say, perhaps, that I am almost a pioneer in that point of view. It was rather an astonishment to the people of England that I should venture to think that there might be anything learned outside the United Kingdom. I am glad to say to this country that we are very happy to use all that we find here. I shall be happy, and I consider it will be not only a pleasure

but a duty, after the liberal treatment I had received when I brought the Commissions here, if I can be of any service when you bring your Commission on the other side. I shall find it a pleasure to help you or introduce you. I shall be glad to do anything I can for this Commission when it arrives. It will be necessary I think, and very necessary, when this Commission starts

LAWRENCE F. ABBOTT,
Editor the New York Outlook.

out that it should be composed of those who think upon all sides of the subject. You will find the same difference of opinion when you get to England that you find here, those who are strong advocates of municipal ownership, others who are against it. And I am bound to say that when one reads one side of the case in an editorial one feels very much convinced of the truth of one side, and on the following day when one reads an editorial on the other side, one is as strongly pulled in the other direction. It only goes to show how, if a case is presented from an ex parte standpoint the public will find it difficult to form any logical conclusion.

I fully appreciate the remarks that have been made by Prof. Gray, of the Northwestern University. I have had the good fortune of having met that gentleman when he was in England, where he made some investigation of the labor party. It is absolutely essential that you will require competent engineering experts to look into the water, gas, and electric light matters, and you will, above all, require a thoroughly competent accountant.

The whole of the controversy which is going on in England is the question, not so largely whether municipal ownership is good or bad, but whether the accounts presented to the public really represent the true state of affairs. That accountant, in my opinion, must be a

J. W. SULLIVAN,
Editor Garment Workers' Bulletin.

man who will not only deal with figures but who will look somewhat deeper into the proposition. He must be one who is capable of determining as to whether the amount of money set aside for depreciation is sufficient; the sums of money that must be necessary for any large undertaking to keep pace with the times, to give all the latest improvements, and give all the latest machinery—as to whether the sums of money set

aside in those accounts sufficiently show to the public that there has been a full provision for those important matters. It will take more than an ordinary accountant; it will require an expert in the various departments to decide those matters.

Then again, I venture to think there is another side that will require to be investigated; that is, the moral and political side. We find in France and in Europe generally the cry that municipal ownership may lead to moral corruption. I do not see necessarily that it does or will, but that point has been raised, and has been raised with very strong emphasis. I do know, as a matter of fact, that politics do enter very considerably into the controversy in England, as to state ownership and municipal ownership versus private enterprise. That, again, I think is a point that your Committee will require to consider when it makes its investigation in England. I don't know that there is any suggestion that I can especially make. I heard it suggested some little time ago that there should be a further investigation. Perhaps it would be beyond my province at this stage to make a suggestion; but I venture to make it—but I think that could easily be left to the body that is proposed to go abroad; that is in regard to savings banks. The small savings of the wage-earners is, to my mind, a very important subject. Their money should, in my humble opinion, be placed beyond any possibility of failure. I don't mean in regard to banks, because a man who is a capitalist takes good care to separate and to average his savings and put them into a variety of different undertakings. But the poor worker, who saves quarter by quarter, and dollar by dollar, has only one way of investing his money, and that is in these so-called savings banks. In England we take care that those few dollars so hardly earned shall not

JAMES DUNCAN,
1st Vice-President American Federation of Labor.

be risked, but are in the hands of the Government. It is true, the interest is small, but the workman knows that when he wants his money it is perfectly safe. I venture to think that if the Commission saw their way to draw up some report upon our Post Office Government Savings Bank, it would be to the advantage of this country.

May I make one other suggestion? and that is this: That whether this Commission be large or small, I think it is possible and highly probable that the conditions in the United States may differ from those which you will find in the old country. I cannot help thinking it would be wise for those who are going to Europe to look through the conditions of municipal ownership in this country before they go, in order that they may be able to compare similar conditions when they get on the other side. You may find that what is good there would not answer here—what is good in Europe would not, possibly, answer here. You will also find when you get on the other side certain communities are running their street lighting and railways—or rather the surface cars, and water to the full satisfaction of the public; while in other communities they are not giving satisfaction by any means.

It will therefore be necessary for the Commission to investigate thoroughly the why and the wherefore of success on one side and failure on the other, to say how far those successes or failures would be applicable to this country, and how far you may be able to embrace all the strength of the European system and how far you may be able to avoid our weaknesses and failures.

THE CHAIRMAN:—Under the resolution adopted instructing the Chairman to appoint a Committee of which he shall be one, the Chair appoints the following:

Samuel Gompers, A. H. Revell, John B. Devins, Milo

R. Maltbie, George H. Harries, D. L. Cease, Marcus M. Marks.

Mr. MARCUS M. MARKS, manufacturer, New York City:—May I ask, before we retire, to have some expression on the subject of having the same body of men investigate here and investigate abroad? Before Mr. Moseley spoke I thought there were two distinct com-

ALBERT E. WINCHESTER,
Manager South Norwalk Electric Plant.

mittees to be appointed, one to investigate here and the other to investigate abroad, and I was uncertain whether the Chairman wanted to decide as to the best means by which it could be done. But we are no further ahead now than when we started out. These interpretations can only be acquired by personal impressions. The reason I say this is because the size of the active commission can only be determined when it is known whether it is to be one commission or two commissions. I think that the same persons should make the investigation in this country and abroad. How can conditions in two countries be compared if different commissions make separate inquiries? If Mr. Gompers and I should be appointed to find out whether they make the best mince pie in London or in New York, and he should eat a piece of pie on the Strand and I should eat one on Broadway, how could we agree as to which brand of pie was most like the pie that mother used to make? The twenty-one, if appointed, is to be an Executive Committee to lay out the program, as I understand it, while the Committee to do the active work is to be nine. I think it would be well to have the views of the gentlemen on that question.

Mr. EASLEY:—That is one of the questions that this committee of seven is expected to make a recommendation about. After hearing the views of the various speakers this morning, it is certain that the committee

ALEXANDER C. HUMPHREY,
President Stevens Institute.

will act with all the light that it can get at this stage. Prof. PARSONS:—May I move that Mr. Easley be added to the Committee just named?

THE CHAIRMAN:—Yes; he may be added. In view of the fact that it has been announced that lunch is ready I think we will adjourn. The Chair was inclined to say something, but having due regard for the lunch question we will now adjourn until 2:30 P. M.

Afternoon Session.

The Commission reconvened at 2:30 P. M.

Mr. REVELL:—In the absence of the Chairman, Mr. Gompers, who has been called away, I have been asked to call the Commission to order that it may receive the report of the Committee.

MARCUS M. MARKS,
Manufacturer.

The Committee recommends to your body the election of Melville E. Ingalls, of the Big Four Railroad, as Chairman of the full Commission;

John Mitchell, President United Mine Workers of America, Indianapolis, Indiana, First Vice-Chairman;

John G. Agar, President Reform Club, New York City, Second Vice-Chairman;

Edward A. Moffett, editor of the *Bricklayer and Mason*, New York City, Secretary.

Mr. DEVINS:—I move the adoption of the report so far as completed.

Prof. PARSONS:—I second the motion.

The motion was carried unanimously.

Mr. REVELL:—The first thing in order will be to conduct Mr. Ingalls to the chair, and to have the other officers who are present take their respective places. I will therefore ask Mr. Easley and Mr. Marks to conduct Mr. Ingalls to the Chair.

Mr. INGALLS was conducted to the Chair, and said:—I thank you very much for the honor done me. I will not detain you long, but perhaps you will give me five minutes to make a few suggestions that occur to me.

I believe I have always tried to do my duty as a public citizen. This is a time when it is especially important that every man ought to do what he can to try to solve questions of importance to the common weal. There is a tremendous pressure all over the

municipal ownership which may be good in Glasgow, for instance, may not apply to Chicago, St. Louis or Cincinnati, because conditions are different. Those are things which ought to be studied. It seems to me that the men who would give their time to this matter are doing a public duty. I hope no one will undertake to serve in this matter unless he comes here expecting to give his time. It is no easy task. There must be thorough investigation, careful study and impartiality. No matter what your interests are, you should report the facts to the public. I don't believe we ought to spend very much time on it, either. There are many good things ruined by trying to do too much. You can't reform the world all at once. I think you had better take up the question that is present in this country, and the thing present is, whether you shall own your traction lines generally, and your electric and gas plants. I would put in the ownership and management of water more for the advice and history of it than anything else. It is pretty well settled that cities here manage their water plants. The question is, whether it is well for cities to manage gas plants and railways. But if you are going to have a report made upon that, especially in this country, let us investigate water. I hope we will hear more of the management of municipal monopolies. Let us investigate the advisability of owning and operating these monopolies with consideration for circumstances and conditions. What is good for one place and one city may not be good for another. What is a good thing in England might not be good in America; what is a success in Berlin might not be good in New York. Let us try to get the facts, and let us have a committee large enough so that sub-committees may be detailed to special work. But I think the general committee, as to some things, ought to give all its attention.

FRANK PARSONS,
President National Public Ownership League.

Make this the legislative body, so that the sub-committees may report to it. If you provide for a committee of twenty-one, or fifteen, or thirty—I don't care what it is—I think that committee ought to have authority to fill vacancies, and increase its number if it is found necessary. For instance, in considering this question you may find some men you have not thought of—who have not been considered. You may want to send fifteen men to Europe. It is not every man who can go to Europe. But in considering this you may come across somebody you never thought of, who is just the man you want. Therefore, let this sub-Committee have the right to increase their number if necessary, instructing them always that they have to report back to this Committee.

I take this position with a deep sense of the responsibility. I consider it a public duty. Whatever I undertake, I wish to carry out faithfully to the end. Let us put before the American public a history of facts as they exist in this country and abroad.

Mr. REVELL:—It is deemed wise by the Committee to recommend the election of an executive committee, as follows:

The officers, *ex-officio*, and
Alexander H. Revell, Merchant, Chicago, Ill.
E. E. Clark, Grand Chief Brotherhood of Railway Conductors, Cedar Rapids, Iowa.
Isaac N. Seligman, Banker, New York City.
E. Rosewater, Editor the *Bee*, Omaha, Neb.
William Wirt Howe, Lawyer, New Orleans, La.
Samuel Insull, President Chicago Edison Co., Chicago, Ill.
V. Everit Macy, Capitalist, New York City.
John Bancroft Devins, Editor *New York Observer*, New York City.
Frederick N. Judson, Attorney, St. Louis, Mo.
George Harvey, Editor *North American Review*, New York City.
Carroll D. Wright, President Clark College, Worcester, Mass.
Hamilton Hall, Editor the *Independent*, New York City.
Walter MacArthur, Editor *Coast Seamen's Journal*, San Francisco, Cal.
D. L. Cease, Editor *Railroad Troimen's Journal*, Cleveland, O.
Franklin MacVeagh, Merchant, Chicago, Ill.

Henry M. Farnam, Yale University, New Haven, Conn.
George H. Harries, Washington Railway and Electric Company, Washington, D. C.
Louis D. Brandeis, Lawyer, Boston, Mass.
Marcus M. Marks, Manufacturer, New York City.
James O'Connell, President International Association Machinists, Washington, D. C.
Lawrence F. Abbott, Editor the *Outlook*, New York City.

RALPH M. EASLEY,
Chairman Executive Council, National Civic Federation.

Alexander C. Humphrey, President Stevens Institute, Hoboken, N. J.
J. W. Jenks, Cornell University, Ithaca, N. Y.
John F. Tohin, President Boot and Shoe Workers' Union, Boston, Mass.
Frank A. Vanderlip, Vice-President National City Bank, New York City.

Mr. SULLIVAN:—What are the functions of this Committee?

Mr. REVELL:—As discussed in our Committee, there might be some money to be raised; there might be many other questions to come before this Committee; there might something occur while the general investigating Committee is abroad, and instead of calling the entire Commission together of about 100 persons from all parts of the United States, it might be possible to get a majority of this Committee together at New York City, or some other point, and it would be much easier to do it than to get the entire Commission together.

Mr. DEVINS:—And there might be vacancies to fill.

Mr. REVELL:—We provide for that in some other way. It is simply to cover the point that while your Committee appointed to go abroad were away, there would be none here to attend to the work except to call the entire Commission together, which might not be possible.

THE CHAIRMAN:—I understand their duties will be

LEO S. ROWE,
Professor Political Economy, University of Pennsylvania.

country on the question of municipal ownership; one side wants one thing, and another the opposite. You will find people who say that public ownership is the beginning of socialism, and that it will be the ruin of the country. You will read to-day in the newspapers that municipal ownership is a great success, and tomorrow a failure; and there does not seem to be very much solid information to guide opinion. Furthermore,

WALTER MACARTHUR,
Editor *Coast Seamen's Journal*.

to perform the usual duties of an Executive Committee. The general officers of the Commission, it is understood, are to be members of the Executive Committee.

Mr. WALTON CLARK:—Is it the purpose to delegate to this Executive Committee all the powers of the General Committee or any of its powers, and what powers of the sub-Commission of Investigation? And is this Committee to report to the General Committee?

Mr. REVELL:—I understand that there are no powers of the Executive Committee pertaining to the work that the General Investigating Committee has to do; but to attend to any matters that might arise at any time.

Mr. EASLEY:—Each department of the National Civic Federation has its own Executive Committee. There are no by-laws defining their specific duties, but they are expected to meet any emergency that might arise. Permit me to suggest, Mr. Chairman, that you have the full report of your committee read. More interest is naturally taken in the question of whom the committee recommends on the Investigation Committee. The two committees read together will be self-explanatory. The Executive Committee practically takes the place of the general Commission when the latter is not in session. It is subject to the orders of the general body the same as any other executive committee. The Investigation Committee of Twenty-one which will be recommended to you is of an entirely different character and is not charged with any of the administrative burdens of the Executive Committee. It is going to require a considerable amount of money to make these investigations as thorough and as comprehensive as they should be made. Probably the main thing the Executive Committee will have to do will be to raise funds for the Investigation Committee to expend.

THE CHAIRMAN:—Suppose we hear the balance of the report.

Mr. REVELL:—The Committee recommend that a commission of twenty-one members be appointed to investigate in this country and in Europe the conditions of municipal ownership affecting water, gas, electric power, lighting, etc., and be empowered to fill vacancies, subject to the approval of the General Committee.

Those are the recommendations of the Committee; with the exception of one statement. The question of whether or not this Investigating sub-Commission of twenty-one shall be divided came before our Committee and the idea of having two sub-Commissions to do this work, one abroad and one here, did not seem to meet with favor. The sub-Commission of twenty-one was left free to divide itself, or to do as it pleases in the division of the work between Europe and America. Will the Secretary of our Committee read its recommendation?

Mr. MALTBE:—We recommend to this general Commission the appointment of a sub-Commission of Investigation, as follows:

M. E. Ingalls, Big Four Railroad Company, Cincinnati, O.

Dr. Albert Shaw, Editor *Review of Reviews*, New York City.

Talcott Williams, Editorial Writer the *Press*, Philadelphia, Pa.

W. D. Mahon, President Amalgamated Association Street Railway Employees, Detroit, Mich.

Frank J. Goodnow, Columbia University, New York City.

Walton Clark, United Gas Improvement Co., Philadelphia, Pa.

Edward W. Bemis, Superintendent Water Works, Cleveland, O.

John H. Gray, Northwestern University, Chicago, Ill.

Walter L. Fisher, Municipal Voters' League, Chicago, Ill.

Timothy Healy, International President Stationary Firemen, New York City.

William J. Clark, General Electric Co., New York City.

H. B. F. MacFarland, President Board of Commissioners, District of Columbia, Washington, D. C.

Daniel J. Keefe, President International Longshoremen's Association, Detroit, Mich.

Frank Parsons, President National Public Ownership League, Boston, Mass.

John R. Commons, University of Wisconsin, Madison, Wis.

J. W. Sullivan, Editor *Garment Workers' Bulletin*, New York City.

Leo S. Rowe, University of Pennsylvania, Philadelphia, Pa.

F. J. McNulty, President International Brotherhood Electrical Workers, Washington, D. C.

Albert E. Winchester, General Superintendent City of South Norwalk Electric Works, South Norwalk, Conn.

Charles L. Edgar, President Edison Electric and Illuminating Company, Boston, Mass.

Milo R. Maltbie, Franchise Expert and Former Editor *Municipal Affairs*, New York City.

THE CHAIRMAN:—I think it ought to be stated that they are to make their report back to this body.

Mr. EASLEY:—That was the intention.

THE CHAIRMAN:—You have got an Executive Committee, but it will be about as hard to get a quorum of that Committee as of a Board of Directors. Yet you have provided here for a Committee of Twenty-one with power to add and fill vacancies subject to the Executive Committee. That you ought to strike out. I think the Committee of Twenty-one should have the power without going back to the Executive Committee.

On motion, the report was amended so as to authorize the Commission of Twenty-one to fill its own vacancies and to add to its number.

A motion to create an Executive Committee, of whom seven shall constitute a quorum, was unanimously adopted. The names recommended were unanimously approved.

THE CHAIRMAN:—Next is the recommendation that

resolution now stands, it would limit the inquiry to the United States and Europe. I move that it be amended to include all this country—my purpose is to include Canada.

THE CHAIRMAN:—Then why not say in this country and Europe?

The amendment was accepted.

THE CHAIRMAN:—The question is upon the appointment of this Committee with the conditions and limitations as read. Are you ready for the question?

Mr. GROSSER:—Is that Committee to report at any given time?

THE CHAIRMAN:—There is nothing here to show it. That will be left to the Commission.

The motion was put and unanimously carried.

THE CHAIRMAN:—There has just been handed me a bulletin stating that the operation on Mr. Belmont, this morning, was very successful.

(Applause.)

Mr. ROSEWATER:—I think before we adjourn it would be well probably to have the Chairman call a meeting of the various Committees this very afternoon or to-morrow, before the gentlemen get out of town, for a preliminary conference.

THE CHAIRMAN:—I was going to suggest that, if we had no other business, the members of the Committee remain right in this room after the adjournment, and we can go into the whole matter better than at any other time, while it is fresh in our minds. Therefore I would ask that the members of the Executive Committee and those of the Commission of Twenty-one whose names have been read will remain here after the adjournment. If there is any gentleman present who has any suggestions to make we should be glad to hear him. If not, a motion to adjourn will be in order.

Upon motion, the Commission adjourned.

The Mode of Procedure.

Following the adjournment of the general Commission on Public Ownership and Operation, sixteen members of the Committee of Twenty-one on Investigation met and discussed for two hours the mode of procedure. A sub-Committee, consisting of Prof. Frank J. Goodnow, Mr. Walton Clark, Mr. Edward W. Bemis, Mr. J. W. Sullivan and Mr. Milo R. Maltbie, was appointed to formulate a set of practical questions that would be useful in pursuing the investigation. This sub-Committee, up to the date of publication of this issue of *THE REVIEW*, has held three meetings. It will be prepared to report to the entire Committee on Investigation on November 11. At that time, the Committee will probably determine upon the personnel of the domestic and foreign committees and fix the date for beginning the work.

MEMBERSHIP OF THE GENERAL COMMISSION.

The following is the full membership of the Commission on Public Ownership and Operation as constituted by the Executive Council of the National Civic Federation:

Abbott, Lawrence F., Editor the *Outlook*, New York City.

Adams, Prof. Henry C., University of Michigan, Ann Arbor, Mich.

Agar, John G., President Reform Club, New York City.

Allen, Walter S., Former Secretary Massachusetts Board of Gas and Electric Light Commissioners, Boston, Mass.

Andrews, Horace E., President Cleveland Electric Company, Cleveland, O.

Archibald, James P., Brotherhood of Painters and Decorators, New York City.

Baer, J. Willis, Secretary Presbyterian Board Home Missions, New York City.

Barker, F. E., Chairman Massachusetts Board of Gas and Electric Light Commissioners, Boston, Mass.

Bemis, E. W., Superintendent Water Works, Cleveland, O.

Bliss, W. D. P., Sociological Author, New York City.

Bowker, R. R., *Publisher's Weekly*, New York City.

Bramwood, J. W., Editor *Typographical Journal*, Indianapolis, Ind.

(Concluded on Page 16.)

AUGUST BELMONT,
President National Civic Federation.

CORNELIUS N. BLISS,
Treasurer National Civic Federation.

SAMUEL GOMPERS,
1st Vice-President National Civic Federation.

OSCAR S. STRAUS,
2d Vice-President National Civic Federation.

certain names that have been read to you be appointed a Committee of Twenty-one to investigate in this country and in Europe the advisability of private and municipal ownership affecting gas, water, electric power and light, and street railways, and that this Commission of Twenty-one be empowered to fill vacancies or add to their number subject to the approval of the Chair. Are you ready for the question?

Mr. HUGO S. GROSSER, City Statistician, Chicago:—I wish to inquire whether, of this Committee to investigate in this country and in Europe, a part will investigate the conditions in this country and the other part in Europe.

THE CHAIRMAN:—As reported, the Committee has the power to do as they please about that. They can all stay here or all go to Europe.

Mr. GROSSER:—May I ask you to read again the names of the Committee?

Mr. MALTBE read the names.

Mr. CLARK:—I call attention to the fact that, as the

MR. INGALLS' APPOINTMENT.

Cincinnati Star.

The appointment of Mr. M. E. Ingalls, of this city, to head the commission of the National Civic Federation, which has undertaken the study of municipal ownership abroad, will secure for that commission an admirable executive—and it is a position which, because of the enormous amount of detail to be gathered and to be digested, requires a man of more than the ordinary qualities as a director of forces.

It is a position in which personal theories will weigh little until formed by the evidence gathered, but in accepting it Mr. Ingalls touched upon a point that must be insisted upon when he declared: "You read both sides in the public press, one showing that it is a success, while the other records a failure. What is good for one country is not good for another."

While to many people the fact that a project is profitable or that it is unprofitable constitutes the deciding factor in an argument relative to public governmental policies, we must submit that such is not the case. Because a thing is profitable or satisfactory in Germany or Russia constitutes no argument why it should be adopted in America; neither does the fact that it is a failure there justify Americans in rejecting it. One might produce statistics showing that autocracy has proven profitable to Russia, but Americans would not believe that would justify us in submitting to a czar.

Whether municipalization is profitable or unprofitable when it is to be considered as a governmental policy, it can only be viewed in the light of our form of government. This Government was founded to carry into effect a theory; to depart from that theory is revolutionary. This theory is not that of England, France, Germany, or Russia, but is our own. It has carried the nation to its present stage through periods of distress, corruption and rebellion, and we are no more willing to abandon it for municipalization than we are for autocracy merely because it might make dollars.

The spirit of American institutions, the philosophy underlying them, must be recognized as the determining factor in any policy which it is sought to engrain upon them. To do otherwise would be to invite either revolution or disaster.

PLENTY OF WORK TO DO.

Boston Journal.

Melville E. Ingalls, a famous railroad man of Cincinnati, was recently chosen head of the commission of the National Civic Federation that has undertaken a study of the municipal ownership problem as exemplified here and in Europe. In accepting the office, he said:

"A tremendous pressure for municipal ownership is abroad, and it is our duty to the public to give them all the facts we can get together. You read both sides in the public press, one showing that it is a success while the other records a failure. What is good for one country is not good for another. The great fault we are liable to fall into is to try to do too much. We want to study gas plants, electric lighting plants, and especially water plants. I consider this investigation a public duty, and if we put the facts before the American public we shall give them a history of to-day, and we shall do a greater work for our country than ever performed by any statesman."

With one of his sentences Mr. Ingalls drove the arrow of truth straight into the bull's-eye of fact. We do, indeed, try to do too much. We make municipal ownership a mayoral issue, as in Chicago, carry the issue through and then fail lamentably in the attempt to establish even municipal street car lines. We need to do a great deal of careful investigation and preparation before we vote to municipalize everything all at once.

AN ILLUMINATIVE INQUIRY.

Bradstreet's Journal.

In response to a demand for information on the subject of municipal ownership and operation of public utilities, the Executive Council of the National Civic Federation has appointed a committee to investigate and report upon the general subject. It is suggested by the council that the present debate upon the matter is often misleading because of contradictory or unsatisfactory statements of fact, and it is intended that the investigation proposed shall disclose the actual results of public ownership and operation as far as they have been undertaken in the United States, and of their more extensive practice in foreign countries. The inquiry proposed will cover in its scope the relative advantages of public ownership and operation as compared with public ownership and private operation and private ownership and operation. Each system will be examined with regard to its effect upon wages, hours and conditions of labor; collective bargaining; the cost and character of service; political conditions;

civil service regulations; the spoils system; possible municipal corruption; the spoils system and taxation. The Executive Council of the Civic Federation has an eye for the needs of the time, and it is safe to say that no such illuminative report has ever before been presented on the subject of municipal ownership as that which will be laid before the public by the National Civic Federation committee."

MUNICIPAL OWNERSHIP STUDY.

Boston Transcript.

If the National Civic Federation had never done anything else, its study of the subject of municipal control would entitle it to recognition as an agency of public service. There is an immense amount of loose talk in this country about the municipal ownership of public utilities, and we have every shade of opinion, from the man who believes that a city ought not to supply light or water, or anything else of this nature, to those who believe that the city should own the street railways and telephones and do the family washing for its citizens, and the effect has been to have both sides evenly represented on the Civic Federation's committee of inquiry. Out of these varying opinions come diverse theories of municipal government, most of them of the half-baked sort, because there is a painful lack of definite and tangible information in the possession of the holders of these opinions.

Now, a committee of twenty-one people who are particularly well qualified for the work proposes to investigate the general subject of municipal control on behalf of the Civic Federation. It is the belief of the members of this committee that there are some places where municipal ownership is a good thing, and some places where it is not. What does very well in some foreign city may not be a good thing for Boston or New York. Furthermore, there are certain public utilities which in one place may be most economically operated by the municipality, while others may best be handled by private ownership. The subject is one of profound interest, and it affects all classes of people, and all sections of the country. But what is needed is definite information. When a certain rate for a certain service is talked about, those who are discussing the measure should know the circumstances under which that rate is made, and whether under other circumstances the same service could be performed economically at the same rate. The question of municipal ownership has heretofore been discussed in too general terms, with no particular regard paid to the local conditions. The Civic Federation proposes to obtain all the facts which apply to the subject generally, and to assist local communities in a consideration of the subject by giving them all the light possible upon the relations of municipalities to corporations and to public utilities under substantially similar conditions. This is a public service of no small value, and the report should be widely circulated and wisely read.

PROBE MUNICIPAL OWNERSHIP.

Milwaukee Journal.

The greatest interest should attach to the latest announced investigation of the National Civic Federation. At a meeting held in New York plans were completed for the study of municipal ownership both in this country and in Europe.

An investigation of municipal ownership by this organization will carry the greatest weight, and whatever recommendations, if any, result should be eagerly looked for. The entire problem is one of such enormous proportions that its careful study can scarcely be attempted by individuals. The country, it is true, is and has for some time been flooded with the opinions of doubtful "authorities" on the intricate questions involved, but the country has not been treated to that thorough discussion of principles and precedents which a responsible national association is alone capable of affording.

The United States as a nation is fast entering that stage in its development where every effort is being expended by a large and active class of its citizens to force the adoption of the principle of municipal trade. The strength already gained by the movement, as shown in the results of Chicago's last city election, was such as to cause the greatest surprise.

The National Civic Federation, by digesting in a careful and scientific manner the experience in trading of municipalities in Europe and America, will be able to throw a clear light on the problem which will be of invaluable assistance in finding a successful solution of the real difficulties at hand. It is safe to say that this investigation and study offers more present possibilities for actual assistance to the country than almost anything the Civic Federation has ever undertaken.

TO ENLIGHTEN PERPLEXITY.

Chattanooga Times.

The Civic Federation has referred the question of municipal ownership to a committee of twenty-one specialists for investigation and report. That is probably the best way to dispose of it for the present. The public are yet in great perplexity as to the real merits of the question, although there appears to have been a very decided drift toward the affirmative of the proposition during recent years. If the report of this committee shall avoid the multiplicity of features and the technicality of terms usually confusing the results of expert investigations, it will doubtless have great influence in determining future popular action.

FACTS ABOUT PUBLIC OWNERSHIP.

Collier's Weekly.

The National Civic Federation has determined to underpin the discussion on public ownership with a solid basis of fact. The trouble with the bulk of the alleged information collected on that subject heretofore has been that it has been frankly, or at least rankly, partisan. It has been collected by persons who have been looking for material to help one side or the other of their case, and has commanded no more confidence than the arguments based upon it. In the meeting of the Civic Federation's Committee of One Hundred at Columbia University, New York, on October 4 and 5, both sides were strongly represented. Chairman Belmont, one of the chief representatives of corporate interests in the country, who was kept away by illness, sent a letter in which he expressed hearty approval of the investigation. His place was taken by Samuel Gompers, President of the American Federation of Labor, an apostle of the public ownership creed. Corporations were very strongly represented among the participants—another evidence, like the recent decision of the American Street Railway Association to enter upon an active campaign against the "socialistic heresy" of municipal ownership, that vested interests are resolved not to let the verdict of public opinion go against them by default. The Civic Federation appointed a committee of twenty-one to conduct an exhaustive investigation in America and Europe. The advocates of public ownership were rather alarmed at first lest this body should be controlled by corporate influences, but this fear did not appear to be well founded. Its catholicity was indicated by the choice of Melville E. Ingalls, head of the Big Four railroad system, as president; John Mitchell as first vice-president, and John G. Agar as second vice-president; and by the selection of a subcommittee on plan composed of such serious students of civic problems as Professor Frank J. Goodnow, of Columbia; Edward W. Bemis, head of the Cleveland Water Department; Walton Clark, J. W. Sullivan and Milo R. Maltbie.

PUBLIC AND CORPORATE OPERATION.

Pittsburg Post.

Melville E. Ingalls, in accepting the chairmanship of the commission of the National Civic Federation which is to study the municipal ownership problem, said: "A tremendous pressure for municipal ownership is abroad, and it is our duty to the public to give them all the facts we can get together. I consider this investigation a public duty, and if we put the facts before the American public we will give them a history of to-day, and we will do a greater work for our country than ever was performed by any statesman."

There is no doubt that municipal ownership will come to be favored generally by the people wherever the existing service of public utilities by individuals or corporations is unsatisfactory. The temper of the people is daily becoming more indisposed to put up with the exactions and abuses growing out of the efforts of greedy owners to afford the least possible accommodation for the public at the highest possible rate. Wherever the public utilities are so managed as to accommodate the public there will be no demand for municipal ownership. But where the contrary is the case the ranks of those favoring such ownership will be rapidly increased. There will be an increasing tendency toward municipal ownership also if the experiments in this line now in progress in Europe and this country should prove satisfactory. The great danger is that such ownership, by increasing the number of employees subject to the city government, would by that much enhance the opportunity for corrupt political leaders to profit. Municipal ownership and non-partisanship in municipal affairs would therefore seem to be necessary accompaniments if the best results are to be attained.

The National Civic Federation Review

VOL. II. No. 7

NEW YORK, DECEMBER 1, 1905

TEN CENTS

THE GREAT PROBLEM OF IMMIGRATION.

OFFICIAL DELEGATES FROM EVERY STATE IN THE UNION WILL HOLD THE FIRST NATIONAL CONFERENCE UPON THIS SUBJECT.

THE first National Conference ever held in the United States upon the subject of Immigration will convene in Madison Square Garden Concert Hall at 10:30 o'clock, Wednesday morning, December 6, under the auspices of the National Civic Federation. The sessions will continue during December 7 and 8. One feature of the Conference will be a visit to Ellis Island, where the delegates will be entertained at luncheon, the food and its preparation being identical with that provided the alien arrivals after leaving the steamships and while awaiting inspection. Steamships

due to reach this port at that time should afford the delegates an opportunity to witness the arrival, inspection and disposition of approximately five thousand immigrants.

Those composing the Conference on Immigration will be delegates appointed by the Governors of States and Territories, and representatives of commercial, economic, ecclesiastical, labor and agricultural organizations. The participants have been selected because of their interest in the general subject and their expert knowledge of some of its social, economic, moral and

industrial phases as manifested in their own localities. Because of this composition of the Conference, the Committee of Arrangements has not presumed to prepare a complete program. Through correspondence with delegates the Committee will be able, however, to facilitate the discussion by outlining the several topics and in some cases by suggesting an opening speaker for a subject.

The Conference will consider the problem of immigration in its relation to our industrial and social prosperity. The discussion will include the effectiveness of the administration of existing legislation and propo-

ELLIS ISLAND, THE PRINCIPAL GATEWAY FOR INCOMING ALIENS.

sitions for new legislation. Especial consideration will be given to the relation of alien labor to domestic crafts, the industrial progress of the negro and other questions growing out of the distribution of incoming aliens. One day will be accorded for a particular discussion of the Asiatic phase of the problem.

The Conference will be called to order by August Belmont, President of the National Civic Federation. Addresses of welcome will be delivered by Governor Frank W. Higgins, of New York State, and Mayor George B. McClellan, of New York City. The national Government will be officially represented by Frank P. Sargent, United States Commissioner of Immigration.

The importance of this Conference and its potential influence upon public policy toward a problem of far-reaching importance to the racial composition, the present and future industries and the political and social institutions of the nation have been widely and significantly recognized. The call for the Conference, issued by the National Civic Federation, has been followed by a continual debate upon various phases of the question that has served to clear the way, to some extent, for the proceedings of the Conference itself. Valuable papers upon the theme have been published in many periodicals, including THE NATIONAL CIVIC FEDERATION REVIEW.

In this preliminary debate, the newspaper press has taken a lively part. The comment has concerned itself with the comparative quality of various elements in the incoming stream of aliens and with methods proposed for its modification. The discussion has brought out plans for more thorough inspection, at ports of arrival and of embarkation, and at original sources; for a higher head-tax; for more rigid educational requirements, and even for suspension or absolute exclusion. There has been much examination into the correct significance of statistics.

The National Civic Federation, as an organization, has taken no attitude for or against any of the propositions that have been advanced for the regulation, restriction, encouragement or exclusion of immigration. The Conference will be an open forum for debate by the best thought of the country, in the hope that its conclusions may be an efficient aid in forming a sound and consistent policy that will safeguard the social and industrial welfare of the United States, while conducing to the fullest development of its prosperity and the furtherance of its destiny as a member of the great family of nations.

At the date when this issue of THE REVIEW went to press, nearly all the Governors had appointed delegates to represent their States, and of these several have signified their intention to be present with their delegations. Some of the names of these delegations were not received in time for insertion in this issue of THE REVIEW. Here follows a list of the delegates appointed by the Executives of States and Territories:

ALABAMA.

Appointed by Governor William D. Jelks.

Hon. Robert R. Poole Montgomery.
Hon. W. H. Seymour Montgomery.
Hon. W. W. Screws Montgomery.
Hon. Erwin C. Craighead Mobile.
Col. Frank Y. Anderson Birmingham.
Hon. Wilson Brown Birmingham.
Hon. R. A. Mitchell Alabama City.
Hon. Eli S. Shorter Eufaula.
Hon. Ross C. Smith Birmingham.
Dr. Louis Edleman Huntsville.

ARKANSAS.

Appointed by Governor Jeff Davis.

Capt. E. A. Darr Atkins.
R. J. Wilson Russellville.
Dr. Love Dardanelle.
Ad. Bertig Paragould.
Dr. Wallace Carter Ozark.
B. A. Hardy Monticello.
J. H. Pryor Hamburg.
Hon. Jake Shaul Marianna.
Hon. W. H. Harvey Ponte Ne.

COLORADO.

Appointed by Governor Jesse F. McDonald.

Hon. Wilbur F. Cannon Denver.
Judge Frank T. Johnson Denver.
D. C. Packard Denver.
Dr. F. K. Dabney Denver.
C. E. Wantland Denver.
Joseph G. Brown Denver.
John T. Burns Denver.
J. L. Donahue Denver.
R. A. Morrison Denver.

CONNECTICUT.

Appointed by Governor Henry Roberts.

Rev. Joel Ives Hartford.
Hon. Wm. D. Parker Meriden.
Hon. F. Clarence Bissell Willimantic.
Hon. Robert A. Griffing Hartford.
Hon. John H. Perry Southport.
Hon. Henry H. Bridgman Norfolk.
Hon. Waterman R. Burnham Norwich.
Rev. Watson L. Phillips New Haven.
Rev. Clarence E. Bacon Middletown.
Rev. Olcott B. Colton Hartford.
Hon. Lynde Harrison New Haven.

DELAWARE.

Appointed by Governor Preston Lea.

Hon. John Hunn Wyoming.
Hon. Ebe W. Tunnell Lewes.
Hon. George Gray Wilmington.
Hon. Anthony Higgins Wilmington.
Henry B. Thompson Wilmington.
Thomas H. Savery Wilmington.
George A. Harter Newark.
Willard S. Meredith Wilmington.
Harry A. Richardson Dover.
Samuel H. Messick Bridgeville.

DISTRICT OF COLUMBIA.

Simon Wolf Washington.
W. V. Cox Washington.
James F. Oyster Washington.
William F. Downey Washington.
George Truesdell Washington.
Ellis Spear Washington.
L. G. Hine Washington.
M. I. Weller Washington.
W. F. Gude Washington.
F. S. Hight Washington.

FLORIDA.

Appointed by Governor N. B. Broward.

Irving H. Welch Jacksonville.
H. S. Gateskill McIntosh.
W. R. Fuller, President Tampa Board of Trade, Tampa.
R. S. Hall Tampa.
Z. C. Chambliss Ocala.
J. R. Saunders Pensacola.
George F. Miles St. Augustine.
William M. Brown, President Miami Board of Trade, Miami.
Capt. C. E. Garner, President Jacksonville Board of Trade, Jacksonville.

GEORGIA.

Appointed by Governor J. M. Terrell.

Hon. G. Gunby Jordan Columbus.
Hon. J. E. Page Wrightsville.
Hon. Crawford Wheatley Americus.
Hon. S. F. Parrott Macon.
Hon. I. C. Wade Cornelia.
Hon. T. M. Cheatham Broxton.
Hon. J. P. Billups Atlanta.
Hon. W. G. Cooper Atlanta.
David Robinson Atlanta.
Dr. B. Wildaur Atlanta.
Hon. Pleasant A. Stovall Savannah.
Hon. Thomas G. Hudson, Com. of Agriculture, Atlanta.
Hon. William S. West Valdosta.

IDAHO.

Appointed by Governor Frank R. Gooding.

Hon. R. M. McCracken Blackfoot.
Hon. Avery C. Moore Weiser.
(The names of the additional delegates will be announced later.)

ILLINOIS.

Appointed by Governor C. S. Deneen.

A. H. Revell Chicago.
F. W. Mathieson La Salle.
Charles H. Williamson Quincy.
Charles Ridgely Springfield.
Charles E. Kiler Champaign.
John M. Stahl Chicago.
E. A. Bancroft Chicago.
W. G. Edens Chicago.
Charles H. Wacker Chicago.
George Parsons Cairo.

INDIANA.

Appointed by Governor Frank Hanley.

John Halliday Indianapolis.
(The names of the additional delegates will be announced later.)

IOWA.

Appointed by Governor Albert B. Cummins.

B. Annundsen Decorah.
Edward A. Steiner Grinnell.
V. Lyngby Cedar Falls.
W. R. Patterson Iowa City.
Rev. J. F. Nugent Des Moines.
O. H. Cessna Ames.
C. F. Wennerstrum Des Moines.
Charles Grilk Davenport.
A. L. Urlick Des Moines.
E. E. Clark Cedar Rapids.

KANSAS.

Appointed by Governor Edward W. Hoch.

Hon. F. D. Coburn Topeka.
Hon. C. C. Carver Pratt.
Hon. A. E. Case Marion.
Hon. John E. Frost Topeka.
Hon. J. H. Stewart Wichita.
Hon. H. J. Smith Ottawa.
Hon. W. L. A. Johnson Topeka.
Hon. James A. Orr Weir City.
Hon. Archie Fulton Lansing.
Hon. D. J. Hanna Hill City.

KENTUCKY.

Appointed by Governor J. C. W. Beckham.

Geo. L. Schon, Pres. Children's Home Soc., Louisville.
F. A. Burgess Louisville.

Dr. B. F. Laird Covington.
Col. John R. Allen Lexington.

LOUISIANA.

Appointed by Governor Newton C. Blanchard.

Senator S. D. McEnery New Orleans.
Senator Murphy J. Foster New Orleans.
Congressman Adolph Meyer New Orleans.
Congressman Robt. F. Broussard New Iberia.
Congressman J. T. Watkins Minden.
Congressman J. E. Ransdell Lake Providence.
Congressman Samuel M. Robertson Baton Rouge.
Congressman A. P. Pujo Lake Charles.
Hon. E. F. Kohnke, Pres. Board of Trade, New Orleans.

Hon. M. J. Sanders, Pres. Progressive Union, New Orleans.
Hon. W. E. Glassel, Pres. Board of Trade, Shreveport.
Dr. John P. Scott, Pres. Progressive League, Shreveport.

F. L. Maxwell Mound.
Hon. Thomas C. Barrett Shreveport.
Mayor A. A. Forsythe Monroe.
Hon. J. B. Lee Mansfield.
Judge R. R. Reid Amite City.
Hon. R. H. Snyder St. Joseph.
Hon. Paul Capdevielle Baton Rouge.
Hon. W. W. Duson Crowley.
Hon. John Marks Napoleonville.

MAINE.

Appointed by Governor William T. Cobb.

Edwin Riley Livermore Falls.
Robert McArthur Biddeford.
Hayward Peirce Frankfort.
Jasper Wyman Milbridge.
F. E. Wheel Rumford Falls.
H. E. Dunnack Augusta.
E. S. Clark Bar Harbor.
Charles L. Fox Portland.
D. N. Beach Bangor.
George K. Walker Millinocket.

MARYLAND.

Appointed by Governor Edwin Warfield.

Fabian Franklin Baltimore.
Norval E. Foard Baltimore.
Theodore Marburg Baltimore.
George E. Barnett Baltimore.
Richard M. Venable Baltimore.
Frank K. Carey Baltimore.
John M. Glenn Baltimore.
Charles J. Fox Baltimore.
Rev. C. E. Redecker Odenton.
Dr. D. F. Penington Baltimore.

MASSACHUSETTS.

Appointed by Governor William L. Douglas.

Charles F. Pidgin Boston.
Joseph Lee Boston.
John Graham Brooks Cambridge.
Frank K. Foster Boston.
Henry Abrahams Boston.
Max Mitchell Boston.
Prescott F. Hall Boston.
Frank B. Hall Worcester.
Frank W. Merrick Boston.
Augustus P. Gardner Hamilton.

MICHIGAN.

Appointed by Governor Fred M. Warner.

William F. Bird Ann Arbor.
S. T. Fairbanks Saline.
Allen B. Morse Ionia.
Hamilton Carhartt Detroit.
Edward C. Hinman Battle Creek.
Frederick B. Smith Detroit.
F. A. Peavey Port Huron.
Gilbert W. Dickson Detroit.
Stephen Corvin Bay City.
Paul Merin Grand Rapids.
Mathew H. Walters Wegaunee, Mich.
William H. Longley Kalamazoo.

MINNESOTA.

Appointed by Governor John A. Johnson.

Hon. Adolph Bydal Crookston.
Hon. Alex. C. Johnson Minneapolis.
Hon. R. E. Burbridge Minneapolis.
Hon. R. S. Odell Marshall.
Hon. John E. Burchard St. Paul.
Hon. B. F. Beardsly St. Paul.
Hon. John M. Dahlby Moorhead.
Hon. W. D. Washburn, Jr. Minneapolis.
Hon. Wiley Tindolph Thief River Falls.
John H. Hoeschen Melrose.

(Concluded on page 12.)

AN INTERNATIONAL INVESTIGATION OF PUBLIC OWNERSHIP.

EVERY SHADE OF OPINION AND ALL INTERESTS CONCERNED ARE REPRESENTED IN THE COMMISSION APPOINTED BY THE NATIONAL CIVIC FEDERATION.

THE Commission appointed by the National Civic Federation to investigate the ownership and operation of public utilities is now organized and prepared to prosecute its inquiry into selected divisions of that subject. The general Commission on Public Ownership, as it is called for sake of brevity, held its first meeting in Earl Hall, Columbia University, New York City, October 5. The Commission spent the entire day in a discussion of the scope and method of its work. A verbatim report of this meeting was published in a special number of THE NATIONAL CIVIC FEDERATION REVIEW.

The impartial attitude of the National Civic Federation, in providing that the investigation should be a purely scientific inquiry, was made clear in a letter written by President August Belmont, who was unable to be present because of serious illness. In his absence, Samuel Gompers, First Vice-President of the National Civic Federation and President of the American Federation of Labor, presided at the first session of the Conference. The letter of Mr. Belmont, addressed to Mr. Gompers on the day before the meeting, follows:

"There is no function which it has ever been my privilege to exercise, and no duty I ever more desired to perform, than that of presiding at the first meeting of the Public Ownership Commission, which is entrusted by the National Civic Federation with the duty of selecting committees to seek abroad and at home information on the subject of municipal ownership and operation of public utilities.

"My physicians have forbidden me to postpone an operation which they have prescribed for me, and I will be compelled to subject myself to their treatment. Therefore it is a matter of personal satisfaction to me that you are here in New York to take my place.

"The subject of municipal ownership and operation of public utilities is forcing itself upon the attention of all thoughtful persons. Unfortunately, the very lack of comprehensive and authoritative data and information leaves the discussion to theorists on both sides who often advance arguments which can neither be accepted nor rejected, for the very reason that no authoritative data exist. The National Civic Federation, through this Commission, will now try to obtain true and reliable facts to guide the student and legislator in seeking the best means to establish peace and maintain cooperation between capital and labor. To the accomplishment of this purpose, I have encouraged this movement and advocated the missions of the subcommittees.

"The relations of capital and labor are vital to the prosperity of the individual and to the State. It is proper, therefore, that arguments should be based on correct facts and known conditions. The Civic Federation has no greater work among its varied duties than to secure these data. The committee, which this Commission proposes to send abroad, will represent every shade of thought and opinion on the subject. This committee, when it returns, will report to a larger commission of men at home, likewise drawn from every part of the country and representing every phase of life. The Civic Federation has no interests to serve and no arguments to make on the subject, but to present the facts and conditions as they may

exist abroad and at home, for the use and benefit of the entire country, without respect to party and without respect to special interests.

"Believe me, had I been able to attend the meeting, I would certainly have been present, and I trust that I may regain my health and strength at an early date, in order that I may cooperate in every way in the furtherance of the great object of the gathering over which you are to preside to-morrow."

At the conclusion of the reading of Mr. Belmont's letter, John Mitchell, President of the United Mine Work-

and other public utilities is a great impending question occupying the attention of the people of the cities of our country; and it is well that it does. I am sure the advocates of municipal ownership will have no cause of complaint if a rigid, full, and analytical investigation is undertaken, so that the real facts may be ascertained and clearly, impartially, and without bias presented to the people of our country in such form that they may understand that the truth is before them, unvarnished and untarnished by individual predilections. I am sure that those who may be opposed to municipal ownership should have their minds in such a receptive condition, that when the presentation of facts is made, these facts will find a ready lodgment."

As a result of the day's discussion, the Commission decided to restrict the initial investigation to the comparative results, in America and abroad, of public and private ownership and operation of gas, water, electric power and lighting, and street railways—those utilities being at the present time most prominent in the public mind. The general Commission elected the following officers:

Chairman, Melville E. Ingalls, Chairman Board of Directors, Big Four Railroad, Cincinnati;

First Vice-Chairman, John Mitchell, President United Mine Workers of America, Indianapolis;

Second Vice-Chairman, John G. Agar, President Reform Club, New York City;

Secretary, Edward A. Moffett, Editor *Bricklayer and Mason*, Indianapolis.

In accepting the chairmanship of the Commission, Mr. Ingalls said in part: "This is a time when it is especially important that every man ought to do what he can to try to solve questions of importance to the common weal. There is a tremendous pressure all over the country on the question of municipal ownership; one side wants one thing, and another the opposite. You will find people who say that public ownership is the beginning of socialism, and that it will be the ruin of the country. You will read to-day in the newspapers that municipal ownership is a great success, and to-morrow a failure; and there does not seem to be very much solid information to guide opinion. Furthermore, municipal ownership which may be good in Glasgow, for instance, may not apply to Chicago, St. Louis or Cincinnati, because conditions are different. Those are things which ought to be studied. It seems to me that the men who would give

their time to this matter are doing a public duty. I hope no one will undertake to serve in this matter unless he comes here expecting to give his time. It is no easy task. There must be thorough investigation, careful study and impartiality. No matter what your interests are, you should report the facts to the public.

"I take this position with a deep sense of responsibility. I consider it a public duty. Whatever I undertake, I wish to carry out faithfully to the end. Let us put before the American public a history of facts as they exist in this country and abroad."

The general Commission elected an Executive Committee and a Committee of Twenty-one on Investigation. The latter was authorized to investigate the phases of the subject which have been specified, to

Ownership and Operation.

EDWARD A. MOFFETT,
Secretary Commission on Public Ownership
and Operation.

ers of America, moved that a letter of acknowledgment be sent to President Belmont, of the National Civic Federation, expressing regret for his illness and earnest wishes for his speedy recovery.

Prof. Frank Parsons, President of the National Public Ownership League, Boston, moved that the letter also state the Commission's appreciation of the impartial spirit, breadth of view and desire to bring out the facts manifested by President Belmont and the National Civic Federation throughout the organization of the Commission.

Mr. Mitchell accepted the amendment and the motion was unanimously adopted.

In his opening remarks, Chairman Gompers thus emphasized the impartial character of the investigation:

"The municipal ownership of our street railroads

STREET RAILWAY EMPLOYES VINDICATE PRESIDENT MAHON.

THEIR NATIONAL ORGANIZATION UNANIMOUSLY APPROVES HIS REPUDIATION OF THE INTERBOROUGH STRIKE.

THE true attitude of national organized labor toward the strike on the New York Subway last March is clearly and forcibly expressed in the report which William D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees of America, made to the national convention of that organization at Chicago, October 2. The keynote of that report is the inviolability of contracts. It is of great significance that the malcontents with the action of President Mahon in repudiating the strike on the Interborough signally failed in a movement for his defeat in the convention. That movement dwindled into insignificance, the result being the enthusiastic and unanimous adoption of his report, while only sixteen votes were cast against his reelection. The other officers of the Association, also reelected, are: First Vice-President, A. W. Morrison; Second Vice-President, Benjamin Commons; Third Vice-President, J. C. Colgan; Fourth Vice-President, J. J. Thorpe; Treasurer, Rezin Orr; Chairman Executive Board, D. L. Dilworth.

Besides treating of the Interborough strike, President Mahon's report dwelt upon the tendency among the organized street railway employees to increase sick and death benefits; the satisfactory settlement of a number of disputes by arbitration, without inconvenience to the public; and the increasing number of trade agreements.

President Mahon's report upon the Interborough strike follows:

"I desire to submit to you a full history of the New York Subway strike, which took place on March 7, 1905, that you may understand my attitude in connection with the same. A great deal of criticism has been heaped upon your officers and the officers of the American Federation of Labor because of our attitude in connection with this strike by persons who had no true information as to the facts or who never sought to obtain the true situation, but have misrepresented and lied about the facts in order to belittle the trade union movement and magnify and exploit their own particularisms.

"In order to give you thorough information concerning the Elevated and Subway organization, it will be necessary to refer back into the early history of this organization.

"In November, of 1902, Mr. Herman Robinson, the Organizer of the American Federation of Labor of New York City, decided to organize the Elevated railway men. An attempt showed Mr. Robinson that he could not approach an individual man, because they were all afraid to discuss with him the question of organization. So after a consultation between Mr. Robinson and myself it was decided that a letter should be drafted and published, and this letter be forwarded to each and every employe whose name Mr. Robinson could secure, and invite them to send him their applications by mail, pledging them that the names would be kept an absolute secret until enough could be gathered together to form an organization. This policy was adopted. After four months of hard work on the part of Mr. Robinson a sufficient number of names were secured to establish the organization, and on March 4, 1903, Mr. Robinson and myself called the men together and organized Division 332. The organization being once established, the men upon the service very rapidly enrolled themselves as members, and in the early spring of 1903 they made requests upon the Company for improved conditions of labor and an increase of pay. Results of their conference with the Company were unsatisfactory, and when I arrived in New York I found them on the verge of a strike. Through the assistance of the Civic Federation I was able to secure a conference for myself and the committee with the officials of the Company, and after several conferences we succeeded in securing a very satisfactory settlement; so satisfactory that it was accepted by almost the unanimous vote of the membership.

"Matters then moved along until the Subway trouble in September, 1904. Prior to this trouble, however, I had received a communication from the organization saying that they had secured a satisfactory understanding concerning the operation of the Subway when it would be opened for travel. However, on or about the first of September I received a telegram urging me to hasten to New York because of threatened trouble. I arrived in that city to find that the Brotherhood of Locomotive Engineers had made demands on the Company concerning the conditions of labor when the Subway would be open for travel. The Company had refused their demands, and they had sought the assistance of the Locomotive Firemen and Division 332 of our Association. I found that a written agreement had been entered into between Grand Master Stone of the Brotherhood of Locomotive Engineers and Division 332, in which our Division had pledged itself to strike upon the Elevated if the

Engineers did not secure a satisfactory adjustment of the Subway trouble. I again took up this matter with the Company and after several conferences we succeeded in reaching a settlement satisfactory to the Engineers and Firemen. This agreement was for three years, and covered the conditions of the motormen in the Subway, who were members of our Association.

"I speak of these matters, so that you may understand that we had always been able to secure a satisfactory adjustment with the Company of any dispute when approached in accordance with our laws and rules.

"As to the late trouble, the first knowledge I had that the situation was serious was on Saturday, March 4, when I received a telegram from Secretary Madden, requesting me to come on to New York at once. I was at that time in Columbus, Ohio. I returned to the General Office immediately, and left Sunday afternoon, arriving in New York City at about noon Monday. Shortly after my arrival I was met at the Clarendon Hotel by Secretary Madden and Vice-President May, of Division 332. They informed me that they were on their way then to the Company's office to attend a joint committee meeting. This committee was composed of members of Division 332, of the Locomotive Engineers and Locomotive Firemen. In our discussion of the situation they showed me a copy of an ultimatum that it was the intention of the joint committee to present to the Company. I asked

W. D. MAHON,
President Amalgamated Association Street Railway Employees.

them if they had not already presented copies of an agreement embodying the conditions which they desired for the next year. They stated they had, but, at a later conference between the organizations, they had agreed upon this ultimatum.

"Now, the ultimatum set aside all existing agreements that had been made by all three of the organizations and made entirely new demands. In this ultimatum they gave the Company until eleven o'clock that Monday night to concede to their demands. If not, they informed me they had decided to strike.

"I argued with these two representatives strongly against any such policy, and tried to persuade them not to present the ultimatum to the Company. They both seemed to agree with my position and promised to discuss the matter with the committee when they met. Secretary Madden then told me that no one knew that I was in the city; that I had not been officially called; that it was not the intention of the other officers to notify any of the International representatives as to what was taking place, and he asked me to keep my presence a secret and not to inform any one. He advised me, however, to wait at the hotel until the committee would adjourn at the Company's office, and then they would let me know what the results of the conference had been. I waited until about five o'clock in the evening, when Vice-President May accompanied by President Pepper of Division 332 returned to my room. They informed me that the ultimatum had been presented to the Company.

"I argued with them against any such a course, and pointed out to President Pepper that it was contrary to our laws and rules and that the International Organization would have to repudiate any such action. Mr. Pepper stated that he knew it was contrary to our laws, and that he expected we would repudiate, but he stated that before we could repudiate the strike,

it would be won, and they didn't care what we did. An investigation of the situation showed that the joint committees had prearranged everything, and that no meetings were to be held upon this evening. The men were then voting upon the proposition of a strike, and they were coming individually to the headquarters for that purpose. After a long discussion with Mr. Pepper, I was unable to change his views at all. So I gave up any hopes in that direction, and set to work to see if it was possible to get in touch with the organization. I then called up Mr. Edward Moffett, Editor of the *Bricklayer and Mason*, and met with him and several other representatives of organized labor of New York, and had them assist me in trying to locate the committee of the Division, with the hope of changing their views. We were unable, however, to find any meeting. However, Mr. Moffett met President Pepper, but could do nothing in influencing him against the policy that he was then prepared to carry out. So after working until one o'clock that night, we gave up any hopes of heading off this rash and unconstitutional strike.

"The Company refused their ultimatum, and at five o'clock on Tuesday morning the strike took place. I remained in New York during Tuesday, but I was unable to do anything. On Wednesday I got in communication with the representatives of Division 332, and on Wednesday night met with their committee jointly with a number of representatives of the different trade unions of New York City. We argued with them against the position they had taken, and advised them to call in their International Officers, and seek to get a settlement of the matter. The committee agreed with our position and returned to their headquarters with the hopes of having the joint committee agree with the same, but in this they were unsuccessful, and so notified me later in the night, but asked that I wait until Thursday morning to see what could be done.

"In the meantime, President Gompers, Vice-President Mitchell and Vice-President Kidd of the American Federation of Labor arrived in the city and extended to me an offer of their assistance to bring about an adjustment of the trouble. When I again met the representatives of the committee, I communicated this fact to them, and told them to lay that proposition also before their joint committee. These representatives of the committee went back and forth before the joint committee, and consultations took place until six o'clock in the evening, when they informed me that the joint committee had decided that they would not accept the assistance of any of the International Officers or the Officers of the American Federation of Labor. They stated that if any overtures for a settlement came from the Company, they must be made directly to them, the joint committee; that they would not seek any settlement. After this statement as to their position, I prepared and submitted to the press the following statement of our position, which I now submit to you just as it was published at that time.

"The present strike of Local Division 332 of the Amalgamated Association of Street & Electric Railway Employees was undertaken without consulting the responsible officers of the General Organization, without their consent or approval.

"Last Saturday a telegram was received at my Detroit office stating that "the situation in New York City is critical," and my presence was essential at once. I reached this city on Monday morning, and was astonished to learn that the request for my presence here was made upon personal responsibility and not at the instance of the Local Division.

"A copy of the demands to be presented to the Interborough Company on Monday afternoon was shown me, and I strongly advised against their presentation, for in addition to the demands for better conditions the document contained the indorsement of the Local Division of Engineers (Motormen), which violated the agreement that organization had with the Company.

"I had reason to believe there would have been little or no difficulty in obtaining from the Company better conditions, but our organization is strongly committed to the maintenance of its own agreements with employers, and was in honor bound not to encourage the violation of an agreement which another organization had with the employers of its members. Under our laws our Local Unions have no right to strike in violation of any agreement they have with employers, and surely they then can have no right to strike to support another organization to do an act they themselves have no right to do.

"It seemed to me that without resorting to drastic measures I might yet give whatever assistance my

(Concluded on page 7.)

A PROGRESSIVE TRADE UNION'S EDUCATIONAL ENTERPRISE.

NEW YORK STATIONARY FIREMEN FORM CLASSES TO INSTRUCT FELLOW CRAFTSMEN, BOTH WITHIN AND WITHOUT THE ORGANIZATION.

FREQUENTLY nowadays trade unions find useful functions beyond the mere struggle to secure or maintain standards of living wages and hours. These unions, having safeguarded with strong, protective organization the material interests of their members, set about to supply other needs—educational and benevolent.

The educational branch of this policy received the emphatic approval of the convention last year of the American Federation of Labor, which adopted a resolution recommending study and lectures upon appropriate subjects in lodge-rooms and in the homes of members.

A commendable example of putting this policy into practice is afforded by New York Local No. 56 of the International Brotherhood of Stationary Firemen. This Local has started a School of Instruction which will accommodate as many of its 4,000 members as care to embrace this opportunity to improve their knowledge of the technical equipment with which they have to deal while at their work. Both day and evening classes will be formed, so that the fireman who works either during the day or through the night may enjoy the advantages of this progressive plan. The number of classes and instructors is to be increased as the demand requires. This school is conducted in the large room in old Military Hall, on the Bowery (at No. 193), where as long ago as 1868 general conventions of labor and reform representatives were held. Susan B. Anthony tells of being at a convention in Military Hall in that year whose object was to organize the sewing women of New York and improve their condition.

The Firemen's School of Instruction will be supplied with charts and blackboards for illustrations and drawings to augment the lectures. The scheme of instruction includes engineering, and will not only teach the fireman all about handling boilers and fuel for either steam or electrical energy, but will prepare him incidentally for the promotion in the engine room that all good firemen aim to attain. Non-union firemen are also welcome to attend these lectures.

This technical education supplements the regular efforts of the union to make its members temperate and thoroughly reliable for loyal service wherever they are sent by the organization, which, moreover, holds each of its members to a strict accountability as to the performance of his duties. The employer is thus aided by union discipline to be assured of responsible service.

Stationary Firemen's Local 56 is nineteen years old.

STATIONARY FIREMEN'S SCHOOL OF INSTRUCTION.

During the past ten years it has had no strike nor lockout to interrupt its steady and prosperous growth. Every threatened trouble has been averted by conference and conciliation, or settled by arbitration. No. 56 has benevolent features which are met by the small dues of 50 cents per member a month, showing careful and economical management of the funds. On the death of a member in good standing \$100 is paid to the dependents, and on the death of a member's wife the organization contributes \$50 toward the funeral expenses.

The union maintains a business office, and a waiting and reading room for the unemployed at No. 193 Bowery. The reading tables are supplied with newspapers and periodicals and also magazines containing useful information concerning the engineering craft.

Local 56 is one of the 215 unions in the International Brotherhood of Stationary Firemen, whose jurisdiction over the United States and Canada is under the direction of President Timothy Healy, of New York, the man to whom credit is generally awarded for building up the local union which is the subject of this sketch. Mr. Healy has been twice elected by the International Brotherhood without opposition as its general president. The President of Local 56 is James Carroll and its Business Agent is James P. Holland.

The International Brotherhood maintains a headquarters and a suite of offices for its general secretary at Omaha, where also a monthly magazine is published as the official organ of the brotherhood, and is sent to every member's home.

The 50,000 members of this Brotherhood, in the

United States, Canada and British Columbia, are employed under trade agreements which include provision for arbitration in the electric lighting plants, street railway power houses, paper mills, large office buildings, breweries, packing houses, ice-making plants, the great manufactories, hotels and theaters.

(Concluded from page 6.)

experience and position afforded to advise a way out of the difficult and questionable position in which our men and our Local Division were placed, to try and bring about an honorable adjustment and the establishment of better relations between the men, the organization and the Company. However, the repeated tender not only of my good offices, but also those of President Gompers of the American Federation of Labor, President Mitchell of the United Mine Workers of America, Vice-President

Kidd of the American Federation of Labor, and President Healy of the International Brotherhood of Stationary Firemen, they inconsiderately rejected.

"Nothing now remains for me to do but to declare that the present strike is neither authorized nor approved by the Amalgamated Association of Street & Electric Railway Employees of America, and I therefore advise all our loyal members to report for duty at once, to maintain their organization which has done so much for the betterment of their material and moral conditions, and by the result of their present experience avoid such errors in the future. In that effort I shall be glad to assist to the fullest.

"(Signed) W. D. MAHON,
Street & Electric Railway Employees of America.
"New York, March 9, 1905."

"I now submit the report of this case for your consideration and approval or disapproval, as you may decide, but in connection with the same I desire that my position shall be clearly understood by this Convention, for if this organization is to be a success its laws, rules and agreements must be strictly adhered to and carried out by its membership, and so long as I am an officer I shall adhere to that policy; and were the same conditions confronting me to-day I would act exactly as I have acted in this case."

The unions that live up to their agreements, written or verbal, are the ones that enjoy the respect and confidence of the general public and accomplish the greatest good for the greatest number all the time.—*Label Bulletin.*

NATIONAL CONFERENCE ON IMMIGRATION.

The first National Conference upon Immigration ever held in this country, when it convenes in New York City on December 6, under the auspices of the National Civic Federation, will find itself a body representative of practically every State in the Union and of every interest, ethical, civic and industrial, concerned in a problem of many phases and of the highest importance. The program, so far as it could be prepared in advance for a body that is sure to be inspired by its own initiative, is attractive and instructive. The visit of the Conference in a body to Ellis Island will enable many of the delegates to witness for the first time the actual arrival, inspection and disposition of some 5,000 aliens; to partake of the same food served to them, and to comprehend accurately how the most important gate to the Republic and its citizenship is kept. The discussions of the Conference will not be confined to a rigid syllabus, but will be elastic in their range, in the hope that the utmost freedom of expression may result in conclusions of benefit to the national welfare.

THE FACTS OF PUBLIC OWNERSHIP.

There is solid ground for confidence that the people of this country, who are showing keen and wide-spread interest in the ownership and operation of public utilities, will within a reasonable time be placed in possession of the entire facts as to that question, so far as they can be discovered from experience in the United States and other countries. The Committee of Twenty-one appointed by the National Civic Federation to investigate this subject passed upon a plan for its inquiry on November 27. This plan was elaborated by a subcommittee, whose composition indicates the thoroughly representative character of the larger body. Its members are: Professor Frank J. Goodnow, of Columbia University; Walter Clark, of the United Gas Improvement Company, Philadelphia; Edward W. Bemis, Superintendent of the Cleveland Water Works; J. W. Sullivan, Editor of the *Garment Workers' Journal*; and Milo R. Maltbie, franchise expert. Here are represented the most diverse interests and the most divergent opinions. But this subcommittee has worked harmoniously in planning a comprehensive and searching investigation because of its unanimous agreement upon the desirability of ascertaining the entire truth about public and private ownership and operation; thus furnishing a basis for debate between the advocates of conflicting theories, out of which a satisfactory public policy may be evolved. Such harmony of purpose warrants expectation of agreement upon facts, regardless of differences as to their general interpretation or local applicability.

ANOTHER BLOW TO SOCIALISM.

In simultaneously adopting resolutions condemning Socialism and commending the methods for industrial peace advocated by the Civic Federation of New England, the State Federation of Labor of Massachusetts has made an exemplary demonstration of the progressive wisdom that is growing to rule the councils of organized wage-earners. It is noteworthy that the author of the anti-Socialist resolutions was David Goldstein, who was once himself a leading advocate of Socialism, but who was impelled by years of conscientious study to reject its theories as unsound. The workingmen of Massachusetts, once a hotbed of Socialism, are arrayed upon the side of rational and equitable relations between the productive forces of industry.

RECREATION ON THE ISTHMUS.

The official report to the United States Isthmian Canal Commission upon the needs and opportunities for recreation of Government employees engaged in canal construction, published in this issue of THE REVIEW, presents the carefully considered conclusions of two Welfare experts, recommended for that purpose, at the request of the Commission, by the Welfare Department of the National Civic Federation. This report outlines plans designed to secure the content, and consequent health and efficiency, of many thousands of men engaged in the prosecution of the greatest engineering work in the world's history, amid tropical conditions and far from their usual surroundings. Already some

of these plans have been put into effect by the Commission and others have been approved.

The recommendation in the report that the sale of beer and light wines be permitted in employes' club houses raises a question of growing importance in all large industrial establishments. Does it conduce to the welfare of employes to allow the use of beer and light wines of assured purity at cost prices in the lunch rooms or club-rooms of such establishments? Or should employes who desire such beverages be left to buy them in nearby saloons? These queries open a broad social and moral proposition, which has strong advocates and opponents. They will form one of the main topics of discussion at the annual meeting of the Welfare Department, to be held in New York City in January.

Another noteworthy recommendation of the experts is the establishment of the Saturday half-holiday, in order that the workers on the Isthmus may have opportunity to enjoy the recreative features that are designed.

WHO PAYS THE LABOR BILL?

Directly contradictory statements have recently been made, concerning the question of wages and of who ultimately pays the labor cost of production, by the President of the American Federation of Labor and by the President of the Citizens' Industrial Association of America. The first declares that high wages are both a cause of general prosperity and a preventive of industrial and commercial depression, because they increase the purchasing power of the mass, making consumption so great as to maintain production at its highest point. The other claims that the cost of higher wages must be paid ultimately by the consumer, so that the worker really gains nothing by an advance of wages, since he has to pay a higher price for every article he buys.

The wage-earners being the mass of consumers, this is a question of vital interest to them. It involves directly the relation between wages and the cost of living. Is the one to determine the other? There was a concrete presentation of this question the other day between a Chicago employer and the Wagon Drivers' Union. These teamsters asked an advance of their wages above \$2 a day on the ground that they could not live on that sum. They presented this interesting schedule of the daily expenses of an average city worker's family:

Rent	\$0.50
Food75
Fuel30
Light07
Carfare10
Extra meal25
Total	\$1.97

If correct, the figures of this schedule leave three cents a day for clothing, medicine, and minor household needs. The reply of the employer to this representation was also interesting: "No, I could not live on \$2 a day, and I don't believe that you can. But I can get plenty of teamsters who are willing to work for that price. That is really what governs wages more than the cost of living."

This incident suggests the further queries: Why can these other teamsters live on less than \$2 a day? What do they do without, that the teamsters who find \$2 a day too scant count as necessary to healthful living? If the rate of wages were thus to be determined by competition alone would the result to society at large be desirable? Or would the tendency be to degrade the American workingman to the condition of the coolie laborer?

The Industrial Economic Department of the National Civic Federation will devote a meeting to the consideration of the questions involved in this problem.

The merging of *Charities* and *The Commons*, now in charge of the newly formed Charities Publication Committee, is the concentration of policies common to each, and will give to the cause they represent a national periodical with greatly increased resources. The union brings into effective cooperation the two editors, Edward T. Devine and Graham Taylor, both recognized authorities in their special fields, the one being the head of the Department of Sociology in Columbia University and the other conducting the Institute of Social Science and Arts of the University of Chicago.

MASSACHUSETTS WAGE-EARNERS DENOUNCE SOCIALISM.

THE STATE FEDERATION OF LABOR REPUDIATES ITS PROPAGANDA AND STRONGLY APPROVES THE CIVIC FEDERATION OF NEW ENGLAND.

THE Massachusetts State Federation of Labor, at its annual convention held in Pittsfield in October, adopted resolutions denouncing Socialism as antagonistic to the trades union movement, and pledging its cooperation in the work of the Civic Federation of New England.

This is the first aggressive declaration against Socialism that this State organization has made in the twenty-five years of its history, its conventions hitherto having been content with a successful defensive attitude against the recurrent attempts to cause the adoption of Socialist resolutions. Consistent with this action was the simultaneous approval of the New England Civic Federation by the State Federation of Labor.

The *Boston Transcript* published the following editorial under the title "Organized Labor against Socialism":

"If the Socialist contingent carries out its threat of withdrawing from the State Federation of Labor because of the resolutions adopted at Pittsfield this week, it will certainly appear to the outside public as a most fortunate thing for legitimate unionism. It will relieve the trade union movement proper, in this State, of a cantankerous, disrupting element which has been making the lives of conservative labor leaders miserable for many years, frequently nullifying their efforts to hold union policies and methods within the limits of sound judgment and fair-minded moderation. The Socialist propagandists have no love for unionism as such; their connection with it is for the sole purpose, often frankly avowed, of capturing the labor movement by 'boring from within,' and converting it into a revolutionary crusade against the existing social and industrial order, which is held, regardless of the facts of steady improvement, to be destined only for abolition, root and branch.

"In denouncing this propaganda as 'intellectually unsound, impractical from an economic standpoint, and demoralizing to the general wellbeing of society,' the State Federation renders a public service which should be frankly acknowledged even by those who see little to admire in either the principles or policies of unionism. It is a service that has been rendered on many previous occasions, and cannot therefore be described as a new departure, but it becomes increasingly important as the Socialist agitation spreads. The growing disposition of organized labor bodies to ally themselves with the broader, constructive interests of the whole community, seeking progress along the lines of evolution rather than revolution, was further indicated in the resolutions strongly endorsing the Civic Federation of New England, in which respect the convention followed the action of the Boston Central Labor Union last May. It is one of the most significant signs of the times that trade unionism, whatever its shortcomings in leadership here and there, or mistakes of policy in special cases, is to-day one of the main bulwarks against the inroads of socialistic radicalism in the very quarter where those inroads would otherwise prove most effective—that is, among the wage workers of the country."

The anti-Socialist resolutions, presented by David

Goldstein of Waltham and adopted by the convention, follow:

Whereas, the American Federation of Labor, now entering upon its twenty-fifth year of work, has, by its principles and policy, gained for itself a place of usefulness and of honor within the body politic.

Whereas, trade union principles are those universally recognized as the basis of economic and civil society, namely, the right of private property in capital, the right of buying and selling potential labor, the right of free association, the right of personal protection under the law.

Whereas, the primary object of the trade union is to maintain and to advance the standards of American living, to maintain and to advance the wage earner's position relative to the economic and political progress of our nation.

Whereas, our experience—as an organization founded upon the general lines of trade autonomy—has demonstrated our tactics, high dues, collective bargaining, trade labels, trade agreements, adjustment of trade differences by conciliation and arbitration, and as a last resort the boycott and strike, to be effective in the progressive attainment of the end we have in view; and also to be sound by having won for unionism a place of well deserved importance in American institutions.

Whereas, the American Federation of Labor has for many years been harassed and is now under the assault of men holding to opposite principles, and employing contrary tactics, whose aim it is to convert unionists to socialism, that the economic power of our organization and the political power of our members may form an adjunct to social propaganda, and an accession to socialist party strength.

Whereas, the principles of socialism are intellectually unsound, impracticable from an economic standpoint and demoralizing to the general well being of society.

Therefore be it resolved, That we, the Massachusetts branch of the American Federation of Labor, in convention assembled at Pittsfield, October 9, 1905, do hereby denounce as detrimental to our progress, as destructive to our good fame, as disruptive of those personal and civic virtues, which it is our duty to cultivate, any attitude of sympathy toward socialist propaganda within our ranks.

Be it further resolved, That we recognize as the most despicable attack yet made upon the life of our national body, that organization launched in Chicago, July, 1905, known as the industrial workers of the world; headed by men of international reputation, namely, Eugene V. Debs, late presidential candidate of the socialist party; Daniel De Leon, editor of the *People*, official organ of the social labor party; A. M. Simons, editor of the *International Socialist Review*; ex-priest Thomas J. Hagerty, Messrs. Haywood and Moyer, president and secretary, respectively, of the Western Federation of Miners, and many other socialists of national reputation.

Be it finally resolved, That we condemn, in toto, this organization, and that we resist by all lawful means its encroachment upon our rightful territory, the labor world of the United States.

The debate over these resolutions consumed several hours. Among those who opposed Mr. Goldstein were James Kelly and James McCahe, Socialist delegates from Brockton, and Patrick F. Mahoney, Socialist candidate for lieutenant-governor. After the resolution had been adopted by a vote of 71 yeas to 28 nays, Mr. McCabe called upon all Socialists to leave the hall. None followed him, and he later resumed his seat.

The resolutions approving the New England Civic Federation, offered by Thomas M. Nolan, were as follows:

Resolved, That the Massachusetts State Branch, American Federation of Labor, conveys to the New England Civic Federation earnest approval of the efforts made and in contemplation by that organization, in bringing about a condition in which both employer and employed will more fully recognize the rights of the other, and whose work of educating the public upon the value of mediation and conciliation as preferable to strikes, lockouts, boycotts and other similar methods, deserves the loyal and hearty support of the American trade union movement.

Resolved, That the secretary be and is hereby instructed to convey to the New England Civic Federation, the purpose of the Massachusetts State Branch to cooperate with it in every way that will make for the happiness and advancement of the wage-earners of America.

The report of the Pittsfield *Journal* says:

Patrick Mahoney, of Boston, took the floor at the completion of its reading by Chairman Frank Foster, at once wildly gesticulating. Recognized by the chair, he read first a magazine article of the most disparaging sort upon the late Mark Hanna, and touching also August Belmont. He then characterized the Federation as of no account. He reflected upon the integrity and honesty of the union labor men connected with it, and characterized the work of the Federation as of no account and the reading and adoption of such a resolution foolish and uncommon and stated that he would oppose it to the end. Frank Foster, in the most brilliant speech yet heard in the convention, replied to Mr. Mahoney. With no attempt at eulogy, he showed what Mr. Hanna had done. He characterized the efforts of Mr. Mahoney as detrimental to trade unionism, and pointed out to the convention by many examples the great good accomplished for trade unionism in New England through the assistance of the Civic Federation in Massachusetts, and closed with the assertion that the Civic Federation was brought about through the efforts of Samuel Gompers and other noted labor union men, and not through capitalists, and that it was doing good work, and what was good for him should be good for any union man.

Peter Collins, of the Electrical Workers' Union of Boston, followed Mr. Foster. He showed by actual cases what the Civic Federation had done—how it had opened doors to trade union organizations which previously were closed to them because of the influence of its members securing hearings for unionists on matters of importance to them. He cited the case in particular of the American Bell Telephone Company, where advantageous five-year agreements with the electrical union had been entered into by this company, where a lockout seemed certain, owing to the kindly administration of the Civic Federation.

The debate was resumed on the following day. The Springfield *Republican's* report says:

Peter Collins told of meeting the officials of the American Telephone and Telegraph Company through the Civic Federation and of the results attained. He said that the successful outcome of a difference between the electrical workers and the American Telephone and Telegraph Company could never have been reached had it not been for the Civic Federation. He desired to refute the allegations made against the Federation by Patrick Mahoney, of Boston, Tuesday, and wished to be recorded as standing first, last and always in accord with the Civic Federation. He believed those principles will cement the labor movement in this country and provide a common ground on which capital and labor can meet in conjunction with representatives of the public and arrive at a lasting peace with just and honorable conditions for both parties concerned.

Mr. Mahoney again attacked the Civic Federation, which he said would strip organized labor of its strength. If the workmen were organized as they should be they could enforce their demands themselves without the necessity of calling in the assistance of the Civic Federation, which would in itself be an acknowledgment of weakness.

Frank McCarthy, of Boston, spoke warmly in favor of the Federation. He said that it was formed solely to assist in arriving at some understanding between employer and employee without the necessity of resorting to strikes or lockouts. It was not organized to settle strikes and has no authority to do so; its services can only be exerted upon request of the parties involved. Its avowed object is to bring together parties who could not be brought together for a conference through any other means, and it has accomplished this object on numerous occasions. The principles of Civic Federation are in line with those of every bona fide labor organization in the country. If federation was not indorsed, laboring men will be accused by the people of the country of being afraid to stand up and openly avow these principles.

The resolution was adopted by an overwhelming majority, its opponents not asking for a roll-call.

(Concluded from page 5.)

add to its members and to subdivide itself, employ experts when in its judgment necessary, and to allot its work as it sees fit. This Committee of Investigation is to report its final conclusions to the general Commission.

Since the appointment of the Committee of Investigation, a special subcommittee, appointed immediately after the adjournment of the general Commission on October 5, has been occupied in preparing a series of questions, calculated to facilitate, for purposes of precise comparison, the simultaneous ascertainment of facts in this country and in others. Its members are Prof. Frank J. Goodnow, Walter Clark, Edward W. Bemis, J. W. Sullivan and Milo R. Maltbie. This special subcommittee has held at this writing four meetings, each consuming an entire day, while its members have devoted much time to individual consideration of the questions. Its report was submitted to a meeting of the Committee on Investigation on November 27, when plans for prosecuting the inquiry, comprehensively and analytically, were elaborated. The conclusions of this meeting and subsequent steps will be presented in future numbers of *THE REVIEW*.

The following are the members of the Executive Committee:

The officers of the General Commission, *ex-officio*, and Alexander H. Revell, Merchant, Chicago, Ill.
E. E. Clark, Grand Chief Brotherhood of Railway Conductors, Cedar Rapids, Iowa.

RECREATION FOR GOVERNMENT EMPLOYEES ON THE ISTHMIAN CANAL.

**Club Houses; Athletic Fields; Sunday Excursions;
Sea Bathing; Saturday Half Holiday; Fourth of
July Celebration; Schedule of Activities.**

THE following is the report to the United States Isthmian Canal Commission of two experts in Welfare Work, upon the needs and opportunities for the recreation of the workers occupied in canal construction. The experts, W. E. C. Nazro and Edward Moffett, were engaged by the Commission, upon the recommendation of the Welfare Department of the National Civic Federation. This report embraces their conclusions, after a thorough study of the conditions between and including Colon and Panama. They are designed to promote the contentment and happiness, conducive to the health and effectiveness, of thousands of Government employes in a trying climate and amid novel environments. The publication of this report in THE NATIONAL CIVIC FEDERATION REVIEW has been authorized by the Isthmian Canal Commission.—EDITORIAL NOTE.]

NEW YORK CITY, August 28, 1905.

To the HONORABLE THEODORE P. SHONTS,
Chairman of the Isthmian Canal Commission,
Washington, D. C.

SIR:

We have the honor to submit the following report as to the necessity and opportunity for wholesome recreation for employes of the United States Government in the Canal Zone upon the Isthmus of Panama. It is proper to state that our inquiries into this subject have been thoroughly facilitated by yourself and your executive officers as well as by the civil and military officials within the region upon the Isthmus controlled by the United States. We enjoyed the advantage, also, of making our investigation at a time when the great body of employes was welcoming with enthusiasm what was understood to be a new régime.

Club Houses.

After a thorough inspection of the Canal Zone, we reached the conclusion that the first and most obvious method of providing for recreation is to build club houses at suitable points along the entire route. We believe that these club houses will prove both useful and popular.

We found some plans for the club houses already drafted which, with additions and modifications, appear well calculated for their purpose.

We would recommend that there be three classes of club houses, which for convenience we may designate A, B and C. These several types are recommended to bring about the greatest adaptability of the club houses for the enjoyment of those who will naturally use them.

Class A club houses would be designed for the recreation of army officers, engineers, architects and employes who are graduates of colleges or technical schools, or who have received such a measure of higher or professional education as would cause them to be of common tastes and sympathies.

Class B club houses would be designed for skilled workmen.

"A" AND "B" CLUB HOUSES AND EQUIPMENT.

A single type of club house, as suggested in the plan marked Exhibit A-B, may be used for both classes A and B. This type of house would include in its features the following:

Swimming pool and shower baths;
Reading and writing room;
Bowling alleys;
Billiard and pool room;
Buffet;
Card room (cards, checkers, chess, dominoes, shuffleboard, etc.);
Social hall.

In the equipment of the building, all the verandas should be covered with mosquito netting and provided with rattan chairs, couch chairs, hammocks and small smoking tables.

In the billiard room there should be stands for serving cool drinks and seats for the players and the spectators, in addition to the requisite paraphernalia.

The social hall should contain a piano with a

self-playing attachment, as well as chairs and tables. The refectory should be fitted for the service of sandwiches and other light refreshments, including beer and light wines, but not spirits.

The room for shower baths, toilet arrangements and lockers should be equipped in accordance with the plan and supplied plentifully with soap and towels. The bowling alley should be equipped with seats for the players and the onlookers.

In the reading and writing room there should be desks with an abundant supply of stationery, tables, chairs, lounges and also well-kept files of periodicals and newspapers from the States.

Chairs, tables and the usual appurtenances should be provided in the card room.

In the grounds of the club house provision might be made for tennis courts, golf-croquet, rifle ranges, archery and handball.

"C" CLUB HOUSES AND EQUIPMENT.

Class C club houses would be intended for the

use of the unskilled houses should and simple in construction. The principal feature large hall, called a smoking room, with billiard, tables, equipments and simple games, of plain wooden

POOLS.
tion that club should be provided pool is made sub- the Sanitary De-

partment of plans for their construction, water supply and drainage. It is necessary, if these swimming pools are to be installed, that arrangements should be made to keep the water constantly in motion in order to prevent the breeding of mosquitoes. If such an arrangement is not possible, we would advise, on account of the sanitary conditions, the elimination of swimming pools. If it is decided that there can be no swimming pools, it would be wise to install shower baths in Class C as well as the other club houses.

READING MATTER.

We recommend that an effort be made to obtain contributions of newspapers, periodicals and books from the people of the United States for the use of these Isthmian club houses. Such contributions could be sent to the Commission in New York City, whence they could be readily shipped to the Isthmus. The effect of the giving and receiving of this reading matter would be most beneficial in making it evident to the employes, far removed from the United States, that their labor and hardship are the objects of friendly and encouraging popular appreciation at home.

LOCATION OF CLUBS.

We recommend the erection, at the earliest possible moment, of club houses for either Class A or Class B, or both, at points upon the route where there already is, or apparently there is likely to be, a considerable concentration of those classes of employes: for example, at Corozal, Empire, Culebra, Gorgona, Cristobal and Colon.

Understanding that it is the general policy not to encourage the concentration of employes in the city of Panama, we do not recommend the erection of a club house within its limits. If, however, there is need for a club house in that city, the dwelling now used by officers of the Commission, if available, might be put to that use.

Class C club houses should be erected wherever the work of construction is most active. If the places of greatest employment of unskilled labor are to be shifted from time to time during the progress of construction, it would be practicable so to construct Class C club houses that they could be taken apart and moved from place to place with trivial expense.

MAINTENANCE AND ORGANIZATION.

All club houses should be built and equipped entirely at the expense of the Government.

The maintenance of club houses in Classes A and B should be provided only in part by the Government, the balance of the cost of running them to be borne by voluntary organizations. It may be possible to make Classes A and B self-sustaining.

The maintenance of Class C should be borne entirely by the Government.

The process of forming clubs for Classes A and B would begin with calling two or three of the men together to talk over the matter. On becoming interested, they could bring together a number of their friends and form an organization. There should be monthly dues in clubs for Classes A and B, the receipts to go toward defraying the running expenses, as in any other club.

The members in clubs of Classes A and B should be consulted as to the appointment of the paid supervisor for each club, who, in turn, would be expected to employ the necessary service.

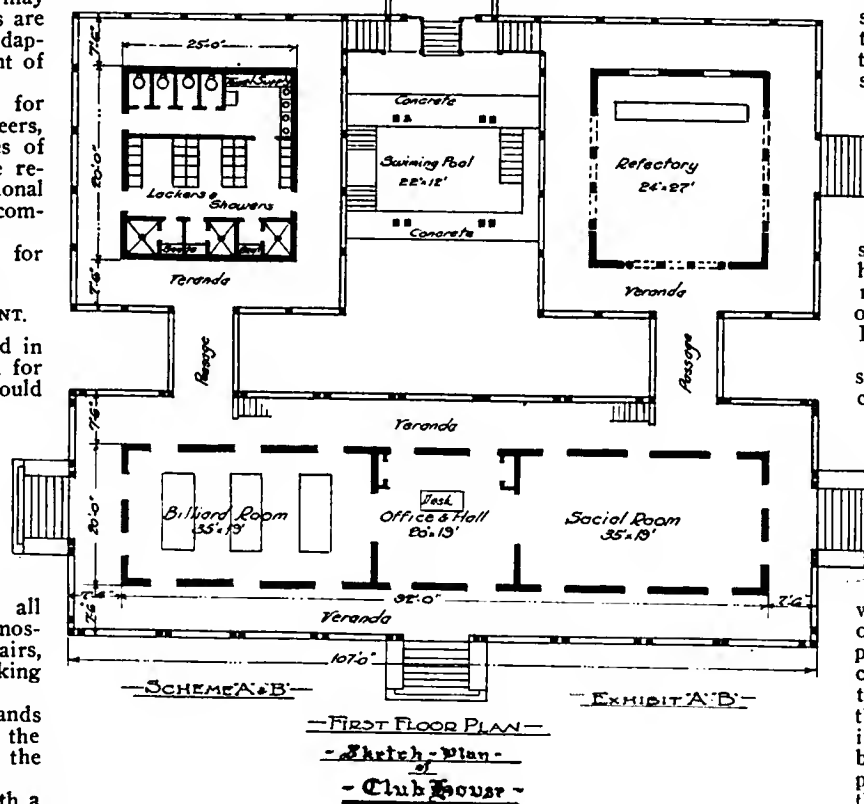

The club supervisor in Class A should be appointed by a committee elected by the members.

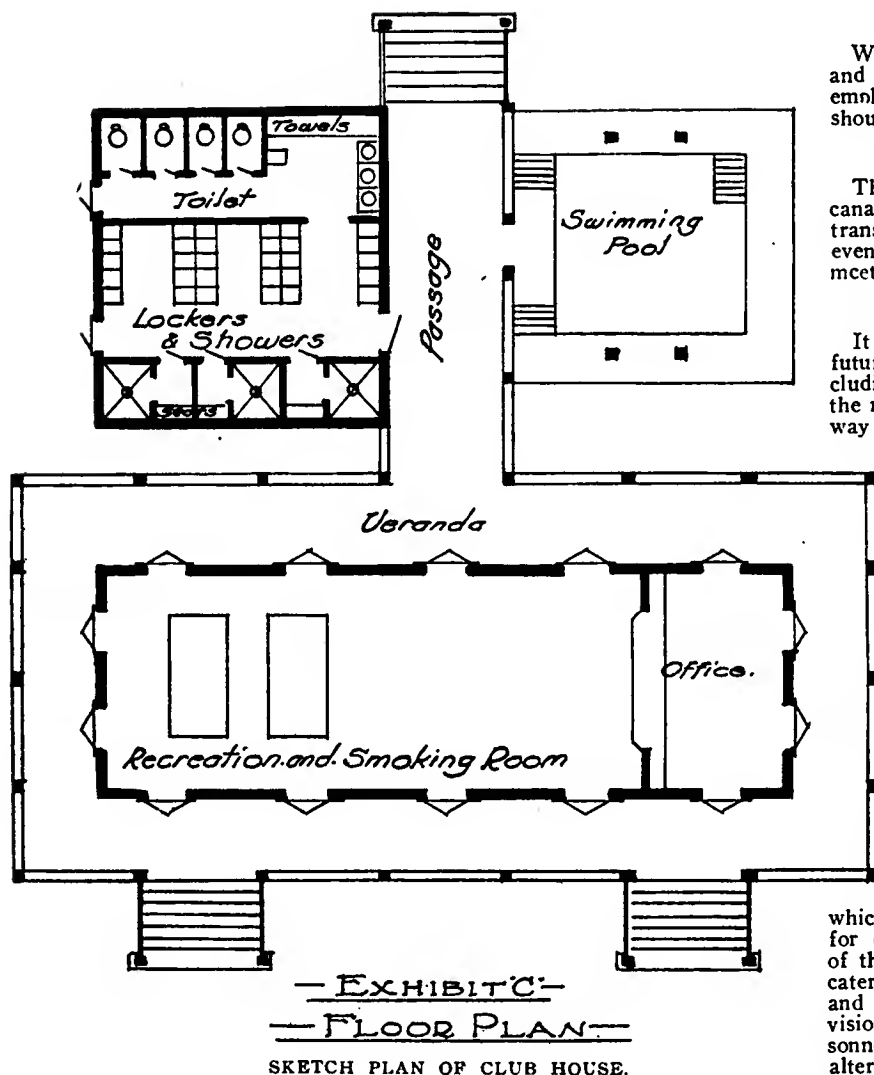

In clubs of Class B, the supervisor should be appointed by a committee of members selected by the proper representative of the Bureau of Quarters and Personnel in the locality. It will be advisable to have the Government represented on this committee by one or more persons from the organization of the Bureau of Quarters and Personnel.

The Bureau of Quarters and Personnel should appoint the necessary supervisor for each club in Class C.

Athletic Fields.

We recommend that the project to lay out an athletic field at Corozal be pushed through. In every way this location seems to be more adapted to such a purpose than any other along the route. Upon one side of the railroad at this point there is a large hotel to which the Government is making additions. We would suggest that a band stand be added to one of the wings of the hotel, to be used for popular concerts. Instead of the lawn tennis court now planned, which it is contemplated to place on the grounds directly in front of the hotel, we recommend the making of lawns; if that be impracticable, some other means by which this place can be kept as an open plaza for the people to walk about and enjoy the concerts should be provided.

On the opposite side of the railroad is an open, level field, spacious enough to accommodate all open air athletic features. In this field should be constructed a racing track for ponies. Beside the track for ponies, there should be constructed a cinder path, for those who like running sports, equipped with running and jumping bars, etc. Within this track tennis courts and a band stand may be located. Other spaces in the field may be set apart for a rifle range, a place for the practise of archery, grounds for golf-croquet, etc. Thus would be afforded a suitable opportunity for outdoor exercises for women, as well as men.

At one side of the track should be built a club house, the type marked Exhibit A-B, of extra large size, to be used by both Class A and Class B employees Saturday afternoons. In this connection we suggest the future development of Corozal as a principal athletic center, the result of the Saturday Half Holiday whose establishment we recommend at another place in this report. This club house should include a commodious cafe which could be conducted by the caterer in the hotel. It might be possible to have this club house for the regular daily use of the members of the Class B local club, if that type is needed at Corozal. If the situation should be such that Class A employees should use it as their regular club house during the week, it would be necessary to have some rooms reserved for their special use on Saturdays. In other words, an effort should be made to avoid the necessity of having this club house in addition to a club house A and a club house B at Corozal.

At Corozal, we recommend that regular evening concerts be given at the hotel and that the employees now invited to go in to Panama to hear the band play on Sunday evenings be invited instead to these concerts at Corozal. There appear, to our judgment, several reasons why this commendable diversion should be offered to the employees at Corozal rather than at Panama. Among these reasons may be specified two:

(1) The inviting of a large number of employees to the capital, whatever the occasion, is not consistent with the evident policy to keep as many of the employees as possible away from the city and its centers of fever contagion.

(2) Along the route from the railroad station at Panama to the plaza where the band now plays, visitors are exposed to many temptations; while at Corozal, after the concert it would be but a step to the train, and the surroundings would afford no inducement to detain any employee from returning home promptly. This plan would in no way interfere with the present popular Sunday evening concerts furnished in the capital for its people by the band of the Panama Government.

BAND OF THE EMPLOYEES.

We believe that the Bureau of Quarters and Personnel could organize a band of the employees. If this can not be done, a band should be provided by the Government.

FREE TRANSPORTATION.

The employees at every point along the canal route should be provided with free transportation to and from the Sunday evening concerts and the weekly athletic meetings.

ATHLETIC FIELD AT CRISTOBAL.

It may be feasible and advisable in the future to duplicate this athletic field, including all its features, at Cristobal, when the number of employees warrants. In this way there would be two centers for general recreation, one near Panama and one near Colon, available respectively for each half of the route.

A suggested lay-out for this field is presented in the plan, marked Exhibit D.

Sunday Excursions.

We recommend that the excursions that have been run from Panama to Toboga at irregular intervals be hereafter continued regularly, if possible, on each Sunday. At present there is much complaint because of the irregularity of these excursions, which are highly popular, and because of the inconvenience of carrying food for the day, most of the excursionists being able and willing to buy luncheons at a reasonable price. We, therefore, recommend that some arrangement be made by which a steamer can be chartered regularly for each Sunday so that the uncertainty of these excursions will cease; and that a caterer be permitted to sell light luncheons and soft drinks on board, under the supervision of the Bureau of Quarters and Personnel. The steamer should be used on alternate Sundays for employees paid in gold and for employees paid in silver. The present plan of issuing free tickets to employees for these excursions, until the capacity of the boat is reached, should be continued.

Sea Bathing.

We believe that facilities for sea bathing at Colon should be provided for employees who make occasional excursions to that place. At present the fear of sharks deters employees from entering the sea. The beach at Colon is well adapted for surf bathing. There should be constructed small and inexpensive bath houses as an experiment, with a view to their enlargement should they prove popular. Separate bath houses for those employees who are paid in gold and those who are paid in silver should be erected.

It would be necessary to protect those portions of the beach assigned to bathing from sharks by means of closely driven piles connected with coarse wire netting or some similar device.

Bathing suits should be provided at a nominal rental.

A paid supervisor, employed by the Bureau of Quarters and Personnel, should look after the maintenance of the bath houses, the cleanliness of the beach, the care of bathing suits and towels. Under his authority there should be an attendant qualified to teach the bathers to swim, the entire system of instruction and the insurance of safety being similar to that now employed in the municipal baths at American seaports.

Saturday Half Holiday.

If the methods of recreation we have the honor to recommend are to be provided, either in whole or in part, sufficient time should be allowed employees to make them available. Sunday alone, in our judgment, does not afford sufficient leisure for adequate recreation. Even though there were no other uses to which employees might desire to put their weekly day of rest, it would not be well, in our opinion, to crowd into that day all the opportunities for recreation which we have recommended. If employees were to devote their Sundays almost wholly to the proposed athletic field, or fields, or to the amusements in the club

houses and grounds, there would be no intervening time for rest and recuperation for the week's work which begins on Monday morning.

Moreover, many of the employees desire to devote a part of their Sundays to purposes other than either rest or amusement, including religious services, writing letters home and mending clothes.

In talking with many employees of all classes upon various subjects connected with recreation, there was brought to our attention a prevalent and spontaneous desire for the Saturday Half Holiday.

The consideration of the Saturday Half Holiday involves, we are aware, some rearrangement of the present weekly schedule. In order to secure the Saturday Half Holiday, it would not be feasible to add to the hours of work for five days in the week, inasmuch as the climatic conditions are such that the men should not work more than eight hours in any one day. This would necessitate a reduction of the weekly working hours which we believe to be warranted by the conditions.

Considering the amount of physical energy burned up in the work, we believe that the Government would be the actual gainer by the Saturday Half Holiday. The Government would apparently lose weekly the three (or four) hours' time of the salaried employees, plus the three (or four) hours' output of the larger body of employees paid by the hour. This loss of the Government would be offset by the fact that there would be introduced into the working force the element of stability, thus reducing to a minimum the continuous loss consequent upon the hiring and training of new workmen. On the other hand, the employees paid by the hour would lose weekly three (or four) hours' pay which, we believe, they would be willing to sacrifice.

We know of no other one proposition, outside of those considerations relating to shelter and food, so well calculated to make the mass of workers on the Isthmus contented and happy as the Saturday Half Holiday. The climate of the Isthmus is such as to make this weekly half holiday important, not only for recreation but, what is more important still, for health. The Saturday Half Holiday will, moreover, afford a distinct opportunity to bring together for outdoor sports and other recreation employees from places scattered along the route, thus encouraging a feeling of communal interest throughout the zone in the social life of all its communities and in the prosecution of the enterprise that binds them all together in a common purpose.

We regard this recommendation of the Saturday Half Holiday throughout the Canal Zone as of great importance. We most respectfully bespeak for it your earnest and full consideration as a measure that would conduce to the comfort, the health and the efficiency of the working population of the Isthmus.

Fourth of July Celebration.

We found abundant and enthusiastic evidence among the employees that the celebration of the Fourth of July this year was highly appreciated, and we recommend its continuance.

W. E. C. NAZRO,
E. A. MOFFETT.

(Concluded from page 4.)

O. C. Edwards	Montgomery.
George H. Child	Harper's Ferry
J. R. Thomas	Charleston.
I. Schwabe	Charleston.

(The names of the additional delegates will be announced later.)

The following have been appointed to represent the organizations preceding their names:

American Academy of Political and Social Science, Philadelphia.

Dr. Karl Kelsey, Assistant Professor of Sociology, University of Pennsylvania	Philadelphia.
Dr. F. J. Warne, Editor of the <i>Railway World</i>	Philadelphia.
Dr. George Mangold, University of Pennsylvania	Philadelphia.
Dr. Walter E. Weyl, University Settlement	New York City.
Dr. William H. Allen, New York Association for Improving the Condition of the Poor	New York City.

Farmers' National Congress, Chicago.

Hon. E. W. Wickey	Ocean Springs, Miss.
W. L. Ames	Oregon, Wis.
Hon. Levi Morrison	Greenville, Pa.
George M. Whitaker	Boston, Mass.
John M. Stahl	Chicago.

Trans-Mississippi Congress.

Theo. B. Wilcox	Portland.
Herbert Strain	Great Falls.
John W. Noble	St. Louis.
Ed. F. Harris	Galveston.
A. E. Carlton	Cripple Creek.

Atlanta Chamber of Commerce.

S. D. Jones, President Atlanta Chamber of Commerce	Atlanta.
Marion M. Jackson, Lawyer	Atlanta.
Col. B. F. Abbott, Lawyer	Atlanta.
Forrest Adair	Atlanta.

Detroit Board of Commerce.

M. J. Murphy	Detroit.
George H. Barbour	Detroit.
F. B. Smith	Detroit.
W. P. Harris	Detroit.

Japanese and Korean Exclusion League, San Francisco.

Walter Macarthur	<i>Coast Seamen's Journal</i> .

Mayors.

The following Mayors have accepted invitations to attend as representatives of their respective cities:

George B. McClellan	New York City.
Horace Wilson, Mayor	Wilmington, Delaware.
Alex. T. Connell, Mayor	Scranton, Pa.
Edwin R. Gerber, Mayor	Reading, Pa.
Adolph Lankering, Mayor	Hoboken, N. J.
Charles H. Gaus, Mayor	Albany, New York.
Hon. J. H. Wilson	Cohoes, N. Y.
Hon. Francke W. Dickinson	Springfield, Mass.
Hon. Julius Fleischmann	Cincinnati, O.
Hon. George Milton Hine	Poughkeepsie, N. Y.
William S. Meyers	New Brunswick, N. J.
Edwin F. Sweet	Grand Rapids, Mich.
Hon. H. M. Pindell, representing A. B. Tolson, Mayor	Peoria, Ill.
Charles H. Ellis	Camden, N. J.

Delegates Appointed by Colleges.

The following representatives of colleges will attend:

Hall, G. Stanley, President Clark University	Worcester, Mass.
Lefavour, Henry, President Simmons College	Boston, Mass.
Rev. S. B. McCormick, Chancellor, Western University of Pennsylvania	Pittsburg.
Dr. Alexander S. Hunter, Western University of Pennsylvania	Pittsburg.
Dr. Walter F. Willcox, Professor of Political Economy and Statistics, Cornell University	Ithaca, N. Y.
Reed, George Edward, President Dickinson College	Carlisle, Pa.
Needham, Charles W., President the George Washington University	Washington, D. C.
Atkinson, Fred. W., President Polytechnic Institute	Brooklyn, N. Y.
Humphreys, Alex. C., President Stevens Institute of Technology	Hoboken, N. J.
Stephens, Dr. D. S., Chancellor the Kansas City University	Kansas City, Kas.
Martin, Rev. S. A., President Pennsylvania College	Pittsburg, Pa.
Hooper, Franklin W., President Board of Trustees Antioch College	Yellow Springs, O.
Nelsenius, Rev. G., Augustana College and Theological Seminary	Rock Island, Ill.
Alternate—Lilja, Rev. A. B.	New York City.
Wilson, George Grafton, Professor of Political and Social Science, Brown University	Providence, R. I.
Grant, Rev. Percy S., Member Board of Trustees, Berea College	Berea, Kentucky.
MacCracken, John H., Syndic of the University and Professor of Politics, New York University	New York City.
Dr. A. G. Fradenburgh, Professor of History and Political Science, Adelphi College	Brooklyn, N. Y.
Dr. J. H. Hollander, Professor Political Economy, Johns Hopkins University	Baltimore, Md.
Ware, Rev. E. T., Atlanta University	Llewellyn Park, Orange, N. J.
Hopkins, Henry, President Williams College	Williamstown, Mass.
Patterson, Professor W. R., Professor of Commerce and Statistics, State University of Iowa	Iowa City, Ia.
Marshall, A.M., Professor Leon C., Head of Department of Economics, Ohio Wesleyan University	Delaware, O.

RHODE ISLAND WELCOMES THE CIVIC FEDERATION.

AN ENTHUSIASTIC MEETING AT THE PROVIDENCE BOARD OF TRADE ROOMS APPROVES ITS PURPOSE AND ITS METHODS.

(From the Providence Journal, October 28.)

The work of the National Civic Federation, especially in the "welfare department," was ably expounded and illustrated to the edification and interest of a good-sized gathering at the Providence Board of Trade last evening, the meeting being preliminary to the organization of a local branch in this State. Gov. Utter made a brief introductory address and Lieut. Gov. Jackson, as President of the Board of Trade, presided. The purpose and progress of the Federation were explained by Ralph M. Easley, Chairman of the executive committee of the organization, and Miss Gertrude Beeks, Secretary of the welfare department, the meeting being devoted principally to this feature of the work.

The fact impressed by the speakers, that the work of the Federation was designed to bring about harmony between capital and labor, among its other purposes, was well illustrated in the attendance at last evening's meeting. The gathering included representative business men, manufacturers and representatives of labor, among those present being Joseph Fletcher, Charles Sisson, of the Hope Webbing Company; J. F. P. Lawton, of the Gorham Manufacturing Company; John W. Danielson, of the Waukegan Mills; Hon. Augustus O. Bourne, of the Bourne Rubber Company; Charles Rockwell, of the Cranston Print Works; Jesse Metcalf, of the Wanskuck Mills; Henry C. Dexter, of Green and Daniels; Stephen A. Jenks, of the United States Cotton Company and the Fales & Jenks Machine Company; Arthur W. Dennis, of the Elmwood Mills; Jere Campbell, of the Eastern Coal Company; George E. Brady, International President of the Jewelry Workers; R. A. Ripley, Secretary of the Electrical Workers' Union; James Coleman, business agent of the Plumbers' Union, and Thomas F. Kearney, President of the Rhode Island Building Trades Council.

Lieut. Gov. Jackson called the meeting to order, and with a few introductory remarks presented Gov. Utter, who likewise spoke briefly, as he had another engagement and was obliged to leave early. In part he said:

"I feel that I can scarcely do more than act as curtain raiser for the principal speakers of this evening, but I want to express my admiration for the movement of which you are to hear a description. When I was a young man there used to be in Westerly a lawyer, of whom, when he died, the Providence Journal said: 'Nathan F. Dixon may have done very little toward making legislation, but he did a great deal to prevent bad legislation. He was a good lawyer and he always did what he could to keep his clients from getting into court, to avert needless litigation.' In other words, his effort was ever to maintain harmony, a purpose that actuates this Civic Federation."

"It is natural for a man to look first to the welfare of his own family, but men should teach their children that not only does their responsibility lie toward the family but to the people at large. Selfishness is absolutely essential to the welfare of the world, but the selfishness that looks only to self is a detriment. Any organization that can enable men to see things with a common eye, without conflict, can accomplish great good for a community. It seems to me that this is the work being done by the Civic Federation. It is regrettable that we have not had a definite form of this line of work in this State, and I sincerely hope that this meeting tonight may result in the organization of a local branch of the National Federation."

The Governor was greeted with hearty applause as he rose to speak, and again as he concluded his remarks. The Lieutenant Governor then introduced Mr. Easley, who explained the purposes of the organization he represents as follows:

What is the purpose of the National Civic Federation? What terms accurately define its mission, its scope and its methods? These questions are pertinent, for the reason that the prominence accorded to a single branch of its work has so attracted attention as to convey to the public mind an erroneous impression of the real scope of the organization. The organization has been especially active during the past three years in advocating rightful relations between capital and labor, as a means of promoting industrial peace. Hence has arisen, quite naturally, a prevalent conception of the National Civic Federation as a body dealing exclusively with strikes and lock-outs and with the questions underlying these industrial disturbances; whereas this work is confined to certain of its Departments. A part has thus come to appear greater than the whole. Again, it is not infrequently described as a Board of Arbitration, which is as far from the fact as possible.

The broad and original purpose and scope of the organization are thus set forth in its by-laws, as adopted in 1901:

"The purpose of the National Civic Federation is to organize the best brains of the nation in an educational

movement toward the solution of some of the great problems related to social and industrial progress;

"To provide for study and discussion of questions of national import;

"To aid thus in the crystallization of the most enlightened public opinion; and, when desirable,

"To promote legislation in accordance therewith."

The present activities of the Civic Federation, of which the above definition permits further extension, are exercised through the following agencies:

Public Ownership Commission.
Immigration Department.
Conciliation Department.
Industrial Economic Department.
Welfare Department.
Taxation Department.

There exist, with results of acknowledged benefit and usefulness, organizations of farmers, mine operators, manufacturers, wage-earners, financiers, merchants, lawyers, scientists and other distinct but interacting elements of society. All these hold meetings for discussion of affairs peculiar to their own pursuits and callings. The National Civic Federation, in addition to its Departments for the elucidation of specified subjects, provides a forum where representatives of all these industrial, professional, commercial, scientific and other societies may meet to discuss national problems in which they have a common ethical, social or economic interest.

The membership of the National Civic Federation renders its auspices especially appropriate to such a forum. It is drawn from practical men of affairs whose acknowledged leadership in thought and action makes them typical representatives of the various elements that voluntarily work together for the general good. Its national executive committee is constituted of three factors: the general public, represented by the church, the bar, the press, statesmanship and finance; employers, represented by the heads of great corporations, large manufacturers and chiefs of employers' organizations; and labor, represented by the principal officials of national and international organizations of wage-earners in every great industry.

The actual benefit to the entire community of public discussions initiated and conducted by the Federation has been thoroughly established by the practical results of five national Conferences which have already been held under its auspices.

The first of these, the Conference on Primary Election Reform, was held in New York City in January, 1898. This was the first National Conference ever held on this subject. Its discussions brought out in vivid relief both existing evils and their appropriate remedies. Direct results were the improved primary election laws of New York and Illinois and the formation of a national organization to promote this specific reform in other States. Another Conference upon this subject has been called to meet in New York, January 15 and 16, 1906. Its discussions will embrace such topics as ballot reform, primary election reform, corrupt practices acts and naturalization.

The second, known as the "Saratoga Conference on Foreign Policy," was held at Saratoga Springs, N. Y., in August, 1898. Its date was most felicitous, being almost coincident with the advance of the United States Government to the rank of a great world-power, and with the advent of its extra-continental expansion. Public men of widely divergent views participated in its debates during two days, when they were able to agree upon a memorial. Its presentation to President McKinley elicited the following response:

"I heartily congratulate the Civic Federation upon the success of its conference. It came at a time when its able discussions and conservative resolutions did much to point the way for the nation."

This memorial asked the President to instruct the representatives of the United States at the first Hague Conference, called by the Czar, to urge the establishment of a court of international arbitration and to obtain a declaration in favor of the protection of private property at sea in time of war. It is now an historical fact that the proceedings of the first conference at The Hague were along these lines.

The third Civic Federation Conference, known as the "Chicago Conference on Trusts," was held in September, 1899. Its sessions, covering four days, were attended by more than five hundred delegates, appointed by Governors of States and by organizations representing commerce, labor, agriculture, finance, economics and the professions. Its discussions, published in book form, have furnished the basis for much of the subsequent literature upon the subject.

The fourth Conference, on "Conciliation and Arbitration," was held in Chicago in December, 1900. Its participants included official representatives of all the organizations of employers in the United States, and

of practically all the national labor unions. After two days' discussion of the relations between employers and wage-earners, which brought out clearly the principle of conference and conciliation, with the trade agreement as their object, this Conference took action which resulted in the organization of an Industrial Department of the National Civic Federation. It was the first annual meeting of this Department, in New York City, in 1901, that attracted the attention of the public to this one phase of the work of the Federation—the promotion of industrial peace.

The fifth national Conference, that upon "Taxation," was held in Buffalo, N. Y., in May, 1901. More than three hundred delegates, appointed by thirty-one Governors, attended. The call for this Conference, issued by the National Civic Federation and signed by many men prominent in legislation, economics, finance and commerce, set forth the necessity for considering the problem of taxation as no longer local, but as involving the mutual relations of localities and communities as well as the complications of interstate taxation. The two days' discussion dealt with such subjects as the interstate taxation of public service corporations; the taxation of personal property; the taxation of mortgages; the separation of State and local revenues; the taxation of the farmer; the equitable assessment of real property; the inheritance tax; the taxation of corporations; the franchise tax; the income tax. The published proceedings of this Conference have afforded valuable guidance for legislation affecting sources of public revenue. A Department on Taxation, organized at this Conference, has issued several educational bulletins looking to uniformity of legislation.

At the present time the National Civic Federation is engaged, in addition to its continual departmental work, upon the subjects of Public Ownership and Operation, and of Immigration.

It has formed a National Commission to make a thorough investigation in this country and abroad of the ownership of public utilities. This Commission held its first meeting in Earl Hall, Columbia University, New York City, on October 5, 1905. The Commission elected also an Executive Committee and a Committee of Twenty-one on Investigation.

The current discussion and acute agitation of this subject indicate its hold upon the popular mind, and the necessity for its analytical and comprehensive examination. Its present debate is often inconclusive, because of contradictory or unsatisfactory statements of fact. It is intended, therefore, that this investigation shall disclose the actual results of public ownership and operation, as far as they have been undertaken in the United States, and of their more extensive practice in foreign countries. The ascertainment of these facts will afford a solid basis upon which to found discussion and conclusions for the guidance of future policy.

The scope of this inquiry will cover the relative advantages of Public Ownership and Operation, as compared with Public Ownership and Private Operation, and Private Ownership and Operation. Each system will be examined with regard to its effect upon, among other topics:

Wages, hours and conditions of labor;
Collective bargaining;
Cost and character of service;
Political conditions, civil service, spoils system, and municipal operation;
Financial results;
Taxation.

The Committee of Twenty-one which will report to the general Commission has divided itself into two Subcommittees, which will carry on simultaneously the domestic and foreign investigations. The initial inquiry will be restricted to the comparative results of private and public ownership and operation of gas, water, electric power and light and street railways.

A National Conference upon Immigration will be held in New York December 6, 7, and 8, to which the Governors of the various States and national, commercial, economic and ecclesiastical organizations will send delegates.

The problem of immigration in its relation to our industrial and social prosperity will be considered. In its promotion of this conference, the National Civic Federation has committed itself to no attitude of approval or opposition as to any of the propositions concerning the regulation, restriction, suspension, exclusion, or encouragement of immigration that have been advocated. The Conference will be an open forum for debate by the best thought of the country in the hope that an earnest thrashing out of every phase of the subject may result in definite recommendations of far-reaching consequence and value to our national welfare. The discussion will include the effectiveness of the administration of existing legislation and propositions for

new legislation. Especial consideration will be given to the relation of alien labor to domestic crafts, the industrial progress of the negro and other questions growing out of the distribution of incoming aliens. One entire day will be devoted to the consideration of the Asiatic phase of the problem.

Three departments of the National Civic Federation are devoted entirely to the so-called labor problem. These are the Conciliation Department, the Industrial Economic Department and the Welfare Department.

The Conciliation Department deals entirely with strikes, lock-outs and trade agreements. In averting or settling strikes or lock-outs, the services of this Department, during the last four years, have been enlisted in about 500 cases, involving practically every conceivable problem or phase of a problem interwoven with or underlying an industrial controversy. Out of this experience, the lesson has been well learned that in the great majority of cases thus treated publicity is not desirable. This is usually true both during and after the negotiations in relation to any labor trouble. The work of the Department is often of so delicate a nature that publicity during its progress would defeat its very purpose; and even after its successful conclusion it has been found that both employers and employed are often averse to having the private adjustment of their relations paraded before the public. A report of the work of this Department could be made very impressive if it were to enumerate names and dates; but in most cases the statement would be displeasing to both parties concerned. Out of the 500 cases treated, probably 100 have been made public by one or the other or both of the parties; but only when publicity originates with one of them does information reach the press. Thus the public, which always receives an abundance of information, more or less accurate, about a strike, may hear nothing at all about the inner negotiations resulting in its settlement; or the public may be wholly uninformed about the quiet but effective measures taken to prevent a strike which, had it occurred, would have filled columns of the newspapers, while causing enormous inconvenience and incalculable loss.

The usual method of procedure by this Department is greatly facilitated by the character of its membership, which extends to every industrial center, and includes representatives of both practically all the organizations of employers and the organizations of wage-earners in the country. Through this membership information of any threatened trouble between capital and labor usually reaches the headquarters, from one side or the other, in advance of any public rupture. The headquarters thus serves as a clearing house where industrial news is focalized. This early intelligence is of the utmost value, since the best time to adjust a dispute is before a rupture occurs. In accordance with this information, usually two members of the Conciliation Department, who are likely to be personae gratae to either or both the employer and the employees, are assigned to the case—an employer to the employer's side and a labor representative to the employees' side. These two members, exercising special precaution against any suspicion of meddlesome interference, unobtrusively get into touch with the situation, personally and unofficially. The two investigators then consult, usually with a view to bring about a conference between representatives of the two sides. When it can be ascertained that a conference will be granted by either side, the other side is usually willing to make the request. Sometimes at such a conference the committee of our Department is present, and sometimes not. That depends entirely upon circumstances and the temper of the opponents. In many cases, the parties in interest could not entertain the idea of inviting any outside person to be present. They avail themselves of the services of the committee up to the very point of a conference; but when that has been arranged, the two sides feel competent to discuss their affairs without further aid, and the members of the committee are only too glad not to be needed. In some other cases, their presence at the conference is desired, and is found useful in allaying temper, soothing the pride of obstinacy or pointing the way to compromise without impairing self-respect or wounding dignity. In one controversy a year ago, between two organizations representing respectively 95 per cent. of the capital invested and 95 per cent. of the labor employed in an entire industry, the Chairman and Secretary of the Conciliation Committee acted in these capacities at a conference running through eight consecutive days, and lasting frequently from 10 o'clock in the morning until from 10 to 12 o'clock at night. This conference resulted in an annual national trade agreement, which was renewed last spring. Other conferences have resulted in trade agreements for a year which, upon expiration, have to be worked out afresh.

A concrete example of this method occurred only last week. The members of one of the great railway brotherhoods employed upon a street railway system in one of the largest cities in the United States, believing that they were suffering serious grievances, were on the very verge of a strike that would have tied up immense traffic and caused great inconvenience to many thousands of passengers. The national chief of the brotherhood involved, being a member of the Civic Federation, brought the threatened trouble to the attention of the Conciliation Department. One of its members promptly arranged a face-to-face conference between the chief of the

brotherhood and the president of the corporation, and the difficulty was quickly adjusted. Not one of the daily passengers upon that road ever heard of the impending strike, although it was averted by a margin of only a few hours.

At all times the Conciliation Department advocates the making of trade agreements, having a special committee for their study and encouragement. Their advocacy is warranted by experience in their operation in both the United States and England during more than fifty years, which has proved them the best practical method where organization exists, of reducing industrial disturbances to a minimum. Trade agreements now obtain in practically all the great basic industries, such as coal, iron, lumber and transportation, between employers and national organizations of labor. Each party to these agreements has at various times undergone successfully the strain of granting higher wages on the one side and of accepting lower wages on the other. The honorable maintenance of these agreements in the great industries is an object lesson that is aiding much in the education of other employers and labor organizations into a realization of the inviolability of the collective contract. The use of trade agreements is extending among the building trades, the great daily newspapers and manufacture in many industries.

In averting or settling controversies upon the great railway systems with the brotherhoods of engineers, firemen and trainmen, thus affecting the industries dependent upon transportation in practically every State of the Union; in promoting agreements between the longshoremen and vessel-owners, vitally related to all the industries in shipping, such as coal, iron, steel, lumber and the elevator interests; in adjusting street railway troubles in San Francisco, New Orleans, Chicago, Pittsburgh, New York, Newark and other cities; in averting troubles in the teaming industry in several large cities; in improving relations and averting strikes in many branches of manufacture, such as textiles, garment-making, boots and shoes, the metal trades, including machinists, molders, steel and iron workers, structural steel and bridge workers, blacksmiths, etc.; in promoting agreements between coal operators and miners; in bringing about contractual relations between the thirty-four crafts grouped as the building trades and the corresponding associations of employers; in establishing agreement between theatrical managers and musicians and actors throughout the country; in securing more than two hundred conferences, at the request of one side or the other, thus checking as many controversies at their incipient stage—in these and in many other directions the Conciliation Department has exerted an influence repeatedly effective for peace in industries widely diversified and of national magnitude. There have arisen cases where the spirit of antagonism on both sides has been so aroused, and where the issues presented were so utterly irreconcilable, that there seemed no recourse but to fight it out.

The Department of Industrial Economics was formed to meet the plain necessity for more light upon the principles underlying the ever recurring problems that are encountered in the work of the Conciliation Department. When once representatives of employers and employed are brought into conference for the purpose of making a trade agreement, these problems invariably arise in multifarious forms. They demand knowledge among the negotiators of such industrial subjects as "Wages and Cost of Living," "The Shorter Work-Day," "The Open and Closed Shop," "The Minimum Wage," "Restriction of Output," "The Ratio of Apprentices," "The Introduction of Machinery," "Piece-Work and Day Work," "Arbitration," etc. The drawing of any collective contract implies contact with any one of these or many other questions. For example, in the joint convention of 1904 between the organized bituminous operators of Illinois, Indiana, Ohio and Pennsylvania, and the United Mine Workers of America, the whole controversy revolved around the question of wages. The operators advanced the industrial depression then existing as making necessary a reduction of wages of 10 per cent. John Mitchell, speaking for the Union, said: "If you reduce the wages of our 500,000 members, you will reduce correspondingly their consuming power, thus making the business situation worse, instead of better." Francis L. Robbins, speaking for the employing operators, replied that if that were sound philosophy, the thing to do when panic threatened was to double the wages of workmen. Many other instances might be cited where able disputants have differed about fundamental principles. In most cases, out of their debates light has been evolved.

To further earnest, intellectual discussion of practical economic problems, the Department of Industrial Economics was formed in 1905. Its membership is composed of leading economists, including the heads of the departments of political economy in universities, lecturers and economic and legal authors; editors of the daily press, of politico-social magazines, of trade papers and of labor journals; representatives of the pulpit; large employers and representatives of labor. This Department will soon announce a program for the discussion, by the ablest experts to be procured, of each of the vital and frequently irritating questions that arise in the Conciliation Department.

The Welfare Department is devoted entirely to efforts to interest employers in giving especial consideration to

the physical, mental and moral welfare of employees in all industries. Membership in the Welfare Department is confined to employers. While the work in the other Departments deals with controversies and may be itself controversial, as in the Industrial Economic Department, the dominant note in the Welfare Department is that of the highest altruism; yet is its work intensely practical. In extending the practise of Welfare Work, the Department has found of especial value conferences of employers, held under its auspices in different parts of the country, for the interchange of experiences. Conferences for a similar purpose are also held between Welfare Managers. Successful Welfare Work, when pictured by practical business men in connection with their own industries, exerts an influence toward gaining the application of similar ideas by other employers. Thus Welfare Work is not advocated alone by theorists and philanthropists. The Welfare Department maintains a bureau at the National Civic Federation headquarters, where information about the work is furnished and exchanged. The Department also undertakes to supply, upon request, experts qualified to examine industrial establishments, make suitable recommendations for the introduction of Welfare Work and, if required, superintend its installation. Recently, for example, the Department, at the request of the Isthmian Canal Commission, furnished two Welfare experts to investigate the needs and opportunities for the recreation of the workers engaged in canal construction. Their report, which has been made to the Commission, is designed to promote the contentment and happiness, conducive to effectiveness, of thousands of Government employees in a trying climate and amid novel environments.

The Welfare Department gives special consideration to the following topics:

- Light and Ventilation;
- Drinking Water;
- Locker and Wash Rooms;
- Seats;
- Laundry;
- Lunch Rooms;
- Rest Rooms;
- Fire Protection;
- Elevators;
- Street Cars;
- Suggestions;
- Recreation;
- Educational;
- Boarding Houses;
- Housing;
- Pensions and Relief Associations;
- Banks.

The chief mission of the National Civic Federation being educational, it presents accounts of much of its work in a monthly periodical, entitled THE NATIONAL CIVIC FEDERATION REVIEW. This publication is now recognized as a valuable contribution to the economic literature of the world. It is sent to the principal libraries and educational institutions of every country; to the executive and departmental officials of every nation; to the headquarters of all professional, literary and scientific societies; to organizations, both national and local, of employers and of employees; and to thousands of editors, clergymen, educators and other leaders of thought in the professions, commerce, finance and industry. THE REVIEW has become a far-reaching educational force in the elucidation of all great public questions.

It is hoped that this statement will make clear the broadly educational purposes of the National Civic Federation and that it will enlist the earnest cooperation of those who are interested in elucidating vital social and industrial problems whose thorough comprehension is essential to national progress.

Miss Beeks was then introduced and was greeted with applause. Her talk was entirely of the work of the welfare department, and was accompanied by more than 100 fine stereopticon views showing actual conditions in scores of factories and industrial concerns of various kinds. The wonderful improvement made in provision for the comfort, health and pleasure of employees in many places was admirably illustrated, and among the model places shown were views of what has been done in this line by several local concerns, notably the Gorham Manufacturing Company and the Brown & Sharpe Manufacturing Company.

The views as illuminated by the speaker's explanations proved highly instructive, and the remark of Mr. Jackson at the close to the effect that "the world, as well as the sun, do move," was undoubtedly echoed by all present. The Lieutenant Governor said that he wished that Infantry Hall might have been filled with all classes of men and women to see the work that has been accomplished. Miss Beeks was given a rising vote of thanks at the conclusion of her talk.

Last evening's meeting was held largely through the efforts of Col. George H. Webb, Commissioner of Industrial Statistics, who in his forthcoming annual report will have a chapter devoted to what has been accomplished in this State along the line of work followed by the welfare department of the Federation. It is probable that within a week or two a local branch of the National Civic Federation will be formed in this State. Messrs. Joseph Fletcher, Rowland G. Hazard and J. F. P. Lawton are already members of the organization.

A GRAPHIC TALE OF FUTILE EFFORTS AGAINST RUINOUS COMPETITION.

CAPITAL, LABOR AND MERCHANTS SUFFER COMMON INJURY THROUGH THEIR UNIQUE ATTEMPT AT ARTIFICIAL REGULATION OF AN INDUSTRY.

The eleventh special Report of the United States Commissioner of Labor, upon "Regulation and Restriction of Output," is a volume of nearly one thousand pages. Yet its bulk is not sufficient to permit of a really exhaustive treatment of a subject whose ramifications are exceedingly numerous and complex. But so far as it goes, this Report is of great interest and value to the student of both industrial and commercial conditions. It is a work of experts. It was prepared, when Carroll D. Wright was Commissioner of Labor, in the main by Prof. John R. Commons, now of the University of Wisconsin, assisted by John H. Gray, Ph.D., who collected the data for England; Walter E. Weyl, Ph.D., who dealt especially with the anthracite industry; and several special agents, including Ethelbert Stewart, Walter B. Palmer and Henry T. Buffington. The introduction to the report frankly states that it is impossible to present a complete summary of the evidence, "for the conditions are so widely different in various industries and in different localities in the same industry that a summary would be misleading." It has been thought best, therefore, for the purpose of conveying to the readers of *THE REVIEW* a conception of the method and results of the investigation into this subject, to republish the entire chapter upon the Window Glass Industry, which stands by itself as an absorbing narrative of attempted combination between manufacturers, jobbers and wage-earners, with its effects upon all three interests.

THE WINDOW GLASS INDUSTRY.

THE conditions in the manufacture of window glass have peculiar features not found in any other industry investigated for this report. It is the only industry where the workmen, through their organization, have attempted to join with the employers to regulate the total output of the industry according to the varying states of the market. By reason of thus entering the province of the manufacturer the history of the restrictions on output in this industry is a history of the alliances of various associations of employers with associations of workmen. More than this, the associated jobbers and wholesale dealers have become parties to the agreements, and the regulation of output has been temporarily determined by the joint action of skilled workmen, manufacturers and jobbers. The varied interests, internal dissensions, and changing market conditions have caused kaleidoscopic changes in these arrangements, and at the present time (March, 1904) alliances are broken and the output is unregulated as far as joint action of the three interests is concerned. But for more than twenty years some form of regulation, alternating with unrestricted competition, has been going on.

It is firmly believed by all parties in the trade that the peculiar nature and situation of the industry made regulation and restriction of output necessary. They point out in the first place, that the market for window glass is wholly inelastic or inelastic. That is, consumers can not be induced, even by the most extreme concessions in prices, to take a larger stock than they will take when prices are held up. This is because the market is almost wholly that furnished by the building trades, and the amount of window glass that will be purchased depends on the amount of building construction that is going on. The cost of the window glass for a building can scarcely exceed 1 per cent., or 2 per cent., of the total cost of the building, and an extreme change in the price of so small an item has no appreciable effect on the amount of construction. A concession of 50 per cent. in the price of window glass will not stimulate owners to construct more buildings, neither will a doubling of the price restrain them. Retail dealers and local builders can not be tempted to lay in a stock at low prices in anticipation of a rise, because they do not know how much or what sizes they will want. The building industry is itself largely speculative, and therefore subject to extreme fluctuations. The annual demand for window glass in recent years has fluctuated from 4,000,000 to 6,000,000 boxes, irrespective of prices, so the jobbers and manufacturers say. Now, the manufacturing capacity of the country, amounting to 4,000 pots, is enough to supply this demand in three or four months. Owing to the restriction on membership and apprenticeship imposed by the organizations, there are only about 2,500 window glass blowers in the country, so that 1,500 pots are idle on that account. Yet this number of blowers is enough to supply the country's demand in four to six months, their output being about 1,000,000 boxes a month when they are all at work. Altogether the consequence is that while the factories are working, the output is beyond the current demand for building, and the stock is piling up in the hands of the manufacturers, unless they can get the jobbers to help them carry it. In either case the carrying charges are heavy, and the weaker manufacturers, if they are com-

pelled to sell, must do so at a destructive sacrifice, the jobbers not being willing to take their product when the consumers are not ready to buy. Price cutting at such times becomes utterly reckless, and, frequently, the weaker producers go to the wall. Frequent repetition of these experiences has firmly convinced the trade, all the way from workman to jobber, that restriction, or what they call regulation, of output is necessary for the protection of all. In general this regulation has been brought about in three ways, namely, by limiting the maximum output per week of each blower, by limiting the number of blowers, so that there are not enough to operate all of the pots and pot capacity, and by alliances of the unions with leading manufacturers to force a shut down of the independent manufacturers when stocks accumulate.

The window glass workers' organization began its restrictive policies in 1879, instituting the July and August shut downs. In the spring of 1879 the union passed the law restricting the output of workmen while at work, this restriction to take effect September 1, 1879. Curiously enough, this was the first year of wage agreements with the employers; and it is stated that the restrictions grew out of the demoralized conditions of trade. The manufacturers had failed to prevent destructive competition, and as a solution of troubles occurring in 1877, the union undertook to unify conditions to the extent at least of fixing the running time of all plants alike, settling an equal

JOHN R. COMMONS,
Professor Political Economy, University of Wisconsin.

amount of output per blower, and hence per pot capacity, for each; and in addition to this it gave a differential to the localities where coal was most expensive, so as to even up conditions as much as possible. Prior to 1879 the length of fire had been a go-as-you-please, and so had the output of the workmen. There was a summer vacation tradition in the industry, and few houses attempted to run without a stop. These stops varied in length and occurred sometimes in winter, when the men could work best, and then the plant would run during the summer, when the work was hardest on the blowers. The union set the limit at ten months of work, and required all plants to close from June 30 to September 1. A few of the larger plants objected to this, but it was accepted without strike. This was changed later to read: "From June 15 to September 15;" and in recent years the length of fire is fixed annually and made part of the wage-scale agreement.

At the outset of restriction (1879) the summer shut down was made a constitutional provision by the union and was intended to make a uniform working period for the men and factories, and incidentally to limit production. In practise it is found necessary to close down each year for needed repairs and changes. Especially is this true in pot furnaces, and all were pot furnaces in those days. July and August are especially disagreeable months for the working glass blower, and since shut downs were necessary it was decided that they must occur and all repairs be made during these months. With the increase in productive capacity in the United States the shut down became more and more a means to reduce the general output. The fire of 1885 was the last ten months' fire in the industry as a whole. The constitutional provision was changed to read: "Blowers or gatherers shall not work from June 15 to September 15," thus shortening the fire to nine months. With

the opening of the gas fields and the increase in furnaces, and especially with the organization of manufacturers into associations, came the further shortening of the fire.

There are four trades in the window glass workers' organization which, prior to 1880, were organized in separate trade unions with unrelated sections known as east and west. In 1880 these unions were consolidated in one organization, Local Assembly 300, Knights of Labor, and this organization remains to the present time as the only strong union among glass workers that has retained its allegiance to the Knights and has refused to go over to the American Federation of Labor. The four trades referred to are the blowers, gatherers, flatteners, and cutters. The gatherer takes the molten glass from the pot or tank; the blower shapes it in long "rollers"; the flattener smooths out the sheet in a hot oven after the snapper has cut off the ends to form a cylinder and has slit it down the side, and the cutter cuts it into commercial sizes.

On the side of the manufacturers the leading combinations in recent years have been the American Glass Company, organized in 1895 and reorganized as the American Window Glass Company in 1899. This corporation was a consolidation of the more prominent survivors of the preceding period of price war. As a result of the shortage of men the company entered into a contract with Local Assembly 300 by which a block of stock, whose par value was \$500,000, was placed in trust for the union, to be paid for out of accruing dividends, and the union was to have representation upon the board of directors of the corporation. The whole transaction was conditioned upon Local Assembly 300 furnishing this corporation an adequate number of skilled men to run its plants to their full capacity during the "length of fire" agreed upon each year. The Assembly accepted the stock and elected its president, Mr. Simon Burns, as its representative on the board of directors. The attempt to carry out this arrangement disrupted the union and caused the formation of another organization, which at first contested for the right to the title Local Assembly 300, Knights of Labor, but, being defeated in this contention, took the name of "Window Glass Workers' Association of America." This organization immediately advocated longer fires and a fair show for the independent manufacturers. Had it not been for this split in Local Assembly 300 the independents would have been deprived of a large proportion of their workmen. As it was, their plants were manned by the new organization, and at a later date Local Assembly 300, being unable to fulfil its part of the contract, forfeited its block of stock and its representation on the board of directors.

The independents being able to continue in business, a bitter war of price cutting was kept up. Jobbers took more glass than consumers could handle, and their business also suffered heavy losses. The jobbers were organized in an association which was closely affiliated with the American Company, and, indeed, was created on the suggestion of that corporation. The independents, thus threatened with a loss of their workmen on the one hand and a loss of their markets on the other, and fighting between themselves, were forced to unite in a pool to protect themselves. This they did in December, 1900, and then the American Company, "realizing the folly of senseless competition, joined with them in a share-and-share-alike agreement."

The Independent Glass Company was not a manufacturing corporation, but a selling agency, designed to regulate the output of its members. Each firm subscribed for as many shares of \$300 each as its pot capacity, which thereupon became a pledge or forfeit, binding the firm to obey the orders of the board of directors. The entire product of each firm was turned over to the company and paid for at a rate agreed upon. It then became the property of the company, to be sold, marketed, and handled with the product of the other firms. Each firm retained the management of its plant as before, except that the board of directors of the parent company had authority to designate, by a majority vote, the time for starting in the fall and shutting down in the summer, thus regulating the output for all. The board of directors was composed of one representative from each firm. This form of organization to control output was similar to that of the American Glass Company, which had preceded the American Window Glass Company. It was to expire by limitation in January, 1903.

These two combinations of manufacturers controlled about 90 per cent. of the window glass capacity of the country.

The workmen were also divided into camps, like the manufacturers—operating, respectively, the plants of each combine. Local Assembly 300, Knights of

Labor (hereafter called the old organization), manned the plants of the American Company, with a contract to furnish an adequate supply of competent workmen, while the Window Glass Workers' Association (hereafter called the new organization) manned all but three of the plants of the Independent Company. The American Company had an agreement with the old organization for a seven months' fire ending April 15, 1901.

The jobbers were organized as the National Wholesale Glass Jobbers' Association, with a New Jersey charter, the organization including every important jobber in the country. Each jobber took stock in the association to the amount of \$1,500, and the board of

SECRETARY OF THE EXECUTIVE COMMITTEE.

Theodore Hardee, who has been elected Secretary of the Executive Committee of the National Civic Federation, comes to that position from Portland, Oregon. There he was assistant to the President of the Lewis and Clarke Centennial Exposition, his duties including the care and entertainment of distinguished guests, and the arrangement of social functions of an official character. Mr. Hardee's previous experience has developed his qualities of tact and executive ability. After a tour of South America, he read law in California, and in 1900 became an official in the Post Office Department. He accompanied President McKinley during his visit to the Pacific coast. Afterward he was detailed as assistant secretary of the United States delegation to

THEODORE HARDEE.
Secretary of Executive Committee.

the Pan-American Congress in Mexico, where he was also special correspondent of the New Orleans *Times-Democrat*.

In 1902, Mr. Hardee was assigned to accompany John Barrett, Commissioner-General of the Louisiana Purchase Exposition, on a tour of the world to confirm to foreign rulers, in person, the invitation of the President of the United States for their countries to participate in the World's Fair at St. Louis. He was made the Special Commissioner to Oriental countries, and in recognition of his labors in China, the Emperor conferred upon him the Order of the Golden Dragon.

Upon his return, Mr. Hardee was appointed assistant to the General Secretary and Director of Exploitation of the Exposition, Walter B. Stevens. In this capacity his activity was devoted principally to securing attention to foreign Commissioners in fulfillment of the promises of the management. At the conclusion of the St. Louis Fair, the management conferred upon him a commemorative diploma and medal, in special recognition of his "active interest and efficient cooperation in the Universal Exposition of 1904."

Mr. Hardee is a grand-nephew of General William Joseph Hardee, of Georgia, author of "Hardee's Tactics," and Commandant of West Point prior to the Civil War. He is a graduate of St. Stanislaus College.

directors had authority, in case a jobber violated the rules regarding prices, to call for his stock, refund his money, and thus drop him from the organization. The association employed a president, on a salary, to attend to the purchase and apportionment of glass. There were two committees, a Western and an Eastern, acting with the president. The object of the jobbers' association was to make their purchases in a lump from the manufacturers and then apportion the boxes among themselves. The first purchase was 750,000 boxes, in January, 1901, at a price 30 per cent. in advance of the preceding unregulated scales, and this was furnished by the two companies of manufacturers in a proportion agreed upon between themselves.

The second purchase was made in March, when 1,000,000 boxes were taken at a further advance of 25 per cent. The jobbers' association became practically the sole selling and distributing agent of the two combines. A jobber not a member of the association, or expelled from it, could nominally purchase glass from the combines, but he would be in the position of a small purchaser at higher prices, which practically shut him out of business. Such jobbers could look only to the small number of manufacturers outside the combines, and these were not then in a position to deliver a large amount of glass.

But new conditions rapidly developed. The increase in prices was a strong motive to outsiders to build new factories, and the shortening of the fire alarmed many of the ablest and most responsible workmen. The latter went in considerable numbers into a new movement which had heretofore been experimented upon in a few cases successfully, namely, the building of cooperative factories. The workmen put in a certain amount of capital, secured a loan of the balance and elected one of their number manager. As the cost of a twelve-pot furnace—the usual size—is but a moderate figure, this form of independent action extended, until at the present time (1904) there are forty-three cooperative factories in different parts of the Middle West. Other outsiders started up, and in January, 1902, the American and Independent Companies were operating but 60 per cent. of the total number of pots in actual operation.

The cooperatives were opposed to an early stop, but an arrangement was made in 1901 by which practically all of the factories were shut down in May. It was found that both the jobbers and the manufacturers could not dispose of their stocks, and an agreement was made with the unions to advance wages 10 per cent., if they would close three-fourths of the outsiders in May. The cooperatives were placated by a contract to purchase their product for the next year, and were paid \$250 per pot as a bonus in lieu of the profits they expected to make by running to the end of June. This agreement was carried out, and by the first of June, a month earlier than the regular close, not only had the combines shut down, but the unions had withdrawn their men from practically all of the outside factories, notwithstanding the wage scale they had agreed to work until the end of June.

The wage scales agreed upon at this time for the fire of 1901-02, besides the 10 per cent. advance, provided for an eight months' fire, beginning September 15 and running to May 15. Before the date for starting, it became evident that consumers were not buying sufficient glass to warrant a start on the date arranged, and the two combines decided to postpone it to November 1. The American paid its men one-half "market money" to hold them till that time, and the cooperatives were persuaded to postpone starting till October 15. A small number of factories and workmen could not be restrained from starting the last week in September.

During the course of this season's fire the Independent Company, which was manned by the new organization whose men had declared for longer fires, announced its withdrawal from the restrictive agreement. There followed one of the most remarkable of industrial battles. The American Company joined forces with the cooperative factories, which had now in their turn organized a selling agency called the Federation Window Glass Company, which was designed to regulate output in a manner similar to that followed by the Independent Company. These cooperative factories were manned by members of the old organization (L. A. 300). This year it was agreed to shut down the factories manned by the old organization on May 24, the consideration being another increase of 10 per cent. in the wage scale for the year 1902-03. The old organization fulfilled its part and shut down the majority of the outsiders as well as three factories belonging to the Independent Company. The new organization of workmen had made an agreement with the Independent Company to work full nine months, but did not, however, secure the 10 per cent. advance granted by the American and the Federation Companies.

In the season of 1902-03 a still greater surplus stock of glass accumulated in the hands of the companies and jobbers. An early closing seemed necessary and, while the agreement of Local Assembly 300 provided that the blast should terminate May 27, 1903, the three combines shut down on or before April 18, and the old organization adopted a resolution inviting or ordering others to do the same.

The general business conditions became serious during the year 1903 and the conflict between the two labor organizations, after a temporary truce, broke out afresh. The contention turned solely on the question whether the unions should assist the manufacturers in restricting output, the old organization favoring such a policy and the new one opposing it. Wage scales were made and the members violated them by private agreements. The scales were then cancelled and lower ones accepted, and the old union made an agreement to go 5 per cent. below the wage scale of the new organization "no matter how low they go, said reductions to take effect on same day and date as their reduction." The manufacturers no longer

maintain their agreements and are selling directly to jobbers as best they can, and the jobbers' association has suspended activity and stopped expenses.

This much of the recent history of the window glass industry has seemed to be in place in order to show definitely the peculiar policy of the union for the time being in going beyond the ordinary form of restriction on output and joining with the manufacturers in attempting to control the commercial side of the business. As already stated, such a policy has not been found in any other industry. In this case it disrupted the union, caused many of its best members to venture their savings in cooperative experiments, produced an oversupply of factories, many of

CONSULTING EXPERT OF THE WELFARE DEPARTMENT.

The Welfare Department of the National Civic Federation has engaged as its Consulting Expert W. E. C. Nazro. At the time of his acceptance of this appointment Mr. Nazro was Welfare Manager of the Plymouth Cordage Company, North Plymouth, Mass. He is one of the two Welfare experts whose report to the Isthmian Canal Commission upon the needs and opportunities of recreation for Government employes in the canal zone is published in this issue of *THE REVIEW*. Mr. Nazro graduated from Harvard University in 1897, with the degree of B. A. S. upon landscape architecture, the laying out of recreation grounds, etc. In 1898 he received the degree of S. B. in architecture, having made a special study of all recreation

W. E. C. NAZRO.

buildings, such as club houses, gymnasiums, etc. After leaving college, Mr. Nazro traveled through England, France and Italy, devoting most of his time to the study of these subjects. After returning from Europe he spent two or three years in practical work along the line of architectural and mill construction, and studying particularly the adaptation of sanitary conditions, light, etc., in the construction of mills, to the needs of employes. He was for a time with a large engineering firm, which made a specialty of mill construction. From there he went to the Plymouth Cordage Company as Welfare Manager, to take up its work of mill architecture, landscape improvements, homes for employes, a library, lunch-house, recreation hall, athletic association, and the development of other Welfare features. Mr. Nazro carried on this work successfully for four years, and won the gold medal for his specialty at the St. Louis Exposition, and honorable mention and a gold medal at the Lewis and Clark Exposition for exhibits of Welfare Work.

When request is made to the Department by an employer, Mr. Nazro will study the especial needs and opportunities for Welfare Work in an industrial plant, advise the best methods of introducing such features as may be deemed most essential, and direct their installation. For example, Mr. Nazro is at present developing a new mill town at Welland, Canada. His services will be furnished to employers free, the only cost to them being his traveling expenses.

them projected for speculative purposes, and finally ended in reductions of wages and a suicidal wage-cutting war, exactly similar to the price-cutting war of the manufacturers.

Fair dealing and honorable treatment are the best business policy to pursue, and in this respect the advantages as well as the obligations of fair dealing should be reciprocal. It is not alone the duty of the corporation to be fair to its employes, but in reciprocal measure it is the duty of the employe to be loyal to his employer. —*Electrical Worker*.

NEW YORK, JANUARY-FEBRUARY, 1906

TEN CENTS

THE NATIONAL CONFERENCE ON IMMIGRATION.*

A LARGE AND REPRESENTATIVE GATHERING ENGAGES IN FREE DISCUSSION OF THE VARIOUS PHASES OF THE SUBJECT.

MORE than five hundred delegates, representing commercial, economic, ecclesiastical, labor and agricultural organizations throughout the United States, gathered in Madison Square Garden Concert Hall on the morning of December 6. They met in response to the call issued by the National Civic Federation for a National Conference on Immigration, the first ever held in this country.

President Belmont's Address.

The Conference was called to order by August Belmont, President of the National Civic Federation. In welcoming the delegates and outlining the course of their deliberations Mr. Belmont said:

"As President of the National Civic Federation it becomes my pleasant duty to call this meeting to order

* A full stenographic report of the proceedings of the Conference will be issued by The National Civic Federation.

and to welcome you to this Conference, held under its auspices—I repeat and emphasize, under its auspices only. The Civic Federation has no opinions and no policy to advance on the subject you are to consider, but will afford you, under its protection and through its efforts, free, uninfluenced and untrammelled debate.

"It is claimed that a change is taking place in what I may call, in a general way, the complexion or character of the immigration, which causes a very substantial portion of our most intelligent citizens to advance arguments for restrictions. They deny that this country is an asylum for the oppressed and unhappy of other nations. Indeed, they say that if this were the case, changed conditions and our growth compel us to deny what we formerly admitted. Is this really sound? You are to deliver the verdict.

"For years Europe gladly dumped her human refuse in our lap, and we housed, fed and clothed it. Of late,

however, a spirit of what we owe to ourselves has come over us. Our Federal Government has become discriminating, if not restrictive, in those matters, and it is asked by some, Do our restrictions go far enough? This is for you to answer.

"Proceeding on the theory that our national character was formed and that we had room enough for all comers, we were taught to believe that by the power of assimilation we would gain—not lose—by this constant and growing alien influx. Has the character of the flood changed, and how? If so, it is right to inquire whether from the standpoint of correct economics and sane care for our national health and mental soundness, it is for good or evil.

"Customs foreign to us and calculated to sap our national vigor are brought to our shores, and if maintained by the people to whom they have become a part of their existence, they destroy the theory of assimila-

OPENING SESSION OF THE NATIONAL CONFERENCE ON IMMIGRATION

tion. If it were true—and unfortunately it is not true—that our people only absorbed what was good and rejected what was bad, we would have no cause to fear that menace. If, however, the enhancement of the value of material wealth is the main argument for receiving into our national existence all comers, if this is the paramount consideration, then I say you should discuss this question for the benefit of the country at large and point out a sane and beneficial course to pursue.

"That this fair land of ours, however, is not to be made a receptacle of the human refuse of nations is evidenced by the trend of Federal laws; and that the

son of unrestricted and unregulated immigration. Apart from the ordinary immigration, the general tide that may flow toward our shores by reason of some improved economic material condition, we find this artificially stimulated immigration from several sources, one of them those who are interested in the carrying of immigrants; secondly, the employer of labor, who is continually desirous of maintaining an army of unemployed workmen who shall be in continuous competition with those who are employed; and thirdly, those people whom some tyrant monarch seeks to drive out of his country as the safety valve for the maintenance of his monarchical machine. Those causes, and many others which do not now occur to me, contribute to make the condition of the American working man an exceedingly precarious one. Taking this fact, together with the industrial conditions as they obtain in our country, the highest developed machinery, the most wonderfully propelled force and power in driving the wheels with greater velocity than the wheels of any industrial machine the world over; taking again the millions of colored men, who, up to this time, have manifested but very little evidence of a desire to exert themselves to their own material improvement—all these things, my friends, make it essential that the working people of our country first exert themselves, and that you should co-operate with them and they co-operate with you, in order that the economic and material and social problems confronting them in our time may be solved in our own country without our being compelled to bear the additional disadvantage of this overwhelming number of immigrants coming from all shores and from all climes.

"I do not think that we desire to restrict immigration because we fail to appreciate the true meaning of the brotherhood of man. I do not believe that we can

we all agree that there should be some restrictions upon the natural immigration. If I have one passion and love that is stronger than another, it is for the people who are so ably and so well represented by my predecessor, President Gompers, and for that reason, for the reason that for so many centuries the laboring man has been tied to the soil and treated as a chattel belonging to the soil, that he could not leave without the permission of his seigneur—it is for that reason that I maintain that, with some limitation, the right of the human being to move from one part of the earth to another is a fundamental element of personal liberty.

"You have heard, so far as the Civic Federation is

HON. ANTHONY HIGGINS.

Vice-Chairman of the National Conference on Immigration; former U. S. Senator for Delaware.

mission of our institutions is not to afford asylum to the intemperate, the habitual beggar and pauper, the insane and the criminal of foreign nations, is well established in our minds. Other phases of this question command your time and your best thoughts. You are to consider legislation as it bears upon immigration, and to inquire whether existing laws are sufficiently comprehensive to exclude all undesirable elements; whether the volume is stimulated by extraordinary influences and whether the system of inspection as now operated is properly conducted.

"Another phase of discussion and inquiry which will be presented at this session is of momentous interest. I refer to the distribution of immigrants from ports of entry to the agricultural districts, and more particu-

SETH LOW

Chairman of the National Conference on Immigration.

be justly accused, because we desire restriction of immigration, of a failure to recognize the obligation of the fraternity of man. But the principle applies to international contests, to international questions, the same as it applies to the nation, to the family, to the individual, that self-protection is the first law of nature; and let me add this, too, that if the American people shall attempt some practical measure that shall stop to a considerable degree this wholesale immigration of people from several of the monarchical countries where tyranny is the handmaid of poverty and misery, and these people shall be compelled to remain in their own country, it will also compel them to find the remedy for their economic and social ills in their own country, and compel reform and improvement."

Oscar S. Straus.

Oscar S. Straus, Second Vice-President of the National Civic Federation, was then introduced and spoke in part as follows:

"Is it not rather remarkable that of the three gentlemen, including my humble self, who have addressed you, respectively the President, the First Vice-President and myself, two were themselves immigrants and the third is the son of an immigrant father? (Applause.) It has been said truthfully that in this country we are all immigrants; that there is simply a question of a few years between us. And therefore we, best of all, are able to study and to consider this important question and weigh in the balance the human rights, on the great platform of humanity itself. The United States is the greatest immigrant country that has ever been known to the history of the world, and I think I can say without boasting that this is, at the same time, the most prosperous, the most flourishing and the greatest country that the world has ever known.

"I think there is no difference between us upon the question that this country is not to be used as the prison house of the nations of the world. I think that

HON. W. S. WEST.

Vice-Chairman of the National Conference on Immigration; President of Georgia State Senate.

concerned, from the side of capital and also from the side of labor, and the little I have said is from the side that is neither represented as capital or as labor, but from the side of the general public; or, if I may put it in another way, you have heard from the right hand of industry and from the left hand of industry, and I am supposed to represent the heart that unites the two."

Commissioner Frank P. Sargent.

Letters expressing sympathy with the movement in favor of judicious restriction of immigration were read from Cardinal Gibbons and John H. Vincent, Chancellor of Chautauqua, after which the Chairman introduced the Commissioner of Immigration, Frank P. Sargent, who said in part:

WARREN S. STONE.

Vice-Chairman of the National Conference on Immigration; Chief of the Brotherhood of Locomotive Engineers.

"We have just passed the banner year in the history of immigration, with a record of 1,026,499 arrivals. These represented the actual accredited immigration, for which the head tax was payable to the Government, and did not include the large number coming from Canada or from Mexico, citizens of those two countries. The admission of one million people in one year from foreign countries is a large addition to our community. It makes quite a large city of itself. It is important to discover where the greater proportion of them go. You will be interested in knowing something about whence this immigration comes, what it is, where it goes, and what it is worth.

JOHN A. HOLLIDAY.

Vice-Chairman of the National Conference on Immigration; President of the Union Trust Company, Indianapolis.

larly to its effect in the South, where the industrial education and social betterment of the negro race are still unsolved problems."

Samuel Gompers.

Samuel Gompers, First Vice-President of the Civic Federation and President of the American Federation of Labor, followed Mr. Belmont. In the course of his remarks he stated the position of organized labor with regard to immigration in these words:

"Speaking primarily for those with whom I have the honor to associate most intimately, those who are usually termed the wage-earners, I know with a peculiar emphasis the conditions from which they suffer by rea-

NATIONAL IMMIGRATION CONFERENCE DELEGATES AT ELLIS ISLAND.

"New York, out of this figure 1,026,499, received 315,511; Pennsylvania, 210,708; Massachusetts, 72,152; Illinois, 72,770; New Jersey, 57,358; Ohio, 49,351. Six States of this Union received 777,748, or 76 per cent of the whole. The West received 43,571. The beautiful and prosperous South, just entering upon a season of great activity, commercial and otherwise, received 46,343, divided as follows: Maryland, West Virginia and Florida, 9,000; Louisiana, 5,000; Texas, 4,000; Kentucky—a glorious State for immigration, offering splendid inducements to good, hardy agriculturists, got 618. (Laughter.) Tennessee, wide-awake and prosperous, opening up some of the grandest iron industries of the South, received 782. North Carolina, a glorious State, blossoming out splendidly, got 183. South Carolina, a good second, got just 328; Georgia, 518; Arkansas, 432; Indian Territory, 438; Oklahoma, 260.

"In the great open country where immigration is required, where the best possible opportunities are offered to the peasantry of Europe to settle and grow into independence, the proportion is hardly noticeable in this great aggregation of immigration.

"Where do they come from? Austria-Hungary led the world in immigration to the United States last year with 275,693; Italy sent 221,479; Russia, 184,897; Germany, 40,574; Norway, Sweden and Denmark, 60,625; England, 64,709; Ireland, 52,945.

THE QUESTION OF DISTRIBUTION.

"Three years ago I made a recommendation, which was probably considered as rather an unusual proposition. I said: 'Let the Government go a little further than it goes to-day, merely deciding the right of the immigrants to enter on Ellis Island, and let it decide where they shall go.' In a little while you will have an opportunity to see the method of the admission of aliens

to America. There is determined what? Whether or not the alien shall come; that is all. Nothing is said as to where he shall go, but whenever he has passed the line he has the right to go wherever he pleases. I believe that in addition to telling him he can enter, we could offer, under the auspices of this Government, some information as to where it would be to his advantage to go, that we might be helpful in sending to those localities where immigration is desired a large number of those people who are to-day coming to our shores destined to the very places that are already overcrowded and where there are no opportunities for them.

"If there is any subject to-day that ought to appeal to the humanitarian in this country, it is that of the bringing of these men, women and children, some of whom you will see to-day, who have been denied admission into this country, and who have to be taken back. Why were they brought? Nine out of ten of them have been brought by the solicitation of some agent who wanted to get the percentage from the sale of tickets. In my annual report this year I urge that this subject of such vital interest be made an international one, and that a convention of the several countries be called for the purpose of discussing this subject in the interest of humanity; because if there is any person, I do not care whether he lives under a despot or under a republican form of government, who has not got sympathy for men and women and children under those conditions, I am sorry the Almighty God ever made him. (Applause.) Think that over from a humanitarian point and see if such regulations cannot be made as will provide for such inspection in Europe as will guarantee, barring an outbreak of contagion, the landing of every alien when he comes to the shores of America. (Applause.)

"Put your medical officers at the port of embarkation (applause), and let them determine there whether or not a person is afflicted with a disease that is denied admission into the United States. It is of far greater importance to us to stop the disease at the port of embarkation than to have the paltry sum of \$100 turned over to the Government by the steamship company that brings the person and takes him back.

OCCUPATIONS AND WEALTH OF IMMIGRANTS.

"Now, it may be of some interest to you to know the occupations of those who came last year. We had 162,134 agriculturists and farm laborers; you gentlemen from the agricultural districts, who are having such trouble in getting farm laborers, can realize that there was not such a very large number of farm laborers among the million who came. Common laborers, those that work at anything they can get, and get all they can for it, were 287,450. Skilled in the various trades—not all trade unionists, I am sorry to say, but many of them will be—were 180,812. Servants numbered 125,472. And yet any lady will tell you it is almost impossible to get a servant. Men, women and children without occupation were 232,018. Under the age of fourteen years were 114,668; fourteen to forty-five years of age, 850,419; forty-five years and over, 56,412.

"How much money—that is what will interest my financial friends who are present—how much money did these people bring? They brought \$25,159,012, an average of \$25 per capita. Now, would you like to know how this proportion of money is distributed? The Croatian and Slavonian races, \$15 per capita; the English, \$57; the German, \$44; the Hebrew, \$14; the Irish, \$26; North Italian, \$29; South Italian, \$17; Magyar, \$15; Polish, \$13; Scandinavians, Norwegians and Swedes, \$26; the Slavic races, \$16.

"I think that the time has come when this Government should positively assert that no convict, no man of immoral character, no man who is escaping from punishment that he rightfully deserves, no pauper, no person afflicted with contagious disease, should be permitted to obtain transportation to America on any line which has the right to enter an American seaport. (Applause.) Make every man who comes to America with his wife and children present some good evidence of his good character and his good citizenship at home. That can be obtained, if it is exacted. Bring about an influence that will prevent this promiscuous advertising and encouraging of immigration in Europe by all the interests which are involved in the carrying trade.

"Exact the most stringent enforcement of regulations for the health and comfort of those who travel by sea, especially in the steerage. Give a little more attention to the steerage and less attention to the first cabin.

"Then find some means to make known to the intelligent immigrant that it is to his advantage to keep away from New York. (Applause.) You, gentlemen, use your influence to open up some of your Southern seaports, and then immigrants can go direct to your own harbors and be landed at the gateway, where you want immigration of the right kind, and where there is plenty of opportunity for them."

Commissioner Robert Watchorn.

The first address of the second day's session was that of Robert Watchorn, Commissioner of Immigration at the Port of New York. Dealing with the subject of the exclusion of the unfit, he urged that the present law be

FRANK P. SARGENT.
U. S. Commissioner-General of Immigration.

amended so as to exclude the feeble-minded as well as idiots and the insane. He also suggested the advisability of legislation which should prevent the recurrence of such painful incidents as the deportation or detention of alien children whose mother, by virtue of marriage with an alien since naturalized, is admitted as an American citizen. His address follows in part:

"The law provides that an idiot shall not enter the United States, and I presume that if ever there was any sound legislation, that may be considered sound. I do not believe that any idiot should be permitted to land on these shores. But the law does not say one word about those who are feeble-minded, or imbecile, and if any one here who is familiar with that subject can point out to me where idiocy leaves off and imbecility begins, I shall be indebted to him for the information, for I have not yet received it. You cannot know the number of people who are recorded by the physicians as being feeble-minded, and yet the social and political pressure that they can bring to bear upon the governing machinery oftentimes effects the landing of such persons. My contention is that persons certified by the medical examiners as afflicted with feeble-mindedness or imbecility should be classed with those certified as idiots. No amount of pressure can effect the landing of an idiot, and you should classify the weak-minded, the imbeciles, in such way as to prevent pressure effecting their landing.

"The only way you can weed out that which is, by common consent, undesirable, is by Act of Congress, for there the opinions of the country are crystallized. The way to weed it out successfully is to do what we have done in Section 9 of the present Act, the Act of March 3, 1903; and that is, summed up in a word, to make it more unprofitable to bring them than it is to leave them. In 1903 for the first time the Government could assess a fine on any steamship company or any carrying company for bringing into the United States a diseased person. Since that time, those who are afflicted with disease have fallen to such an insignificant number that they are scarcely worth mentioning. If this kind of legislation applied to loathsome

diseases can so successfully weed them out and keep them on the other side and save them the burden of a journey across the sea, surely we can extend that principle so as to include those who are also considered unworthy and those who would be a detriment to this country."

Prescott F. Hall.

Among the speakers on the topic, "What Shall be the Limitation of Immigration?" was Prescott F. Hall, of the Immigration Restriction League of the

DR. ALBERT SHAW.
Chairman, Conference Committee on Resolutions.

United States, who enlarged upon the dangers of immigration artificially stimulated by foreign steamship companies, and quoted statistics to show that the foreign-born population furnished a much higher percentage of criminals than the native-born. In the course of his remarks Mr. Hall said:

"Fifty, or even thirty years ago the expense of coming here, the hardships of the voyage, acted as a sieve to screen out the undesirable. By undesirable immigrants I mean those ignorant of a trade, lacking in resources, of criminal tendencies, averse to country life and tending to congregate in the slums of the large cities; with a low standard of living and lacking ambition to seek a better; failing to assimilate within a reasonable time and having no permanent interest in this country.

"It is significant that in general immigration legislation was found unnecessary until some years after the present flow of relatively undesirable aliens had begun. The result of this influx is shown in the large number of persons who are diseased, insane and criminal at the time of landing, or become so shortly afterward. Commissioner Watchorn asserts that the general physique

CHARLES RIDGELY.
Vice-President of Ridgely National Bank, Springfield, Ill.

of the immigrant has very much deteriorated in the last thirty years. Among recent immigrants, one Hebrew in forty-two was certified as having serious physical defects, and one Syrian in twenty-nine. Of those certified for minor defects having some bearing upon the ability of the immigrant to earn a livelihood, there was one Italian in twenty-six, one Syrian in twenty-four, one Hebrew in sixteen. The proportion of im-

migrants sent to the hospital in proportion to the landed, was for Hebrews, one in ninety, for Italians, one in one hundred and seventy-seven. Comparing male prisoners with males of voting age, those of foreign birth and parentage contributed three times as many prisoners as those of native parentage, while the foreign-born contributed more than twice as many prisoners as the native white of native birth and parentage.

"It is often said that, however it may be with the original immigrants, their children become good citizens. That this is a fallacy is shown by the fact that, of juvenile prisoners in the North Atlantic division, those of native birth and parentage furnish 855 per million, the native children of foreign parentage 2,740 per million, and the foreign born 2,252 per million. In certain special regions like the mining regions of Pennsylvania and our large cities, the figures as to criminality are more striking. In the anthracite regions from 1880 to 1890 the convictions increased nearly 10 per cent more than the population, and the proportion of Slav criminals increased nearly 25 per cent more than the Slav population. In Massachusetts the foreign-born population furnishes three times as many prisoners as those of native birth and parentage, and those of foreign birth and parentage furnish ten times as many prisoners as the natives. As regards insanity, the foreign-born furnishes 2.1-3 times the normal proportion of insane. The proportion of paupers who are foreign-born is increasing. As compared with the male population of voting age, the foreign whites furnish 4,653 paupers as compared with 2,096 of those of native birth and parentage.

JOHN W. KERN.
Representing the Commercial Club of Indianapolis.

"The last danger of the present immigration which I would mention, and perhaps the most important, is its effect, not on those whom it introduces into the country, but on those whom it excludes. It is well known that when immigration becomes of a certain low quality it tends to prevent immigrants of a better quality in foreign lands coming here. Those immigrants are diverted to other places where they will not be brought into competition with the lower grade of immigration. If we wish to have selected immigrants, it does not follow that the first effect of the selection would not be to increase the immigration of the most desirable people. But more important than that is the effect which undesirable immigration has in excluding a certain large class of persons who are never born. It is well known that the native birth-rate and even the birth-rate of more recently arrived immigrants is beginning to fall. It is falling very fast. In Massachusetts the birth-rate of the native part of the population is lower even than in France. And why? Undoubtedly this is due to several causes, but the chief cause is the desire for concentration of advantages, and one of the principal reasons for the desire of concentration of advantages is the desire for people not to have their children obliged to take up a trade and a calling in which they will be brought in close competition with a low grade of foreign labor.

"I believe we should increase the head-tax from \$2 to \$10 or \$15, so as to equalize the cost of coming to the United States with the cost of going to South Africa, Australia and South America. Let us put the United States on a level with these other countries, so that this country will not be the cheapest place to come to, the place that the poorest and least thrifty class shall seek.

"Second, let us absolutely exclude persons of poor physique, that is to say, those mentally and physically weak, defective or degenerates, so that their ability to earn a living in their particular occupation is interfered with.

"Third, I think also we should exclude the illiterates, that is, those who cannot read in their own language."

Professor Morris Loeb.

Professor Morris Loeb, of New York University, said that the spirit which actuated the last speaker was "that which whipped the Quakers out of New England towns, which drove Roger Williams and Ann Hutchinson into the wilderness. It is the spirit of the grandfathers of the present generation, the Know-nothings who attempted to keep out of this country in the 50's those people who saved for the North the State of Missouri. According to the rules which the

HON. W. A. CLARK.
U. S. Senator for Montana.

Know-nothings of that period tried to bring forward, General Siegel, General Schurz, the Germans who fought for the Union in the North, as well as the Irish and the Germans who fought for the Southern States, would have been excluded. (Applause.)

RESTRICTIONIST STATISTICS ATTACKED.

"I object to the introduction of pseudo-science of every kind, and the worst pseudo-science is false statistics; and as a college professor I protest against the misuse of statistics. As an American citizen I protest against the misuse of the United States Government returns for the propagation of false statistics. I hold in my hand one of the letters of the Immigration Restriction League in which they objected to the publication by this Civic Federation of certain material which had been read in an open meeting, saying it was a one-sided representation of the facts, and that no one-

HON. ROBERT ADAMS.
Ranking Member of the House Committee on Immigration.

sided representation should go forth before an honest and fair exchange of opinion had taken place. Upward of fifty leaflets have been distributed by the League without the chance of answer. Some of them have not yet come to my hands, but some have, and I would like to show you what are the statistics upon which Mr. Hall and his friends base their aspersions upon the character of the foreign-born. He has read himself statistics about criminality upon the basis of 1,000 people of various births resident in Massachusetts. He

states that there are 3.60 per thousand of Germans who have been committed in one year for crime; 5 per thousand of Scandinavians, 5.8 of Scotch, 6 of French, and so on in descending scale, 7 in the thousand for Russians, 10 for Austrians, 16 from Poland, 15 from Hungary and 18 from Italy. Now, gentlemen, that is a serious accusation—eighteen per thousand arrested against a very small proportion, only 3 per cent. of Germans, 5 per cent. of Scotch, etc. I don't like that kind of argument. At the present time, 22.7 per thousand of the members of the United States Senate have been convicted of felony. (Laughter.) Quite a number of other gentlemen are under indictment or at least under suspicion of the commission of felony.

"He suggested that the figures that I have given you here are false, because in giving a list of arrests, for the reason that some of you will understand, arrests for drunkenness have been excluded. The Italians, the Russians and the Poles are not addicted to drunkenness, and if drunkenness had been included in the arrests, the Massachusetts figures would have had quite a different significance. (Applause.)

"We have heard about the number of dependents. Leaflet No. 42 of the Immigration Restriction League gives us the figures for dependents, which have been taken from the Immigration Commissioner's report of 1904. I quote from that leaflet verbatim:

"Considering only the insane and charitable institutions, it appears that an alien population which is only 1.3 per cent. of the total population furnishes 12 per cent. of the inmates of the institution.' Twelve per cent. of alien inmates! Gentlemen, we have 80,000,000 citizens; 1.3 per cent. of 80,000,000 is about 1,000,000. One million aliens arrive every year. Five times 1,000,000 cannot have been naturalized, therefore, and instead of having 1,000,000, that is 1.3 per cent., he should have stated five times that, about 6.3 per cent. aliens resident in the United States, if we only take into account immigrant statistics themselves. Only a born idiot or a person who is completely blinded by prejudice would have put forth figures like that without looking into it. I give the members of the Immigration Restriction League the choice of the horns of the dilemma."

Z. P. Smith.

Z. P. Smith, of North Carolina, favored an educational qualification for immigrants and thought any man an undesirable immigrant who did not purpose becoming an American citizen. Speaking of his visit to the Immigrant Station he said: "There was one thing that impressed me very forcibly: that Ellis Island ought to be on the other side. (Applause.) I was struck with the injustice that this country is perpetrating upon some helpless and defenceless people, aided and abetted by their mother country. We bring a woman here with a lot of children, and you saw them and I saw them, and we don't know whether they will be deported or not. I have no doubt that the medical examiners perform their duties faithfully and well—there is no question in my mind about that—but the examination given the immigrants is very superficial. The place to examine the immigrants is before they are allowed to get on the plank of the steamship. If you will do that, if this Civic Federation will pass a resolution saying that we demand a rigid, not a superficial medical examination and a physical examination of the man, the woman and the child, I tell you you are going to reduce this immigration a very great deal."

Mr. Carnegie for the Open Door

Andrew Carnegie was introduced as "probably the most distinguished immigrant that ever came to these shores." After remarking that immigration was not among the serious problems of the country, Mr. Carnegie said:

"We have solved the question in the present by the somewhat too drastic law that we have enacted. You heard Mr. Watchorn, and you know that the right man is in the right place. (Applause.) Now, what would this country have been without immigration, and who is there here who is not either an immigrant himself or has not immigrant blood in his veins? (Applause.) It is not a problem for us; it is the problem of the poor, unfortunate countries from which we are draining the best blood. (Applause.) Prince Bismarck declared that the United States was draining the most valuable blood of Germany, and he would pass laws preventing the Germans from leaving their country to swell the growth and the prosperity and happiness of the American people (applause), and he was a wise man.

"Now, I hold the prime test and the only test we should exact is this: Has a man ambition to enjoy the rights of an American citizen? Has he the habits of sobriety and frugality to save the sum necessary for him to reach that port? And is he skillful enough to earn that surplus? I want no better proof or testimony than that. If I owned America, and was running it as a business operation, I would not only look for that man, but I would give every man of that kind a premium to come here (applause), and consider it the best bargain that I had ever made in my life.

"Gentlemen, taking the cost, the value of a man, a woman or a child in this Republic as low as you put

the slave, and that was an average of about \$1,000, you are getting 400,000 a year, and that means \$400,000,000 cash value. And every man who comes here is a consumer, and 90 per cent. of all his earnings—even the most saving of them don't save more than 10 per cent.—every dollar of that goes to employ other labor of some kind. The grossest mistake that labor ever makes—if it ever makes a mistake at all (laughter)—is this, that a man coming in here to work injures others, and that they are all in compartments di-

W. D. JELKS.
Governor of Alabama.

vided from each other. Gentlemen, labor is one undivided whole, as society is one undivided whole, and the prosperity of one branch of labor entails the prosperity of other branches. Every laborer is a consumer, and he employs the labor of others. We are interdependent, and the laboring classes of this country have not only nothing to fear from immigration, but as the country becomes wealthy and grows in population, it will be all the more important that we should have the right kind of immigration. Now, this country is the most prosperous in the world. You will all agree with that. It is also the country that receives the great stream of foreigners. A speaker said something about the purity of blood. It is not purity of blood you want; it is a mingling of different bloods that makes the American. (Applause.)

"This question of immigration is settling itself. The net foreign immigration is about 400,000 a year. Your

HON. AUGUSTUS P. GARDNER.
Representative in Congress for the Sixth Massachusetts District.

native births are 1,200,000 a year. There is no danger of foreign immigrants ever affecting the dominancy or the characteristics of the American people. A gentleman has said here that immigration is to increase rapidly. Never was there a greater mistake. Immigration is at its height now, and it is to fall and fall. Don't trouble yourself about imaginary dangers, and don't lie awake at night over the danger to the American nation from immigration. Consider something real. You have got them here, and let Mr. Watchorn

go along with his arrangements and little adjustments that he has talked to us about, and go to bed and sleep. The American Republic does not need you to lie awake on the subject of immigration." (Applause.)

Archbishop Ireland Welcomes Aliens.

Archbishop Ireland's address was an eloquent plea for a liberal immigration policy. In the course of it he said:

"It is now proposed by some to limit immigration. Of course we should limit it to exclude the criminals, to exclude the idiots, to exclude those afflicted with con-

excel in history, a nation that will excel in art, a nation that will have high ideals as well as practical judgment. And for that we need these different races, each one bringing the best, and out of all a great world uprising that will stand unparalleled in history.

"Gentlemen, be not afraid of immigration. Be assured that the more, as the President says, of the right kind we can have, the better. And if you go selecting here and there, you will drive out the very best. Increase the per capita tax? Why, some of the sturdiest and best are those who have worked hard for years to earn in other countries \$30 or \$40 to buy tickets, and must we put on \$30 or \$40 more? We must remember that it is a dangerous thing to pick out the weeds here and there in such a manner as to pick out the good seed as well as the weed."

Congressman Adams on Discrimination.

The Hon. Robert Adams, of the House Committee on Immigration, speaking of his efforts to frame legislation which should discriminate between desirable and undesirable classes and nationalities, said:

"In a conversation with my colleague, Mr. Gardner, of Massachusetts, he made the suggestion, why not limit the number from any given country, and that ought to give the solution? That put into practical form the idea that I had in my mind, and I drafted a short bill, which simply stated that no more (and the number is empiric) than 80,000 immigrants from any one country should enter the United States in any fiscal year. That is all. Now, what is the practical result? Italy sent 232,000 men in 1903. Russia sent 106,000, and Austro-Hungary 202,000. No other nation on the entire continent of Europe sent more than 40,000 immigrants in any one year. So you see

panies would seriously object to any of these restriction laws. At heart I doubt if they seriously would object to an educational test, though they will fight it on the principle of keeping us as long at the soup as possible in order to avoid our getting at the meat. Now, if it is selection or distribution that you want, we will do our best, if that is what the people want. I do not underrate distribution and selection, but I want restriction, and if the people want that they have got a fight on their hands, and it is none too soon to begin. You cannot get restriction that really restricts without such a fight.

CHARLES W. ELIOT.
President of Harvard University.

tagious disease; but to limit it so as to exclude a man coming attracted by the freedom of America, ready to put his hand to the tiller, or to the plough, ready to be an American, would be to turn back upon all the traditions of the past—would be a mistake. (Applause.) What may be done two or three hundred years hence is another question; but to-day America has not at all the population it should have to develop its resources. It has not at all the population which it should have to be great. We need immigrants. We need them in almost every State in the country; in new States to develop our unbroken lands; in other States to give great impetus to our industries.

"It has been asked, 'But shall they vote?' That is another question. Let us dissociate absolutely the question of voting from that of immigration. When they are here it is time enough for us to say: 'Well, it will

ANDREW CARNEGIE.
Publicist and Philanthropist.

the practical working of this simple bill is that Northern Europe is left to develop from 40,000 up to 80,000; Southern Europe is reduced to 80,000.

"The immigrants that come from Southern Europe do not go out upon the land and fertilize our country; they herd here in cities. I am sorry I haven't the time to give you the facts, which I am sure would have very great weight with you, but I can only say that the Hebrew Charities Association of New York shows that there are 20,000 Hebrews dependent upon charity right here in this City of New York."

Hon. Augustus P. Gardner.

In opening the discussion of "The Method by which Immigrants may be Selected," Congressman Augustus P. Gardner, of Massachusetts, said in part:

"If every law that I have heard suggested for the selection of immigration had been in operation last year, though I cannot prove it, I venture to say that nevertheless last year would have been just the same the banner year of immigration into this country. Even your educational test would not, in my opinion, have substantially reduced the number. The figures are not available, or I have not been able to get them for this year, but taking the last previous year, out of 800,000, 200,000 could not read. There were, however, over 100,000 under the age of fourteen. Therefore it is presumable that a large part of the 200,000 illiterates were minors. But let us assume that 125,000 would have been excluded; that is not such a very big proportion. Is it not true that it would simply have resulted that the padrone or the steamship company, or the agents of the corporation would have been obliged to take Jones and Smith for his passage to America instead of Brown and Green? They would have no difficulty in selecting material to draw from, surrounding the Mediterranean, that can read and write. And I don't believe that that law would substantially restrict our immigration. I don't believe that the steamship com-

RT. REV. JOHN IRELAND.
Roman Catholic Archbishop of St. Paul

"Now, if we honestly want restriction—and I confess that I have no idea whether the people of the United States want it or not—if we really and honestly want it, let us go for it, and not waste our energies in long battles over minor issues. Really and seriously, to cut down immigration we need a law drastic in its nature, easy to enforce, independent of human frailty, of the judgment of our officials, and automatic in excluding valueless citizens. And such a measure I believe can be found in a \$40 head-tax to be imposed on males alone coming from all countries with the present excepted countries, Canada, Mexico, Newfoundland and Cuba, with, of course, such exceptions as are necessary of a humanitarian kind.

"Now, under a head-tax of \$40 it would pay no foreign nation to dump their paupers upon us. It would not be worth while for any contractor to keep a weak

WALTER MACARTHUR.
Representing the Japanese and Korean Exclusion League.

take so many years more or less to entitle them to the franchise." What we are talking of now is bringing immigrants here to develop the country, and we need them, and we need not fear them. We need all the different elements to build up one great American nation. We need the plodding men of the North, and we need the poetic men of the South. What is making to-day the greatness and grandeur of the British Empire is the fact that the Anglo-Saxon, the Scotch, the Irish, each one with his own element of mind and heart is building up that great empire. This is an age of new things, new nations. We are building up here the greatest and best of nations, a nation that will

PRESCOTT F. HALL.
Secretary of the Immigration Restriction League.

alien until he paid back that extra \$40, and I believe that the padrone would very surely find that the duty on the assisted immigrant was prohibitive."

Dr. Frankel Defends Jewish Immigrants.

Dr. Lee R. Frankel, Superintendent of the United Hebrew Charities of New York, was one of several forceful and eloquent speakers who championed the cause of the immigrant, particularly of the Jewish immigrant. "Now," he asked, "are we going to select our coming immigrants in the light of those who have come

(Continued on page 14)

THE HOURS OF LABOR.

EMPLOYERS AND WORKINGMEN DISCUSS THE QUESTION AT THE ANNUAL MEETING OF THE NEW ENGLAND CIVIC FEDERATION.

THE first annual meeting of the New England Civic Federation was held at the Revere House, Boston, on the evening of January 11. The number in attendance exceeded two hundred and included 86 employers, 86 representatives of labor organizations and 49 others, largely representative of the various professions. The subject for discussion was "Hours of Labor." A reception preceded the speaking, and Governor Guild and ex-Governor Douglas cordially greeted the members of the Federation and their guests.

Welcomed by Governor Guild.

Governor Guild was obliged to leave before the formal meeting opened, and, standing in the center of the group of those assembled, he said that he was glad to share with his friend, Governor Douglas, the opportunity to congratulate the Federation on its first year of success.

"We have The Hague Conference to adjust difficulties between nations," he said, "and we now have a no less important organization like this in our midst to adjust and bring peace, law and order in the civil as well as military life of the nation."

CURTIS GUILD, Jr.
Governor of Massachusetts.

"I congratulate you on your work and bring to you the greetings of the Commonwealth of Massachusetts, which has always tried to be somewhere near the front, no matter what party was in control, in matters of justice and equal rights for all men, which should be not merely the Massachusetts, but the American motto."

Secretary Robbins opened the meeting and read a letter from President Lucius Tuttle, who was delayed. First Vice-President Frank H. McCarthy presided.

Ex-Governor Douglas.

Ex-Gov. William L. Douglas was then introduced as the first speaker of the evening, and said:

"Mr. Chairman, I find myself heartily in accord with the purposes of your organization. For some years the community has felt the importance of finding a common ground in industrial matters on which the public, the employer and the employee could stand. It seems to me that you have found it. The fact that so many are here to-night proves that the mutual desire to be helpful in establishing right relations between employer and employee is entertained by a considerable portion of the community, and your success in organizing them into a power for good is apparent. Such an organization as yours would hardly be possible in any other country; it is essentially American; equality and free speech are its basis, and I am sure that as time goes on it will take an important part in establishing the relations of employer and employee."

FORMER OPPOSITION TO CONCILIATION.

"I am not a stranger to the proposition which you represent. Twenty years ago, when the idea of conciliation and arbitration had not been accepted by the public, and at a time when such a flourishing organization as yours would have had no support in the minds of the people, it became my duty on the floor of the Senate to labor for the enactment of a law which should define the policy of this State in labor difficulties."

"The arguments of those who opposed the position which the State then took seem strange to-day. It was claimed that the community had no interest in matters

pertaining solely to employers and employees; that it was beneath the dignity of the public to enter into the private affairs of the buyers and sellers of labor, who must be left to fight out their differences alone. The State, it was claimed, had no right to assert itself in any manner, even though its prosperity were at stake. It was only by overcoming a strong opposition of this sort that we are enabled to enter upon a policy which is substantially like the idea which you represent."

"The difficulty of the present industrial situation and the means of handling it are best understood by a study of the evolution of modern forms of industry. Men of my age have lived in all the stages of the development of the industrial system from the time when the employer worked side by side with his journeyman, up to the modern factory with its thousands of employees, whose very names it is impossible for the employer to know. The remedy is simply to replace what has been lost by the change. There was no need for the employer and the employee to 'get together' a generation ago, because they were together all the time."

"The personal relationship, made impossible by the factory system, we endeavor to replace by instituting boards of conciliation in each department of the business, composed of workmen who represent the interests of the individuals and bring to the employer their questions, which we feel bound to consider in the spirit of helpfulness, fairness and justice. In this way the confidence of both parties is strengthened; and by a reasonably conciliatory attitude on the part of both we succeed in many instances in speedily adjusting the matters of difference caused by the ever-changing methods and system of production, which too frequently, by lack of confidence, become the cause of chronic grievances. By means of these boards of conciliation in the different departments we are enabled to reduce the number of causes to be left to arbitration."

"I have endeavored to extend this plan of conciliation so as to embrace groups of local factories in the same industry; and while it is not always successful on that line, still I am sure you will agree with me that this plan, having been adopted at Fall River for the settlement of the six months' strike there, resulted in the establishment, for the first time in that city, of a working basis for the settlement of wage disputes, and the lasting benefits accruing to those concerned are apparent to all."

JAMES DUNCAN.
General Secretary, Granite Cutters' International Association
of America.

"Such a plan, of course, requires organization of the workman. No man needs to fear organization of his employees if he sincerely approaches in this way the questions that arise between them. As a workman at the bench, I was a member of all the organizations of my craft and since becoming an employer have always felt that my employees had the same right to belong to labor organizations that I had myself."

"It seems to me that the employees think too much of arbitration and the employer too little of conciliation in industrial matters to-day."

"I notice in the statement of purposes which you have put forward in your by-laws, Mr. Chairman, that you propose to encourage mutual agreements between

employers and employees as to conditions under which labor shall be performed, and the faithful adherence of both parties in letter and spirit to agreements so made. I understand that you refer to collective agreements."

WORKINGMEN MUST KEEP AGREEMENTS.

"I believe that this matter of faithful adherence to agreements is the most important phase of the industrial problem now before the public. I wish I could impress upon workmen the importance of unwavering support of contracts which they make. I believe that in the past laboring people have lost more by a failure to keep agreements than by almost any other cause. They have not understood that the employer must know that their agreements can be relied on in order that he may go into the market and make contracts of which he can give them the benefit. Business honor is no more the foundation of mercantile success than industrial honor is the foundation of industrial success. I hope that your Federation will require uncompromising adherence to this provision of your constitution and continually exert an active influence to assist in upbuilding that

WILLIAM L. DOUGLAS.
Former Governor of Massachusetts.

faithful adherence to contracts which you name as one of your purposes. A high standard of honor in such matters, Mr. Chairman, comes by gradual growth. Not at first, but after slow and sometimes difficult progress, do we arrive at a high standard."

"I can see progress in the last ten years. Now, we must not expect to arrive at a high standard in one bound, but rather, while we continually insist with firmness on the necessity of the fulfillment of agreements, we should at the same time be mindful of the importance of the spirit of helpfulness toward those who have not been accustomed to the importance of integrity in agreements. I believe that, in the long run, we shall do more good in this way than by wholesale condemnation of every failure. When an employee is wrong he should be told so; but then, there is such a difference in the spirit in which you tell him. We shall arrive at a full appreciation of the importance of industrial honor more quickly by the helpfulness of which you speak in your by-laws than by denouncing and speaking evil. It is the policy of some to denounce the laboring people for certain shortcomings, which they undoubtedly have, and to minimize the value of the progress already made."

"I have no desire to allow either party to compromise the right and admit that we all have much to learn in industrial relationship; still I believe that the spirit with which we approach new and knotty questions is more important than what we do. An employer who is honest with himself and his employees is not likely to go far wrong if he is determined to meet the questions which arise in a fair spirit; while he who approaches his difficulties with the opposite spirit is not likely often to be right."

A British View—Mr. Mosely's.

Alfred Mosely said in part:
"Eight hours' work, eight hours' play, eight hours' sleep and eight dollars a day. (Laughter.) That is the ideal which I often hear expressed by work people. There are some who would probably place eight pints of beer instead of the eight hours' sleep (laughter),

but I venture to think in this country that number is happily small. There are others again who doubt the possibility of this ideal of eight hours all round, including eight dollars a day, and are inclined to view the situation from an economic standpoint.

"There are some trades in which I quite agree that eight hours are more than ample, such as mining, and there are many industries where competition does not enter into the field, where you have safeguarded your

LUCIUS TUTTLE.
President of the New England Civic Federation.

markets against the intrusion of foreign products, and where you are safe from outside competition, such as in the printing trade, say of newspapers. I do not see why, with no fear of competition, providing that the work is sufficiently arduous, eight hours should not be ample in such trades, and there are others that may be enumerated. But as a whole the question arises as to whether eight hours can be made universal for all trades for all countries under all conditions.

"Personally I am one of those who think not. Before you can get such an ideal as that, it is necessary to bring, in my opinion, the labor world under one head. Organized labor must not look alone to this country, but to other parts of the world in order to bring it thoroughly into harmony before you can decide upon a universal standard of hours.

"One great question that you have to answer is—and this is a very important question, gentlemen—does the United States intend to manufacture only for itself, or are you going to try to compete in the neutral markets of the world? How can you hope to compete with eight hours' work if Germany and other countries are going to work nine and ten hours and pay their people infinitely lower wages than you are accustomed to receive in this country? Now, gentlemen, you who are representing the labor organizations, I put it to you as a serious question: Is such a thing possible as eight hours?

"The Civic Federation is an organization with which I am in hearty sympathy. I have seen much of its workings. If you will remember, some years ago I was here with an industrial commission of some twenty-two or twenty-three trade union leaders from Great Britain. The Civic Federation, to whose members I appealed for help, readily came forward and piloted the whole of my commission through the States. Mr. Marcus Marks, who is with us here to-night, kindly came forward and said: 'If I can be of any assistance, I will travel round the country with you.' Mr. Easley appointed Mr. Marks, Mr. Donnelly and one or two others to guide us, and their efforts were devoted to making our trip instructive and easy, and I have to thank the employers of this country for having so liberally opened their doors to our people. It was a great opportunity. It was a great education for our commission, and I feel that I am deeply indebted to the Civic Federation for the courtesy which they showed to my people and to myself on that occasion.

"The Civic Federation, as I understand it, lays itself out for the settlement of labor disputes. It does not wait until a strike has taken place and both sides have taken up a position from which they cannot climb down with dignity, but the Federation steps in before any breach has occurred and gets the employer and employee at a round table conference. Now, gentlemen, we all know if before any bitterness has entered into a struggle; if before any act has occurred from which neither side can recede, if you can only get them at the round table to talk out their difficulties, that as a rule half the trouble is over, and ten to one that they will succeed in finding a way out of the various difficulties presented; and I believe it is often found when they come together that they are really talking about that which each side does not understand. In other words, there is no real difference of opinion; it is only imaginary.

The Civic Federation has undertaken this work and has carried it to a triumphant issue. A thousand and one disputes that you hear nothing at all about have been, I believe, settled. It is only here and there, when the Federation unfortunately failed to bring about settlements, that it is bruited about in the papers that there is another strike, or that the Civic Federation has attempted to do something and failed. You hear of their failures very largely, but there are scores of successes they are modestly inclined to say nothing about; and I venture to think that both capital and labor are under a deep debt of gratitude to the Civic Federation, which makes for peace, prosperity and contentment, and I have no hesitation in congratulating you gentlemen upon the splendid work that has been accomplished in the past, a work which is only at its inception; and if you people will try to pull together in the future as in the past, there is no limit to the work that the Civic Federation may accomplish for the good of all concerned and especially for the good of the United States." (Applause.)

Eight Hours Enough—James P. Archibald.

James P. Archibald, District Organizer of the Brotherhood of Painters, New York City, said:

"I do not quite agree with Mr. Mosely when he is perhaps pessimistic as to the outcome of our efforts for the eight-hour day. I have been convinced for a

JOHN MASON LITTLE.
Treasurer of the New England Civic Federation.

great many years that eight hours is at least long enough for any man to labor, and I hope and trust that the American trades union movement will never for a single instant do anything that will impede the progress of that advance and its ultimate consummation in this country.

"The movement has given an incentive to the trades unionism of the country, not alone this country but of

FRANK H. MCCARTHY.
First Vice-President, New England Civic Federation.

the entire world. And I do believe that if that were eliminated from our movement to-day it would be hard to keep together that compact and solid mass of men that are coming from all trades to stand together for the purpose of achieving a distinct record in that particular line."

Mr. Archibald said that shorter hours would bring

greater opportunities for education and the development of home life, and thus make for contentment and peace between employer and employee.

Marcus M. Marks.

Marcus M. Marks, of New York, spoke as follows:

"That there has been a strong tendency—in fact, a well-defined movement—toward the shorter workday during the past few years will hardly be denied. The

ALFRED MOSELY.
Former Chairman of the Mosely Industrial Commission.

question is, has this movement a logical basis? Is it for the best interests of employer and employee? How can it be regulated so as not to affect industry unfavorably?

"The cry for shorter hours comes invariably from the side of labor. Legislation looking to the shortening of the work day has received its inspiration almost entirely from the same source. Rarely, if ever, have employers inaugurated movements in this direction. In fact, capital as a class has resisted and opposed such efforts.

"Let us see what causes these forces of capital and labor to range themselves in opposing columns in this discussion.

MACHINERY AND SPECIALIZATION.

"Labor asks for shorter hours not on account of a mere whim, nor because the call makes a popular slogan, but because the conditions of employment have been changed so much in recent years that workers feel justly entitled to a shortening of the day. They contend that the introduction of machinery has in a large degree replaced the exercise of the muscles, by the use of the eye and the mind. This causes more strain on the system. They contend further that specialization of labor has taken away the restful variety and change of occupation which formerly diversified the day's employment, and has substituted a regular monotony of daily labor which is much more tiring. For, whilst a workman might contribute his maximum efficiency in working ten to twelve hours per day when strictly physical and variegated effort was required, the greater strain of the present so-called 'improved' condition of labor may now bring about the necessity for a reduction of hours in order to preserve the same degree of efficiency. Of course, different trades and occupations vary considerably in the degree of wear and tear on the workman; some classes of work are comparatively easy and simple, while others are more complex and difficult; so that while an eight-hour day may be proper and economically successful in some, a nine or ten-hour day would be just as natural and not unreasonable in others.

"There is another consideration with prompts the demand on the part of labor for a shorter workday: it is the greater desire for self-improvement. This has been encouraged by the advance in the public school system which affects our younger workmen in particular; also by the multiplication of popular free lectures, public libraries, cheap books and newspapers, etc., that have awakened in the workmen's minds the ambition to lead a better life, possible only in the enjoyment of a reasonable amount of leisure.

"It has frequently been charged by employers that a reduction in hours of labor would mean a corresponding increase in saloon patronage. Is this so? Is it a reason, or an excuse for keeping up the grind? Human nature is very much the same whether a man is clothed in Kentucky jeans or in fine linen. When do you, Mr. Employer, feel the need of a stimulant? When you are fresh and rested, or when you are tired and exhausted? Why should you, then, conclude that your workman is differently constituted? Try him—give him shorter hours if you possibly can, a Saturday, half-holiday if trade conditions permit, and you will find that in most cases he will join his wife and chil-

dren in reasonable healthful recreations. He will take advantage of one of Nature's greatest blessings, the bright warm sunshine, and will from time to time enjoy benefits that will tend to make him a better man, a more useful citizen and a more intelligent worker.

RESTRICTION OF OUTPUT.

"If workmen expect employers to be influenced by the arguments already set forth in favor of a shorter work day, they in turn must give earnest assurance that existing restrictions of output will be withdrawn, with due regard, of course, to the protection of health and maintenance of the quality of labor; that they will do their very best work during the desired shorter hours of employment. I have heard that there are three sorts of day's work. One is a day's work, another, a good day's work, and a third, the best one can do in a day. It is the last that should be forthcoming, and then it may be found that, while the worker has gained, the employer has not lost. For it stands to reason that the quality of the stroke will be better, more energetic and forceful, when the pull is a shorter one. Also, the spirit put into the task when the worker feels that he is being liberally treated and not being made a slave of, should count favorably in the net result of his effort. When machinery is used it will be found that when the man who attends to it has shorter hours, there will be fewer repairs required, fewer stoppages, fewer accidents and in other ways many economic advantages.

"When we discuss the question of restriction of output by union regulation, we touch a rather tender spot. The existence of schedules defining and limiting the amount of work a man may do in a day is usually denied by the unions; and it is a fact that such restrictions have latterly not been countenanced by na-

manufacture. Then the effect of a reduction in output, necessitating the employment of more men to do the same amount of work, frightens the manufacturer. He fears that he will have to build a larger factory to accommodate more help in order to turn out the same product. This would mean more rent, more machinery, more supervision, more wear and tear, more expense generally. These objections may be overcome, if all manufacturers in a trade agree on a basis of hours that will be uniform, and therefore work injury

Government contract under an eight-hour work day. We are waiting for the results, and we organized workmen have no fear of these results. The figures up to the present time show that the men with the shorter day and higher pay are producing a cheaper job for the Government than the Government is getting by contract under a low wage system. The actual figures for that work can be had through the Department of Labor at Washington, to prove what I say."

Louis D. Brandeis on the Need of Leisure.

In the course of his remarks on the subject, Louis D. Brandeis said:

"Whether in a particular business at a particular time the hours of labor should be materially shortened presents usually a grave question. Such a change, owing to competition direct or indirect, may seriously threaten the prosperity or even the life of the business; or the demand for the reduction of hours may be coupled with other terms or conditions clearly inadmissible. In such cases strenuous resistance becomes the duty of the employer. But however commendable the resistance of the employer to a reduction of hours may be in a particular case, we should all recognize that a short working day is in general essential to the attainment of American economic, social and political ideals, and our efforts should be directed to that end.

"Mr. Gompers quoted some time ago the saying of Heine that 'bread is freedom.' The ancient Greeks, recognizing that 'man cannot live by bread alone,' declared that 'leisure is freedom.' Undoubtedly 'a full dinner pail' is a great achievement as compared with an empty one, but no people ever did or ever can attain a worthy civilization by the satisfaction merely of material needs, however high these needs are raised. The American standard of living demands not only a high

LOUIS D. BRANDEIS.
Chairman of the Conciliation Committee, New England
Civic Federation.

to none. It is, however, quite true that in many lines of manufacture, foreign competition must also be carefully taken into account."

James Duncan.

James Duncan, of Quincy, General Secretary of the Granite Cutters' International Union, said:

"You may take any locality in this or any other country where the hours of labor have changed from ten to nine or nine to eight, and I say that temperance has increased in accordance with that reduction. I had the honor to speak in a meeting in Georgia a short time ago, where the mayor of the town was the presiding officer, and he told me when he first became a municipal officer a great part of the revenue of the town came from fines for drunkenness and disorderly conduct of the working people of the vicinity. The granite industry, with which I am proud to be connected, became busy in that locality, and we began the agitation for the shorter work day. The mayor told me that after we had introduced the eight-hour day—and we

MARCUS M. MARKS.
President of the National Association of Clothing Manufacturers.

tional labor leaders. But the stubborn fact remains that shop regulations frequently do establish them with or without national authorization, and the result is very bad indeed. Many workmen still feel that by 'going slow' the job will last longer and give steadier employment. They forget that they are thus handicapping the employer, and that soon, if they continue the evil practice, he will be unable to give them a job at all, for the competition of other manufacturers, whose men are turning out a full day's product, will slowly but surely drive him out of business. Whatever injures employers soon comes to injure employes as well. Unrestricted production, inventive genius and executive talent have brought Americans to the front rank in the world's industries. If the English 'ca' canny' policy creeps in, there will be danger of our dropping out of our proud place of leadership. In the last message of President Roosevelt, under the heading of 'Labor,' we find the sentiment: 'Unless we continue to keep a quick and lively sense of the great fundamental truth that our concern is with the individual worth of the individual man, this Government cannot permanently hold the place which it has achieved among the nations.'

"Arbitrary restriction of output injures not only the employer, not only the commerce of the country, but, worst of all, it degrades the workman. When a wage-earner does not deliver a full day's work for a full day's pay, he is dishonest to himself as well as to his employer; he loses his self-respect, the safeguard of his manhood. He further fails to develop the best that is in him; his latent energies are not encouraged and die out; and he becomes in time a weary, hopeless plodder.

"There are many considerations in the employer's mind in dealing with the shorter hour question. First and foremost, on account of keen competition, he can not ignore the effect of the possible increase in cost of

HENRY ABRAHAMS.
Recording Secretary, New England Civic Federation.

were successful, and other trades working nine hours were afterwards reduced to eight—disorderly conduct and intemperance became so little known in the community that the town had to look for taxation in other directions than the saloons in order to meet its necessary expenses.

"The labor movement has proved its position by experience. Take, for instance, the competition that is going on in the building of the two great warships now under construction, one being built by contract under a long-hour work day, and the other being built by

HAYES ROBBINS.
Secretary of the New England Civic Federation.

minimum wage, but a high minimum of leisure, because we must meet also needs other than material ones.

"The welfare of our country demands that leisure be provided for. This is not a plea for indolence. Leisure does not imply idleness. The provision for leisure does not contemplate working less hard. It means ability to work not less, but more; ability to work at something besides bread-winning, ability to work harder while working at bread-winning; and ability to work more years at bread-winning. We need leisure, among other reasons, because with us every man is of the ruling class. Our education and condition of life must be such as become a ruler. Our great beneficent experiment in democracy must fail unless the people, our rulers, are developed in character and intelligence.

"Now consider what, particularly in our large cities, the chance for such development is for men and women who are required regularly to work ten or even nine hours a day. Even a nine-hour work day means, including the noon hour, ten hours at the factory or work shop. That means in Boston for most of those who live in the suburbs eleven or twelve hours devoted to the work shop and getting to and from it. When you add the time necessarily spent at breakfast and supper, dressing and undressing, housework, shopping and sleep, you find that at least twenty-one of the twenty-four hours are devoted to subsistence, and a small fraction of the day is left for living, even if after the long day one is in a condition mentally and physically really to live.

"To attain proper development of character, mind and body a short working day is essential, and the eight-hour day is in most occupations and for most people not too short. For the exceptional occupation and for the exceptional man in any occupation, no general rule is required, and right thinking on this subject cannot

THE NATIONAL IMMIGRATION CONFERENCE.

The National Conference on Immigration, which assembled in New York on December 6—a synopsis of whose proceedings appears elsewhere in this issue—was a remarkable gathering from several points of view. It was the first of its kind ever called in this country; and that the importance and magnitude of the problem to be discussed by its members was fully appreciated is shown by the fact that more than five hundred delegates attended the opening session. These included representatives of every considerable section of the United States proper, and, in one case, of this country's insular possessions. That so many bankers, merchants, professional men, labor leaders and legislators should leave their callings to take part in this conference argued an intensity of interest which insured a discussion worth listening to. All shades of opinion were represented, from that of the capitalist who desired cheap foreign labor to that of the trade unionist who feared alien competition in wages; from that of the humanitarian who would welcome every strong and willing worker, however poor, to that of the reformer who would raise a higher barrier against the penniless alien. All these and many other views were presented with great fullness and frankness from the floor and platform, the widest opportunity for argument being afforded; so that the resolutions voicing the sentiments of the Conference were finally adopted with practical unanimity.

Apart from the formal results obtained in the framing of these recommendations to Congress, the educational effect of the Conference cannot fail to be of permanent value. The delegates who returned to their homes with a wider outlook upon the subject of immigration will influence their communities in the sane discussion of it; and the Department of Immigration of The National Civic Federation, one of the consequences—and not the least important—of the Conference, will, by its systematic investigation of the questions raised there, furnish a basis for intelligent and practical action upon some of the most perplexing phases of the immigration problem.

GOOD WORDS FOR UNIONS FROM THE "SUN."

Two bits of recent strike history are significant of a growing spirit of fair play in industrial differences. Under the caption of "A Model Strike" the New York *Sun* of January 13, commenting upon the action of the union printers in their contest with the Typothetae, said:

So far in its history the strike of union printers against the book and job offices in New York City has differed in one important particular from many previous contests of a similar nature, in that it has been free from violence and outrage. The union men, exercising their undoubted right to quit work, walked out of their employers' shops over a week ago. Since then the employers have borne public testimony to the good order observed by their former workmen and the absence from their campaign of violations of the law.

Too often a strike means bludgeonings, sandbaggings, attempts at arson, the distribution of explosives and similar terrifying tactics. The printers' struggle of 1906 sees the adoption of no such measures, in its early stages at least, and witnesses the use of proper arguments, offers of better treatment and the like, to induce support and win recruits. This policy indicates an understanding among the strike leaders of the public opinion that demands from all, employer and employee alike, strict observance of legal methods in the adjustment of their disputes.

Perhaps it may mean the beginning of a period in which the sober, honest, law-abiding men among the unionists of all trades are to have their way, and the passing of that class of violent agitators who regarded themselves as licensed dictators, the defiance of whose commands justified retaliation by fire and sword.

From the Middle West comes the report of a decision as to the responsibility of a labor union as an organization for the unlawful acts of a minority of its members. The Supreme Court of the State of Indiana has denied an injunction applied for by the Karges Furniture Company, to restrain the Amalgamated Woodworkers' Local Union No. 131 from "picketing, intimidating and otherwise interfering with the plaintiffs' employees." It appears that the Woodworkers' Union of Evansville, numbering about six hundred members, declared a strike for higher wages and shorter hours,

and voted to establish an orderly system of picketing the furniture factories, according to a definitely formulated policy.

It was shown by the testimony that fourteen members of the union, despite instructions to the contrary, assaulted the non-union workers and by threats and violence succeeded in closing the plaintiff's factory.

In passing upon the application for an injunction, the Indiana courts, from the lowest to the highest, held that such a prohibition would lie against the actual aggressors only, and not against the union, which had officially discountenanced coercion. Judge Hadley's opinion contains the following passages of practical comment:

The strike being properly conceived and conducted by the great majority of members, its purposes will not be defeated by the unlawful conduct of a few rowdies and lawbreakers that may be found among them. "Where a combination or association is innocent in its inception," says a recent author, "but is afterward perverted to unlawful ends, only those participating in the conversion are held to be conspirators. . . . Under no circumstances have pickets the right to employ force, menaces of intimidation of any kind in their efforts to induce non-striking workmen to quit, or to induce those about to take the strikers' places to refrain from doing so; neither have they the right as pickets or otherwise to assemble about the working place in such numbers or in such manner as to impress workmen employed, or contemplating employment, with fear and intimidation."

It is, however, generally conceded in this country and in England that workmen when free from contract obligations may not only themselves, singly and in combination, cease to work for any employer, but may also, as a means of accomplishing a legitimate purpose, use all lawful and peaceful means to induce others to quit or refuse employment.

This embraces the right to support their contest by argument, persuasion, and such favors and accommodations as they have within their control. . . . So, in a contest between capital and labor, on the one hand, to secure higher wages, and on the other to resist it, argument and persuasion to win support and co-operation from others are proper to either side, provided they are of a character to leave the persons solicited feeling at liberty to comply or not, as they please.

"Surely," says the *Sun*, from whose editorial columns we quote the foregoing, "no partisan of either side, no matter how violent, can fail to see the fairness of these statements of the court or can find fault with the justice of the decision." And such decisions, in conjunction with the repudiation by the unions of all tactics smacking of violence—and their summary punishment of offenders against a declared policy of fairness—will go far toward the removal of prejudice against unionism on the part of employers as well as the general public.

THE CHURCH AND ORGANIZED LABOR.

In admitting the Rev. Dr. John B. Devins and the Rev. Milton Smith Littlefield as "fraternal delegates" to its meetings, the New York Central Federated Union has taken a step in the direction of a better understanding between the church and organized labor. "Fraternal delegates" have no vote, but are accorded the privileges of the floor when they desire to offer suggestions in the debates of the active members of the organization. In return for the courtesies extended to its ministers in this and other cities, the Presbyterian Church invites labor representatives to the Ministers' Association and presbytery meetings. A week before the admission of these two Presbyterian clergymen to the New York Central Federated Union, the Rev. Dr. J. Howard Melish, rector of Holy Trinity Protestant Episcopal Church, and the Rev. Warren H. Wilson, pastor of the Arlington Avenue Presbyterian Church, were present as fraternal delegates at the meeting of the Brooklyn Central Labor Union.

Three of the great religious denominations are active in endeavors to promote closer relations between the church and organized labor. The general movement of which the appointment of fraternal delegates is the latest manifestation is carried on by the Department of Church and Labor of the Presbyterian Church, whose plans for the study of the labor problem have the official endorsement of the American Federation of Labor. These plans were devised, and for the last three years have been successfully executed in a number of cities by the Rev. Charles Stelzle, the special representative of the church in the interest of workingmen. The

THE PUBLIC OWNERSHIP COMMISSION.

IT ENTERS UPON ITS INVESTIGATION OF THE RELATIVE MERITS OF MUNICIPAL AND PRIVATE OPERATION OF PUBLIC UTILITIES.

THE Public Ownership Commission of the National Civic Federation is steadily proceeding in the work of investigating the relative merits of municipal and private operation of public utilities. Unusual interest has been manifested in the work of this Commission, and it is surprising to see with what willingness persons occupying important positions have given of their time and labor without compensation.

The sub-committee in charge of the investigation has laid out a broad and thorough plan involving the investigation of a considerable number of public and private water, gas, electric lighting and street railway plants in various parts of the United States. Expert accountants are to be employed to investigate the financial records of these systems; well-known engineers of recognized standing will handle the engineering aspects of the investigation; and trained investigators will report upon the history of the plant, the franchises granted, the methods of public regulation and supervision and the political and sociological results of each system of operation. When these reports have been completed to the satisfaction of the committee, they will be collated and analyzed for the preparation of the final report. Indeed, it is planned not to omit a single subject of importance in this investigation, and both municipalities and private corporations have expressed a willingness to aid the investigation in every possible way.

The plan adopted in the United States will be applied to Europe, certain of the expert investigators being taken from the United States because of their familiarity with conditions here and other investigators from Europe because of their better acquaintance with the local conditions to be studied there. The reports made to the various Government departments will be thoroughly examined and tested. If found to be accurate for the purposes of the investigation, they will be utilized; if inaccurate or incomplete, they will be omitted and their inaccuracies pointed out. In this way the ground will be thoroughly covered and a more complete, exhaustive and valuable report prepared than has ever been attempted.

The work in the United States has already been begun, and by the middle of February accountants, engineers and statisticians will probably be put to work upon a number of plans. It is hoped that the work in

Europe will be also under way by that time, so that all reports may be presented simultaneously. No date has yet been fixed at which the final report will be published, the unanimous opinion being that the work should be thoroughly done as soon as possible, but that thoroughness should not be sacrificed to haste.

At a meeting held in this city January 10 the report of the sub-committee in charge of the investigation was presented and fully discussed. The meeting was attended by members of the Commission from Boston, Chicago, Cincinnati, Philadelphia, Cleveland, Detroit and several other places who came to New York especially for this purpose. This fact alone shows how widespread is the interest not only in the general question of municipal ownership, but also in the investigation which The National Civic Federation is conducting.

For the purpose of obtaining all the essential facts, three sets of elaborate schedules for each industry have been prepared. One set, relating to the financial aspects of the industries, is to be placed in the hands of accountants. A second set, relating to the engineering questions which are factors in the investigation, will be placed in the hands of engineers. A third set, dealing with the development of the industries, franchise conditions, methods of management, political relations and labor conditions, will be entrusted to statisticians of recognized ability. The persons in whose hands these schedules are placed will be expected to fill them out for each plant investigated.

The schedules for each industry are most complete, and they embody every possible bit of information of use to the Commission. It is impossible to reproduce them here, because of their great length, but a résumé will suffice to show their scope and character. The most important points covered are the following:

History of the plant with special reference to any changes from private to municipal ownership, or *vice versa*.

Local opinion and attitude toward management.

Duration, extent and results of competition.

Public supervision of municipalities.

Methods of taxation.

Systems of granting franchises to private companies.

Franchise restrictions.

Methods and extent of compensation for franchise grants.

Means of enforcing provisions; their success or failure.

Organization of department or company.

Character of officers and employees.

Methods of selecting and discharging employees.

Effect of political considerations.

Efficiency of workmen.

Wages and salaries paid.

Political influence of employees.

Political corruption.

Extent and conditions of free services.

Hours and conditions of labor.

Rules regarding sick leave.

Pensions and profit sharing.

Character of service rendered.

Price of service to private consumer and the city.

Efficiency of the plant and its present value.

Extent of use of service.

Economy of management.

Progressiveness of the industry.

Rapidity with which new inventions are adopted.

Powers of the city relative to acquisition, construction and operation of plant.

Provisions limiting city's power relative to the operation and management of the plant.

Supervision of private corporations.

Methods of incorporating companies and limitations imposed in original charters.

Statutory provisions regarding financial matters, equipment of plant, price and character of service.

Public inspection.

Cost of service.

Treatment of depreciation.

Disposal of profits or payment of deficits.

After these schedules have been filled out and returned to the committee, the results will be tabulated and analyzed. The public records will be examined and all available data used for the preparation of the final report, which will contain all of the special reports prepared under the direction of the Commission, a readable summary of these reports and the conclusions of the Commission. The report in its entirety will be of great value to students of the subject; for no such thorough and comprehensive investigation has ever been undertaken by any Government or organization, either in the United States or abroad.

Protestant Episcopal Church has for four years maintained a standing commission on the Relations of Labor and Capital, one of whose purposes is mediation between workmen and employers; or, to quote the words of the commission, in one of its reports: "The church helps to remove the moral causes of industrial strife when she brings these different members of her family into better acquaintance." The Church Association for the Advancement of the Interests of Labor, which is recognized by the Protestant Episcopal Triennial Convention, has a long history of helpful effort in promoting conciliation movements, the recognition of organized labor and general industrial betterment. Miss Harriette Keyser, its secretary, has been cordially received at meetings of labor organizations, though the society does not seek regular representation at such gatherings. The Industrial Committee of the National Council of Congregational Churches, of which Dr. Frank W. Merrick is chairman, makes inquiries into the industrial situation through its own members, besides urging upon the State organizations of the church the appointment of similar committees and their affiliation with kindred agencies in other denominations and with non-ecclesiastical bodies that work for industrial betterment.

Great mutual benefit should be derived from this freer interchange of opinions between the church and organized labor. Many ministers of the Gospel know far too little of the point of view of the workingmen among their parishioners, and it cannot be denied that among certain classes of laboring men the influence of the church is nil, even if actual enmity to religious teachings does not exist. When the clergy understand the facts in the relations between employers and workmen, and workingmen see their clerical friends standing beside them in loyal co-operation for the betterment of social conditions, many problems which now vex society, while they may not disappear, will be found easier of solution.

THE DEPARTMENT OF CONCILIATION AND ARBITRATION.

The Executive Council of The National Civic Federation, at its December meeting, elected the Hon. Seth Low as chairman of the Department of Conciliation and Arbitration. Mr. Low's name is almost synonymous with the words "conciliation and arbitration." He was a delegate to the Peace Conference at The Hague, and in addition to having been an arbitrator in a great many cases of industrial disputes, has been connected with all the important movements relating to such work. The full committee is as follows:

Seth Low, Chairman.

Representing the public:

Andrew Carnegie, capitalist, New York City;
Cornelius N. Bliss, ex-Secretary of the Interior, New York City;
Isaac N. Seligman, J. & W. Seligman & Co., New York City;
Louis D. Brandeis, attorney-at-law, Boston, Mass.;
Frederick N. Judson, attorney-at-law, St. Louis, Mo.;
Benjamin Ide Wheeler, President, University of California, Berkeley, California;
V. Everit Macy, capitalist, New York City;
Dr. Albert Shaw, editor, "The Review of Reviews," New York City.

Employers:

Lucius Tuttle, President, Boston & Maine Railroad Company, Boston;
Frederick D. Underwood, President, Erie Railroad Company, New York City;
Clarence H. Mackay, President, Postal Telegraph and Cable Company, New York City;
Frederick P. Fish, President, American Telegraph and Telephone Company, Boston;
Samuel Mather, of Pickands, Mather & Co., Cleveland, Ohio;
Franklin MacVeagh, of Franklin MacVeagh & Co., Chicago;
Charles A. Moore, of Manning, Maxwell & Moore, New York City;
Francis L. Robbins, President, Pittsburgh Coal Company, Pittsburgh, Pa.;
Otto M. Elditz, Chairman, Board of Governors, Building Trades Employers' Association, New York City;
Marcus M. Marks, President, National Association of Clothing Manufacturers, New York City.

Representing the wage-earners:

Samuel Gompers, President, American Federation of Labor, Washington, D. C.;
John Mitchell, President, United Mine Workers of America, Indianapolis, Ind.;
James Duncan, General Secretary, Granite Cutters' International Association of America, Quincy, Mass.

Daniel J. Keefe, President, International Longshoremen, Marine and Transport Workers' Association, Detroit, Mich.;

William D. Mahon, President, Amalgamated Association of Street Railway Employees of America, Detroit, Mich.;

Warren S. Stone, Grand Chief, International Brotherhood of Locomotive Engineers, Cleveland, Ohio;

E. B. Clark, Grand Chief, Order of Railway Conductors, Cedar Rapids, Iowa;

J. J. Hannahan, Grand Master, Brotherhood of Locomotive Firemen, Peoria, Ill.;

P. H. Morrissey, Grand Master, Brotherhood of Railway Trainmen, Cleveland, Ohio;

John F. Tohn, General President, Boot and Shoe Workers' Union, Boston, Mass.

This committee will have to do with industrial disturbances exclusively. It will meet in March for the purpose of outlining a plan of procedure. At that meeting it will consider the advisability of adopting the methods of the British Board of Trade in organizing local commissions in all important industrial centers, and will also consider how best to co-operate with the various State boards of arbitration.

NEW YORK CIVIC FEDERATION MEETING.

The annual meeting of the Civic Federation of New York will be held Wednesday evening, February 14, 1906, at the Park Avenue Hotel. The subject for discussion will be "Welfare Work."

Leading New York employers will describe what has been done to better the conditions of employees in several important industries.

The necessity of making such provision for the physical comfort of employees as ventilation for stationary firemen and metal polishers, baths for moulders, sanitary dressing rooms for theatrical employees, the factory lunch room, and emergency hospitals for structural iron workers, as well as the requirements of employees in bakeries, the clothing and other trades, will be presented by leaders of employees' organizations.

"How New York City Cares for its Institutional Employees" and "The Need of Better Accommodations in the Station Houses for Policemen" will be presented by former city officials.

Stereopticon views, illustrating what has been done throughout the country by practical, successful business men in providing for the comfort of employees in the work rooms, for recreation, for educational opportunities, and in the housing of labor, will be shown.

WELFARE DEPARTMENT OF The National Civic Federation

OFFICERS

H. H. VREELAND, Chairman.
CYRUS H. McCORMICK, First Vice-Chairman.
JOHN H. PATTERSON, Second Vice-Chairman.
EDWARD A. FILENE, Third Vice-Chairman.
CORNELIUS N. BLISS, Treasurer.

EXECUTIVE COMMITTEE

George W. Brown, Treasurer United Shoe Machinery Company, Boston, Mass.
W. A. Clark, President United Verde Copper Company, Butte, Montana.
Frederic S. Clark, Treasurer Talbot Mills, North Billerica, Mass.
Ralph M. Easley, Chairman Executive Council National Civic Federation, New York City.
Charles L. Edgar, President The Edison Electric Illuminating Co., Boston, Mass.
G. E. Emmons, Manager Schenectady Works General Electric Co., Schenectady, N. Y.
Edward A. Filene, Treasurer Wm. Filene's Sons Co., Boston, Mass.
Frederick P. Fish, President American Telephone and Telegraph Co., Boston, Mass.
Frederick S. Fish, Chairman Executive Committee, Studebaker Bros. Mfg. Co., South Bend, Ind.
W. C. Fish, Manager Lynn Works General Electric Co., West Lynn, Mass.
G. Watson French, President Bettendorf Metal Wheel Co., Davenport, Iowa.
Orrin S. Goan, Manager National Biscuit Co., New York City.
William C. Greene, Treasurer Peace Dale Manufacturing Company, Peace Dale, R. I.
B. J. Greenhut, Treasurer Siegel-Cooper Co., New York City.
F. R. Hazard, President The Solvay Process Co., Syracuse, New York.
H. J. Heinz, President H. J. Heinz Co., Pittsburgh, Pa.
Edwin M. Herr, First Vice-President Westinghouse Electric and Manufacturing Co. and Westinghouse Air Brake Co., Pittsburgh, Pa.
Charles W. Hubbard, Treasurer Ludlow Manufacturing Associates, Boston, Mass.
Charles H. Hulburd, President Elgin National Watch Co., Chicago, Ill.
John S. Huyler, President Huyler's, New York City.
M. E. Ingalls, Chairman Executive Board C., C. & St. L. Railway Co., Cincinnati, Ohio.
G. Gunby Jordan, President Eagle and Phenix Mills, Columbus, Ga.
John F. P. Lawton, Assistant Treasurer and Secretary Gorham Mfg. Co., of Rhode Island, Providence, R. I.
William W. Lohdell, President Lohdell Car Wheel Company, Wilmington, Del.
Arthur T. Lyman, Treasurer The Boston Manufacturing Co., Boston, Mass.
W. G. Mather, President Cleveland Cliffs Iron Co., Cleveland, Ohio.
Cyrus H. McCormick, President International Harvester Co., Chicago, Ill.
L. A. Osborne, Vice-President Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.
Thomas F. Parker, President Monaghan Mills, Greenville, S. C.
John H. Patterson, President National Cash Register Co., Dayton, Ohio.
Thomas G. Plant, President Thomas G. Plant Company, Boston, Mass.
Albert L. Pope, Vice-President Pope Manufacturing Company, Hartford, Conn.
Francis L. Robbins, President Pittsburgh Coal Company, Pittsburgh, Pa.
H. A. Sherwin, President Sherwin-Williams Company, Cleveland, Ohio.
Theodore P. Shonts, Chairman Isthmian Canal Commission, Washington, D. C.
Ellison A. Smyth, President Pelzer Manufacturing Company, Pelzer, S. C.
Nathan Straus, R. H. Macy & Co., New York City.
H. H. Vreeland, President New York City Railway Co., New York City.
J. H. Williams, Vice-President J. H. Williams & Co., Brooklyn, N. Y.
Rufus K. Wood, Maryland Steel Co., Sparrows Point, Md.
Miss Gertrude Beeks, Secretary.
W. E. C. Nazro, Consulting Expert.

A SUCCESSFUL APPRENTICE SCHOOL.

The Theoretical and Practical Training of Boys in the West Lynn General Electric Shops.

The following address by M. W. Alexander, Engineer of the General Electric Company of West Lynn, Mass., was delivered before a conference of welfare managers and special welfare workers held at Atlantic City under the auspices of the Welfare Department of The National Civic Federation:

"The Thomson-Houston Electric Company at West Lynn, Mass.—a part of the General Electric Company—organized in February, 1902, an apprenticeship system, under which boys of at least sixteen years of age who have had a grammar school education and are desirous of learning a trade, are indentured as apprentices. The period of apprenticeship lasts four years, during which time the boys are taught the mysteries and arts of the different trades which are practiced at our factory.

"Our aim is not only to make of these boys efficient machinists and tool-makers, pattern-makers and carpenters, iron, steel and brass moulders, instrument makers and electrical workers, but to develop a class of artisans from whom we can choose men for our leading positions in the factory, for assistant foremen, foremen and master mechanics. To hold such positions requires

not only a knowledge of all the operations that have to be performed by hand or machine, but also a knowledge of the scientific principles that underlie the work, and of the ways and means of conducting the work in a businesslike manner.

"With this aim in view, we recognized the necessity of educational development of the boys and incorporated right from the beginning in our apprenticeship system a school especially fitted for the needs of our apprentices. The lack of proper educational opportunities in the evening in the city of Lynn, such as, for instance, the city of Philadelphia offers in the Spring Garden Institute, was one reason which prompted our company to start its own school. The other reason was the desire to give to the boys eminently practical knowledge of the very kind which they will need later on as journeymen and foremen. We therefore selected our own engineers, draughtsmen and shop foremen as teachers. These men know the needs of our factory and can impart to the boys the specific knowledge which they require in our own factory and, in a general way, in any manufacturing establishment of a similar character.

M. W. ALEXANDER.

Engineer of the General Electric Company of West Lynn, Mass.

The contact during school hours with the same men who direct them during working hours in the factory has a tendency to maintain better discipline among the apprentices, because school does not then appear to them as a separate institution, but as only one part of our apprentice work.

"The school first met in the evening, when the factory closed; the boys assembled in the school rooms, partook of a light lunch furnished free of charge by the company and received instruction for about two hours. It soon became apparent that after a day's work the boys were too tired to reap the full benefit of the school instruction, and the evening school was therefore changed to a morning school. The blowing of the factory whistle in the morning is now the signal for the commencement of the school. The boys come to the school room physically and mentally rested. Formerly we had difficulty in keeping the apprentices in the school; now we rather experience difficulty in getting them out of the school room into the shop. The improvement in the results has been marked.

"Each boy receives three years of instruction. He enters school after he has been an apprentice for about six months and he graduates from the school several months before he graduates from his apprenticeship. Each school year consists of forty weeks with two sessions of two and one-half hours each per week. The comparatively small amount of time devoted to instruction does not permit us to go very deeply into the various subjects which we teach. In fact, a large part of the teaching is merely a review of some of the grammar school work, but applied to practical factory conditions. Experience has prompted us to devote a good share of the time to this review and to carry it back to the elementary stage of the subjects which we desire to review. The rest of the time at our disposal is devoted to subjects which either have not been taught in the grammar school at all or have been touched upon only in a general way.

"The question will arise: Why should we, who have had no pedagogical training, attempt to review what has already been taught in the public schools by pedagogically trained teachers? With all due respect to our public schools, excellent as they are in the main—and nobody has a higher regard than I for a teacher and his efforts—I find from my years of experience that the public schools fail to teach the boy to think for himself and to think clearly and logically. The school has taught the boy a great amount of knowledge and has committed to his memory many formulas, but when it comes to the application of this knowledge and of

these formulas to practical uses, many a boy finds himself blocked, because he has not acquired the faculty of independent thinking. Our review, then, aims to instil in the boy the habit of independent thinking.

"Those of you who are closely connected with the management of an establishment will have experienced the difficulty of finding men who can occupy positions of responsibility as foremen. The head as well as the hand must constitute the foreman's equipment. Our industries require of the men who want to rise above the rank and file this very faculty of clear and logical thinking which we find so often lacking in otherwise excellent artisans. I venture to make this criticism of the public schools, because in it I only give you the benefit of my experience. It does not apply to the schools of any particular locality. Our boys come from all parts of the State of Massachusetts and neighboring States, and we have one or more representatives from almost every State in the Union; my previous activity in the Middle West has shown me that about the same conditions exist there.

THEORETICAL INSTRUCTION.

"There is, however, another aim in our review of grammar school subjects, namely, to give the boy additional knowledge by giving him an insight into technology. To make my point clearer I shall take the liberty to outline briefly the course of study.

"During the first year we teach English and mathematics, devoting one-third of the time to the former and two-thirds to the latter. In English, the spelling of technical terms is first taken up and then followed by short dictations explaining technical processes, describing materials and their properties and various kinds of apparatus. The boy, therefore, becomes acquainted in a general way with all our practical work.

"Mathematics is the second subject which we review during the first year. We start with simple processes of addition, subtraction, multiplication and division, first of whole numbers and then of decimal and common fractions, finishing the year with proportion and percentage calculations. Alternating with arithmetic, we review mensuration.

"Only concrete examples are given by the teachers, who as stated before, must aim to lead the boy on to independent thinking and to make him acquainted with the very technical arithmetic which he may have to use as a shop foreman. It is only a test of the boy's memory if you ask him to solve '3 x 420 x 12,' but it is an entirely different test if you put the same problem in the following manner: 'A factory consists of three rooms; each room is lighted with twelve arc lamps, each of which requires 420 watts of energy. How much horsepower of energy will have to be provided for the lighting of the whole factory if 746 watts equal one horsepower?' In stating such a problem, we explain in the very briefest manner the meaning of 'watt' as a unit of measurement of energy, and we also explain briefly the nature of an arc lamp, showing the outside appearance of the same and the inside mechanism. In fact, whenever a teacher speaks of a piece of apparatus or a part thereof, I insist upon having such apparatus or part shown to the boys, if this is at all possible. The boys will associate the picture with the name of the apparatus and will therefore retain the name better in their memory. I do not expect that the boy will learn fully the meaning of a watt of energy, or a volt of pressure, or an ampere of current, or for that matter, the operation of an arc lamp, the characteristics of an incandescent lamp, or the principles that govern the running of a motor. The terms 'watt,' 'volt' and 'ampere,' 'arc lamp,' 'incandescent lamp' and 'motor' will become, however, familiar to him by frequent usage, and when, later on in the teaching of physics and magnetism and electricity, these same terms are brought before him again, they will appear to him as old acquaintances and will therefore make their study so much easier to him.

"I desire to give one more illustration, taking this time mensuration as my subject. A problem may be commonly stated as follows: What is the weight of a steel rod one-half inch in diameter and fifty inches long? We state the problem in a different manner: 'The machine shop is ordered to produce seventy-five steel pins, each to be one-half inch in diameter and three-quarters of an inch long. These pins are to be cut from a long steel rod and the tool for cutting off the pins will waste one-sixteenth of an inch of material between each two pins. How long a steel rod will be required, and what will be the weight of the same?' This is a problem which we meet in everyday factory life and which involves nothing else than plain multiplication and addition. It is simply a question of multiplying 75, the number of pins, by $\frac{3}{4}$ inch, the length of each pin, and adding to it 74 x $\frac{1}{16}$ inch, which we have wasted by the cutting-off tool. The whole will give the length of steel rod required. Now this length is multiplied by the area of a half-inch circle to obtain the cubical contents, which, when multiplied by the specific gravity of steel (a figure which we give to the boy) will give the total weight.

"During the first part of the second year, two-thirds of the time is devoted to square and cube roots applied to practical problems and to calculations of weights of different materials and machines. The remaining one-third is devoted to English.

"We teach the boy to write 'shop notes,' by which

I mean that we teach him to express himself in a very brief and clear manner and without flourish and frills. To illustrate: if a boy should be unable to finish a piece of work because his machine is worn out and, therefore, cannot be run at the proper speed, I expect him to notify the superintendent of this fact immediately—nothing else than what we would expect of any proper shop foreman. His note should, perhaps, be as follows:

I. F. Baker, Supt.:

I shall be unable to finish the 20 motor shafts by next Friday as promised, because my lathe is in very poor condition and cannot, therefore, be run at the proper speed. I expect to finish the shafts by Monday of next week.

(Signed) N. M. SMITH.

"It is not necessary for the boy to start the letter with 'Dear Sir.' The superintendent knows how 'dear' he is to the right boy without being reminded of it. It is a waste of time for the boy to write and for the superintendent to read a letter like the following:

I. F. Baker, Supt.:

I am extremely sorry to report that I shall not be able to fulfil the promise which I made you a few days ago in regard to the twenty motor shafts which I expected to finish by Friday of this week. The lathe on which I am turning these shafts is in very poor condition. I cannot, under the circumstances, turn out as fast work as I could if my machine could be run at a higher speed. I shall endeavor to finish these shafts by Monday of next week and hope that this delay will not cause you any inconvenience.

I remain, yours very truly,

(Signed) N. M. SMITH.

"Many a good shop foreman impairs his usefulness in a position of responsibility because he cannot write a correct and concise letter.

"During the second part of the second year, English has been dropped entirely, and mathematics is only pursued on alternate mornings; the other mornings are taken up with physics with particular reference to mechanics.

"During the third year, one morning per week is devoted to mechanical draughting, the other mornings to mechanics and mechanism, magnetism and electricity. Again we pursue the policy of speaking in concrete terms and illustrating these terms by the objects of which we speak. Our whole factory is utilized as a laboratory which not only aids in the proper understanding of the subject matter, but also arouses and keeps awake the interest of the boys. Mechanical drawing does not aim at the designing of machinery, but rather at the designing of the tools which journeymen need in the process of manufacturing machinery. We give, for instance, to the apprentice the cover of an arc lamp which has nine holes of different sizes and ask him to sketch a jig or holder by means of which these different holes can be drilled by a machine accurately and quickly without the necessity of laying out each hole separately.

"The last few weeks of the third year are devoted to lectures on factory organization and factory systems. A boy too often acquires the idea, which sticks to him even after he has become a journeyman, that a foreman is after all nothing but a slave driver, whose chief duty is to obtain from the man the last ounce of work. We endeavor to show to the boy that the foreman is only one link, though an important one, in the big chain, which cannot operate if even the smallest link gives out. As soon as the boy begins to realize this, he begins to understand that even his own little efforts have their importance and are needed in the carrying on of the whole work; he will become a supporter rather than an antagonist of the foreman.

"I attach quite an importance to these few lectures and to the effect they should have upon the future working men. An ambitious working man may inquire the reason for doing a certain thing in a certain way. What is the usual answer that most foremen will give him? They will tell him in a more or less polite way that it is none of his business; that he should bother about his own work and not waste time by asking such questions. I believe most decidedly that it is an ambitious man's business to understand, in a general way, the conditions that surround him and the reasons for carrying on work in the way in which he is directed to perform it. A question asked in the right spirit deserves some answer in the same spirit. The man will be benefited by it and the company will be better off for that.

"I think it of sufficient interest to state here a psychological element in our school work. If we ask a boy to figure out the weight of a piece of brass three inches long by one inch in diameter and tell him that he is wrong if his calculation does not give the proper figure, he may assume an attitude of antagonism to the teacher. We give to the boy a piece of brass, let him measure the same and sketch it on a piece of paper and calculate the weight. We then hand to the boy a pair of scales to check his own results. If now the scales tell him that he is wrong, he will feel rather ashamed of himself and re-calculate the problem with the earnest

desire of arriving at the proper figure. The boy has, so to speak, a greater confidence in the veracity of the scales than in the veracity of the teacher.

"An examination is held at the end of each term, and only those apprentices who obtain a percentage of 60 or more are allowed to advance to the next school term. Some have been left behind. The knowledge of their failure, however, became quickly known among their shop-mates and had a most stimulating effect on the mental machinery of these boys. The final examination after three years of schooling is a competitive one, wherein everyone who obtains a percentage of 95 or more is presented by the company with a technical book or a useful working tool. The standing obtained in the school is also stated in the 'certificate of apprenticeship,' which is given to the boy at the successful termination of his apprenticeship, together with a cash bonus of \$100.

PRACTICAL TRAINING.

"At the same time with the theoretical instruction in the school, practical instruction in the handling of tools was carried on in the shop. We soon recognized, however, that there must be a very close connection between the theoretical and the practical instruction, so that a boy may be stimulated to apply every day to the work-shop what the school has taught him. The difficulty can easily be understood of giving systematic practical instruction in the factory with an equal chance of giving the same training to all boys and yet of taking into account the individuality of every apprentice—the quickness of his mental grasp, the dexterity of his hand.

"The work which apprentices perform in the different shop departments must of necessity be governed to a large extent by production requirements. One department may be very busy to-day and may offer splendid opportunities for the boys, while to-morrow, it may have to work up only a small amount of production of a character, perhaps, which does not give the apprentices a really good chance. Then, again, the practical instruction in the shop is influenced materially by the individuality of the workmen, assistant foremen and foremen, all of whom act as instructors to the boys.

"In order to equalize and improve the conditions it was decided a year and a half ago to concentrate the first practical instruction in a separate department, the apprentice training room, and to make the factory a post-graduate course, for the purpose of acquiring increased speed and accuracy on a greater variety of work. The factory would then not only apply the finishing touches to the boy's practical education, but would bring him face to face with real factory conditions and the emergencies that arise. The apprentice training room is, therefore, a second part of the apprentice school and may justly be called a trade school in contradistinction to the theoretical school which we have just described. The training room is in charge of a man who is not only an expert mechanic with inventive ability, but one who takes an interest in boys and understands how to handle them. This man, therefore, has the responsibility of not only initiating the boys into the trade in such a manner as to lay a solid foundation for their future work, but also of arousing in them the proper interest in and respect for manual labor. He furthermore has the opportunity of studying closely the boy's make-up, so that he may drop from the apprentice course those who do not display the qualities which are essential for a successful career, and he has a chance to develop an inventive capacity in those who by nature are endowed with inventive minds.

"Every apprentice has first to enter the training room, where he will be kept from nine to twelve months, according to his ability. Bench-work during the first month is followed by work on simple machines, such as drill presses, from which the boy advances to work of a more difficult character on different lathes, on planers and shapers, on boring mills and milling machines. Some old machines have been rescued from the scrap heap and placed in the Trade School, in order to afford the boys a chance to make repairs—an excellent training for a machinist and an opportunity to develop the ability to meet emergencies. They are also taught to take care, for a short time, of the stock room, which is a part of the training room, and to perform such clerical work as making out time-cards and order blanks, which is required of every assistant foreman and foreman. During the last few months of their stay in the trade school, the best boys act as assistants to the man in charge, looking after some of the new apprentices.

"The present equipment of our training room is limited, due to lack of sufficient room, so that we can take care in it of only about forty apprentices at a time, while about 150 apprentices are distributed through the shop. As those at the top are graduated into the factory post-graduate course, new freshmen, or, rather, fresh young men are taken in. We expect to move into a large, well-equipped building next spring, when we shall be able to accommodate a larger number of apprentices.

"It is a most gratifying pleasure to me to find this trade school and our whole apprenticeship system so universally endorsed by the large body of our working men, whose sons and relatives are always given preference in the selection of apprentices. The trade

school movement is a movement of the present time, which is especially alive in our State of Massachusetts. We have therefore only undertaken what in due time and on a better foundation the State or municipality will undertake, and when the State has established trade schools of the proper character, I think there will be no further reason for a private corporation like our company to maintain its own trade school.

"The object of our whole apprenticeship system, as I have already pointed out, is to develop a very high class of employees. Their technical education should therefore be of as broad a character as possible, because with this better education goes a greater sense of responsibility, a firmer grasp of the work, a better understanding of the business methods. This aim cannot fully be accomplished within the compass of our theoretical school. I have therefore supplemented this school by an apprentice club, where the apprentices may congregate in their leisure hours for social as well as educational enjoyment. Expert engineers lecture to the boys once a week on various subjects which are allied to their business and stand ready to enlighten the boys further by answering any questions which may be asked during discussion. The club has been handsomely furnished by the company, but is conducted by the boys themselves, with a representative of the company on the board of directors. It is very interesting to observe how well the boys conduct the business of their club, which develops in them a business instinct and self-reliance.

"These three institutions, therefore, namely, the theoretical school, the trade school, and the apprentice club, constitute the apprentice school of the Thomson-Houston (General Electric) Company at West Lynn, of which you did me the honor to invite me to speak to you to-night."

THE COST OF THE EXPERIMENT.

At the close of his address Mr. Alexander gave additional information about the school, in response to a number of questions put to him by the delegates. He said that at the present time 148 apprentices had signed the apprentice agreement and that 21 were serving on trial. If these latter prove satisfactory they will be allowed to sign the agreement, otherwise they will be asked to leave the company.

A high standard has been set by the General Electric Company, and only boys who give fair promise of becoming first-class men are wanted in the apprenticeship course. Some time in May of each year a letter is sent to the superintendents of schools through the State of Massachusetts, wherein the opportunities offered to boys at the General Electric Works are set forth, with a request that the superintendents recommend good boys who want to learn a trade. Most of the boys are grammar school graduates, although lately a number have applied who have had either a partial or complete high school training.

Apprentices are paid from the hour when they enter the service of the General Electric Company, even during the trial month, and their wages are advanced at stated periods. Grammar school graduates receive six cents an hour for the first six months; high school graduates receive eight cents an hour for the same period; thereafter all apprentices are advanced two cents per hour after six months and again after six months, and so forth as stated in the agreement. Regular wages are even paid for the hours spent in the school rooms. This means considerable expense to the company, but it is believed that it is fully offset by the appreciation of the boys manifested in the zeal to learn in the school and to apply the knowledge thus gained to the work in the factory.

It has been found more convenient to start the day with school work than to take the boys out of the shop and into the school room during the day. "It is no hardship to the foremen," said Mr. Alexander, "to start certain machines at 9 o'clock in the morning instead of at 7 o'clock. It would be a hardship on the foremen to stop such machines in the middle of the afternoon and start them again at say 4 or 5 o'clock."

The form of agreement under which apprentices are engaged is signed by the apprentice and his father or guardian and binds him to perform satisfactory service for a certain compensation. Mr. Alexander values the contract, not so much from the legal standpoint, as for the moral effect which it carries. He illustrated this point by giving the following example: "Some boy who has been with us for perhaps six months or so thinks that in a pop-corn store at the corner he can make a dollar a week more, and he is therefore very much tempted to make that extra dollar. The agreement holds this boy down until he comes back to his senses and prevents him from taking a rash step and thereby, perhaps, spoiling his future. If a boy, however, shows a disposition to break the agreement, that is taken as sufficient indication of his unfitness for the company's purpose."

In response to a question in reference to the limitation of the number of apprentices, Mr. Alexander said: "There certainly will be a limit to the number of apprentices which can be employed by the company. We have, at the present time, about 7,500 employees, and the works are constantly growing. We consider that we should have 250 to 300 apprentices and figure that, if 25 per cent. of all the apprentices who graduate stay

with us, we shall have a sufficient number of trained employes from whom to choose our leaders in the shop. The other graduated apprentices will go to other establishments, which we hope will be benefited by them, and by and by, other establishments will turn out good apprentices who will come to us; so we shall gain about as much as we lose. As stated before, we encourage graduated apprentices to remain with us. At the present time we have graduated eight apprentices, six of whom have remained with us, while two have gone into small machine shops where well-trained men are in demand. I feel sure, however, that these boys will come back to us after a while."

Referring again to the use of old machines in the training room, Mr. Alexander said: "We have placed in our training room a number of old machines which nobody could use, because they were on the point of breaking down. We know that something will happen to the machines as soon as they are started, but we do not tell the boys about it. We have a boy start the machine and run it until something happens. We then instruct the boy how to repair the machine, which sometimes may require a new bearing, or a new spindle, and sometimes the inserting of a new tooth in a gear. When the repairs have been finished and the machine is able to perform work again, it is noticeable that the boy takes a greater pride in his machine and pushes his work along with increased pleasure. In this manner we have not only made some first-class tools out of almost useless machines, at a reasonable expense, but have at the same time taught the boys one of the most valuable things—to meet emergencies as they arise and to overcome the difficulties themselves."

The cost of equipment in the training room has been about five thousand dollars, and an additional three thousand dollars will be spent within the next half year for the purchase of new machines. These machines are a good investment and can be used anywhere in the factory. "The General Electric Company," Mr. Alexander said, "does not believe in letting anything go to waste. No money is spent in a purely sentimental way; there is always a straight business proposition at the bottom of things. If that were not the case I would not care to help in the work."

MILL CONDITIONS AND TUBERCULOSIS.

At the Boston Tuberculosis Exhibition, December 29, the reduction of the death rate from tuberculosis, as the result of modern conditions in the factory and home, was given consideration. Among the papers read was one on "Sanitation in the Textile Industries" by C. J. H. Woodbury, Secretary of the New England Cotton Manufacturers' Association. In the course of his address Mr. Woodbury said:

"Every humane and every commercial motive impels those in charge of others to desire that the people in their service should be in the best of physical health. The sound body is more directly essential for those who labor with their hands than for those whose occupations are mental."

"Changes in mill construction and equipment, I believe, have fulfilled their purpose of contributing to the health and comfort of those employed in the mills. The early mills were low-studded, and, after the days of the stoves, heated by cast-iron pipes, about six inches in diameter, hung from the timbers above, to the discomfort of those employed beneath them, owing to the severe exposure to heat radiating upon the head; the walls were of uniform thickness at each story, and questions of strength limited the size of the windows."

"Sanitary and washing accommodations were such as the ignorance of the time afforded."

"Lighting by kerosene or by gas vitiated the air far more, I believe, than the respiration of the help, and the same was true of whale or lard oils earlier in use."

"In contrast with these conditions, by the inorganic evolution of commercial advancement, the modern mill has displaced the old plant by improvements in which the building and equipment has shared with the machinery in receiving the benefit of engineering skill and invention."

"The more economic distribution of masonry in buttressed wall construction establishes greater rigidity of the structure and also permits larger windows with increased introduction of sunlight, and I believe that a layman is warranted in expressing the opinion that this change furnishes more healthful conditions. A practical measure of the increased sunlight through the large windows of the modern mill is shown by the fact that under the same conditions of hours of labor and class of goods, a new mill requires 300 hours of artificial light a year, and an old mill 450 hours. This also means that the purifying effect of the sunlight is more efficiently applied throughout the day in the new mill, as well as extended 150 hours a year."

"The upper portion of the modern mill window is generally swung on a transom, so that incoming air strikes the ceiling and is diffused throughout the room without being concentrated into rapid currents, producing draughts. The rooms are higher and, if heated by a number of elevated wrought-iron pipes, of small diameter, the heat is diffused without discomfort to those employed beneath them. Many mills are heated by a method which also furnishes ventilation, by blow-

ing warmed air throughout the building, and in later instances, a combination of the two methods produces efficient results with greater economy. The humidity artificially produced in mills, primarily for the removal of the disadvantages of unduly dry air in the textile processes, also furnishes more agreeable and, I believe, more healthful conditions."

"The sanitary and washing accommodations have water-proof floors and are equipped with modern appliances such as were unknown a few years ago."

"The appliances for the removal of dust from the air are of two types. In napping and card rooms it is done, when necessary, by centrifugal extractors which whirl the fine fibres from the air and send it back into the room cleaned. In polishing and grinding rooms the metallic dust flies into hoods from which it is drawn by exhaust blowers to the open air. In both cases, it is evident that the removal of dust from the air conduces to conditions which apply more directly to the purpose of this meeting than the other improvements which merely establish more favorable hygienic conditions."

NATIONAL CONFERENCE ON IMMIGRATION.

(Continued from page 6)

here in the past? Shall we establish, as has been suggested, an educational test? Has it any merit? Has it any demerit? Congressman Gardner has stated that of those immigrants who came here in one year 200,000

SIMON WOLF.
President of the Order of B'nai B'rith.

could neither read nor write. But there is a brighter side to this picture. Out of the census reports of 1900 we find that out of the children in the public schools, or rather the children of native parents, 5.70 per cent. were illiterate, whereas of the children of foreign-born parents, 2 per cent. were illiterate. If that demonstrates anything, ladies and gentlemen, it demonstrates that the test of our immigration is not the immigrant. The test of immigration is the American generation. (Applause.)

"Congressman Adams said that there were 20,000 Jews in the City of New York who are at present dependent. They are, to a greater or less extent, because they are driven here from countries where they have been so persecuted that when they arrive here they are, to all intents and purposes, poverty-stricken. But out of those who needed assistance ten years ago, less than 2 per cent. are in need at the present moment. Of the immigration that has come here in the last twenty-five years, less than 2 per cent. of Jews in the city of New York or the United States that require help is native born or the children of the first generation. This is true of Italians and every other immigrant. Given an opportunity, these people no longer remain dependent upon either public or private support."

"Shall we select our immigrants along the lines of race? I think we need not go over this subject again. I think we have been convinced by what has been said to us to-day in particular that we can draw neither racial nor religious lines, and that if anything the citizen of the future, the American of the future, is going to be a composite of the various races that have come into these United States, whether he belongs to the Anglo-Saxon or to the South or East European races."

"Shall we select on volume? The statement has been made here to-day that we should limit it to 80,000 from any particular country, and I am going to ask Congressman Gardner how is he going to know that the first 80,000 are the desirable ones?"

"Or shall we adopt the extreme of a head-tax of \$40 on males? This means that you are going to debar

whom? The wage-earner; and you are going to allow the women and children and those who may become dependents more readily to enter this country in any number they may deem fit or wise." (Applause.)

Broughton Brandenburg.

Discussing the possibility of keeping undesirable aliens from starting on their journey to this country, Broughton Brandenburg said:

"The European districts from which immigration is profuse and dangerous occupy a limited area no larger than the State of New York. Lay these spots off into districts and appoint through civil service a small board for each, with one medical member, all speaking the language, to visit each community once a month, say, and issue certificates to intending immigrants. Secure these from forgery and transfer by photography, or other means. Then, when the immigrant has sold his few belongings and made ready in the time limit of thirty days, let him join a group that shall travel in charge of a courier direct to the nearest large port where they shall be delivered directly on board. On every steamer put an officer and enforce all the present laws for decent treatment, hygiene and cleanliness. I estimate \$12 as the average amount grafted off each immigrant before he reaches Ellis Island. Make him pay the heavy cost of his examination with a fee of \$5, and, having been safeguarded by the direct delivery and supervision, he will be saved the other seven."

President Eliot Condemns Exclusion.

The address of President Eliot, of Harvard, was as strong in its advocacy of a policy of free and unrestricted entry for sound labor as was that of Mr. Carnegie. He began by saying, in reference to a remark previously made by Mr. Gompers:

"I want to express a doubt that the doctrine of self-protection is one which is going to be useful in the settlement of this question. The word protection has been very much overworked in this country. (Applause.) Self-protection is a natural idea if we are thinking of protection from the elements, from the forces of nature, but the moment we begin to think that self-protection is a sound motive for dealing with men, we are getting on dangerous ground. (Applause.) That is not the nobler thought. That is not the generous thought. And in my opinion it is not a thought that will ever commend itself to the American people in regard to immigration. (Applause.)"

"I suppose it is wholly useless to talk about the desirability of excluding pauper criminals and imbeciles. There is no difference of opinion about that. There may be better devices than we now have for that purpose, but the present arrangements are very tolerably satisfactory in that respect. When it comes to excluding labor, sound labor, on the ground that it has been induced to come here, we enter upon an altogether different discussion. I have no belief whatever in endeavoring to prevent sound, healthy, moral laborers from coming hither (applause), no matter whether they are induced or not induced. (Applause.) They are welcome, and I think we may all be sure that the American people mean to welcome them, although coming in masses from time to time they may somewhat depress the average rate of wages."

"Moreover, there is another thing going on in this world that needs to be taken into consideration in dealing with this problem; namely, the mobility of capital is becoming greater and greater. It is more mobile than population, than working people—much more mobile. We have seen it moved about in a wonderful way already in our own country, and now we are seeing it move out of our country into other countries where there are laborers and a market. This is a process that is going on more and more and must be taken into account. Do we, on the whole, prefer to have the laborers come here and build up our country, or to have our capital go elsewhere and build up other nations? Trade, commerce, manufacturing are becoming international, in spite of tariffs. Now, we see that even in the names of trade unions. How often we read now of the international union of such and such a trade! Why? Because labor organizations themselves perceive that the industrial problems are transcending national bounds. Let us remember this when we are asking Congress or any other authority to deal with this problem of immigration. Let us remember that capital can take care of itself. It will take care of itself. It is taking care of itself. Just remember, too, that national greatness, after all, depends on the soundness of the brain and the brawn of the people." (Applause.)

Jesse Taylor.

The Conference then passed to a general discussion by delegates (under a five-minute restriction) of the subject,—a discussion which reached its climax in the impassioned declaration of Jesse Taylor, a delegate from Ohio, that if influential Protectionists did not soon advocate some way of protecting the American laboring man against the "riffraff of Southern Europe," there were many people that belonged to the old full dinner-pail Republican party who would "flop over, body, bag and breeches, to the other side." He continued:

"In fairness to the farmers and the laboring people

of this country, if you multimillionaires and owners of factories, with all due respect to you (I am not jealous of you because you have got money and because you wear diamonds by the quart), if you have the right to go into the markets of the world for your labor and bring it into competition with American labor, the raff of Southern Europe that can live on two beers and

AUGUST BELMONT.
President of The National Civic Federation.

a hard biscuit a day, then I say to you the time is coming when the laboring people of this country will assert their right and say to you: 'Down with the high tariff; we will go some place else to buy our goods.' (Applause.)

Rev. Joel Ives.

The Rev. Joel Ives, of Connecticut, laid special stress upon the undue proportion of immigration received by the New England States. "The early immigration," he said, "moved Westward and merged itself into our life and civilization, and the last census names Dakota as the most foreign State in the Union. But statisticians tell us to-day that Massachusetts is the most foreign State in the Union. The census gives us four cities in Massachusetts and one city in Rhode Island with a larger percentage of foreign parentage than New York City, Chicago or San Francisco. If we are to maintain the New England ideals we have a large proposition on our hands when Southern New England is already 65 per cent. of foreign parentage, and when our towns, our farming communities are so largely depleted of that New England stock. Our common schools must be maintained, and a righteous and honorable press must be maintained, and all the influences both of the press and the school and the church must be of a kind to maintain that New England life which

HON. OSCAR STRAUS.
Publicist.

has sent out its people and its influences from the Atlantic to the Pacific; for it is said to-day that there can be found communities on the Pacific Coast that are more purely New England than can be found upon the Atlantic Coast.

"I am proud of the growing generation of the immigrant. One of our people went into one of the schools

in Hartford in a section of the city where very few of the native stock are to be found, and looking into the faces of the school children, the question was asked: 'How many of the school are Americans? Please raise your hands.' Every blessed little hand in the school went up. They were all Americans. They all loved the flag; they all are seeking after the knowledge of the English. I am told that there are not as many newspapers printed in a foreign tongue in New England to-day as there were ten years ago, in spite of the enormous increase of the people of foreign tongue within our borders. And therefore there is every reason for an optimistic view in regard to this large immigration if we can properly distribute it."

Dr. Edward A. Steiner.

Speaking on "Distribution of Immigration," Dr. E. A. Steiner, of Grinnell, Iowa, held that the question of distribution was the question of wages. "If South Carolina," he said, "would offer, instead of the \$2 which a man earns here, \$2.25 or \$2.50, she could have all the immigrants that she could take care of. They will go first of all into the industrial centers because work is ready for them. They will stay largely in the city of New York, not because New York is attractive to them, not because they are used to skyscrapers and electric cars, but because New York pays the highest kind of a wage.

"Has this congested immigrant proved a political menace? It has been said that there are 30,000 illegal citizenship papers in the possession of foreigners in the city of New York. That may be a fact. I have been offered citizenship papers for \$10, but by an American. (Applause.) I have seen Polish peasants herded and made drink and pulled to the polls. They sold their votes cheap for a drink of whiskey, the man behind them swearing that they had been long enough in this country. And it was done not by aliens, but it was done by Americans—in this case by members of the Republican party. (Applause.) If you wish to go with me, I will take you among them here in this city, and you will find that it is that East Side that elected Jerome. It is that East Side which put Low up and Tammany down. It is not the fashionable West Side, but the unfashionable, dirty, congested East Side which has over and over again saved the city of New York. And they are ready to do it everywhere, wherever you find them. Politically, wherever you get them they will rise at least as high as you are.

"Now, gentlemen, I believe in scattering the immigrant as quickly as possible for his own sake and for our sakes. But it cannot be done by resolutions. The fact is that the immigrant who comes here has not much more than his muscle, his strong heart and bellows for lungs. The West calls these men. It wants them to buy land, and they have not the money to buy land with. I could send you 20,000 agriculturists if you gave them five acres of ground to call their own, and they would make the wilderness blossom as the rose, where some Yankee farmer has been starving on fifty or seventy-five acres. (Applause.)

"I am strongly in favor of a measure which may never be passed, that every alien, who, after three years, becomes a public charge, who is convicted of crime and serves his time in the penitentiary, should be sent back. But let me say that the figures about crime lie; that the men who figured did not lie, or intentionally so. It has been my privilege to walk from penitentiary to penitentiary in all our Eastern and Central Western States. I have conversed with the prisoners and with the wardens. These men who are convicted and imprisoned—a very large number of them—are there for some petty crime. They could not defend themselves, they had no money to hire able lawyers, and, more than anything else, they had no political power, and so they were pushed in, and they stay there."

Hon. R. A. Mitchell.

Speaking for Alabama, the Hon. R. A. Mitchell said: "We live at perfect peace with the negro as a citizen and are trying in every way to elevate him and to make him occupy that condition which his intelligence and standing would justify. But the greater the demand made on the negro for work just to that extent do his efforts relax, until to-day he is not as efficient as he was years ago, and in fact has steadily declined for the past two decades.

"While Alabama is not a large State, her population being approximately 2,000,000, I believe that 75,000 people could find profitable employment there to-day. The farmer, the manufacturer, the railroad, in fact every industry, is languishing for lack of labor.

"We think that the distribution of the immigrant North and South can be furthered by getting Congress to pass laws allowing the different States to appoint their agents to go to Ellis Island and present the advantages of their respective communities. As an Alabamian, as a manufacturer and a native citizen, I wish to say that we do not lay much stress upon the money that an immigrant shall bring. All that we demand is that he be of good character, that he be not a criminal convicted of some crime involving moral turpitude. What we want is a good, healthy, strong man, and it doesn't matter whether he has a dollar or not. He is rich in his brain and his muscle, and there is a place in our section for profitable employment for him. We

want all we can get. And we are not particular about nationality. I want to say for one I don't believe all the good things reside in any one nationality. They all have good qualities, and we should be very glad to have you aid us by sending them down to us, where land and living are cheap, and they can get plenty of work." (Applause.)

SAMUEL GOMPERS.
President of the American Federation of Labor.

Ex-Senator Higgins on Asiatic Immigration.

Ex-Senator Anthony Higgins, of Delaware, took part in the discussion of the subject of "Asiatic Immigration," speaking in part as follows:

"The reason that has controlled my judgment in favor of the rigid exclusion of an Asiatic population on this continent is one of a character that if well founded makes, as it seems to me, discussion on any other branch of the subject almost unnecessary; and in what I am going to say I would not for an instant be considered as desiring to exclude those classes whose exclusion seems to have given such umbrage, and just umbrage, to the people of China. I mean their scholars, merchants, travelers, their men of science and all men who do not come here as laborers. But with our nation having the great Pacific shore, to be filled with a great American population, we confront a problem of the utmost importance when they are faced by four hundred millions of Chinese upon the other side of that ocean.

"We have a race question already, and with our experience with that race problem, how should it be possible that any plain American would either welcome or be willing to permit that this country should be vexed and troubled with another? (Applause.) I can say this because the active and militant part of my life has

REV. THOMAS R. SLICER.
Chairman, Conference Committee on Rules.

been much absorbed in making as good a fight as I could for the equality of rights to be given the negro. I therefore feel that I can speak as I shall speak without any reproach from any member of that race. But, saying that, I ask first, What would any sensible, sane American give if no negro, slave or other, had ever landed on our shores? (Applause.) We should have had no

negro problem, no North, no South, no slavery, no secession, no rebellion, no war, no destruction of life, no public debt, no pension list, no problem of reconstruction. Should we be willing to invoke another race rebellion? The negro can probably never rise to more than his already demonstrated capacities, but the silent, patient, enduring Chinaman brings into your body other elements that make him absolutely impossible of assimilation. The great problem of America has been assimilation. We have assimilated the Spaniard of Louisiana, we have assimilated the Frenchman of Detroit and St. Louis and all that Western country. It has not been done in a century. But assimilate the negro, except to a certain extent, you cannot. And so you have here this practical problem. It seems to me that it is a great, substantial, abiding reason why there should be the most rigid exclusion of the laboring element of China."

Ng Poon Chew Speaks for China.

Much interest was aroused by the speech, delivered in fluent and forcible English, of Ng Poon Chew, of San Francisco, editor of the only Chinese daily newspaper in the United States. He minimized the danger to American labor and American institutions to be apprehended from Chinese immigration, saying:

"An often cited objection to the Chinese is that we do not assimilate. Assimilating humbug! You don't give us a chance. You throw all the obstacles you can in our way. You pass laws against us becoming citizens of the United States. You have passed laws on the Pacific Coast forbidding us to intermarry with other nationalities. You have passed laws forbidding us to bring our women over, and at the same time you damn us for not helping you to solve the race suicide question. (Laughter.) You say we take money away from the country. Gentlemen, we have taken hundreds of dollars from the country. At the same time we have

capacity. Therefore, if the Emperor of China or the Empress Dowager ever had the audacity to try to reach this country they would be deported. A teacher is one who teaches the higher branches of learning in a recognized institution of education. A student is one who pursues the higher branches of learning in a recognized institution of learning. A merchant is one who has a fixed place of business in his own name. If he does a million dollars' worth of business a year, and if at the same time he is interested in a hotel like the

CHARLES A. MOORE.
President of the New York Civic Federation.

Waldorf-Astoria, the very fact of his having one dollar's interest in such a hotel would invalidate him as a merchant, and he can be deported. A traveler is one who has all his pockets full of money to support him through his trip, and when he gets through he has to get out of the country immediately. But it is much easier for a rich, fat American millionaire, with all his tainted dollars on his back, to climb to heaven through the fire escape than for a Chinese to come through the ports of the United States. (Laughter.) Therefore, outside of those five classes—an actor, we cannot get an actor over here to amuse us in our leisure hours; we cannot get a minister of the Gospel over here to come and minister to our spiritual welfare, to tell us which way to go to heaven and which way to the hot place; we cannot get a doctor over here to heal us, or to kill us, either way. Here we are; we are supposed to come in, but all those are not.

"Now, I have a letter in my pocket written by a friend of mine of the class of '99 of Yale College, and he went back to teach English in our college in Singa-

"When we wake up from our slumber we will never submit to discrimination. And fifteen years from now, if you want to restrict our labor, that restriction law ought to be universal. Restrict all the unworthy people from all the nations. The Chinese Exclusion Law should be modified, because it is opposed to the American sense of justice. It is opposed to this twentieth century civilization, because in all civilized countries every man is looked upon as innocent of crime until he is proved guilty. But under this Chinese Exclusion Act every Chinaman in the country is looked upon as guilty until he can prove himself, by the aid of at least two creditable white men, to be innocent of smuggling into the country."

Senator W. A. Clark.

Senator W. A. Clark, of Montana, who followed Mr. Chew, spoke in part as follows:

"We have in China alone four hundred millions of people. In India, if India is to be considered, and in Japan, the Philippines and other Pacific islands there are several hundred millions more. If we are to throw down the barriers and allow these people to come to our shores unrestricted, we are in danger of an invasion of those hordes that will practically exterminate and destroy American labor.

"In my opinion, in any exclusion act that may be passed by Congress there should be such provision as will enable us to treat the officials of our neighbors in the East or in the West with some consideration. Under the present law, men high in authority in China and other countries have been treated with the greatest indignity. We are laboring to establish and keep the open door in China, and we will succeed. But while working for this plan, let us not lose sight of the fact that we should establish friendly commercial relations with these people, and I believe that we should in

ROBERT WATCHORN.
Commissioner of Immigration for the Port of New York.

never taken the money; we never send money out of the country in the form of coin. We do not use gold in China, and we do not use your American dollar. Every dollar here amounts to 100 cents, but if your money goes to China it amounts to 47 cents; therefore we leave every American dollar, whether it is tainted or not, in the country (laughter), and we only send the value of money in the form of goods; and if we do send the value of money in the form of goods it helps this country.

"From 1848 to 1882, a space of thirty-four years of free Chinese immigration, when every grade of labor was open to them, the largest number of Chinese who came in was 106,000. Those 106,000 would not be a great menace to the country. During the same period you got from Europe several million people. I am demanding, not the repeal of the Exclusion Law, but the modification of the Exclusion Law. (Applause.) I demand that you should modify the Exclusion Law so as to admit those who do not in any way interfere with the laboring class of the American people. (Applause.) I am here, gentlemen, twenty-five years; I obtained my education in this country; I own property and I pay taxes, and I have raised a family of five children, and yet I am excluded. I am not deported because I am so insignificant that the Chinese inspector could not find me with a great magnifying telescope, and because I came here before the year 1882. Therefore, as long as I stay in this country I am permitted to stay here, but if I should leave the country I should never be able to return to this land of liberty and human progress.

"The Act excludes everybody except five classes—officials, merchants, travelers, students and teachers. The official is one who holds a commission from the Chinese Government to come here in an official ca-

pore. He taught three years there, and then he taught in other colleges in China, and eight months ago he came over here and tried to take the post-graduate course in philosophy in Columbia University. Eight months ago he arrived in San Francisco; after a month in the detention shed he was deported. I have got a letter in my pocket, and I defy any Chinese immigration official to write a letter in such beautiful English, in such well-chosen diction and in such elegant style as that letter was written by a Chinaman they deported.

JESSE TAYLOR.
Representing Junior Order United American Mechanics.

this Exclusion Act, when it shall be passed by Congress, provide that all of the officials who enter this country from any other countries, all persons who are seeking to come here to obtain knowledge from us, all students, all professors who are making a tour of observation and students who come to study our customs and to take places in our schools and institutions, all travelers and all persons of respectability who are not coming here to come in competition with the American laborer should be treated as the subjects of the most favored nation. (Applause.)

"Now we come to the question, Shall the bars be thrown down, and with the restrictions that apply to the reception of immigrants from European countries shall we allow an indiscriminate entrance upon our shores to people from Asiatic countries? I believe that I voice the almost unanimous sentiment of the people of the State which I have the honor here to represent, both employers and employees, that we should not allow what we call the coolie labor to come into this country unrestricted. I think it would be an act of inhumanity to the people who are struggling in this country to secure employment and a maintenance for their families and to build up homes in our midst to allow the immigration of hordes of people who, as the distinguished gentlemen who preceded me recently stated, had no idea of making homes amongst us, who had no idea of assimilating themselves with our institutions."

Walter Macarthur Opposes Japanese Immigration.

The views of organized labor on the Pacific Coast were presented by Walter Macarthur, of California, editor of *The Coast Seamen's Journal*, and representative of the Japanese, Chinese and Korean Exclusion League, who asserted that, so far as Asiatic

immigration was concerned, there were no labor men and no capital men in California; all were exclusionists, without exception. Continuing, he said:

"The discussion of the question up to this time has been confined to the Chinese phase. There is another phase which is equally, and in fact more important than the Chinese, and that is the Japanese and Korean phase. The people of the West stand not only for the literal, strict maintenance of the Chinese Exclusion Act, but for the extension of the provisions of that Act so as to exclude Japanese and Korean labor. We take that position because all the objections that may be raised to

"In the State of California and other States of the Union on the Pacific Coast the Chinese and the Japanese have driven the white man off the soil. They have driven the white man out of certain industries, not only the laboring man, but the business man. In some sections of California they are establishing banks and driving the bankers out of business. It is not simply a question of protecting labor; it is a question of protecting all classes of men. Just as sure as these Japanese are permitted to come in here without let or hindrance, they will drive us all across the Rocky Mountains.

exclusion were not kindred subjects; the West was willing to abide by the results of closing its ports to Asiatics. He also said:

"It is the testimony of history that cheap labor promotes social degeneracy and national degradation, and yet it was not a great while ago that a well-known master of transportation stated that what this country needed was cheap labor. But I make bold to say that the problem is not how to secure laborers in foreign lands who will work for less than the prevailing wages, but how to secure better wages for the laborers who are already here. (Applause.) The West does not claim

Chinese labor apply with equal and with added force in the case of the Japanese and the Koreans. We object to these classes of labor upon three general grounds: the racial ground, the economic ground and the political ground.

"We object to the Asiatic laborer, whether Chinese or Japanese, because he comes from a different and an unassimilable race; because he comes from the Mongolian as opposed to the Caucasian race. And we regard this problem as a problem of race preservation. We object to these classes of labor upon the economic ground because they tend to undermine, and do, as a matter of fact, undermine the standard of living to which the American laborer is accustomed, and which he desires to maintain.

"We object to them upon the political ground, upon the main ground that, being incapable of becoming citi-

"It has been assumed in certain quarters that we are enforcing the Chinese Exclusion Act because China was not able to protect herself, because China was not able to insist upon a recognition of her equality with the other nations. And it is now hinted that that time and that conditions are passing, and that the day is near when China will be able to protect herself, will be able to compel the United States to throw down the bars and let in the Chinaman upon the basis of equality with other nations. Now, you can clearly see the suggestion. I am a man of peace, and the men of the West are men of peace, and we are pursuing a peaceful policy. We are pursuing a policy in demanding the enforcement and maintenance of the Chinese Exclusion Act and the extension of that act to the Chinese and Japs; we are pursuing in that respect a policy designed to preserve the peace between ourselves and other na-

to have a solution for this problem, but it has reason to know that the free admission of Chinese labor would postpone its solution indefinitely.

"We are opposed to any modification of existing laws on this subject, and 'modification' constitutes the whole program of China. Chinese diplomacy is a subtle science that hides infinite menace in simple words. A few days ago the Chinese Minister to Washington appealed to the Government for a more liberal interpretation of the exclusion laws. He asked that the bars be let down to the professions, as they are now down for students and travelers. But we of the West know the Chinese character—as nearly as it is possible to know the inscrutable and the contradictory—and we see the hidden danger in the word 'professions.' We have learned that the destination of the Chinese 'traveler' is nearly always a cheap labor market, and that the brain

zens of the United States, they are a standing menace to the perpetuity of our political institutions. We cannot afford to have in the United States a class of labor permanently proscribed, permanently denied political rights, because, after all, it is upon the laborer and upon the exercise by the laborer of political freedom that the whole superstructure of our Government rests, and to the extent that the laborer is denied the right to participate in the political affairs of the nation you endanger and undermine the political institutions of the nation. (Applause.)

tions, and unless that policy is adopted the peace will be broken. The time will come, unless some restrictions are placed in the way, when the people of the West will be forced to take a stand in the defence of their birthright, regardless of the consequences to themselves or others."

No Modification, Says Avery C. Moore.

Referring to the remarks of Mr. Chew, the next speaker, Avery C. Moore, editor of the *Weiser* (Idaho) *World*, said that Chinese trade and Chinese

of the Chinese 'student' is too often located in his hands. This, therefore, is our will: Close such loopholes as now exist—and create no new ones."

Hon. A. L. C. Atkinson.

Hon. A. L. C. Atkinson, Secretary of the Territorial Government of Hawaii, spoke of his territory as "facing the full power of the Orient." More than 60 per cent of the population, he said, was Asiatic. "Shall we," he asked, "advance along traditional American lines, as our President says? I am willing to admit that

the introduction of say twenty-five or fifty thousand Chinese will mean 25 or 50 per cent more dividends. But shall civilization hold its own, or shall we be driven back and the decay of America commence?

"How we intend to meet this problem, and what the present administration in Hawaii is doing is this: it is our definite policy to Americanize these islands and to prevent them from being Japanized. We have done more than that; we are opening our islands; we are making it easy for the homesteaders to obtain land. Our plantations, or some of them, are giving land to every man who will work a certain length of time.

GEORGE PARSONS.
Secretary of the Conference; Mayor of Cairo, Ill.

They will build the buildings, they will give medical attendance, water and firewood. Our whole idea is that we will domicile our labor. We are opening the Government land and fixing the roads so that while the tropical crop is growing men can obtain employment and thereby support themselves. My present mission to this country is to obtain laborers for that purpose. We want to make and build up an American community out there."

Warren S. Stone.

Speaking on the same subject, Warren S. Stone, Grand Chief of the Brotherhood of Locomotive Engineers, remarked:

"The great question which seems to stand in the background to-day is the boycott, which is only sleeping, they say. The question for you to solve is whether, for the benefit of having American manufactures go into China, you can afford to pay the price by letting down the bars and letting the yellow flood pour in. Do you want Chinese immigration at that price? I think not."

In the course of a paper dealing with the question of employing Asiatic labor in the tropical dependencies of the United States, D. G. Ambler, of Florida, advocated the importation of Chinese coolies for the digging of the Panama Canal, but the proposition excited no further discussion.

The Rev. Dr. Arthur J. Brown, Secretary of the Presbyterian Board of Foreign Missions, premising that he was not arguing for unrestricted Chinese immigration, defended the average Chinaman, testifying to his honesty, industry, frugality and peaceful disposition. The real question at issue, however, was whether Chinese who came to this country, not as uneducated laborers, should be treated with common decency.

President Penrose Defends the Chinese.

President S. B. L. Penrose, of Whitman College, State of Washington, declared himself frankly in favor of the admission of Chinese laborers. He spoke in part as follows:

"The exclusion of the Chinaman costs something to the United States. It costs in undeveloped territory; it costs in the neglect of orchards; it costs in the retardation of our Pacific civilization, because we have not at the present time such a labor supply as to meet the demands of the present occasion. I believe that the total exclusion of the Chinese of the labor class from the United States is unwise, because the psychological differences of the Chinaman and the American are not so fundamental as to place him beyond the pale of civilization and the consideration of a decent regard.

"It seems to me there are certain definite things which we should accept with reference to the peoples of Asia. In the first place, we ought to have a fair and honest and impartial examination of all kinds for admission to the United States upon the far side of the Pacific—an honest examination. I have it on very good authority, that of an intelligent, well-informed Chinaman who told me quietly, not thinking that I would ever make use of it in any way, that the fixed

price that a Chinaman had to pay in order to get into the United States over on the far side was \$60. It seems to me that the United States must have an enforcement of honest laws rigidly and impartially administered. I believe also that we ought to make a distinction between our insular possessions and the land of the United States proper. To insist that the same restrictions upon foreigners, upon labor, shall hold in the Philippine Islands, for example, as in the United States seems to me to be confounding the question by failing to recognize the difference economically between those insular possessions and our own country."

The Committee on Resolutions then submitted a report on Asiatic immigration consisting of four resolutions. The first three were adopted without opposition and were as follows:

"Resolved, That we heartily endorse the position taken by the President that the Chinese exclusion laws forbidding the admission of laborers ought to be maintained and rigidly and honestly enforced.

"Resolved, That a rigid examination of all incoming passengers from the Orient be made at the port of departure, as recommended for incomers at the Atlantic ports, so as to eliminate entirely, if possible, the hardship of detention and deportation.

"Resolved, That we request Congress to provide better facilities for inspection and examinations at the Pacific Coast ports, similar to those provided at Atlantic ports."

The fourth resolution read as follows:

"Resolved, That, in the words of the President's recent message, our laws and treaties should be framed not so as to put Chinese students, business and professional men of all kinds, not only merchants, but bankers, doctors, manufacturers, professors, teachers and the like, in the excepted class, but to state that we will admit all Chinese except Chinese of the coolie class, Chinese skilled or unskilled laborers."

Samuel Gompers.

A *viva voce* vote was taken on this resolution, and the Chairman declared it carried. In view of the fact, however, that Mr. Gompers, as a member of the Committee on Resolutions, had opposed the wording of the resolution, and in view of the desire of many delegates that he should state his objections to the Conference as

JAMES P. ARCHIBALD.
Secretary of the New York Civic Federation.

a whole, the vote was reconsidered, and Mr. Gompers addressed the assemblage. He expressed his reluctance to oppose a resolution containing so large a quotation from the message of President Roosevelt; but, he added:

"There is given no opportunity to the President of the United States to understand the underlying causes and motives that lead the American workman and so large a portion of the American people to insist upon Chinese exclusion. The American workmen do not want to keep the Chinese student, or the Chinese traveler, or the Chinese merchant from coming into the United States; but experience has demonstrated beyond question that the deception practised upon our Government in the effort to evade the exclusion law is so great that as a matter of truth the larger portion of those who have been excluded are those who came here under the pretence of being merchants and students.

"It is all very well for our reverend and professional friends to stand up on this platform and tell you that you ought to throw your gates wide open. Some of them have been more cautious than to say that. Some of them have said that we do not want the laborer to come in here; but others have said: 'We want the Chinese laborer to come in here'; less cautious, less adroit. But underneath it all the motive is to let down

the bars of exclusion to Chinese labor. You may come to us in honeyed words. We possess neither the polish nor the urbanity that you professional and reverend gentlemen possess, but into our hard heads have been pummelled by experience the devices that are resorted to to trick the workingman into consenting to conditions. (Applause.) The sugar planter of Hawaii, the adventurer in the Philippines, are all of the one stripe in trying to deceive the working American people into the belief that there is a dearth of workmen, and that the only recourse is to the Chinaman. (Applause.)

"To speak of Chinese immigration, to speak of Chin-

SAMUEL B. DONNELLY.
Secretary of The National Civic Federation.

ese laborers and to refer to the 72,000 Chinese who are here now is begging the question. It is an insult to our intelligence to refer to the 72,000 Chinese who are now here in the United States and ask us to judge from them, as much as it will be an insult to our intelligence to imagine for a moment that the intelligent Chinese gentleman who occupied this platform can be counted as a criterion for his fellow countrymen who have come here in such large numbers, when there was no law upon the subject."

A motion made by Professor Commons that the resolution be referred to the Executive Committee of the National Civic Federation was lost. Mr. Corcoran, of Minnesota, then offered as a substitute for the fourth resolution the following, which was adopted:

"Resolved, That our laws and treaties should be so framed and administered as carefully to except Chinese students, business and professional men of all kinds, not only merchants, but bankers, doctors, manufacturers, professors and travelers, from the action or enforcement of the exclusion law."

This closed the warmest debate of the Conference, and in a manner which was apparently satisfactory to all interests.

Dr. Shaw then offered the following resolution, which was unanimously adopted:

"Resolved, That The National Civic Federation is entitled to the commendation of this Conference and the public for the interest manifested in the subject of immigration, and that the thanks of the Conference are extended to The Civic Federation for its painstaking and complete arrangements of this meeting, and the many courtesies extended to the delegates."

RESOLUTIONS ON WHITE IMMIGRATION.

The resolutions on white immigration, which were unanimously adopted, practically without debate, were as follows:

"Resolved, That the members of the National Conference on Immigration heartily endorse the wise suggestions of the President of the United States in his annual message to the Congress, regarding the enforcement and amendment of the laws concerning immigration, and regarding an international conference to deal with the question. They urge upon the Congress the speedy passage of the laws required to put such recommendations into effect.

"Resolved, That the immigration laws should be amended in the following particulars:

"(a) By placing in the excluded classes 'feeble-minded persons'; 'imbcciles';

"(b) By carefully defining the term 'persons likely to become public charges,' so as to permit the exclusion of those persons of permanently enfeebled vitality, whether this condition is due to accident, inheritance, disease, advanced age or other defect;

"(c) By making provision so that the air-space allotted to each person in ships carrying immigrants be not less than two hundred cubic feet, instead of one hundred and ten cubic feet for the main deck, as now provided, and that the space be proportionately increased for the other decks;

"(d) By making such provisions as shall compel the service of food at tables with seats, in compartments not used for sleeping.

"Resolved, That the penalty of \$100 now imposed on the steamship companies for bringing diseased persons to the United States be also imposed for bringing in any person excluded by law.

"Resolved, That the Government of the United States provide some methods of investigation, examination and certification of foreign immigrants in their home countries, or at the port of departure, so as more certainly to avoid the hardship of deportation by preventing the embarkation of persons excluded by law from admission into the United States.

"Resolved, That in order to prevent the undue concentration of immigrants in some parts of our country, and to encourage their better distribution in sections where conditions may be more favorable, the United States Government afford to the separate States and Territories opportunities to furnish to incoming immigrants at the ports of entry, and also so far as it may be found practicable, before their arrival in this country, trustworthy information regarding the material resources and the conditions of life and labor which confront the followers of different occupations in the various States and Territories.

"Resolved, That we recommend to the Congress that it furnish sufficient means to the Commissioner-General of Immigration to improve the facilities for handling immigration at the South Atlantic and Gulf ports, in order thereby to promote the better distribution of immigration over the undeveloped lands of the South and Southwest.

"Resolved, That on account of the large number of alien immigrants who are admitted contrary to law because of the possession of naturalization papers fraudulently obtained, this Conference recommends that

all naturalization certificates should contain a description of the applicants similar to that provided in the case of passports issued by the Department of State.

"Resolved, That we recommend to the Congress the establishment of a Commission with competent authority, to be appointed by the President, to investigate the subject of immigration in all its relations, including the violations and evasions of the present law; and to report to the President the results of its investigations with recommendations.

"Resolved, That we heartily commend The National Civic Federation upon its initiative in calling together this First National Conference on the important subject of immigration; and in order that this work may be advantageously continued, we request the Civic Federation to appoint a standing committee on that subject."

The officers of the Conference were:

Chairman, Hon. Seth Low; vice-chairmen, John H. Holliday, Indiana; Gov. W. D. Jelks, Alabama; Hon. W. S. West, Georgia; ex-Senator Anthony Higgins, Delaware; Warren S. Stone, Ohio; Hon. Frederick N. Judson, Missouri; secretaries, Professor H. A. Garfield, New Jersey; Professor H. W. Farnam, Connecticut; Hon. George Parsons, Illinois.

The committees were constituted as follows:

RULES—Rev. Thomas R. Slicer, New York, chairman; Hon. A. L. C. Atkinson, Secretary of Hawaii; Dr. A. Tilzer, Portland, Oregon; David Robinson, Georgia; D. G. Ambler, Florida; D. J. Keefe, Michigan; Wiley Tindolph, Minnesota; Charles Ridgely, Illinois; Warren S. Stone, Ohio; Prescott F. Hall, Massachusetts; Hon. Adolph Meyer, Louisiana; Thomas Parker, South Carolina.

RESOLUTIONS: Members-at-large—J. W. Jenks, New York; John M. Stahl, Illinois; Samuel Gompers, Dis-

trict of Columbia; John F. Smulski, Illinois; John R. Commons, Wisconsin; D. J. Keefe, Michigan; J. J. Sullivan, Ohio; Charles P. Neill, Washington; John Willis Baer, New York; Stephen Collins, Pennsylvania.

State members—Dr. Albert Shaw, Chairman, New York; Ross C. Smith, Alabama; David S. Snedden, California; Frank T. Johnson, Colorado; Rev. Joel S. Ives, Connecticut; Hon. Anthony Higgins, Delaware; M. J. Weller, District of Columbia; D. G. Ambler, Florida; Dr. B. Wildauer, Georgia; A. L. C. Atkinson, Hawaii; Avery C. Moore, Idaho; W. G. Edens, Illinois; John W. Kern, Indiana; Edward A. Steiner, Iowa; John E. Frost, Kansas; George L. Sehon, Kentucky; Geo. H. Smith, Louisiana; Dr. F. E. Wheat, Maine; Dr. Fabian Franklin, Maryland; Frank B. Hall, Massachusetts; Edwin F. Sweet, Michigan; W. D. Washburn, Jr., Minnesota; Samuel A. Hughes, Missouri; Hon. W. A. Clark, Montana; B. V. Kohout, Nebraska; Hon. H. B. Quinby, New Hampshire; Hugh F. Fox, New Jersey; L. Bradford Prince, New Mexico; Z. P. Smith, North Carolina; Hon. E. J. Watson, South Carolina; C. H. Salmons, Ohio; Dr. A. Tilzer, Oregon; James W. Kinnear, Pennsylvania; George H. Webb, Rhode Island; N. F. Thompson, Tennessee; H. W. Fairbanks, Texas; Simon Bamberger, Utah; Geo. H. Terrill, Vermont; Theodore S. Garnett, Virginia; S. B. L. Penrose, Washington; Geo. C. Baker, West Virginia; Mark E. Bruce, Wisconsin.

These vice-chairmen occupied the chair at different sessions of the Conference: Hon. John H. Holliday, Governor W. D. Jelks, Hon. W. S. West, ex-Senator Anthony Higgins and Warren S. Stone.

On the afternoon of the first day the delegates were the guests of Commissioner Watchorn at Ellis Island, where they observed the details of the inspection and disposition of immigrants.

"SMASHING THE UNION" IN AUSTRALIA.

THE CRUSHING OUT OF LABOR ORGANIZATIONS HAS RESULTED IN THE DEVELOPMENT OF A POWERFUL SOCIALIST PARTY.

Hugh O'Neill, in Kansas City Independent.

It was Malcolm Donald McEacharn, ship owner and capitalist, who delivered the Commonwealth of Australia to the Socialists. He is the one Conservative on the continent that the Socialists fight without malice. They are under a debt of gratitude to the shipping millionaire, and the bitterest offence he suffers is the occasional reminder of that fact.

Of course McEacharn didn't want Socialism. He only wanted to break the power of the trades unions. He thought that their exaction had become intolerable, and there was some justification for that view. Strikes were common, and frequently the cause of quarrel was trivial. But the strikers were always successful because the country was being flooded with British money, and the voice of the boomster was abroad in the land. The union leaders were ignorant of all economic laws, and they mistook the existing condition for one of natural prosperity. (That's where they made their mistake.)

McEacharn knew better than that. He knew that the burst would come sooner or later, and he prepared to attack labor on a falling market. He figured to smash the unions and remove the heel of aggressive democracy from the throat of capital. A partial victory was not what he wanted. He was after the whole hog. He got it. (That's where he made his mistake.)

The unionists were lions led by asses. McEacharn knew that. Time after time the shipping union made demands upon his company; time after time he granted these demands with smiling readiness. But day after day he went on building together the units of a force to fight trades unionism that was destined to sweep organized labor out of existence. The plan was colossal, but the solid patience with which in the meantime he bore the galling exactions of the trades was quite as great.

And then one day he loosed his thunders and struck hard and straight and true. He chose the time of battle, the cause of battle, and the place of battle. The unions chose nothing. They were arrogant with riches.

The cause of quarrel was childish, as McEacharn meant it should be. A difference arose between the quartermaster and the steward of one of his coasting steamers over the charms of a stewardess. The captain, to settle the difficulty—as he thought, poor man—discharged the sailor. The union demanded his reinstatement. McEacharn, knowing what the reply would be, offered to put him on another ship. The union demanded reinstatement on the same ship. McEacharn in very courteous terms pointed out that that was impossible. Then the asses who led the lions told him that unless the reinstatement was effected within twenty-four hours they would call the crews off all his ships and order a general strike.

Then, like a flash, McEacharn unmasked his guns. Back went the reply that the unions might strike and be damned.

The strike was ordered. And then there followed a

battle grim and great. Union after union was called out, ship after ship was laid up, State after State was involved in the quarrel, until the whole continent stood under arms. In less than four weeks the fires of nearly every coasting steamer were drawn. The trade of Australia was paralyzed. Four hundred thousand unionists were idle, and every man of them was drawing half pay. Also every unemployed man who looked like becoming a free laborer was paid a weekly allowance from the general fund to prevent remanning the ships.

But the Shipowners' Union that McEacharn had organized didn't even try to reman the ships. The land boom had reached its limit, trade was declining, very large coal reserves had been laid up, the funds and membership of the unions were known to a dollar and a man. The shipowners simply sat down on their hunkers and waited.

The trades leaders organized pickets, but there was nothing for them to do. The problem was a new one. They couldn't solve it. The owners were apparently not trying to run their ships at all. Patterson, who owned one fleet, wrote to the strike committee, and in a vein of pawky Scotch humor offered to sell them his ships.

Then it dawned upon the union that the strike had become a lockout. The besiegers were besieged. The weapon of capital was not free labor, but starvation.

Starvation won easily. Ten weeks after the first shot the unions capitulated to the grim foe hunger that before then had bowed the neck of many a proud city. McEacharn had meant to break the unions. And they were broken all right.

Funds gone, membership decimated, courage wilted, the once great trades unions of Australia were counted out.

The capitulation was announced in the biggest public hall the labor leaders could get. John Hancock, big bodied and big hearted—the finest platform man in Australia—rose in that hall of silent hundreds to tell the men that they must return to work on the best terms they could get. It was the shortest and most pregnant speech he ever made in his life. "Friends," he said, "men of Australia, we have not been beaten, we have been starved into submission. Unionism is dead, but anything can happen in a democracy, and from the ashes of the funeral pyre that the shipowners have lighted will rise the phoenix of our liberties."

Nobody knew what he meant. It is doubtful whether he knew himself. But it sounded large and fine, and something with that sort of sound was just what those depressed people wanted that night.

But one year later big John Hancock took his seat in Parliament—the first labor member sent in by the first political labor party in Australia.

Vanquished in the industrial war, the members of the battered trades unions had reorganized their forces on

a political basis and sought to win by the ballot the privileges capital had denied them. Someone discovered that where all men have votes and the bulk of men are wage-earners they only have to decide among themselves what they want from the State to get it.

That was only ten years ago. And now they have gotten nearly all they wanted. Think of it. Eleven years ago the unions were battered, dead, done for. To-day their direct lineal successor owns the whole blessed commonwealth of Australia.

They attacked municipal councils first, and enforced the minimum wage and eight-hour days on all of them. They attacked the State Parliaments next and gained factory legislation and old age pensions and compulsory arbitration. No factory in the country can now employ child labor, or work its people more than eight hours per day, or pay less than the minimum wage fixed by the wages board. In two of the six States the Labor party are the Government in office, in two others they hold the balance of power, and in two others they are the direct Opposition.

But it is their success in the Commonwealth Parliament—the national assembly—that marks out Australia as a Socialistic nation.

In the Senate half the members are pledged Socialists—definite servants of the labor party. In the Representatives the direct Opposition are pledged Socialists also—members of the same party. Compulsory arbitration in labor disputes is the law actually operating in two of the States, and the national legislature has passed a law enforcing compulsory arbitration in any labor dispute that extends from one State to another.

McEacharn, the Lord Mayor of Melbourne, the man who smashed unionism, was defeated last year by a labor candidate in the contest for election of a member of the House of Representatives.

Twelve years ago in Australia there were two parties, the Freetraders and the Protectionists. To-day there is one party—the Labor party—and the dragged remnant of another that occasionally totters helplessly before a tired public and tries to get itself taken seriously as the Anti-Socialist party. But it has no power, it never had a policy, and its friends are ashamed to recognize it in the daylight. Some day a man may arise in Australia who will evolve a policy big enough to cover the anti-labor party and those others who at present remain outside, but so far as the writer knows he hasn't sent word of his coming. And the gentleman who precipitated all this on the country has sought his country seat and the tiresome seclusion of a friendless man.

The writer points no moral. But he has heard the suggestion that Socialism was a coming force in American politics treated with derision, and he thinks that perhaps this story may be worth thinking over, because manhood suffrage prevails in America, and the great, big bulk of Americans are wage-earners, too.

THE HOURS OF LABOR.

(Continued from page 9)

be aided by reference to such exceptional instances. Most professions, many positions in business and some in trades fall within the class of excepted occupations. Good work in such occupations almost necessarily brings with it joy, because it implies development of faculties and, ordinarily, pecuniary advancement. In every occupation there are such possibilities for the exceptional man. But in most industrial occupations—in the unskilled trades and in many so-called skilled trades—the limit of development and of financial success for any individual is soon reached, and consequently there is little joy in such work except as compared with the hours of idleness, or such satisfaction as comes to the needy in securing the means of subsistence.

"LIVING" AND "SUBSISTING."

"And what is necessary to living as distinguished from subsisting?

"In the first place, bodily health is necessary; that is, not merely freedom from illness, but continued physical ability to work hard. For those engaged in the more favored occupations, like the professions and the higher positions in business and some trades, such health, including the postponement of old age, has been measurably attained by better conditions of living, and notably by outdoor recreation. What has been found necessary for continued health and working capacity for those engaged in these favored occupations we should seek to make attainable for all our citizens. The burden and waste to the community and to the individual, and the suffering attendant upon sickness and premature superannuation, may be and should be lessened by a shortening of hours of labor which will permit of proper outdoor recreation.

"In the second place, mental development is necessary. Massachusetts, recognizing the education of her citizens to be an essential condition of a free and prosperous people, has made compulsory the schooling of her children to the age of fourteen, has prohibited their working in manufacturing or mercantile establishments under the age of fourteen and has withheld the right to vote from illiterate adults as inexorably as from idiots. But the intellectual development of citizens may not be allowed to end at fourteen. With most people whose minds have really developed, the age of fourteen is rather the beginning than the end of the educational period. The educational standard required of a democracy is obviously high. The citizen should be able to comprehend among other things the many great and difficult problems of industry, commerce and finance, which with us necessarily become political questions. He must learn about men as well as things. In this way only can the Commonwealth be saved from the pitfalls of financial schemers on the one hand or of ambitious demagogues on the other.

"But for the attainment of such an education, such mental development, it is essential that the education shall be continuous throughout life, and an essential condition of such continuous education is free time, that is leisure; and leisure does not merely imply a time for rest, but free time, when body and mind are sufficiently fresh to permit of mental effort. There is full justification for the common practice in trades of charging at the rate of 50 per cent additional for work in excess of the regular hours. Indeed, I doubt whether that rate of pay is not often grossly inadequate to compensate for what it takes out of the employee. An extra hour of labor may render useless those other hours which might have been devoted to development, or the performance of other duties, or to pleasure. The excess load is wasteful with men as well as with horses or vehicles or machinery. Whether the needed education of the citizens is to be given in classes or from the political platform, in the discussion of the lodges, or in the trade unions, or is to be gained from the reading of papers, periodicals, or books, freshness of mind is imperative, and to the preservation of freshness of mind, a short work day for most people is essential.

"Bodily and mental health and development will furthermore tend to promote innocent, rational pleasures and in general better habits of living. Such conditions will tend to lessen the great curse of drink and with it some of the greatest burdens of the individual and of society.

"It is of course no answer to the plea for a shorter work day to say that the leisure resulting from shorter hours may not be profitably employed. The art of using leisure time, like any other, must be learned, but it is certain that the proper use of leisure, as of liberty, can never be attained except by those who have the opportunity of leisure or of liberty. Nor is it an answer to the plea for a shorter work day, to say most working men secure a certain amount of free time through the irregularity of their work. Such free time is literally lost. Such irregular excessive free time presents an even greater evil than that of excessive work.

"Although the reduction of the hours of labor is clearly desirable, it may, as already stated, be impossible on account of competition or other cause to grant the reduction at a particular time in a particular business. But in my opinion employers are apt to exaggerate the resulting loss of earnings, at least in the long run.

Greater freshness, better health and mental development that go with shorter hours may be relied upon within reasonable limits to make up in many businesses, at least in part, for a shortening of working time, where the employer receives as he should the co-operation of the employees to secure the largest possible production. Obviously no limitation should be imposed upon the output of the individual, nor any rule be insisted upon by the employer which would hamper the most efficient use of machinery. Such arbitrary restrictions are wasteful and uneconomic at all times, and necessarily act as a brake on the movement toward shorter hours. The natural gain in vigor and working efficiency on the part of the employee should be allowed to show itself in the shop results. If this gain in potential efficiency is nullified by artificial limitations on what and how much a man shall do with the facilities placed at his disposal, the decrease in working time must inevitably mean increased cost, without either economic or moral justification, and under such circumstances the employer has no other course open to him than that of resistance to any attempt to reduce the working time.

"If in any case we should find that despite the fullest co-operation of the employees, the reduced working time results in immediate economic loss, the welfare of our democratic community compels us to work, nevertheless, for a reasonably short work day as a condition essential to the making of good citizens."

President Lucius Tuttle.

Lucius Tuttle, President of the New England Civic Federation, in closing the meeting said:

"As you all know, the Federation does not undertake to command any man or any interest. It does not undertake to arbitrate anybody's difficulties. It simply stands ready to hold out the olive branch of peace whenever strife is in prospect, and in the work it has accomplished during the last year it has more and more proved its efficiency and its value in this whole community.

"The principle of this association is the one that I have been working with for more than twelve years, and successfully, I believe. In the companies which I have the honor to represent there are employed about twenty-five thousand men—a good sized army—and we find many differences to work out and many difficulties to solve; and we have had many weeks, many months, of patient negotiation and discussion, and I take it as one of the proudest things I can say that up to the present moment there never has occurred a difference that has not been honorably and amicably settled to the satisfaction of every interest involved. (Applause.)

"It is that kind of thing which the Civic Federation of New England is trying to work out, and I take to this association the credit of much of the industrial peace that exists throughout New England to-day. There never has been a time within my knowledge when there was so little of strife and so little of threat of strife in the borders of New England as at the present moment (applause), and I believe that to no one instrumentality is more of that condition due than to the work which has been accomplished and the influences exerted by the members of your executive and conciliation and other committees.

"I want to add one word more. No organization is ever a success without having in it one man who is the pivot upon which that success turns, and I wish to say, not because he wants or expects me to say it, that this association has that one man in its secretary. (Applause.) Your secretary has conducted, has originated and has helped on negotiations which have resulted in practical good to thousands of people, but he does it in that quiet, unobtrusive way which almost amounts to self-effacement; yet the work has been accomplished. I know of these things, and some of the other members of the committee know of them, but the generality of the Civic Federation cannot, and I think it ought to reach you who may not know, even though our secretary in his modesty would not like to have me speak of the subject.

"Just this much in closing: Every man who works—and we all work—ought to have and must have an interest in every other man, and particularly in every man who works under his direction. There are, of course, well-meaning people who believe that the work of an association like this is unnecessary, but that is usually due to the fact that they have in their own way in the control of the men who work under their direction carried out the same idea. They have met with no troubles, and therefore they do not see why the Civic Federation is necessary. There are others who in a somewhat slurring way criticize the work of the association, who hint that it is giving the workingmen too much control of the business of the employer. The man who says that as a rule is a man who never had twelve men employed under his direction in his whole life (Applause); and the man who says the way to deal with these things is to 'fight it out' is the man that, if he did have the responsibility of a larger number of men, would crawl under the table the moment the fight began." (Laughter.)

OFFICERS FOR THE ENSUING YEAR.

The following officers were elected for the ensuing year: Lucius Tuttle, president; Frank H. McCarthy, first vice-president; Louis D. Brandeis, second vice-president and chairman of the conciliation committee;

John Mason Little, treasurer; Henry Abrahams, recording secretary; Warren A. Reed, vice-chairman of the conciliation committee, and Hayes Robbins, secretary.

Twelve new members were added to the executive committee as follows: On the part of the public, President W. J. Tucker, of Dartmouth College; President W. H. P. Faunce, of Brown University; Hon. John D. Long and Alvin W. Sulloway, of New Hampshire; on the part of employers, Hon. W. L. Douglas, C. L. Edgar, President of the Edison Electric Company; T. E. Byrnes and J. L. Richards; on the part of wage-earners, John Golden, President of the United Textile Workers of America; Samuel Ross, Secretary of the National Spinners' Association; P. F. McCarthy, President of the Vermont State Branch of the Federation of Labor, and Thomas F. Kearney, Secretary of the Building Trades Council, Providence, R. I.

A vote of thanks was tendered Charles H. Taylor, Jr., for his services in the office of treasurer for the past year.

Just before adjournment, upon motion of T. M. Nolan, of the Typographical Union, a rising vote of thanks was extended to the officers and committees of the Federation for their efforts in behalf of mediation and conciliation during the past year.

AS AN AUSTRALIAN SEES US.

Octavius C. Beale, of Sydney, New South Wales, was an honorary delegate and an interested listener at the National Conference on Immigration. His visit to the United States was largely due to his desire to investigate the extent of harmful adulteration of foods and drugs and the means adapted by Government and other agencies for its suppression. He is now in Europe on a similar mission. Mr. Beale, who is the head of Beale & Co., Limited, of Sydney, manufacturers of pianos, is not only a large employer of labor, but is President of

OCTAVIUS C. BEALE.
President, Federal Council of Chambers of Manufactures
of Australia.

(By courtesy of the Music Trades.)

the Federal Council of Chambers of Manufactures of Australia. This organization may be described as analogous to the National Association of Manufacturers of the United States, so that Mr. Beale speaks as an Australian with the same authority with which Mr. D. M. Parry might discuss the business and trade conditions of this country. There is this marked difference between the two presidents, however: that Mr. Beale carries among his letters of introduction strong credentials from the labor leaders of his own commonwealth.

In a conversation with a representative of the REVIEW, the Australian manufacturer spoke with much emphasis of his surprise at the attitude of many American employers toward the question of shorter hours for their workmen. It was almost beyond his comprehension, he said, that in this age and country he should have found so large a number of industrial plants where the day and night shift system of eleven and thirteen hours was in operation, not to mention many cases of a less aggravated nature. He thought it a most serious mistake for any employer to show as little concern as he had seen some men exhibit for the length of the working day; and he was again most emphatic in his prediction that, unless employers in the United States themselves inaugurated reforms in the hours of labor, it was only a question of time when the workingmen of the country would unite and force them to grant an amelioration of present conditions.

Mr. Beale had several interviews with President Roosevelt during his stay in the United States. In one of them the President charged him to advise his Government to encourage immigration, especially from Southern Europe, into the northern part of the island commonwealth.

The National Civic Federation Review

VOL. II., No. 9

NEW YORK, MARCH—APRIL, 1906

TEN CENTS

REFORM OF PRIMARY AND ELECTION LAWS.

RESULTS OF THE SECOND NATIONAL CONFERENCE HELD UNDER THE AUSPICES OF THE
NATIONAL CIVIC FEDERATION.

ONE of the most interesting and important conferences which has yet been held in the interest of Election Reform and of clean government took place in New York City on March sixth and seventh, under the auspices of The National Civic Federation. More than one hundred delegates were present, representing nearly all sections of the country from Massachusetts to Georgia and Texas.

The following were among the delegates present:

Joseph T. Alling, Rochester, N. Y.; Dr. Clarence A. Barbour, Rochester, N. Y.; Albert S. Bard, Citizens' Union, New York; Hon. William S. Bennet, M. C., New York; Robert S. Binkerd, Secretary Municipal League, Buffalo, N. Y.; Henry T. Blake, New Haven, Conn.; R. L. Borden, Leader Conservative Party, House of Commons, Ottawa, Canada; Ernest Bross, Delegate Mayor Bookwalter, Indianapolis, Ind.; Frank T. Brown, Norwich, Conn.; L. Barion Case, West Side Republican Club, New York; Charles Hopkins Clark, Hartford, Conn.; J. Reuben Clark, Jr., Delegate Joseph Howell, M. C., Utah, New York; Alexander Cumming, President Yale Law School Political Club, Yale P. O., New Haven, Conn.; Horace E. Deming, Delegate City Club of New York and National Municipal League, New York; Richard H. Dana, Boston, Mass.; Elmer Dover, Secretary National Republican Committee, New York; Henry M. Doremus, Mayor of Newark, Newark, N. J.; John A. Dutton, Republican Club, New York; Ralph M. Easley, The National Civic Federation, New York; Mark K. Edgar, Director Department of Public Safety, Delegate Mayor Connell, Scranton, Pa.; A. Frank Ferris, Good Citizens' Federation, Grand Rapids, Mich.; Walter L. Fisher, President Municipal Voters' League, Chicago, Ill.; George L. Fox, New Haven, Conn.; Julius J. Frank, Reform Club, New York; George R. Gaither, Delegate Mayor Timanus, Baltimore, Md.; Richard L. Gay, Secretary Election Laws League of Massachusetts, Boston, Mass.; Prof. H. A. Garfield, Princeton University, Princeton, N. J.; Henry M. Goldfogel, Member of Congress, New York; Henry Johns Gibbons, Philadelphia, Pa.; Abraham S. Gilbert, 38 Park Row, New York; James W. Hawes, Delegate Republican Club, New York City,

New York; Learned Hand, Delegate Citizens' Union, New York City, New York; Hon. Lynde Harrison, New Haven, Conn.; William B. Howland, The Outlook, New York; Richard W. Jennings, State Returning Board, R. I., Providence, R. I.; Edward S. Kaufman, Reform Club, New York; Robert N. Kenyon, Alternate Delegate Republican Club, New York, New York; Irvine L. Lenroot, Speaker of Assembly, Wis.; Hon. Seth Low, New York; Robert Luce, Boston, Mass.; Col. Theo. H. MacDonald, Connecticut Commission on Primary Reform, etc., New Haven, Conn.; Frederick F. Meyer, Jr., Newark, N. J.; James G. Monahan, Madison, Wis.; Hon. Roswell R. Moss, Delegate J. Sloat Fassett, M. C., Elmira, N. Y.; Hon. Franklin Murphy, ex-Governor of New Jersey, Newark, N. J.; William Church Osborn, New York; N. G. Osborn, New Haven, Conn.; John E. Owens, Delegate Mayor Dunne, Chicago, Chicago, Ill.; John H. Perry, Southport, Conn.; Roland Phillips, National Civic Federation; Josiah C. Pumpelly, New York; Josiah Quincy, Boston, Mass.; George L. Record, Jersey City, N. J.; Howard D. Ross, Delegate Mayor Wilson, Wilmington, Wilmington, Del.; George Frederick Rusb, Chicago, Ill.; Charles R. Russell, Chairman Committee on Elections, General Assembly, Ga., Columbus, Ga.; Joseph E. Ransdell, Member of Congress, Louisiana; Ralph Curtis Ringwalt, New York; Hon. John O. Sheatz, House of Representatives, Pa., Philadelphia, Pa.; Thomas K. Skinner, Delegate Mayor Wells, St. Louis, St. Louis, Mo.; David S. Snedden, Professor Stanford University, Delegate Commonwealth Club of San Francisco, California; Edward B. Sturges, Scranton, Pa.; Mark F. Sullivan, 215 West 23d Street, New York; Hon. A. W. Terrell, Austin, Tex.; Charles Arthur Trimble, Elizabeth, N. J.; Col. Isaac N. Ullman, Delegate Mayor Studley, New Haven, Conn.; C. V. C. Van Deusen, New York; William D. Washburn, Jr., Minneapolis, Minn.; William R. Wheeler, San Francisco; Fred H. Whitin, Delegate West Side Republican Club, New York, New York; Oliver Whitson, Delegate Hon. William W. Cocks, M. C., New York; Leighton Williams, New York; Rev. Alfred Wshat, Trenton, N. J.; Clinton Rogers Woodruff, Philadelphia, Pa.

The discussions were listened to with great interest, the speakers being for the most part men who have taken leading parts in the practical solution of the questions under consideration. At the close of the

conference, which took up in order the three general subjects of (1) primary laws, (2) ballot reform, and (3) corrupt practices, the following resolutions were unanimously adopted, the purposes being, first, to make provision for the permanent organization of the conference under the direction of The National Civic Federation and, second, to put on record the consensus of opinion of the delegates on the subjects of the purchase of votes and of corrupt practices legislation.

These resolutions were adopted:

First, "Resolved, that The National Civic Federation be requested to establish a permanent department or branch of its organization to take jurisdiction of the subjects which the conference was called to consider, all of the members of this conference to become members of such department, and that the Civic Federation be requested to call another meeting of this conference at such future time as may be deemed expedient;" and, second, "Resolved, that experience shows that existing provisions of criminal law against the purchase of votes are inadequate; that proper corrupt practices legislation should include (1) the publication of all contributions and expenditures; (2) the prohibition of political contributions by corporations; (3) the definition and limitation of permissible political expenditures; (4) provisions for judicial inquiry into election expenditures and existence of corrupt practices, in which proceeding any citizen may participate; (5) the punishment of corrupt practices by further penalties such as disenfranchisement or disqualification for office, in addition to fine or imprisonment."

HON. OSCAR STRAUS.

HON. R. L. BORDEN.

HON. SETH LOW.

The committee appointed to prepare these resolutions as announced by Oscar S. Straus, temporary chairman of the conference, consisted of:

Josiah Quincy, Chairman, Boston, Mass.; Walter L. Fisher, Vice-Chairman, Chicago, Ill.; A. W. Terrell, Austin, Texas; Richard Henry Dana, Boston, Mass.; Richard W. Jennings, Providence, R. I.; John H. Perry, South Port, Conn.; Lynde Harrison, New Haven, Conn.; Wm. Church Osborn, New York; James W. Hawes, New York; Harry A. Garfield, Princeton, N. J.; Henry M. Doremus, Newark, N. J.; Thomas Raeburn White, Philadelphia, Pa. (Henry John Gibbons, proxy); John D. Sheatz, Philadelphia, Pa.; Howard D. Ross, Wilmington, Del.; Geo. R. Gaither, Baltimore, Md.; Percy C. Jones, Toledo, Ohio; Ernest Cross, Indianapolis, Ind.; John E. Owens, Chicago, Ill.; Irvine L. Lenroot, Superior, Wis.; T. K. Skinker, St. Louis, Mo.; D. S. Snedden, San Francisco, Cal.; Charles R. Russell, Columbus, Ga.; Joseph E. Ransdell, M. C. La.; Leo E. Bennett, Indian Territory; A. Frank Ferris, Grand Rapids, Mich.; W. D. Washburn, Jr., Minneapolis, Minn.

The Session on Primary Reform.

In opening the conference, Oscar S. Straus read a paper vigorously denouncing the pernicious system of "boss" rule in our political life. He sounded the keynote of the conference in asserting that a free and full discussion of Primary Laws, Ballot Reform and Corrupt Practices would be a decided step in our progress toward clean government. Mr. Straus said in part:

"Eight years ago in these rooms, on January 20th and 21st, 1898, under the auspices of the Civic Federation, since enlarged to The National Civic Federation, was held the first National Conference for the Reform of Primary Elections.

"The subject was debated for two days, and a committee on permanent organization was elected, and as the chairman of that committee I have the honor to welcome you to this second National Conference, likewise called under the auspices of The National Civic Federation.

"There is no subject to-day of more vital concern to the people of this great democratic Republic, irrespective of party affiliations, than that the principles of popular government which the fathers of our Republic wrested from the grasp of monarchical usurpation shall be handed down from generation to generation pure and undefiled.

"The brave and fearless conflict between honest and dishonest politics has seldom if ever won so signal and precious victories for the moral law as were achieved by Governor Folk of Missouri, by Mayor Weaver in Philadelphia, by Senator Colby in New Jersey, by Jerome in New York, and by the Prosecuting Attorney in Boston, and by similar victories against long entrenched bossism under the stimulating helpfulness and uncompromising attitude of Secretary Bonaparte in Maryland, and Secretary Taft in Ohio.

"The encouragement following these victories has spread far beyond the States and cities in which they were won, so that throughout the length and breadth of our land the 'plain people' who love their parties and their country, who by degrees have been literally disfranchised by the bosses, have been aroused to an appreciation of their rights and to a sense of their power; and from this awakening has resulted a renewed effort to break the chains of boss rule and to reclaim their rights as members of their party and as free and independent American citizens. Let us not forget in the discussion of the topics of reform that will come before us, important and necessary as they are, that all these are but means to the end, and that no political contrivance, however minute and drastic, can serve as a substitute for the indifference of the general body of electors, or for the lack of the ever-watchful spirit of unselfish patriotism."

Following the address by Mr. Straus, the Honorable Josiah Quincy, ex-Mayor of Boston, took the chair as chairman of the first session of the conference and introduced Horace E. Deming, delegate of the City Club of New York and of the National Municipal League. Mr. Deming contended for more appointive and fewer elective offices and pointed out what in his opinion are some of the proper conditions and safeguards of candidacy for such offices as are elective.

As it is the intention to have the speeches made at the conference reprinted *verbatim* in pamphlet form, only the briefest résumé of the proceedings can be given in this issue of the Review. Mr. Deming said in part:

"Under the present system, each citizen, in order to influence nominations, must ally himself with a recognized political party organization, and in casting his nominating vote must choose his candidates for national, for State, and for municipal offices all from a list of men bearing the badge of that organization. The individual citizen may appreciate the incongruity of this, but he has no choice in the matter. The nominating election should be a public election to determine as to each elective public officer who, as a candidate for that office, shall have the right as the sole representative of a given set of political principles properly applicable to its conduct to have his name

HON. A. W. TERRELL.

appear upon the official ballot used at the general election. Prior to registration day, let every candidate for nomination be announced as such candidate, together with a statement of the platform of political principles upon which he stands, each distinct set of principles being denoted by a short title or phrase; let the names of all candidates for the nomination be printed by the State upon an official nominating ballot delivered to the voter upon a registration day and immediately after registering, and let the voter mark secretly upon it his preference among all the candidates for nomination to each office; let the ballot then be deposited in the ballot-box under exactly the same circumstances as at the general election, and at the close of the polls let the votes be canvassed and the result be announced, as at the general election; upon the official ballot used at the ensuing general election, let only such policies and candidates appear as have successfully passed the two tests set forth above. In this way the local interests of the city could be freed from confusion with national politics; and municipal elections could be fought out by local parties, which would appear and disappear according as local issues did or did not warrant their existence.

"The incongruity and absurdity of having so many elective offices would be brought out clearly, and the day would be hastened when the nine out of ten offices now elective which should be appointive would be taken out of politics."

THE NEW JERSEY PRIMARY LAW.

The chairman then introduced the Honorable George L. Record, Corporation Counsel of Jersey City, who spoke on the New Jersey Primary law. "The New Jersey law," said Mr. Record, "is a combination of the direct vote and the delegate vote. This law was passed under the Governorship of Governor Murphy, to whom the credit in my judgment almost entirely belongs for placing it upon the statute book. Now, a contest was had in Essex County, New Jersey, in which Everett Colby fought a machine successfully. I will tell you exactly the steps that he took to do it, and in that way you will see the New Jersey law. In each ward of each city and in each township of that county ten Republican voters signed a petition to the local city or municipal clerks something in this fashion: 'To the County Clerk of _____ Township: We, the undersigned ten voters of the Republican party residing in this Ward or Township, petition you, the Town Clerk, to print upon a Republican primary ballot the names of the following men as candidates or delegates to the County Convention of the Republican Party.' Then followed the names of the number of delegates which the law provides shall go to each township or ward. Thus far, you have simply the delegate system. We provided that the delegates next nominated might, if they chose, add a petition, in which they could say, 'We petition the City Clerk when making up the official ballot to group our names together, to put a bracket opposite, and opposite that bracket to put the name of Everett Colby under the words, 'Choice for State Senator.' Then those petitions went to the Town Clerk. Meanwhile, what we will call the Machine put in its petitions too, in which it nominated in each ward its delegates, and these delegates had their names printed upon the official ballot. Now, the Town Clerk or the City Clerk made up the official ballot for the Republican party, and this appeared: 'Official primary ballot for the Republican party. Candidates for the delegates to the County Convention. Vote for six (or whatever number there may be in each ward) by erasing all the names except the six, for whom you wish to vote.' Of course all the other conventions are represented,

but I am taking one as a sample. The City Clerk made up the ticket in that way, and he grouped the delegates pledged to Colby in the manner in which I have indicated, and then at the bottom, or ahead of them he put the delegates named by the Machine or by any other group in the party that chose to contest, and there was the ticket. You could buy that ticket under the New Jersey law by depositing money with the City Clerk and distribute it in advance of the election.

"Now, the voter on primary day, which is the first registration day, goes to the polls and there registers and asks for a Republican ticket, gets it, puts it in his pocket, goes into the booth, draws a line through every name except those bracketed opposite the name of Colby, if that is his preference, comes out and unless challenged votes that ticket in the Republican box, there being a ballot box for the Republicans and another for the Democrats. If challenged, he makes oath as to his membership in the party, and if he makes that oath his vote must be received. There is no discretion in the Election Board, but he can be punished for a false oath. At night those ballots are counted; they are certified by certificates to the Town Clerk; the Town Clerk adds them all up and the delegates in the party receiving the highest number to the extent of six, we will say, in each Ward, or whatever the number may be, receive from him certificates that they are elected, and these certificates are their credentials in the ensuing election. If there is any attempt to evade that, we have provisions for appealing to the courts."

One of the points brought out by Mr. Record in explaining the operation of this law was that under the system it required a strong man to defeat such a candidate as Colby; and as the "boss" could not put up a strong man and still retain his supremacy his defeat from the start was pretty certain. He added, however, that in his judgment no such system would be successful if the "blank checks" of corporations as in the Colby campaign were available for the "machine" candidate.

THE MINNESOTA PRIMARY LAW.

William D. Washburn, Jr., delegate from Minnesota, outlined some of the provisions of the Minnesota law as follows:

"The Minnesota Primary Law involves the return to the first principles of Democratic Government.

"Its object is to permit the free citizen to vote for whom he pleases without restraint. The existing law includes the following features:

"It applies to all candidates for all elective, district, county and city officers, and elective members of school board, park boards and library, in all cities having over one hundred thousand inhabitants.

"The Primary Election is held seven weeks before the regular election, and includes the safeguard of the Australian Ballot System under the General Law.

"Political parties must have had at least ten per cent. of the vote cast in the preceding election or such party may appear on the ballot by filing a petition with ten per cent. of the actual vote. New parties may also go upon the ballot by a petition provided under the General Election Law.

"All candidates must file their intention to run with the County Auditor at least twenty days before the election. The fee for filing is ten dollars in one county and twenty dollars for an office covering two counties.

"Two weeks before election the County Auditor must prepare a separate ballot for each party for public inspection. Such tickets must be twice printed in full in a legal paper of the county. Rotation in place upon the ballot is also provided, so that each candidate appears first upon the ticket an equal number of times.

"The City Clerk must also give public notice of the time and place of election, and must post the names of all candidates at each precinct voting place.

"Judges and Clerks are appointed under the General Election Law and each Judge appoints two clerks. Ballot boxes are provided for each party, and one box for such women as wish to vote for the school board. No voter may receive a ballot until he has registered and he is required to cast a ballot of his own party, which must be the party for which he voted at the last election.

"This machinery thus provides that the voter be permitted to cast his vote without any restraint, and while it may possess certain defects, these are inherent in the character of the voter, and not in the system which is provided for free registration of his vote."

THE NEW YORK PRIMARY LAW.

Hon. Abraham S. Gilbert, of New York, spoke of some of the features and of some of the objections to the New York Primary Law as it now stands. Mr. Gilbert said:

"In our Republican County Committee in the City of New York, the leaders of which were in favor of direct nomination, what happens when a broad and important question is presented? A committee is selected to investigate and report. Why? Because the subject cannot be properly handled by seven hundred and eighty men in one room; because a committee of seven intelligent, earnest men can hear the arguments pro and con and get down to the meat of the question, say what, summing it all up, they believe, and

then present their conclusions to the seven hundred and eight men for discussion. Now, under the law of New York this is generally the plan, and I will try to point out my objections to our law. Under the present law a man may enroll himself as a member of either one of the dominant political parties, take part in the official primary of the party in which he is enrolled as a member, be elected a delegate to a nominating convention and even take part in the nominating convention, and yet, after the nomination of the party has been made, join in an independent nomination in opposition to the party nominee. I say that this is wrong. I say that when I join a political organization I agree to be bound by the majority decision. Now, here is the trouble. The organization presents the ticket on which we first find in every election district the names of all the delegates to the County Committee, and they run as high as sixty or seventy in an Assembly District, sometimes—the members of the District Committee. You then find a dozen delegates to an aldermanic nominating convention, and so on, and you don't know the men on the ticket. Now, you have absolutely free say. You can vote that ticket or mark another one, but there is your trouble; you have to vote a complete ticket of delegates selected by the leaders. The leader has the selection of all these delegates and he chooses or selects all he knows. That is my objection to the law as it now stands. The delegates are then elected to the convention. I am not at all talking in favor of conventions as they are now conducted, but of conventions properly conducted. These conventions nominate the party candidate. Now, the independent people of New York have the simplest kind of a law, providing that one hundred men in a whole assembly district can sign a petition and nominate any independent man they please for assembly; five hundred for other offices, a thousand for still others. Their names go upon the official ballot. Now, in this city we appreciate that in one block or in half a block there are anywhere from five to six hundred voters. That means a good many thousand people; five or six hundred voters in a block. My contention is and has been for some time that those five or six hundred men ought to have a direct voice in the selection of candidates. My plan is, to have an assembly district cut into small districts; have the enrolled members of the party in an election district select a representative to a district committee, which shall be a powerful organization, and a representative one, one close to the people—as close as you can get it—and let those men, according to the population of the party vote, one or two in an election district, select the candidate for assembly, select the candidate for alderman, and be the delegates to every other convention in the City of New York.

Mr. Gilbert's speech closed the first session of the conference. At the afternoon session of March sixth the Honorable Franklin Murphy, ex-Governor of New Jersey, was introduced by Mr. Reynolds, Chairman of the Committee on Arrangements, and was selected as Chairman of the second session of the conference. Ex-Governor Murphy spoke of the value of the information given by the various speakers and suggested that the Committee on Arrangements adopt the necessary plans to put this information to practical use. The Hon. George Fred Rush, of Chicago, was then introduced and spoke on the Illinois Primary Law.

THE ILLINOIS PRIMARY LAW.

"Many writers," said Mr. Rush, "have stated that most of the evils attending primary elections would

vanish if party nominations as such were abolished and placed on the same footing as nominations by individuals, as in England. But this simple method of nomination in the United States cannot, in my opinion, be put into effect here, because the party prizes of government and of office holding are greater here than there. In the experience of Illinois two systems have been tried:

"(1) The indirect or convention system, wherein the law gives to the parties a method which simply ensured that the delegates to the nominating convention were honestly elected and seated.

"(2) The direct system, wherein the law furnished parties a method whereby the members of a party should vote directly on various names to determine the nominee of the party.

"Illinois has progressed beyond the first method and is making fair attempts at the second method. A sound, acceptable, simple and complete direct primary law has not yet been placed upon any statute book, and the Illinois law has its defects.

"Governor Deneen and Mr. Roy O. West deserve great credit for their labors to make good the Republican State platform demand for a compulsory primary law for the whole State. The Governor and his co-workers exceeded their party promises and caused the enactment of not merely a compulsory primary law, but one containing so many features of a direct primary system as to entitle it to the name of a 'direct primary.' Its chief defects of substance are that nominations depend upon a majority vote instead of a plurality vote, and that too many offices are exempted from the operation of the law."

Mr. Rush then noted the main features of a direct primary law drawn by himself for the City Club of Chicago and closed his remarks with a discussion of the rights—or in his opinion the *lack* of rights—of citizens to vote at a party primary.

The Honorable Irvine L. Lenroot, Speaker of the Assembly at Madison, Wis., who followed, spoke on the Primary Law in Wisconsin:

WISCONSIN'S PRIMARY LAW.

"It would be interesting," said Mr. Lenroot, "to detail the history of the contest, waged for eight years, which finally resulted in the adoption of our law, a contest which has no parallel in the political history of this nation. Upon this issue Senator LaFollette was elected governor for three successive terms. Arrayed against him, and the measures he advocated, were every railroad and other public service corporation, every politician without visible means of support, and every interest seeking or enjoying special legislation for private purposes.

"The machine fought every inch of the ground. Nominations by direct vote were promised in three successive platforms of the Republican party, and in one of the Democratic party. But we learned that under the delegate and convention system the power of the machine was greater than the binding force of a party pledge; that with a majority of the members of our State Senate, when they were compelled to make choice of masters, the people or the machine, the machine was chosen, and the honor of the member, the will of the people, counted for nothing. To bring this about every resource of the professional lobbyist, of the corrupter of good government, was employed. Many members served the machine through gratitude for past and present favors, and the promise of others to come. Others served it through fear of railroad discrimination in their business, and financial ruin to

themselves if they refused to do its bidding. But to the honor of the people of Wisconsin be it said, that few of the men who betrayed their constituents in that great contest are in public life to-day.

"The contest was finally won, and won, it is true, under the caucus and convention system, but it was only through the greatest popular uprising which the State had ever known. It was won in spite of the caucus and convention system, not because of it.

"In 1903 our Primary Law was passed and signed, but attached to it was a referendum, providing for its submission to, and adoption by, the voters at the general election of 1904, before becoming operative. It was adopted by a majority of over 50,000.

"In 1901, seeing that the Primary Bill was beaten in the Senate, its friends proposed a referendum. It was refused and was the subject of savage attack by the machine as being socialistic and revolutionary. In 1903 the machine proposed the referendum, not in good faith, but to postpone the operation of the Primary Law until after the campaign of 1904, and in this it was successful.

"Our law provides that all candidates for elective offices (town, village and judicial officers excepted) shall be nominated at a primary held under the provisions of the act, or by individual nomination papers. One primary for all parties, conducted by the general election officers, at public expense, and so far as possible in accordance with the general election laws, is provided. For general elections the primary is held upon the first Tuesday in September preceding, at the regular polling places in each precinct of the State. Other primaries are held two weeks before the election for which the primary is called. Ample provision is made for public notice of the primary.

"The name of no candidate can be printed upon the official primary ballot, unless at least thirty days prior to the primary, a nomination paper, signed by a certain number of electors, shall have been filed in his behalf. A minimum number of signatures to such nomination paper is prescribed for each office, the smallest being one per cent. of the voters of the party of the candidate, in the case of State officers, based upon the vote at the last preceding Presidential election.

"The names of all candidates appearing upon the ballot are published for three consecutive weeks in at least two, and not more than four newspapers of general circulation in each county.

"Separate tickets are provided for each party, the names of all candidates being placed thereon alphabetically, under the appropriate title of each office. In addition a non-partisan ticket is provided for, and non-partisan nominations may be made in the same way as party nominations.

"The open primary is adopted. The official ballot is made up of the several party tickets, securely fastened together at the top. No person not registered can vote, where registration is required at general elections, but primary day is also a registration day, and the voter may register at that time.

"The voter receives the ballot from the clerks, and retires to the booth. There he selects his party ticket from the ballot, and prepares it in the same way as a ballot is prepared at a general election, making a cross opposite the name of each candidate for whom he desires to vote. After the ticket is prepared he detaches it from the remaining tickets, and folds it. The others, attached together and unmarked, are also folded, and the elector votes the marked ballot, and deposits the remaining tickets in a separate box, designated as the blank ballot box.

GEORGE L. RECORD.

I. L. LENROOT.

ROBERT LUCE.

"The votes are canvassed in the same manner, and by the same officers as at a general election. The person receiving the greatest number of votes is nominated as the party candidate for the designated office, and his name is placed upon the official election ballot. But one ticket can be marked. In other words, the voter must select his party in the booth, and confine his votes to the candidates of that party.

"In each precinct a committee of three is elected at the primary. The person receiving the largest number of votes is made chairman. The precinct committees of each ward or town elect from their number a ward or town chairman, who must be a chairman of a precinct committee; they also elect a member of the county committee. The Assembly District Committee is composed of the chairman of the precinct committees in the district. The State senatorial committees are composed of the chairman of the Assembly District committees in each senatorial district; the congressional committees, of the chairmen of the senatorial district committees.

"Candidates for the United States Senate are nominated at the primary in the same manner as State officers.

"The candidates for the various State offices, and for senate and assembly, nominated by each party at the primary, and the holdover State Senators of such party are required to meet at the State Capital on the fourth Tuesday of September, succeeding the primary, and formulate the State platform of the party. They shall also select a State central committee of at least two members from each congressional district, and a chairman of such committee.

"Penalties are prescribed for bribery and violations of the law.

"This is a general outline of our law. As you have observed, it provides for nominations by a plurality vote. At the next session of our legislature we shall endeavor to secure the adoption, in its general features, of the plan of Mr. Remsen, of this city, providing for the elector expressing his first and second choice for the candidates for the different offices.

"As you have noticed from this outline, the prominent features of our law are:

- "1. Nominations by direct vote.
- "2. A compulsory primary for all parties, held on the same day, conducted by public officials, at public expense.
- "3. The open primary and method of voting.
- "4. The selection of party committees and the adoption of party platforms.

"The first and second are the really important features. The others are matters of detail."

DEFECTS IN THE WISCONSIN LAW.

Mr. James G. Monahan, of Madison, Wis., Collector of Internal Revenue for the Western District of Wisconsin, followed Mr. Lenroot and said that, in his opinion, far from being a good thing for the State, the primary election law of Wisconsin contained many features which were both burdensome and bungling. Mr. Monahan said: "The primary election law of Wisconsin, instead of curtailing the power of the boss, increases it; instead of destroying machines, fosters them; instead of protecting the rights of the people, in many instances takes away those rights; instead of relieving them from taxation, adds to their burdens; instead of bringing the people nearer to the source of power, removes them farther away. To make the objections to the law clearly understood, I will briefly specify some of them. First, it compels the candidate to make two campaigns to secure an office and forces him to waste time unnecessarily and spend more money than he can afford, and, before he can even become a candidate and have his name printed on the primary ballot, he must secure from 1 to 4 per cent. of the voters of his party to sign the petition asking him to become such candidate. This alone will defeat many modest men with but little money from becoming candidates; second, it will practically deprive the farmer vote from a voice in either county or State affairs; third, unnecessary taxation is unjust taxation, and the Wisconsin law will impose a tax approximating \$150,000 upon the people every time it is put into operation; fourth, under the provisions of the Wisconsin primary, we have abandoned the system that majorities may rule for one that minorities may govern—a plurality vote nominates; fifth, the Wisconsin primary law takes away from the people absolutely the right to make the platform, and gives the power to the candidates for the various State and legislative offices nominated by each political party at such primary. Sixth, the law makes it impossible to consider location or nationality in the nomination of tickets; seventh, the law in principle is a long step toward the abandonment of representative government bequeathed us by the founders of this Republic; eighth, by indirection, it virtually takes away from the people the constitutional right 'Peaceably to assemble to consult for the common good.' It does not forbid such assembling, but takes away both the incentive and the opportunity."

THE PRIMARY ELECTION IN GEORGIA.

After outlining some of the provisions of the Political Code referring to elections, the Hon. Charles E. Russell, Chairman of the Committee on Privileges and Elections

of the Legislature of Georgia, spoke on the Primary Election Law in Georgia. Mr. Russell said in part:

"In a Democratic primary election held in my home county, Georgia, in which I had the honor of being elected to the House of Representatives, the Executive Committee, pursuant to a resolution unanimously adopted at a mass meeting held in Muscogee County, formulated rules and regulations calling for a primary election, very closely resembling the Australian ballot system and deviating therefrom only in the following points:

"The ballot obtained by the voter entering the booth or enclosure must contain the facsimile signature of the Chairman and Secretary of the Committee and, also, have printed thereon the number of votes cast in that booth. This is entered on the polling list by the clerk, so that no fraudulent or corrupt practice can be used to trick the ballot. The rules require that the ticket when folded by the voter shall show plainly the number of the ticket.

"Another rule provided for certain impersonal signs, emblems or characters, to be placed on the left of the name of each candidate, which would easily designate to the illiterate voter the person for whom he desired to vote, a true copy of said ballot being published in all the daily papers prior to the date of the primary. The rules further required that the voter should have one minute after entering booth to prepare the ballot, and no one should be allowed to assist in marking his ballot in any manner whatever.

"There was an ample number of booths and voting places to provide for the registered voters, and this system worked most excellently and satisfactorily to the entire community.

PROF. H. A. GARFIELD.

"Our statutes also make it a misdemeanor for any person to sell or furnish intoxicating liquors within two miles of an election precinct, and the only persons not permitted to vote at a regular election are those convicted of treason against the State, embezzlement of public funds or malfeasance in office, bribery, larceny or any crime involving moral turpitude, unless such persons shall have been pardoned. No voter shall be subject to arrest by a civil officer or shall be served with any writ or civil protest while going to, or returning from, or during his stay at, the voting precinct under a penalty of \$500.

"As our party nominations are equivalent to elections, it is the consensus of opinion in Georgia that the will of the voters should be freely and truthfully expressed and accordingly declared."

Following the paper by Mr. Russell, five-minute speeches were made by Messrs. Humphrey, Wadhams, Hendrick, Morse and Allee, the general tone of the addresses being favorable to the enactment of any primary laws which shall have the ultimate effect of making the will of the public the dominating force in our municipal, State and national elections.

The Session on Ballot Reform.

Under the chairmanship of Clinton Rogers Woodruff, of the Ballot Reform section, the first paper on the subject was presented by Albert S. Bard, New York City.

Mr. Bard outlined briefly some historical points referring to the use of the ballot in elections and pointed out that in his opinion, the ideal ballot should have seven chief qualifications:

1. Secrecy.
2. Honesty.
3. Simplicity.
4. Fairness to both candidate and voter.
5. Fairness as between different classes of society.
6. Opportunity to vote quickly, and
7. It must be easy to canvass and count.

In describing the three existing methods of using the secret ballot to-day the speaker divided these types into the separate party ballot, the office group blanket ballot and the party column blanket ballot. He laid stress on the differences in the reform of the ballots of the different States and showed, on account of the great variety of conditions under which elections are held in the United States, what a difficult problem has to be faced by those who undertake to study the question of ballot reform.

THE CONNECTICUT BALLOT LAW.

Mr. Henry T. Blake, of New Haven, in outlining some of the provisions of the ballot law in Connecticut, said that in that State a ballot contains only a single ticket, and the State supplies blanks for the ballots at cost to any one who applies, and on these ballots each party or political organization prints its own ticket. Mr. Blake pointed out that, as the State neither prints nor distributes the party ballots, there is no limitation of time within which nominations must be made and the ballots printed. Any organization and any individual may make up such a ballot as he pleases up to the time of closing the polls, and may put it in the field and get as many supporters as he can. This gives free scope for independent tickets if the regular party nominations are not satisfactory and, moreover, the dominating influence of primaries over the election is curbed and the success of the tickets depends largely on the character of the candidates. The speaker pointed out that some of the reasons in favor of the Connecticut form of ballot are that it is simple and convenient; that it secures facility and secrecy in the act of voting; that it is favorable to independent voting; that it is adaptable to changing conditions, and is economical. Mr. Blake admitted that bribery is possible with the envelope system of voting, but contended that it is rare because of the risk involved by all parties concerned.

In presenting Prof. Harry A. Garfield, of Princeton, the Chairman, Mr. Woodruff, stated that, in his opinion, one reason why we have so much straight party voting in this country is the multiplicity of public offices. Referring to the ballot reform law granted by the Pennsylvania Legislature in 1903, he remarked that it is well to scrutinize closely all laws which pretend to reform the ballot, for in Pennsylvania it was his opinion that every "last condition is worse than the first." Prof. Garfield took the ground that what we need is to elect men to public office who do not necessarily represent one idea or one faction, but who are fully equipped to carry out the duties of office. He argued from that the necessity of having a ballot which should enable every voter to express an opinion as between various men on the ticket with the utmost freedom. Referring to the Connecticut ballot, Prof. Garfield said that his objections could be reduced to a single point, viz., that the fundamental principle was in his judgment, wrong, for it really amounted to nothing more than the old "vest pocket" ballot. He contended that such a ballot made bribery a comparatively easy matter and that, in his judgment, the question of economy in printing really did not count. The Connecticut ballot puts a premium upon party voting and does not procure for the individual voter enough freedom of choice.

The next speaker, Mr. C. V. C. Van Deusen, formerly Assistant Secretary of Elections in the City of New York, defended the New York ballot law and the party column ballot as opposed to the Connecticut and Massachusetts type of ballot. The speaker laid down as a premise that the freedom of ballot or the system of voting bears little, if any, relation to or effect upon corrupt practices at elections except that, under certain systems, such practices are more difficult of detection and punishment. In his judgment, the establishment of a course of instruction in all the grades of our public schools would do more in twenty years to purify politics than twenty centuries of legislation has done. "The Connecticut form of ballot," said Mr. Van Deusen, "is practically the same as that in use in New York from 1890 to 1896 without the official envelope. The latter feature does not compensate for the objections raised to the separate party and independent tickets, and certainly the Connecticut and New Jersey systems, which are almost identical, leave the door wide open to the briber." While contending that in States like Massachusetts which have adopted the office group ballot, all candidates except those at the head of the ticket, are slighted, the speaker admitted that certain objections are raised against the form of ballot in New York; first, that it is too complicated in regard to the markings permitted the voters; that it does not lend itself to independent voting for candidates of various parties and independent bodies; and that it is difficult to canvass, thus permitting a loss of a great percentage of the votes cast. Under the New York system, while many votes are returned as blank, such votes are "infinitely less under our form of voting than under the office group system. I contend that with the adoption of a few amendments to our present law, which will simplify the tally sheet and modify the technical bookkeeping now entailed in making out the returns, we will have an almost ideal law."

THE BALLOT LAW OF TEXAS.

Hon. A. W. Terrell, of Texas, former United States Minister to Turkey, and author of the Election Law of Texas, known as "The Terrell Election Law," referred in his paper which followed, on the ballot laws of Texas, to the widely different conditions to be met in solving the problem by States of the North and South. "What the country now needs," said Judge Terrell, "both North and South, is a system of election laws which will tend to diminish the depraved, the purchasable and the reckless class of voters. Any system based on the desire to have what is called 'A full vote' must end in failure. What the country needs is a voluntary and honest vote, and not a vote that is controlled at the polls by the ward heeler, the campaign boss or the machine demagogue."

"What we in Texas require is, first, to make the citizen perform some act for the public benefit each year to evince his desire for good government and to perform that act voluntarily before a political campaign begins and make his right to vote depend upon its performance; second, to protect the citizen against machine politics, convention dictation and corrupt methods at the polls." With regard to the kind of ballot used in Texas, Judge Terrell said: "A uniform official blanket ballot is furnished each voter by the presiding judge on which every party ticket and an independent ticket, if there be one, is printed, and the voter is not permitted to have in his possession when he enters the booth any other ticket or paper to guide him in casting his vote. These and other precautions have caused the work of advancing poll tax money, or otherwise buying a vote, to almost cease, for the purchaser of a vote is careful in advancing money when he has no means of controlling the vote. A direct primary election is required of all organized political parties that cast 100,000 votes at the last preceding general election."

Hon. William S. Bennet, of the 17th District of New York City, spoke upon the general subject of direct nominations with especial reference to New York. He said: "Up to a certain point the law in the State of New York in relation to the nomination of party candidates is one of the best in the country. The primaries are held under the direction of State officers on a day fixed by law, are participated in by all parties of any size and the polls remain open for a definite, fixed and extended period. Experience has demonstrated that all these matters are essential to the existence of any proper system of primary nominations." The speaker's objection to the system was that the individual voter, Republican or Democrat, had, as a matter of fact, no voice in nominations, nor the right to have his say in relation to the nomination of any particular candidate without at the same time overthrowing the entire organization of his party in the district in which the candidate is to be nominated. "As I said, the nomination law at present is admirable so far as it goes. It may be readily adapted to direct nominations. The change required would be slight. The simple elimination of the convention and the substitution thereof of the names of nominees on the primary ballots instead of the names of delegates to the convention, would effectuate the change. Should it be desired to extend the system to State officers, the provisions of the Wisconsin statute in relation to the preparation of a party platform by the nominees of the party might be added."

THE BALLOT SYSTEM IN MASSACHUSETTS.

Hon. Josiah Quincy, ex-Mayor of Boston, was introduced by the Chairman, and spoke informally about

the merits of the Massachusetts ballot system. The Massachusetts law rests upon the theory that an election is not a choice between parties, but a choice between candidates—between men who are candidates for particular offices. Mr. Quincy said that after an experience of eighteen years in Massachusetts with the Massachusetts ballot law, he was convinced that both in theory and in practice the Massachusetts form of ballot has proved effective as opposed to the party column form of ballot. Under the Massachusetts law the voter is obliged to make a selection between the candidates for each particular office. One objection to the Massachusetts form of ballot is that it constitutes in itself a substantial educational qualification and, therefore, is out of place in States which have not an educational qualification. Mr. Quincy pointed out in answer to this that, in the first place, the educational qualification of Massachusetts is a very limited one, and, second, that any Australian ballot system has in a measure necessarily an educational qualification. Another objection to the system is that it results in the great falling off of the vote. The speaker admitted that this was true. He replied to the objection by calling attention to the fact that under the best conditions only a percentage of the voters exercised the privilege of franchise, and he raised the question whether it is not "exactly as legitimate that the voter who goes to the polls should refrain from exercising his total franchise as it is that a certain proportion of the voters should choose to stay away from the polls altogether."

Following Mr. Quincy, Mr. Richard W. Jennings, Secretary of the State Returning Board of Rhode Island, said that he did not propose to criticize the Massachusetts ballot, but that this system would not be the best for Rhode Island. In Rhode Island the situation on election day is complicated on account, some years, of choosing at one time Presidential electors, congressmen, State officers, members of the legislature, city officials, members of the city council and of the school committee. Further complications arise from the different methods of electing members of the legislature and general assembly. According to Mr. Jennings, the alphabetically arranged ballot, with the names of candidates grouped under each office, produced for a number of years a startling number of blank and defective votes, and, therefore, a large percentage of the voters was disfranchised. The party column ballot is now in use in Rhode Island and, while it has been tested by only one election, the results seem to be satisfactory. The blank and defective ballots have been signally reduced.

The Session on Corrupt Practices.

The fourth session of the conference was called to order by Mr. Reynolds, who introduced, as Chairman of the afternoon, ex-Mayor Low. Mr. Low said: "The subject of corrupt practices at elections has been one that has attracted growing attention in all parts of the country. There has come to be a pretty keen realization of the fact that vast sums are spent (often unnecessarily, often improperly) and people realize with increasing unquietness that the result of an election here and the result of an election there has been determined by the use of money. Further than that, there is a growing conviction that the electorate itself is being progressively debauched, for on every hand those who look into the subject are compelled to realize that constantly growing numbers of men will only vote for their own party when they are paid for it. They may not vote—perhaps could not be persuaded to vote against the side that

they want to support by any amount of money, but they have come to look upon payment for time, as it is euphoniously called, as one of the privileges attaching to citizenship."

"There is a most hopeful movement in progress now, as many of you know, to secure publicity—the requirement of publicity as to election receipts and expenses through the action of Congress, and the same movement is taking place in many of the States. In some States it has already gone so far as to place laws upon the statute books. That is the case in the State of New York, and this year there is a determined effort being made to improve those laws. I think I may fairly say that in the judgment of that association there are at least four points that must in some way be covered.

"The first is this question of publicity, as to which there is very little difference of opinion.

"The second is the prohibition of campaign contributions by corporations. And as to that again there is very little difference of opinion.

"The third is to pass an act that in some form or another shall make it possible to establish by judicial inquiry the fact of bribery, if there has been such in any election district, with a penalty to the party using it of losing the benefit of the votes obtained in that electoral district.

"In other words, we feel that a remedy or *the* remedy for the evil is not to be found in criminal statutes and in fines, but it must be sought along the line of making it unprofitable to the candidate on whose behalf bribery is used, if bribery is to be stopped.

"And in the fourth place, our association at any rate feels that either through the activity of some public officer who is independent of both parties and who will therefore enforce the law against both or through an association which will do for these laws when passed what the Civil Service Reform Association has done for the laws upon that subject—in one form or another these laws must be made effective through such an agency. In other words, no matter how good your law upon the subject is, it won't enforce itself, and there must be behind it a free and well-organized and active public opinion expressing itself either through a public official or through an organization established for the purpose to see to it that the laws upon the statute book are enforced fearlessly through the courts."

CORRUPT PRACTICES IN NEW YORK.

Following the address of Mr. Low, Mr. William Church Osborn, Secretary of the Association to Prevent Corrupt Practices at Elections in New York City, outlined briefly the work and plan of the Association to Prevent Corrupt Practices. "At the present time," said Mr. Osborn, "there are three movements in this State for a corrupt practices act, the movement of the Independent League, the so-called Belmont Publicity Bill and the Association to Prevent Corrupt Practices at Elections, of which Mr. Low is Chairman, and of which I have the honor to be Secretary.

"The Independents' bill and the Belmont bill are both publicity bills and are both largely modeled on the accepted form, which provides for the payment of all contributions for election purposes to a definite person, such as the Chairman and Secretary of a county committee, etc.; for the accounting by those committees and officers; and in some cases for a system of procedure to determine whether those accounts so stated are complete and truthful, and whether such expenses are required.

"The Association has also put in a publicity bill, which has been developed in accordance with the traditions of

JAMES B. REYNOLDS

CLINTON ROGERS WOODRUFF.

ISAAC S. WHEATON.

this State as a part of our Penal Code and is similar to our present provisions requiring candidates to file statements.

After outlining these general provisions, Mr. Osborn spoke of the advanced position taken by his Association in the matter of corrupt practices. He stated that in nearly every instance in which the different States have approached the subject they have taken as their method of procedure attacks against individual candidates for corruption of which they may be guilty personally or through agents. The penalty in nearly all corrupt practices legislation is forfeiture of office. Mr. Osborn stated that his Association wished to go one step farther and to hold not an individual but the party responsible for corruption.

CORRUPT PRACTICES IN MASSACHUSETTS.

Hon. Robert Luce, of Boston, contrasted the situation in his State with that of New York, calling attention first to the fact that Massachusetts is a State where the individual is emphasized and where party development does not present one-tenth of the danger evident in New York. Mr. Luce recalled that the essential parts of the Massachusetts Corrupt Practices Act became law in 1892, and so have been tried for fourteen years. The law was inspired by the English act of 1883 which worked a revolution in English politics. The English act sought four things, first, publicity as to contributions and expenditures; second, a definite maximum limit on expenditures; third, prohibition of certain classified classes of expenditure; fourth, forfeiture of office as a penalty. Now, in Massachusetts only one of these things—publicity—was sought. Mr. Luce said that unless a publicity law is so thorough and drastic that it cannot be safely evaded it will accomplish nothing whatever in disclosing what the statutes have declared to be a crime. This has actually been the result in Massachusetts, for not a prosecution has been made under the provisions of the law during the fourteen years of its existence. Is, then, the publicity secured worth while? Mr. Luce answers this query by asserting that "it has not been worth while if its chief or sole purpose has been an immediate and positive check on the use of money in elections. There is no proof whatever that, so far, the Massachusetts law has had such an effect. On the contrary, the use of money in politics was never so great as it has been in the last two years. Yet clear as it is that expenditure has grown alarmingly, apparently in spite of the law, it is equally clear that the publicity secured by the law has been a powerful factor in bringing public opinion to what is now a universal demand that the evil shall be crushed. The effect of publicity then has been that it has secured public knowledge and understanding of the evil and its danger. Perversion of the suffrage can no more be prevented or even checked by public opinion alone than can perversion of commerce or industry or the social relations." Mr. Luce stated, however, that, in his judgment, better practical results will come from a law which does not insist too much upon the detailed statement of small expenditures, such, for example, as personal expenditures of candidates not to exceed \$40 or \$50.

CORRUPTION IN PENNSYLVANIA.

Following Mr. Luce, Mr. Mark F. Sullivan, of New York City, recounted some of his personal experiences in Greene County, Pa., on the subject of corrupt practices. He stated that in that county it was the usual thing to pay for votes, that by long practice the voters have become accustomed to getting money for their votes and that they count on it as a part of their annual revenue. The evidence against the men who used the money for bribery is practically clear, but they cannot be convicted because of the collusion of the court and the make-up of the grand jury. Mr. Sullivan suggested two remedies, first, to watch the grand jury and its foreman and to get jury laws which provide for a select list of the community so that the mere actual permeation of the machine's influence will not so corrupt the community that a representative grand jury will not indict. Second, to arouse a healthy public sentiment, and, in the case of certain large cities like Louisville, to which the speaker referred in passing, to provide that all the crime of one city will not come before one judge.

CONNECTICUT CORRUPT PRACTICES LAWS.

Mr. George L. Fox, Principal of the University School, New Haven, next spoke of the corrupt practices situation in the State of Connecticut. Mr. Fox said: "If corruption at elections is to be lessened in the United States, the federal congress and the States must enact and enforce laws after the model of the English and Canadian laws which for twenty-five years have been most effective. It is difficult to adapt this law to our conditions because of the very complex character of State and federal government, because of constitutional limitations as to the body who have the final scrutiny of the election and because of the large size of many electoral areas in this country. And yet we should aim to come as near to the English standard as possible by rigorously enforcing without fear or favor existing laws and by strengthening them in every way." Mr. Fox advocated establishing the election court with fearless and rigorous judges; punishing failure to file sworn statements of

W. D. WASHBURN, JR.

expenditure by arrest and fine; limiting or abolishing paid conveyance and strictly limiting the number of paid workers; forbidding contributions by corporations and the granting of passes of all sorts to any public officials by any public service corporation, especially in the case of judges; strictly limiting the amount of expenses to a reasonable amount by law determined by the number of electors in an electoral area.

On the same subject of the Connecticut corrupt practices law the Hon. Lynde Harrison, of New Haven, gave an interesting personal sketch of his part in the framing of the present law and in an informal discussion, in which a number of delegates took part, he outlined the main provisions of the law and stated that, in his opinion, the corrupt practices law, based on the present law in England, would do away with corrupt practices in this country as it has there.

A LETTER FROM HON. PERRY BELMONT.

It was expected that the Hon. Perry Belmont would address the conference on the subject of his corrupt practices bill which he is earnestly advocating at this session of Congress in Washington. Mr. Belmont was unable to be present, however, and sent the following letter:

"I regret extremely that I am unable to attend the Election Law Conference of the Civic Federation, as I find it necessary to remain in Washington to continue the effort to obtain a hearing from the House committee which has the publicity bill in charge. It has been my intention to comply with your invitation to inform you of the progress of the bill.

"The movement had its origin in the last Presidential campaign. The demand upon Mr. Cortelyou and Mr. Taggart for information upon the subject of contributions to the national committees was very insistent towards its close. That demand has been re-echoed throughout the country until it has become evident that before another Presidential campaign, a law will have been enacted, requiring publication of such contributions and expenditures.

"The Armstrong investigation itself has been but one of the important incidents of this agitation. Revelations in regard to insurance companies and their contributions to political campaigns, disclosures before congressional committees of reprehensible pecuniary transactions in regard to the Panama Canal, knowledge of similar sinister influences and considerations in connection with concessions in the Philippines and Santo Domingo have impressed upon the American people the conviction that what may be termed investments in campaign funds for future benefits are constantly growing larger and more threatening to the honest administration of our domestic and foreign policy.

"Last September during the insurance investigation, when Mr. Taggart had made the announcement that 'Neither the Democratic National Committee nor any authorized representative ever asked or received from Mr. McCall, the New York Life, or any other insurance company a single dollar's contribution to the campaign fund,' Mr. McCall himself declared in a public interview that he was in favor of a law prohibiting corporations from contributing and compelling publicity of contributions. He had previously said to me, 'Mr. Belmont, if you knew what I was obliged to do, you would feel sorry for me.' I have often thought of those words since, and the circumstances of his death invite general attention to the evils of the system of which he is regarded as a victim. Those, however, who are mainly responsible and the beneficiaries of that system, should not escape their responsibility.

"The movement for state and national remedial legislation requiring publication of what are now secret political contributions and expenditures has been rapidly increasing in strength and scope. National and state organizations have been formed. Organized labor, by resolutions and petition, is actively and effectively co-operating. Bills have been introduced in Congress and members of the Senate and House of Representatives of both parties are earnestly in favor of a national publicity bill.

"This movement is non-partisan, and the friends of this measure believe that it will continue non-partisan. The controlling elements of the House of Representatives are all-powerful in deciding, under the rules, what bills shall be advanced or retarded. So far, there has been no disposition to delay this measure, and it is to be hoped that there will be none. It cannot be supposed, however, that those who have adopted what is known as the 'stand-pat' policy would

care to assist a movement which would bring about radical changes in the manner of collecting and spending campaign moneys.

"If the publicity bill should meet with obstructions, its friends are now so numerous and the question is so important to the people of this country, that a loud protest would be heard against any indirect methods to bring about its defeat."

As a number of speakers at the conference referred to the corrupt practices acts of England and Canada, the address by the Hon. R. L. Borden, leader of the conservative party in the House of Commons, Ottawa, Canada, was listened to with particular interest. Mr. Borden said:

"We have in Canada, as you have in the United States, government by party. Now, there seem to me to be three absolute essentials of Democracy, and particularly of the party system as associated with democracy. One is the honest appropriation and expenditure of money. The next is the appointment of public officials from the standpoint of efficiency and personal character, and not from the mere standpoint of partisan service. And the third is the cleansing of our elections from those corrupting influences which have made themselves manifest, I believe, in all countries which have adopted representative systems.

"As far as our party system in Canada is concerned, it is very much simpler than yours in the United States. The law does not regard parties so far as nomination is concerned. I will speak of the federal system only, which is typical of all systems in Canada, both provincial and municipal. The federal system in Canada permits any twenty-five electors to nominate a candidate for the House of Commons. We do not elect as many of our public officers as you do in the United States. I am not for the moment concerned with the question as to whether our course or your course is the wiser. I am simply telling you what our system is. For example, in the House of Commons the electoral unit is about twenty-five thousand. Twenty-five men nominate the candidate; a ballot is prepared; usually only two candidates are nominated. Behind all this, behind the formal nominations by twenty-five electors, there is the party organization, of course; that party organization is very often pretty thorough, but the people are absolutely at liberty to nominate as many candidates as they like, whether for the Dominion Parliament, the Provincial Legislature, or at a municipal election. You might think that would result in a multiplicity of candidates. That has not been our experience. It is very rare indeed that we have more than one candidate for either of the two political parties nominated either for the House of Commons, for the Provincial Legislature or in municipal politics. We have very elaborate laws against bribery, laws very much the same as I observe you have in the various States. We have laws against the use of money, laws against the provision of refreshments; we have laws closing our hotel bars and saloons upon polling days; we have laws against intimidation; we have laws providing that any person employed by a candidate for money during the course of an election is thereby disfranchised. In respect of all these matters I think we follow pretty much the law which has been followed in the United States.

"Now, about thirty years ago our Parliament gave up the jurisdiction which it had long exercised of dealing with controverted elections to its own body. With us—and I suppose with you—the Legislature was the judge originally of whether or not a candidate had been elected by corrupt practices or had been fairly elected.

"In 1874 or 1875 the Federal Parliament handed that jurisdiction over to the judges of our superior court. We have found the transfer of this jurisdiction from Parliament and from the Legislature to the courts to be eminently satisfactory. But I should like to say what I think we should have in Canada, and to point out to you what I think might be the advantage. In Great Britain they have an officer called the Public Prosecutor, who is charged in that country with the direction of all important public prosecutions. By the English Act of 1883 that officer has imposed upon him very important duties with regard to election petitions. He is bound to attend the trial of every petition. He is bound to attend every application to withdraw petitions, and if evidences of corrupt practices come to him from any division in which no petition has been filed, it is the duty of the public prosecutor to intervene and to make such investigation and to take such steps as may seem to him to be desirable. In Great Britain also the candidate is limited as to his expenditure for purposes which are declared legitimate by statute. We have not that in Canada. I hope that we shall have it, but I hope especially that we shall have very soon the appointment of some officer, some independent public officer having a status which places him beyond the reach of either one political party or the other, upon whom shall be imposed the duty of investigating every election in respect of which a petition has been filed, as well as of investigating every election where he has reason to believe that corrupt practices have been carried on upon any extensive scale. If we had that in Canada, so that we should not have the scandal (because it is a scandal there) of the withdrawal of election petitions by agreement between the two political parties, we would have accomplished a very great result."

"WELFARE WORK" DISCUSSED BY EMPLOYERS AND EMPLOYEES.

IMPROVEMENT IN WORKING CONDITIONS THE TOPIC AT THE ANNUAL MEETING OF THE NEW YORK CIVIC FEDERATION.

AT the annual meeting of the Civic Federation of New York, held at the Park Avenue Hotel on February 14, the general subject of discussion was "Welfare Work." In connection with the statements made by leading New York employers concerning what has been done to better the conditions of employes in several important industries, interesting papers were read by former city officials showing how New York City cares for its institutional employes and referring in detail to the need of better conditions in the station houses for policemen. One of the most interesting features of the meeting was the presentation, during the dinner which followed the informal reception, of stereopticon views illustrating what has been done by practical, successful business men in providing for the comfort of employes in the work rooms, for recreation, educational opportunities and in the housing of labor. Special importance is attached to the fact that at this meeting leading representatives of labor were for the first time requested to present the needs of workmen in their respective industries.

Among the subjects presented by leaders of employes' organizations were papers showing the needs of stationary firemen and hotel employes, a discussion of what may be done for the men in the building industry, as well as for the moulders, metal polishers, theatrical employes and teamsters. It is well to state that, while only a brief report of the many interesting points covered by the various speakers of the evening can be given here, it is intended a little later to have a complete verbatim report published of all the proceedings.

In addressing the meeting as Chairman, Mr. Charles A. Moore, after describing briefly the work and methods of the Civic Federation, spoke of what, in his opinion, was of first importance to the continued pre-eminence and well-being of both employers and employes in America, that is, economy in industrial methods.

Mr. Moore said in part:

"I had on my desk the other day a pamphlet which contained the address of Mr. Stuyvesant Fish, the President of the Illinois Central Railroad—a very thoughtful and good man—and he says, as to the household question, that the people of America are spendthrifts, earning money freely and wasting it to such an extent as to make it proverbial. He says that the sum wasted is enormous. With a population of eighty-five millions, who either save or waste, it is hardly to be believed that any one will either save or waste less than five cents per capita per day. That is a very small sum, from the American point of view, but it would amount to more than \$4,250,000 or \$1,551,250,000 annually; and yet we think we are just about as smart a lot of people as are produced on the earth. We think we are second to none, and we are not, in general; but some people are so busy getting smart that they omit some of the things that will keep them so. Unless we study economy, unless we utilize these God-given opportunities in a sensible way, the people at whom we are sneering will be taking care of us some time in the future—we may have to suffer the humiliation of falling back on them.

"The other day I had a practical illustration of Welfare Work. A young man had been with me ten or twelve years and had demonstrated pretty well that he had good business ideas. I was thinking about some one whom I could send to Japan to cover that field, and said, here is my man. He was about to be married, and as soon as the ceremony had taken place he came and said he was ready to start. I happened to think a few days before he started: Well, here is a fellow going away off to Japan to look after my interests. Out of the hundred and eighty-five of his associates in the office he might not be able to see more than fifty or sixty to bid them good-bye; so I said to my secretary, go right uptown and see what you can do about arranging a dinner; I want to give this fellow a good dinner as a send-off. It was arranged at the Hotel Astor, and later they called me on the telephone and said, 'How about this dinner?' I said, 'just as good a dinner as the Astor can give.' They said, 'How about wines?' I said, I want to have everything that goes with a good dinner, the best of cigars and everything else. I was asked whom I was going to invite. I said, everyone, the messenger boy who came in last week—the teamsters, packers, shippers, stenographers, bookkeepers and clerks. So I sent formal invitations, and arranged to have the room decorated in Japanese style. I was curious to see whether men who had been with me as long as they had would abuse the privilege; and I want to say to you gentlemen that out of one hundred and eighty-one men there was not a man or a boy that took one drop of wine more than he should have, or who took a cigar and put it in his pocket. I never enjoyed a dinner more in my life, nor felt that I had been with a better average lot of men, nor where there was more enthusiasm

CHARLES A. MOORE.

and interest. One of the best toasts of the night was from the head of the teamsters, who said, 'Here's to Mr. Richards. You go to Japan and get the business, and we will haul the goods for you in prompt time and be back of you solid for the three years you are there.' (Applause.) Now, that spirit seemed to be present everywhere. Richards goes to Japan, not as an individual representative of a concern, but he goes there with the knowledge that all the men he knew in that organization are 'solid,'—just as a man will go to war and know that everyone at home is ready to back him up.

"That is what will result from Welfare Work, and you will all feel that this work is the best investment that one can make."

Mr. Moore said that, in all of his experience as a manufacturer, he had always instructed his superintendents to hand in their resignations the minute they refused to hear a complaint, always going on the theory that about 75 per cent. of the fault was the employer's and 25 the employee's. "But," added Mr. Moore, "they always had to work lively to get rid of their 25 per cent. before I could get rid of my 75."

"I believe that men should meet and understand each other and that is one of the purposes for which The National Civic Federation was founded. It not only helps to prevent controversies but is influential in improving the working conditions through such discussions as we are to have this evening."

Following his address the Chairman introduced Mr. H. H. Vreeland, Chairman of the Welfare Department of The National Civic Federation, who explained the methods of the Department which prepared the program for the meeting, and who then gave an interesting account of the Welfare Work which he inaugurated for the employes of the New York City Railway Company.

John S. Huyler, President of Huyler's, and a member of the Executive Committee of the Welfare Department of The National Civic Federation, endorsed Welfare Work, and stated that in his factory there are 600 employes, about two-thirds of whom are women, and whose regular hours of work do not exceed fifty-four. These are some of the welfare provisions instituted by Mr. Huyler:

The young women wear caps and aprons.

Fire protection has been given consideration, the new building being especially well constructed, and there are many fireproof exits. The floors are tiled. Fire drills are being introduced.

All the employes have seats with foot rests.

There are separate dressing rooms, in which the employes hang their clothes, adjacent to the different departments.

There are individual wash basins and soap and towels are provided by the company.

In the largest dressing room there is a matron who cares for the young women needing her advice or assistance, and who also makes the caps and aprons.

Pure drinking water, which is cooled by having the pipes coiled about the ice, is provided.

There is an emergency hospital with the necessary equipment. There is not much illness, but when em-

ployes are indisposed they are paid in full upon the doctor's authorization.

The company recently purchased a brown stone house next to the factory on Irving Place and equipped each floor with dining-room furniture.

At Christmas time the employes who have been with the company over six months get a week's wages. For some time the company gave one week's vacation to the factory employes who had been in its employ for one year with pay. Lately it has increased the vacation to two weeks with pay, Mr. Huyler stating that it was a hardship for them to be without their pay during the vacation period and that the company should be willing, as its profits increased, to share them with the employes.

There is an annual outing, which is usually an ocean excursion. When the employes and their families and sweethearts reach the boat, each person is handed a basket of lunch, every young woman being presented with a box of chocolates in addition. There is a counter for free soft drinks on the boat, and there is a band to furnish music for dancing. Each child is given a toy, and every effort is made to ensure the enjoyment of the two thousand participants.

In introducing Mr. Timothy Healy, President of the International Brotherhood of Stationary Firemen, the Chairman said:

"Now, we are going to hear from a class of men in which I am greatly interested. When you walk around the streets of New York and see that the sidewalk is clear you don't know that you are walking over a powder magazine. Few people realize how much brains and intelligence and loyalty and faithfulness exist among the men who fire boilers and take care of them. Now, I want to tell you the man who does not speak, who does not say anything, is down there under the building firing that boiler, and we would like to hear something about him. I take pleasure in introducing to you Mr. Timothy Healy.

MR. HEALY: Our chairman has just turned my attention to powder magazines. They certainly are powder magazines—very dangerous—and they take men of brains and men who keep their heads clear to operate them. But I regret that the large employers of labor in this city do not encourage these hard worked men. About six years ago there was a law enacted in this State licensing stationary firemen in the city of New York. That law is not enforced. The large employers of firemen, particularly those employing large numbers of them, don't want that law. I don't know what their object is. We do know that when the men ask their superintendents or chief engineers for the letter, which the law requires, to present to the Board of Examiners, they are frequently told that a license is not necessary for firemen, and, in many instances, they have been discharged for daring to ask for that letter. I wish we could bring it home to the large corporations of Greater New York who have ignored this law and try to get them to recognize it. It would result in improving the efficiency of their men. A good fireman is a good man for an employer; he sticks faithfully and takes care of his plant, and he is a safe man to have around it. And if there are any large employers here to-night whose firemen are not licensed, I hope they will take the matter up in the near future. (Applause.)

The firemen of this city have always been neglected. They are a class of men that never had an opportunity of going to the office, or going directly to their employers. When, by chance, a man has gone over the head of a superintendent, or engineer to make complaint, he has "had to walk" very soon. His job was ended under that man. The firemen never get any show to make conditions known to the employers. Those men have been for years and years, up to a few years ago, working twelve hours a day for three hundred and sixty-five days a year, with never a Sunday or a holiday or any other time to themselves. If they should take a day off to attend the funeral of some relative, or on account of sickness in their families, when they would report for work they would be told that their places had been filled. This was not the exception. It was the rule, and it is to-day in many places. Now, the conditions under which those men work, no one knows except the man who has done the work and who is doing it to-day. Take, for instance, one of the big sky-scrapers downtown. A man way down two stories under the ground on a hot summer's day has to put in twelve hours there in the awful heat, anywhere from 110 or 115 to as high as 160 degrees—generally 130 or 140—with no system for ventilation. Some of these places are wet and damp under his feet

Joseph F. Valentine, President Iron Moulders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Denis A. Hayes, President Glass Bottle Blowers' Association of the United States and Canada, Philadelphia.
William Huber, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.

PROGRESS OF WELFARE WORK.

At the annual meeting of the New York Civic Federation on February 14, the proceedings of which are given elsewhere in this issue, Welfare Work was the general topic of discussion. An important feature of the meeting was the opportunity given to labor men to express their views. One of the speakers, representing the teamsters, remarked that he was at first inclined to wonder whether a mistake had not been made, since formerly his organization was not considered worth recognizing. An employer remarked, after hearing the address by the representative of the stationary firemen, that he had no idea the conditions described could prevail, and that, in the hotel of which he is proprietor, he would at once make a thorough personal investigation of working conditions.

This first recognition by The Welfare Department of the right and of the necessity of men who do the work to be heard on the sanitary requirements in their various trades is, of course, only an extension of the idea of personal conference which is a cardinal principle in the work of the Federation. But it marks an era in Welfare Work in opening the way to the dissemination of accurate, first-hand information on working conditions which will be welcomed by a vast number of our most progressive employers.

To carry out this idea the New York Civic Federation has appointed a committee of sixty which, divided into twenty sub-committees, will report upon the sanitary and general working conditions in as many industries. The reports will include the results of investigations into the Welfare provisions made by the city for policemen, firemen, and letter carriers, and by private employers in such crafts as the bakers, metal polishers, teamsters, and moulders.

ELECTION REFORM.

The Second National Conference on Primary Laws, Ballot Reform and Corrupt Practices was held in New York City March 6 and 7 under the auspices of The National Civic Federation. Delegates representing all sections of the country from Massachusetts to Texas were present, and had the only result of the conference been to bring together such a representative gathering of experts for the purpose of free discussion of what is possible and desirable in election reform, the object of the conference would have been abundantly fulfilled.

But more than this was accomplished. Perhaps the most important result, apart from the information as to the efforts of each State to procure adequate legislation looking toward election reform, was the resolution requesting The National Civic Federation to form a permanent department for a thorough investigation of the topics considered by the conference. The need of such a department is evident. No careful observer will question the growing feeling throughout the length and breadth of the country that our election machinery is too largely controlled by "bosses" and "machine politicians" acting under the direction of great corporations and moneyed interests. To change these conditions, public offices must, *in fact*, be controlled by the people. Now the mere enactment of laws will not bring this result. It is not enough to go to the polls on election day; it is not even enough to go to the primaries. If any considerable change is to be made in the present control of our political machinery the voters must begin further back than the primaries. They must have a voice in the preliminary caucuses; they must join their local party organizations and take an active part in the selection of the ward captains and district leaders. They must take part in the work of these organizations and not make their one political act of the year consist in casting a vote—possibly for a "machine-made" candidate—on election day. This work must be done by the individual voter. It cannot be left to others, and it cannot be shirked. Writing essays or making academic speeches, without work, will not change the name of one delegate to a single convention. On the other hand, good, hard "hustling" and active interest, beginning in the ward and district organizations, will abolish the "money" or other undesirable control of our whole political machinery, and it is the only thing that will.

These ideas were clearly brought out by various speakers at the conference. In organizing the permanent department on Election Reform men will be chosen whose wide experience in practical politics will qualify them to bring these questions home most effectively.

A BROAD-MINDED UNION.

The organization of Eccentric Firemen, which is Local No. 56 of the International Brotherhood of Stationary Firemen, gave its third entertainment and reception of the year on Saturday, April 7, at the Grand Central Palace, New York. It is the admirable purpose of this organization to have every year at least four

large social gatherings, including a picnic and outing during the summer, which are attended not only by the members but by their wives and families. These entertainments take the place to a large extent of the theatre or other forms of amusement which many of the members of the union cannot afford.

The meeting on April 7 marked the twentieth anniversary of the founding of the union, and it was made the occasion for a most fitting tribute from the members to their International President, Mr. Timothy Healy. Mr. Healy was recently elected a member of the Public Ownership Committee of Twenty-one, appointed by The National Civic Federation to investigate the operation of public utilities here and abroad. The members of this committee sail for London on May 22. As a practical form of congratulation upon his appointment and appreciation of his wise guidance and long-continued service on behalf of the union, the members presented Mr. Healy with a purse of \$1,000 for his personal use while abroad. The address of presentation was made by Mr. John N. Parsons, ex-President of the National Association of Letter Carriers.

Replying to Mr. Parsons's address Mr. Healy said: "It is not the first time that you have shown your appreciation of the little that I have done in the interests of all of you and of our organization. I want to say that I fully appreciate your good will more than I can tell you—far more than the money. I shall continue to do the best that I can, not only for the Eccentric Firemen's Association of New York but for the firemen in Canada and in British Columbia who have honored me by electing me without opposition as their International President. There are some people in this city and in this country who will tell you that a labor organization is a dangerous institution. We can refute that statement by our appearance here to-night. I want to say that a labor organization that is governed by the desire to better the condition of its members and is trying to make the wives and children of the members better is not a dangerous organization. Such an organization as ours is one that will build up citizenship for the protection of our American institutions and make future generations better than they are to-day."

"I should like to say a word about that great organization, the National Civic Federation, which has honored me and the Eccentric Firemen's Association by selecting me as one of the commission to inquire into industrial conditions. That great organization is a friend of the oppressed and downtrodden, no matter what it may be called by people who do not believe in it. It is an organization for the purpose of bringing together people in different walks of life, and there is no better proof of what I say than the fact that Mr. August Belmont is in one of the boxes here to-night. If Mr. Belmont and the other gentlemen of the Civic Federation who are with him did not have the interests of your organization and the interests of labor at heart I do not think that they would have come here. If Mr. Belmont had wanted to see an entertainment he would have gone to his box at the Metropolitan Opera House or to one of the Broadway theaters."

"The National Civic Federation has a great mission to accomplish. If I did not believe that honestly I would not be a member of it. If it were not that I had to be at this entertainment to-night I should be out in Chicago taking part in the investigation by its Commission on Public Ownership, and I would have the same voice in the workings of that commission that anybody else would have. The commission is made up of men in various callings and walks of life who will study the conditions of labor and of public utilities."

"WELFARE WORK" DISCUSSED BY EMPLOYERS AND EMPLOYEES.

(Continued from page 7)

and filthy all around—just a little hole under the ground. On account of the work that these men have to do, handling coal, perspiring as they do, they have to make a complete change of their clothing when they are going to work and when they are getting off. But usually no place is provided outside of the boiler room where the clothes may be changed or the street clothes kept in cleanliness during working hours. If a man has any distance to go it will take him an hour to get to his place of work, change his clothes and get ready to jump in to relieve his partner. When he is relieved, after working twelve hours, it takes another hour for him to get home. Sometimes the other fellow does not get in to relieve him when his twelve hours are up and he has to stay and work twenty-four hours. We have hundreds of poor, unfortunate men in this city working those long hours for \$1.50 a day. Large corporations and the big hotels in this city have not raised the wages of their stationary firemen, except in a few instances, since the plants were built—twelve, fifteen or eighteen years ago. I am sure you will bear with me in the statement that the men who could get along on \$2.25 or \$2.50 a day eighteen years ago would find it hard to do so to-day, because the living expenses have gone up thirty-five to forty per cent. Very often the salary they are getting is not sufficient to keep

clothing on their families. We do not make unreasonable demands, but are trying to establish the three-dollar scale. We hear a great deal about the advantages of a young man. I want to tell you gentlemen if you start to give the young American citizen an advantage you have got to give his father sufficient wages to clothe him and feed him and send him to school and give him a common school education."

THE CHAIRMAN: The man who thinks that a fireman is not an artist, if he is a good fireman, makes a big mistake—as big a mistake as if he should say that the man who puts shades and lights on a picture is not an artist. The manner of a man's firing—whether he fires with the desire to get the best results out of a pound of coal, or whether he does it in a desultory way—makes a difference, a very considerable saving. But I want to say right here that The Civic Federation is just the place to come and present these cases. (Applause.) It is a fact that there is a great deal of injustice going on, and whether we can regulate it or not is a question of how much zeal we have in our work. We have with us to-night Mr. Thomas B. Lavey, of the Iron Molders' Conference Board, who will treat the subject of "Consideration for the Physical Comfort of Molders."

Mr. Lavey said in part:

"The main complaint of the molders has been and is to-day against the conditions under which they work. Owing to the peculiarities of the trade of molding, due to the excessive hard work in constructing the mold, which first necessitates ramming it into shape and then changing to the finishing with the most delicate tool, the molder goes from the one extreme of perspiring freely, in the first operation of active exercise, to shivering with cold during the finishing of the job. This is due to the conditions of many of the foundries where in the winter the doors are kept open from five to ten and often as long as fifteen minutes while refuse is being carted away, sand is being brought in and flasks removed. The open doors permit the cold drafts to penetrate every part of the shop. The molder who is compelled to work with as little clothing on as possible suffers from these drafts, which often result in colds and serious illness. We have demonstrated the serious effects of this, not only by our actual experience, but by the fact that our organization, which is the Iron Molders' Union, has paid out in the last ten years \$1,777,000 to members who are on the sick list, and two-thirds of this is put out between the months of December and the last of March—an awful statement to make. Many of the shops are without glass in the windows and their owners seem to be satisfied to have boards placed in these openings which only partly prevent the drafts. A further objection to the boards is the obstruction of the light which the workmen should have for the proper performance of their tasks. A good deal of this I do not attribute entirely to the owner or the manufacturer. I blame it sometimes on the foremen, who neglect to notify the proper official and have repairs made.

"In one shop there is plenty of light and good ventilation. There are air pipes for the purpose of throwing hot air in the winter and for throwing cool air in the summer through the foundry. These pipes are so arranged that the air is distributed in a way to prevent drafts. The cool air coming in contact with the damp ground makes it the most comfortable foundry in New York in the summer. There are only a few foundries in this vicinity where there are steam pipes. There should be steam heat in the winter, because the men have to work with just as little clothing on as possible. Even where there are fires during the week, they are usually allowed to go out over Sunday,

JOHN S. HUYLER.

and on Monday it is just as cold in the shop as it is out of doors. I know of one shop in Brooklyn which used to be an old barn, but which has recently been fixed up by putting in windows and closing the doors and having the place heated, so that now it is one of the nicest shops in that vicinity. So it is evident that these old places can be made comfortable. The reason I speak of this is because of the feeling that the men have after such improvements are installed. It doesn't make any difference how men feel otherwise, but when there is an attempt made to bring out a condition in the foundry which is going to benefit and make the men more comfortable, there is a feeling of gratitude in the heart of every man who works in that foundry. (Applause.)

"Now I have in mind one of the finest shops, where the windows are all in good condition, and there is heat in the foundry, but it might surprise you to learn that 110 men are employed and that there is no place for them to hang their clothes.

"Very few shops in this district have lockers—I mean within a radius of thirty-five or fifty miles of the city hall. In some cases an ordinary soap box is used for that purpose. On my way home from work I have frequently known a stir to be created among the passengers on the cars who thought someone was on fire, so thoroughly had the core smoke penetrated the clothes I wore.

"Every one who knows anything about foundries realizes that during the cast, when the melted metal is distributed, there is plenty of heat. The heat is so great that every particle of the men's clothing becomes moistened and often wet with perspiration. In that condition the men often leave the shop for home, after putting on their overcoats which have hung on the damp wall all day.

"They should have places in which to bathe and put on dry clothing. Those who are charged with the responsibility of the care of men, must make their condition such that the robust man to whom we point with pride as the ideal mechanic, the protector of our institutions at all times, must not be superseded by a generation whose standard will be largely traceable to our lack of interest in their welfare."

THE CHAIRMAN: Now we will have a few words from Mr. Orrin S. Goan, of the National Biscuit Company on "How We Found Space for Welfare Work."

MR. GOAN: We began what we might call our welfare work by thoroughly renovating and rearranging all the dressing rooms. We tore out old lockers, put in shelves for hats, hooks for clothing, and benches with shelves under them for shoes. Then we painted everything thoroughly even to the walls; and, we have continued to paint them every year since, both for the appearance of cheerfulness as well as for cleanliness.

"We also made a plan by which any of our girls could take baths during work hours by arranging with the forewomen in charge of their departments. To show how well these bath-rooms have been appreciated, I may state that out of about eight hundred girls employed in the factory, there have frequently been over fifty baths taken in a day during the hot weather. We naturally followed this up by putting in shower baths for our men. These were placed in the dressing rooms so that a man upon leaving his work could strip off, take a bath and immediately get into his regular clothing. Let me emphasize the importance of having all these things convenient for the help. They should not be required to wash in one place and dress in another. Facilities which are not conveniently arranged may as well not be provided at all.

"About this time we decided to have a restaurant in order to supply our people with good food at low prices. We took some space from another department, put in a small gas stove, a steam soup kettle,

urns for coffee and tea, hired a cook and made a start. Our people took kindly to the plan and in a very short time we were obliged to increase our facilities. Our prices we have endeavored to keep on a cost basis. In fact, they have been a little below cost as the restaurant loses a little—but not enough to be a serious consideration.

"These things we consider of prime importance to the health of our people; and, it is a matter of fact that while many of our people work in places where it is very warm in the summer, we have had very few heat prostrations for several seasons past, whereas previously there were sometimes as many as eight or ten in a single day. We attribute this improvement in the general condition of our help to their ability to get proper food at our restaurant and to improved ventilation.

"In due course we decided to make our dining room somewhat more attractive and table linen was introduced, also better dishes. With the table linen came the necessity for a laundry which was soon established. We then took up the question of supplying our men and women with working uniforms. In consideration of their supplying themselves with these uniforms we do all the repairing as well as the laundry work.

"We now come to our roof pavilions and club room. After eating, some men like to smoke, so it naturally followed after the establishment of our restaurant that we should provide a smoking pavilion on the roof. This pavilion, which is about thirty feet square, is provided with seats and covered with a canvas awning. It overlooks the river and is a most delightful place for a rest after the noon-day lunch. After having the benefit of the roof pavilion one summer the advent of cold weather created a demand for some place to smoke inside the building. The demand was met by the establishment of a club room for our men and boys. As we wanted to do as much for the girls as for the men, we provided for them a little roof garden also, near the tower which contains the sewing room. Of course, neither of these pavilions will accommodate anything like our full force, but we find that some employees will go one day and others another so that there is usually room for as many as may wish to go. Of the things which have contributed most to the comfort of our employees, next to the restaurant and laundry, I should place our emergency room. In this room we attend to our sick and injured. It is now in charge of a trained nurse, and we have also a capable man who is very useful in cases of serious accident. By an arrangement with the New York Hospital, any injured employees whom we may send there receive immediate attention. In such cases the expense is borne by the company. Adjoining our emergency room we have a reading room which also serves as a rest room for the women. Among other things it contains a circulating library, which is a branch of the New York City Public Library, arrangements for the same having been made through the kindly assistance of the Welfare Department.

"In addition to the list thus far enumerated, we have recently put into operation a systematic fire drill, which we feel certain will prevent any panic in case we should be so unfortunate as to have a fire. We have also arranged for the women employed on the upper floors of the building to have elevator service. We have, moreover, made a great effort to keep the entire place clean and pleasant by painting and whitewashing the walls and woodwork, hanging pictures and putting window boxes and hanging baskets of plants in the hallways.

"Now a word about the expense. Omitting the restaurant and laundry equipment, as those are 'going' departments, I should estimate that a thousand dollars would cover all that has been invested. This amount represents

TIMOTHY HEALY.

THOMAS B. LAVEY.

about one cent a week for each employe for one year and leaves no room, therefore, in our case for the thought that welfare work is done in lieu of wages. This is a very important point and it is also a reason why this work should be done in a modest and unpretentious way. Intelligent employes are likely to assume that if a firm can afford to spend money lavishly in this way, it can afford to pay more wages—and naturally, what working people want above all other things is good wages and more wages. But, granted the wages are just and the hours reasonable, a firm may well expend a few extra dollars and a little time and thought on the comfort and happiness of its employes. Let there be no mercenary motive. Virtue and kindness are their own reward. A good name is always valuable in business as in private life and a reputation for good treatment of working people still tend to attract a desirable class of help."

After the address of Mr. Goan, the following letter was read from the Hon. William McAdoo, who was expected to speak, but was detained at home on account of illness:

"The station houses and the prisons connected therewith in a large number of the precincts of Greater New York are a positive disgrace to the city. Many of the buildings used as station houses and prisons are very old and have been allowed to run down and are in a very bad condition. As a rule the prisons are unsanitary, poorly ventilated, and without modern improvements. In some instances they are heated by stoves in the winter which give out a poisonous coal gas. They are at all seasons of the year damp, gloomy, forbidding, and incapable of being kept thoroughly clean. In winter when the windows are closed and the heat turned on, and the prison filled, some of the prisoners being drunk and incapable of taking care of themselves, the air is poisonous. Many of them are so situated that in summer it is impossible to get fresh air in any quantity into them. The cells in the present Police Headquarters have officially been adjudicated as the worst in the city. It is shocking to reflect that a great city like this has allowed such a place to exist so long. In the administration of justice innocent persons are often arrested, and in more than one instance citizens otherwise decent and reputable have been incarcerated for trivial offences which at the best will result in but a small fine. In the meantime they have suffered the fearful degradation of being locked up in one of these black and filthy holes.

The prisons to be erected should be well ventilated, have modern plumbing facilities, and, above all, should be so constructed as to be capable of being thoroughly washed and hosed and lighted with electricity. In many of the station houses the men sleep in over-crowded quarters, the beds being so close that in some instances they have to crawl over each other to reach them. In some of these buildings the dormitories are old and the walls have sunken, so that the windows are never thoroughly closed. They are freezingly cold in winter, and being unprotected from the sun during the day, are heated like ovens in the summer. In the older station houses there is no proper provision made for heating and ventilating them. The waiting rooms, in which the men spend many hours while on reserve, are as a general rule, dingy, dirty, uncomfortable, noisy, and in every way unattractive. In nearly all of the station houses will be found an insufficient number of chairs for the men to sit on. The common sight is an old rickety table and a few old worn-out chairs, dirty and soiled walls, blackened ceilings and a rough board floor, saturated and stained with years of use.

The doormen, as a general rule, do their very best with these houses, but they do not have sufficient assistance, and even if there were a large number of cleaners it would not materially affect the general bad conditions. There are no proper bathing facilities for the men. In the Army and Navy the shower bath is universally used; tubs are dangerous and out of date. Well tiled bath rooms which would admit half a dozen or a dozen men, at a time ought to be provided with hot and cold showers. The bedsteads are some of them fifty years old, and are very uncomfortable and of a primitive type. Except that they are higher up, the dormitories are sometimes not much better than the prisons.

The Police Surgeons as a body have condemned a great many of these houses in an elaborate report giving the details in full; the Health authorities have inveighed against them; the Fire Department has protested against the danger to life; humanitarians, philanthropists, State investigators, and leading newspapers have implored the city to do something. My experience with the city authorities in this respect is not encouraging. Last year they cut down the appropriation for keeping these wretched and tumble-down barracks in somewhat decent order. Many of them need painting and cleaning; some of them have panes out of the windows and it is difficult to get the money to replace them. In some cases the city has really no station house at all for the men, but houses them in stables as in the case of the Sheepfold in Central Park. The best part of that building is given to the horses, and the part where the horses could not be put with safety to their health is turned over to the men. A great sewer opening is within three feet of where the men have to eat their meals. That the police in New York look so healthy, and are in the main a well-conditioned body of men, is owing to the fact that they spend so much of their time in the open air and are compelled to take exercise. The mounted men, for instance, in Central Park, would probably all have been dead long ago from the sewer gas which pours into the horse barn where they have to spend their time when not in the saddle but for the fact that they get so much fresh air and healthy exercise when on active duty. They thrive just as sailors do at sea who stand the horrors of the fo'castle because they have to spend most of their lives on the deck where the air is the best. Were it not for this the sick list of the police would be appalling. The city authorities have either got to face the question squarely or let the whole thing get worse and worse. You can get votes by building a school-house—a very proper thing to do—but there doesn't seem to be many votes in building a station house; hence some of these people seem to be entirely indifferent. I have appealed in writing and in person constantly since I went to the Police Department, but I never found any response.

It will probably cost two or three million dollars to tear down and reconstruct a number of the station houses and renovate and in some instances radically change the character of the others. A smaller sum would make a beginning. The expenditure of this money could go on, however, over a period of years, but the plan ought to be a systematic one. All of the station houses should be constructed on the same general plan. It is a criminal waste of the city's money to have a lot of architects drawing different sets of plans, some of them perfectly grotesque and foolish. The station house should have a distinctive, individual character so that you would know at once what it was intended for. This is the practice of governments

in Europe with regard to public buildings of this kind. The station house should be as distinctive as the green lamp in front of it.

The Mayor should appoint a commission at once, of which of course the Police Commissioner should be one, to consider this very important subject. A sanitary engineer, a police officer, a doctor, an architect of the highest character and professional standing, and a practical builder should also be on the commission.

I am very much pleased that the Civic Federation has taken this matter up. It is entirely in line with your work. The city is the employer and it should treat the employe decently, certainly in a half-civilized way at least. If the Federation will investigate this subject they will find that I have not only not exaggerated the conditions, but that I have rather understated them. If I had had the opportunity I would have been glad to have presented to your body fuller details from the official findings with reference to these filthy and broken-down places. Believe me,

Very sincerely yours,

WILLIAM McADOO.

THE CHAIRMAN: We have with us to-night a gentleman who will now tell you something about "How New York Cares for its Institutional Employes"—Mr. Homer Folks, President of the New York City Visiting Committee of the State Charities Aid Association.

MR. FOLKS: I am especially pleased that the Civic Federation has taken up for consideration the condition of the employes of the city. When we have thought and spoken of Welfare Work hitherto we have almost always had in mind the employes of factories and workshops carried on as private business affairs; but there are two very important reasons why we should primarily consider the employes of the city in our talk about Welfare Work. The first is that the city is by far the largest employer of labor in the city of New York. The employes of the city of New York already number, in round numbers, fifty thousand. No single employer in the city of New York employs any such number of people. Probably the largest group of employers—those operating the traction companies—employ perhaps some twenty-two thousand people. And the second reason why we, as citizens and as a Civic Federation, should interest ourselves in the city employes, is the fact that in so doing we are looking after our own business, for when the city employs, we employ. Each one of us is a constituent part of this city, a voting and contributing member of this corporation, and if the city does badly and fails in its duty by its employes, you and I, each one of us, must share in that responsibility.

(While delivering the rest of his address, Mr. Folks exhibited a number of stereopticon views.)

As an employer the City of New York, through its Department of Public Charities, ranges from fair to indescribably bad. Probably in no other branch or department of the city government are such wretchedly inadequate salaries paid as in the city's hospitals and other institutions. It is not so many years ago that prisoners were employed in large numbers in these institutions, and the Department is still in the transitional stage from prison labor to adequately remunerated labor.

In most of these institutions the city provides board and lodgings for its employes, and pays them very low salaries. The munificent salaries of \$12, \$15, and \$18 a month are not at all uncommon. It is true that some of the employes receiving these salaries are ex-prisoners, and that a much larger number are ex-patients, and some are both ex-patients and ex-prisoners,

HON. WILLIAM McADOO.

ORRIN S. GOAN.

HOMER FOLKS.

ANDREW HELLTHALER.

CHARLES P. NEILL.

EDWARD GOULD.

but the city is not starting them on the road to independence by employing them at salaries which would hardly provide decent clothing.

The city provides board and lodgings such as they are. A few years ago the lodgings were, almost without exception, just about as bad as they could possibly be. Herded together in unventilated, dilapidated, unsanitary, cheerless buildings, with practically none of the creature comforts of life, it was little wonder that these employes soon entered once more the ranks of either prisoners or patients. Progress has been made in some directions. During the administration of Mayor Low a very comfortable dormitory was erected for the male employes of the City Hospital, in place of a wooden rookery which had formerly housed them. This dormitory provides a well-lighted and comfortable dining room, a good-sized room for reading, smoking, games, etc., a considerable number of individual rooms, and two well lighted, well equipped dormitories. At the Kings County Hospital a large kitchen and dining room building was erected, providing well lighted, well equipped dining rooms for the various grades of employes, so situated that food can be served quickly, easily, and reasonably attractive.

There has been little progress, however, during the past two years beyond the consideration of plans. At the Metropolitan Hospital on Blackwell's Island the quarters for employes are so bad that I can hardly describe them before this audience. Imagine a large very low ceilinged dormitory, immediately under the roof of a four-story hospital building, with ceilings so low that there are no windows at the sides, the only light coming in through skylights; accessible by only one small winding stairway (the building non-fireproof); without a closet or other toilet arrangement of any sort; unbearably hot in summer, always dark and dismal—a fire trap—such is the dormitory for female employes at the Metropolitan Hospital on Blackwell's Island. There is a similar dormitory for men. In addition, a large number of the men sleep in a one-story wooden shed, condemned more than a decade ago as unfit for occupancy, in which the plumbing is archaic, the sanitary conditions hopelessly bad, and the sleeping rooms overcrowded. On Randall's Island you will find a large number of male employes sleeping in a prison building, occupying cells constructed years ago for prisoners, but used for the past decade as sleeping quarters for some of the employes of this great city.

I am glad to say that the present Commissioner of Charities is fully alive to the needs of the Department, and that there is every reason to believe that effective measures will be taken for the remedy of these conditions in the very near future.

THE CHAIRMAN: We will now hear from Mr. Edward Gould, President of the Teamsters' Joint Council, New York City, who will say "A Word for the Teamsters."

MR. GOULD: It has occurred to me that there must have been a mistake in getting the word "teamster" connected with some other craft or industry at this meeting, because I had always been under the impression that a teamster amounted to nothing—I was told it so often. There is one hardship in particular that teamsters are subject to, and that hardship is insufficient time to get acquainted with their own families. They work such long hours not infrequently that they can meet themselves going to work in the morning when they are coming home at night. (Laughter.)

In speaking to several of our more liberal employers that have large teaming interests, they have not infrequently told us or told our representatives that it is a

modern impossibility to give better conditions to the teamsters; that the competition is so keen and the other fellow works them under such conditions, that no matter how well he might feel inclined, the business would not warrant it. Quite a number of you gentlemen will remember seeing policemen on our mail wagons some short time ago, and possibly the teamster might be harshly criticised that he should put the business people to the inconvenience of not receiving their mail as promptly as they did at other times; and I would like to place the teamster right, as this is the first time in the City of New York when any cognizance has been given to the teamster.

We made several visits to the representatives of the company that moves the mail in the City of New York and asked them for a conference, to see if we could not bring about some slightly better conditions for the teamsters, who were then working fourteen hours a day, some of them for the paltry sum of \$1.25 remuneration for fourteen hours work a day and seven days in the week. The manager of the company was from Missouri (Laughter)—he had to be shown. We evoked the sympathy of the Civic Federation. Some of the officers brought about a conference, and I want to say that the teamster was willing to concede many things in the shape of minimizing some of the demands regarding increase in wages.

There are several large trucking interests in the City of New York where a teamster reports for work at five o'clock in the morning, and gets through in the evening at seven or half-past seven o'clock. When he leaves the home in the morning, his children are asleep in bed, and when he goes home at night his children are asleep. Is it any wonder that they refer to their father as "that man who hangs around the house here occasionally?"

We want to bring about a condition where employers can improve the conditions of the teamster, without putting themselves out of business or without bringing a hardship upon them, and I contend that can be brought about, if the employers want to do it.

We have a second reform that is very much needed in the City of New York. A remark made by our Chairman reminds me of it—consideration. The teamster doesn't make long speeches—he is abrupt, very abrupt sometimes, and he is not very complimentary in his language, and if I should forget myself at this time, I hope you will pardon me, because I am not long off the team. (Applause.)

And as you are well aware, we have truckmen in the City of New York that have found out from bitter experience that it takes an artisan to drive a truck and it takes a teamster to load and unload a truck, and why don't they get more consideration in our community? You are dependent upon the teamster to take the earth out of the cellar where your home is built. You are dependent on the teamster to move the stone and material to build your home, and when you have it built, you are dependent on the teamster to carry the necessities of life and the comforts of life as well; because the private coachman is a teamster, and he brings a great deal of comfort to the homes of some of our more fortunate friends along Fifth avenue. If to-morrow morning the coal teamsters of the City of New York were to go on strike, and the produce teamsters were to go on a strike—those are only two small spokes that make up the wheel of the teamsters in this city—you cannot imagine what a serious inconvenience it would be. Many of our large office buildings cannot carry a forty-eight-hour supply of coal; many of our large hotels cannot carry a forty-eight-

hour supply of coal, and none of our homes have more than twelve hours' provisions. Before you could get 5,000 men into the City of New York to man those trucks, under the most favorable circumstances, we have no conception of the hardship that a teamsters' strike would entail. Our newspapers speak from time to time of a general teamsters' strike the same as if it were going to a football game or going to a race-track. I hope we will never see the day in the City of New York when we will have a general teamsters' strike. (Applause.)

I believe that a great good could be accomplished, if there was some literature printed and distributed among our various teamsters' organizations. It could teach them to be courteous to each other; it could teach them that the fellow with the light load should give the right of way to the fellow with the heavy load. (Applause.) And I want to say that we have need for that consideration as much on Fifth avenue, where we have horses that only do two or three hours' work a day, as we have on West street, where horses work ten or fifteen hours a day and drag four or five or six tons of merchandise for the same length of time.

Third, and not least, we need better sanitary conditions in the City of New York for our teamsters. We want to abate the evil of the necessity of frequenting saloons from time to time (Applause), during our working hours. I feel that the teamster plays just as prominent a part in our city as any other workman does, and I believe that if he does he is deserving of the same consideration (Applause). It would not cost very much money to have some accommodations placed in various parts of the city in a sanitary way that would not compel our men to frequent saloons. (Applause.) I believe, as I heard a clergyman once say, that going to church is a habit. I think it is a good one. And we should get the teamster to cultivate the habit of staying out of the saloon—and I pride myself with the feeling that he doesn't frequent it any more than any other man. But if we do not get encouragement from the men that feel they are so much to the teamster, what can you expect of them?

In conclusion, I heard mention made of libraries. I would like to know what opportunity a teamster has who works thirteen and fourteen hours a day to go to a library.

We have formed a beneficial feature in most of our local unions in this City of New York, and I want to say that our dues compare favorably with any other fraternal organization. In the last two years our organization has paid out over \$60,000 in sick and death benefits (Applause), notwithstanding the fact that it has only been in operation two years, one of the local unions alone having paid out over \$15,000; and I want to say, in conclusion, that no teamster, a member of our organization, has ever entered the Potter's Field. (Applause.)

THE CHAIRMAN: I am greatly interested in the teamsters as I have a great deal to do with them. I have teamsters that have been with me twenty years, and I wouldn't part with them for any men that I ever saw. They are good teamsters and they take a pride in their work. It is just as honorable to be a good teamster as it is to be a good banker or a good merchant. A man should be good at his calling, whatever that calling may be.

We have with us this evening, Hon. Charles P. Neill, United States Commissioner of Labor, who will tell you "Why the Public is Interested in Sanitary Workrooms."

MR. NEILL: To sum up in a very few words the reason why the public is interested in sanitary work-rooms, and in every other form of welfare work that makes for the health and comfort of the workers, I might say that it is because the public has a very vital interest in the question of the cost of production. We are all familiar, very familiar, with this term. The employer and the manufacturer know what it means, and they naturally and properly keep a close watch on it—for on this depends much of the success of their enterprises. But this aspect of cost is measured in dollars, and it does not represent by any means the entire cost of production. There is a further element in this cost, and that is the social cost, or in other words, what the production of any given thing represents to society. This social cost, gentlemen, cannot be expressed in terms of dollars; it is expressed in terms of sweat, it is expressed in terms of fatigue, it is expressed in terms of pain, and lastly, as we have heard to-night, in too many cases it is expressed in terms of ruined health and even in loss of human life.

I recall now a single industry, which I need not name, in which the death rate alone—leaving out even accidents that maim or disable workers permanently—is so high that taking thirty years as the term of the working life in that industry, a man has less than one chance in six of escaping a violent death.

This represents one aspect of the social cost of production. In the same way, accident, disease, the dwarfed bodies or the stunted minds of overworked children, and all the evils and misery summed up in the term "sweatshop"—these represent other aspects of the social cost of production. These represent the cost that society pays for the product it consumes.

Now it seems to me that society ought to be as careful and as anxious to reduce its cost of production, this human cost of production, as the manufacturer is to reduce his cost; and it is not difficult to determine what in the long run will be the attitude of any body of workers toward a society which remains indifferent and apathetic while this health cost and life cost run up to exorbitant limits.

We have heard it stated here to-night that there are men working twelve hours and sometimes even fourteen hours a day down under the sidewalks of this city in a temperature of 120 or 140 degrees, for \$1.25 or \$1.50 a day. If you let them feel that their health and their strength, their opportunity for enjoyment and for home life are a matter of no concern to society at large, can you blame them if they feel no sense of loyalty to a society which permits such things, and in their resentment against it ally themselves at last with radical movements which look to a social overturning?

It seems to me then that society should be very much interested in how the employer takes care of his workers, and in seeing that no class of workers shall be allowed to feel that the people for whom they toil are indifferent to the conditions under which they do their work. (Applause.)

In the last analysis, the public is the real employer. The men who are hired by the person or firm whom we ordinarily denominate the employer, are after all working for that public which consumes their product or enjoys the result of their services. They are the ones for whom the worker is really working, and in this sense they may be said to be the employers.

As I heard that statement about the conditions of work of the firemen in some of the hotels of this city, I must confess I felt personally uncomfortable, and I said to myself that I trust that this room which has been so pleasant and comfortable for all of us to-night is not being kept warm by a man who is putting in his fourteenth hour of work and earning perhaps only \$1.25. For after all, that man down in the boiler room is working for you and for me, and we should be interested in the conditions under which he does his work. He himself, may think he is working for this hotel, but at bottom he is not—he is working for us; for this evening, at least, we are as a matter of fact his employers. We, at least in part, are paying his wages just as we are paying the wages for this evening's work of the cook who prepared this excellent dinner and of the men who have served it so well at the table. Of course the hotel proprietor will actually hand the money over to these various workers—but after all isn't he really in the position of the man who collects their wage from us and pays it over to them—perhaps, he doesn't pay them all he collects. (Laughter and Applause.) The public, therefore, has a very direct interest in every form of welfare and betterment work. And I might suggest in conclusion that those of us who believe in the existing social order and wish to maintain it, should realize that by remaining indifferent to the human element in the cost of production, by ignoring this question of the social cost of the things we use and enjoy, we are simply furnishing object lessons and arguments ready to hand for every apostle of Socialism or any other *ism* that aims to supplant the present social order.

THE CHAIRMAN: The Civic Federation, I think, with great forethought and consideration brought into the organization the "public" that it might participate in regulating in a measure the very conditions that are brought to your attention. There are the employer and the employee, and there is the public that pays the bill, and it is certainly the great interested party, and

I feel that we are wisely organized—more wisely, perhaps, than we thought when we first came together as a body of men. Now, we have with us a gentleman who will respond to another toast, "What Should Be Done to Provide Ventilation," Mr. Andrew Hellthaler, of the Metal Polishers and Architectural Bronze Workers.

MR. HELLTHALER: I speak for an industry in which the death rate—the enormous death rate directly due to consumption and lung trouble is 98 per cent., 80 per cent. of which occurs before the men reach the age of 40 years. That is the condition of the metal polishers to-day. While it is not generally so considered, these facts are ready for proof at any time a committee will visit our international headquarters and see the death claims as they have been paid in years past. My only idea in this matter is that the average manufacturer, considering that the work is so dirty—and I am frank to admit, being a polisher myself, that I believe it is one of the filthiest occupations a man can work at—the manufacturer seeing the men in that filthy condition, naturally picks out the filthiest corner in the factory and throws the polisher in there and keeps him there. I speak from experience which dates directly to the first of this year, and I myself say that I was employed in a factory where there were 65 men

DR. THOMAS DARLINGTON.

on one floor with only six windows for ventilation. Remember, gentlemen, that these six windows for ventilation are not the same as six windows would be here, where there is no dust-producing machinery, where there are no acid fumes floating through the air. These six windows would probably be all right, were there no fumes or dust, but in a polishing room it is one incessant stream of dust from 7.30 to 5 o'clock at night. There are laws on our statute books which provide for exhaust fans to take away the dust from all polishing lathes. In a great many cases these fans are kept in operation, but in a great many others they are not. In many cases they are there so that when the factory inspector comes around the manufacturer can show him that he is complying with the law. The manufacturers' reason why these machines are not running is that they are very fast speeding machines; but everyone who knows anything concerning machinery knows that high speed machinery takes considerable power, so that in order to lessen the expense, the exhaust fans are shut down. If they are not shut down, they are allowed to get in such a dilapidated state that they are not of any use to the men working there. In most factories where metal polishing is done, acids form a principal part of the work. The polisher polishes the plain part, and the part that is chased is dipped in acid to clean it. The fumes of the acid circulate through the factory, and sometimes they are stifling. Now, we want to get as much natural ventilation as we possibly can in all the factories, but we want still more than the natural ventilation. Improved machinery makes it possible to draw all the obnoxious fumes out of the factory. We should have exhaust fans taking the fumes out of the top of the windows and allowing the natural air to come in. I have seen in the factory that I have just left, which was as large as this room, the fumes of the acid and dust so thick that I could not distinguish the people at the further end. When you see the handsome toilet sets and tea sets in the shop windows, you little realize the number of lives that the production of these things has cost; yet the conditions to-day, so far as ventilation and the obnoxious fumes of acid are concerned, are worse in the silver factory than in the cheap brass factory, although the conditions in the latter are miserable. I am deeply interested in the question of tuberculosis, and I only hope that the Welfare committee will take the matter up. I am at their disposal to give them any

information they may want and I will go so far as to take them into any factory to verify my statements.

In conclusion, I wish to say that consumption is so prevalent in our industry that the Brooklyn Central Labor Union has bought a plot of ground at Patchogue, Long Island, for which it has paid \$1,600, and which is to be devoted to nothing but the curing of this disease. This amount was donated by workingmen, and the ministers of Brooklyn have guaranteed to put upon this plot of ground a building to cost \$50,000. Some of the ministers have suggested that if the industry really costs such an enormous price of human life, it should be cut out altogether. Of course, we do not take that view. What I wish to suggest is that if the ministers and the workingmen are interested in this matter I see no reason why the Welfare committee of the Civic Federation should not be likewise. I thank you. (Applause.)

Following the address by Mr. Hellthaler, the Chairman introduced Mr. August Belmont, President of The National Civic Federation.

Mr. Belmont said in part:

"My interest in the subject which you have before you to-night is such as to cause me to disregard my doctor's injunction not to come out. Before leaving, I want to say to you that this subject has occupied the minds of the management of the Interborough Company for some time. It is fair to say that, as an operating corporation, the Interborough will be but two years old next April, having begun the operation of the elevated roads on the 1st of April a year ago, and opened the Subway for operation on the 27th of October the past year—a year ago last October.

"A complete method of insurance was worked out on lines similar to those mentioned by Mr. Vreeland in connection with the Pennsylvania Railroad. The plan was submitted to our men; but for reasons of their own, it was rejected. Taking that as a basis, and attracted by the success of Mr. Vreeland's management of the welfare department of his corporation, our officers have given that subject a great deal of attention, and have conferred—and did confer before there was any idea of our interests becoming identical—with a view to establishing much the same system and improving it by co-operation. We are only waiting for the return of our vice-president, Mr. Bryan, who was obliged to absent himself for a month on account of his health, and then we purpose to put into operation as soon as possible our own Welfare Department.

"In addition to this, it may have escaped your attention that the new corporation proposes to interest itself to a very large extent, and with the subscription of a substantial sum, in a suburban homes movement, the idea being that it may promote, through that agency, the comfortable housing of such of its men as may wish to avail themselves of it. That is in line also with our ideas of Welfare work.

"Thanking you very much for your attention, gentlemen, I bid you good-night." (Applause.)

Following Mr. Belmont's speech, a number of stereopticon views were shown illustrating the needs and accomplishments of Welfare work. As amplifying a point touched upon by one of the speakers the following statement by Mr. Jess P. Larimer of the Bridge and Structural Iron Workers' Association will prove of interest:

"There has never been any effort looking to the interest of the first trades that are employed in the erection of buildings and in such structural iron work as bridges and viaducts, where no other mechanics are employed. The other trades are in a measure looked after, inasmuch as a building generally has taken some definite shape before they are long at work, and a room can be set aside within the structure for storing their street clothes in the day and their gloves and overalls at night. Wage-earners in the iron industry would be grateful to your worthy organization if you would get some of the largest contractors to supply us with portable rooms in which to store our street hats and coats in the day time and our gloves and overalls at night. This is our first need, as our clothing is constantly stolen. Second, a wash room with sanitary toilet accommodations; and third, an emergency hospital room."

Referring to the working conditions of the city's employees an important offer was made by Dr. Thomas Darlington of the Health Department. He expressed his willingness and desire to co-operate in every way with committees of the Federation in providing better working conditions for the employees of the city. He urged continued agitation of this great work and said that his department would be only too glad to be informed of unsatisfactory conditions anywhere in the city; that, if such information were given, he would use, as head of the department, every effort to improve the working conditions of the city's employees.

As a result of the discussion of the evening the following resolution was adopted:

Resolved, That the Civic Federation of New York appoint a committee on Welfare Work, to be composed of employers, labor representatives, and representatives of the general public, to co-operate with the Welfare Department of The National Civic Federation, and that this committee on Welfare Work be requested to appoint sub-committees to give consideration to improving conditions of employees of the city and in the different trades in this vicinity.

THE PROGRESS OF WELFARE WORK.

EMPLOYERS' INTEREST IN IMPROVING WORKING CONDITIONS THROUGHOUT THE COUNTRY.

It is most gratifying to note the constantly increasing personal interest of large employers throughout the country in making practical improvements in the conditions under which their employes work. As an evidence of the widespread interest in this work, and particularly in the progress which is being made by the Welfare Department of The National Civic Federation, it may be noted that within the past few weeks four important meetings have been held, one at Boston, one at Lynn, Mass., and two at Washington, D. C., at which addresses were made referring particularly to the results accomplished and to the methods of the Welfare Department.

At the meeting in Boston, which occurred on February 7, the work of the department was explained to the members of the National Association of Wool Manufacturers at their annual banquet at the Hotel Somerset. More than 200 members listened with much interest to an illustrated lecture by Miss Gertrude Becks, the Secretary of the department, and at Lynn, Mass., on February 9, the subject was presented at the Oxford Club, the audience including well-known business men and manufacturers.

In Washington two meetings were held at the invitation of Representative and Mrs. Joseph Weeks Babcock, of Wisconsin. Representative Babcock presided at both meetings, and during the two evenings interesting addresses were made by Senator W. A. Clark, of Montana, a member of the Executive Committee of the Welfare Department, on the general work of The National Civic Federation as an introduction to the particular subject of Welfare Work; by Gen. George H. Harries, of the Washington Railway and Electric Company, a member of the Welfare Department, on what his company is doing for the benefit of its employes; by H. H. Vreeland, Chairman of the Welfare Department, on his own experience in Welfare Work, particularly in connection with the New York City Railway Company, and by Miss Gertrude Becks, who illustrated her paper with a most interesting collection of stereopticon views.

Mr. Vreeland said in part: "As Chairman of the Welfare Department of The National Civic Federation, I desire to express my appreciation of the opportunity of presenting its work to such a representative gathering.

"First, permit me to give you a brief historical review of the formation of the department. Its organization was authorized for the reason that it was believed that the efforts of The National Civic Federation to better the relations between employers and employes would be materially aided by the promotion of what is called 'Welfare Work.'

"Our first step was to call a meeting at the Hotel Waldorf in New York of representative employers of labor in the eastern and middle sections of the United

States. To our great surprise there was an immediate response from many large employers. It developed that it was the first time that employers who were giving especial consideration to the welfare of their employes had been brought together. Each one had an idea that his Welfare Work was an individual effort in his particular locality, and was surprised to find that a great deal of this work was being done throughout the United States."

Mr. Vreeland went on to say that it had been found of especial value to employers to bring about conferences for the interchange of experiences; to discuss the

question at public meetings; to arrange conferences of the Welfare Workers themselves, and to have assistance given when asked by employers. While it may seem odd that the men successful in business should require assistance in introducing Welfare Work, it should be recalled that this is a day of specialization, and that those who have had practical experience in installing Welfare Work are best qualified to give advice. Further-

H. H. VREELAND.

more, many employers would introduce Welfare Work into their establishments were it not for the time and trouble needed for its organization.

"An employer who is noted among his employes for fair dealing," continued Mr. Vreeland, "need have no fear of introducing Welfare Work, after a careful study of conditions has been made. That is, after recognizing that the first needs of employes are steady work, an equitable wage, and hours as short as competitive conditions will permit, the employer may successfully install Welfare Work if proper attention is given to its introduction. All our investigations of failures in this line have shown us conclusively that a just and fair policy of dealing with labor must be the foundation for all Welfare Work. With that foundation, it may be emphatically stated that employes will welcome all such efforts to provide for their welfare."

"Thirty years ago, as a brakeman on a steam railway, I was away from home, forced to live in such boarding houses as the railroad terminals and my wages would afford. There was absolutely no place for me in the evenings where it was warm except the saloon and the pool room. My knowledge of the homelessness of the average railroad employe led me to the establishment of club rooms for the men employed on the street railways in New York City. A large percentage of the 15,000 men employed by the company of which I am President live in boarding houses; many are from the country. The club rooms I established include an auditorium where monthly entertainments are given, a library, a pool room and a physician's office. They were used immediately and extensively, and a chance visitor will find the rooms filled every night in the week. Keeping in mind my own early struggles to gain information and to get the requisite books to read, I determined that, if fortune favored me and I attained a position where I had sufficient control of money and the friendship of those who were interested in the property, I would provide facilities of the character of which I felt the need. The books in the library were not only widely read by the men, but, in many instances, were taken home to be read in the men's families. Another feature of the work is the relief association which provides assistance for the men in case of illness or accident, a pension in old age, and, at the time of death, a fund for burial.

"The success of our work is due to the fact that nothing but illness has ever kept me from the platform of that organization on Saturday night monthly nine months in the year since the society was organized with thirty men in 1893. While a paid Welfare Secretary is necessary to supervise the activities, the participation of the employer is essential to success."

In presenting the general situation in Welfare Work Miss Becks exhibited views showing what many employers have done in providing for the physical comfort of workers, for recreation, in supplying educational opportunities and in the housing of labor.

"Where ventilation has been given especial consideration, the air is changed completely in the work rooms every fifteen minutes. In the foundry, where the pipes which are used in the winter for heating serve to bring in the cool air in the summer, great comfort is afforded the molders.

"In a rolling mill, galvanized iron pipes carry the fresh air to the faces of the men occupied at the rolls. Previously, in very hot weather, the men were frequently overcome, and sometimes it was necessary to shut down the entire mill, the workmen thereby losing their wages and the company the product of their work. Since the installation of the ventilation system not a single hour's time has been lost because of excessive heat."

"The value of the emergency hospital has been evidenced by the testimony of an employer, who said, 'Our hospital has been a preventive instead of an emergency room as we had anticipated. Instead of patronizing it now and then, the men use it continually. Previously when a man injured his hand he was satisfied to put a piece of waste on it. Blood poisoning followed and he would be laid up for a few days. Now every injury receives immediate attention, and the men are not obliged to lay off for slight accidents.'

"Women who have been overcome are frequently able to return to work after resting for an hour or receiving treatment in the emergency hospital."

Reference was made to the effort of an employer to raise the moral tone of a town by providing a social hall. The company furnished pool rooms and bowling alleys in such an attractive manner, and conducted them on such a high plane, that private enterprises in the town were obliged to follow their standard.

Speaking of the homes rented and sold to employes and of the willingness to take advantage of the opportunities offered for better living conditions, the speaker said: "Rents for unskilled laborers in several mill towns, from \$7.50 to \$10 a month, including bath and furnace, are within the reach of wages of the tenants, and yet give a return upon the investment. Very fine tenements have been provided for skilled laborers at from \$16 to \$22.

"Cash prizes are offered for the best kept premises and for the best gardens. This has had a salutary effect upon the tenants. When one man received recognition in the form of a prize, his neighbor, who had not previously thought of improving his place, was stimulated to do so, not only because of the desire for a prize, but because he took pride in having his premises look as well as the neighbors'.

Miss Becks did not confine herself to the workingman's conditions while he is in his prime of useful-

HON. JOSEPH WEEKS BABCOCK.

ness. She exhibited the portrait of a man eighty years of age at work in a shop, and asked the question: "Is it better to pension or give him light work?"

"Many employers have inaugurated systems for supplying funds for employes in illness and old age. The advantage of relief systems for employes was stated to be the assurance of prompt relief in case of illness or accident. The old plan of 'passing around the hat' was apt to work hardship on the employes contributing and did not always reach those in distress.

(Continued on page 16)

MRS. JOSEPH WEEKS BABCOCK.

THE FACTS OF PUBLIC OWNERSHIP.

ANALYSIS OF THE PLAN AND SCOPE OF THE WORK UNDERTAKEN BY THE COMMISSION ON INVESTIGATION.

BY EDWARD A. MOFFETT, SECRETARY PUBLIC OWNERSHIP COMMISSION.

AS has been pointed out in previous issues of the REVIEW the great work to be accomplished by the Commission on Public Ownership and Operation which was called together under the auspices of The National Civic Federation, is to undertake a thorough and absolutely impartial investigation of all the facts connected with these important questions here and abroad and to present the facts to the public as a practical and efficient aid to the solution of the perplexing problem of public ownership.

Schedules relating to the four subjects to be investigated—Gas, Water, Electric Lighting and Power, and Street Railways—have already been formulated by a sub-committee consisting of:

Frank J. Goodnow (chairman), Columbia University;
Walton Clark, third vice-president United Gas Improvement Company, Philadelphia;

Edward W. Bemis, superintendent water-works, Cleveland;

I. W. Sullivan, editor official journal United Garment Workers, New York;

Milo R. Maltbie, former editor *Municipal Affairs*, New York.

Of this committee two were considered to be in favor of public ownership, two opposed and one neutral. As the duties of this sub-committee involved not only the preparation of the all-important schedules upon which the investigation is to be based, but also the general plan of procedure, the advisability of such representation is apparent.

The best possible idea of the scope, impartiality and thoroughness of the investigation would be given by the presentation in full of all the schedules made up by the committee.

To reproduce in full, however, even one schedule dealing with but one of the four subjects would require more than a single issue of the REVIEW. As the general divisions are the same in each schedule an analysis of the schedule relating to Street Railways will indicate the broad scientific lines upon which the investigation is to be conducted. Such an analysis shows that the investigation of each subject—Gas, Electric Lighting and Power, Water and Street Railways—falls under several general heads, as follows:

- (a) Historical and General;
- (b) Supervision of Municipalities;
- (c) Public Supervision of Private Companies;
- (d) Franchises of Private Companies;
- (e) Organization;
- (f) Political Conditions;
- (g) Labor;
- (h) Character of Service and Plant;
- (i) Financial Matters;
- (j) Capital Stock and Bonds;
- (k) Assets;
- (l) Liabilities;
- (m) Receipts;
- (n) Expenses;
- (o) Profit and Loss.

HISTORICAL AND GENERAL.

Under this head questions are asked intended to trace the history of the particular plant, the dates of adopting special features, and other matters that may assist in reviewing its development. The general sentiment in relation to the present system of ownership and operation, and the attitude of the press, are inquired into. The current objections, if any, to the present system; the degree of interest taken by the citizens in the management; whether or not there have ever been competing companies, and whether there is competition now—all these questions are made subjects of inquiry.

Whether or not private companies have consolidated, with dates and methods required, is a phase that is taken care of by a considerable group of questions.

SUPERVISION OF MUNICIPALITIES.

This separation of the subject deals with the power of municipalities to construct their own street railways without purchasing existing private systems; also whether or not they may condemn private systems under the right of eminent domain. An entire group of questions is devoted to this aspect. The power of the particular city in the matter of raising funds for any such undertaking is then inquired into. In this connection are asked the following questions:

What is the limitation upon the city's taxing power for municipal street railways?

What is the limitation upon the general taxing power of the city?

What is the limitation upon the city's power to incur debt for municipal street railways?

What is the limitation upon the general power of the city to incur debt?

State fully step by step the procedure which MUST be followed and the requirements which MUST be met before

the city may construct or acquire a plant; also source of each provision, whether State constitution, statute or ordinance. Note particularly requirements as to initiation of proposal, special action by city authorities before its adoption, mayoralty veto, referendum, publicity, making of appropriations, bond issues, and approval of scheme by courts or State authorities.

Then follow questions on statutory provisions relating to fares and transfers, character and quality of service (method of traction, type of cars, speed, headway, etc.), extensions and general improvements, performance of public work by contract or otherwise, salaries and wages, hours of labor, pensions to employees, strikes and citizenship of employees.

PUBLIC SUPERVISION OF PRIVATE COMPANIES.

This line of the inquiry opens with questions designed to bring out the features of the incorporation of the particular company, with special reference to powers and limitations. As in the case of municipal systems, statutory provisions are examined in detail. A description of defects in remedies and penalties in this relation is also required.

The next questions concretely show the searching nature of the investigation in a most important phase:

What powers of supervision over the construction and operation of the plants of private companies does the city possess?

What provision has the city made for the exercise of its powers of supervision?

How frequently and with what efficiency does the city exercise its powers of supervision?

What provisions have been found impossible of enforcement, and why?

Information concerning taxes paid to State and to local authorities is the object of a considerable number of questions; these conclude with:

Is the company subject to assessment for local improvements?

Are such assessments actually levied?

FRANCHISES OF PRIVATE COMPANIES.

The power of the municipality to grant franchises is here inquired into in detail. Then follow questions to define the legal provisions delimiting the powers of the city as to the insertion of clauses in franchise (a) regarding streets company may utilize; (b) nature of plant and equipment; (c) construction of extensions; (d) adoption of improvements and new processes; (e) duration of grants; (f) forfeiture of franchises; (g) time, method and acquisition of system by city; (h) disposition of plant thus acquired; (i) fares to be charged and transfers to be given; (j) character and quality of service; (k) right of city to regulate operation; (l) taxation; (m) compensation for franchises; (n) paving of streets, etc.; (o) issuance of stocks and bonds; (p) returns to public authorities; (q) transfer of franchise to third parties; (r) labor clauses, and regarding minor features.

Information is then sought to show what penalties and means of enforcing such provisions have been provided, and whether or not they are effective.

The date of issue of each existing franchise, by what authority granted, whether exclusive or competitive, the period for which it has been granted, and approximate mileage of streets conceded—this information is likewise required. Each franchise is further examined in detail, and a full and clear statement of conditions upon which forfeiture may be declared and its possible acquisition by the city, is particularly required. Has the municipality experienced difficulty in forcing companies to live up to the terms of their franchise? is the next inquiry; and this embraces inquiries into the reasons for the difficulty, in case it exists.

The questions that follow trace existing private companies to their very inception, and relate to a most important phase of the investigation. They are:

How much deliberation has usually been given in the granting or renewal of franchises?

Has the exercise of the franchise granting power been attended with public scandal, and if so, in what respects?

How much publicity has usually accompanied the granting or renewal of franchises?

By whom are franchise grants usually drafted?

ORGANIZATION.

The principal questions under this division are intended to bring out how and upon whom the responsibility is placed for the proper maintenance of particular municipal systems: whether or not the authority is divided; how the persons in positions of control are selected and to what extent, if any, political considerations enter into their appointment, and whether or not members of the governing body have technical knowledge. These questions are also designed to determine whether the head of the engineering service is an engineer by profession, and if so, what scope he is allowed in the exercise of his duties, to what extent these duties are executive; and whether or not political considerations affect his appointment or his tenure of office.

It is particularly asked whether or not the office he fills changes with each change in the city administration.

The remaining questions under this head are framed to ascertain to what extent politics may affect the number of employees at any given period; the average length of service; the system of promotion, and whether politics influence the selection or dismissal of wage-earners.

POLITICAL CONDITIONS.

In the questions set down under this head the main object is to ascertain in what measure employees have sought to organize, openly or secretly, their political strength for the purpose of influencing the conditions of their employment, or of exercising similar influence upon city elections; also whether candidates for office have made promises of better wages, etc.

To what extent employees are active in party work, is also inquired into; and whether or not they are expected or required to pay political assessments. The question is also asked as to what evidence there is "of the influence of private companies upon the nomination and election of members of the franchise-granting and franchise-controlling authorities."

This division concludes with a series of inquiries designed to show to what extent, in the case of municipally owned systems, free transportation is given, under what regulations, and the possible abuses of this privilege.

LABOR.

Under this important head the opening inquiries seek to ascertain what, if any, significant relations exist between increases of the working force and elections: the wages, maximum and minimum, paid each class of labor; the legal and actual number of hours per diem; pay for overtime, and provisions for sick leave and vacations and holidays with pay. Then follow inquiries in relation to prizes offered for faithful service, profit sharing, and to a possible system of pensions for aged or infirm employees. It is also asked whether or not the employees have local benefit associations and if the funds of these are contributed to by the municipality or company. The question of who makes the payment for badges and uniforms, is inquired into; also the matter of surety bonds and premiums on same; likewise what efforts have been made to provide clubhouses, libraries, toilet facilities, etc.; the frequency and regularity of pay days, the place and manner of payment, and by whom and how wages are fixed.

The succeeding questions relate to the contentedness of the employees, and the answers are to indicate in what manner and to what extent the employees have a part in determining the conditions of employment. These questions are:

Were union rates observed?

If there were trade agreements, state them.

Was there any form of collective bargaining?

Has there ever been any concerted action among employees to have wages raised or hours shortened? Describe.

Were the employees organized in unions?

Was the "closed shop" or "open shop" policy in force?

Was the municipality or company opposed to organized labor?

Has there ever been a strike on the system? If so, describe fully.

How were labor disputes settled?

Were the laws relating to health, employer's liability, and contract labor observed?

Were there any printed or written instructions to employees? If so, enclose copies.

The concluding questions of this division of the subject require a statement of the number of persons, employees and others, killed during the past year; also the statistics with regard to persons injured, and the record of law suits on this account.

CHARACTER OF SERVICE AND PLANT.

The questions that comprise this part of the schedule refer first to those parts of the particular system, municipal or private, that generate and transmit power. The initial inquiries are necessarily of a most technical nature. They seek to determine the general capacity and comparative economy of what is called the power plant.

Then follow questions designed to ascertain the number of lines of the different companies, under and above ground, their types, special features and dates of installation; the number of cars in active service and their character, whether open or vestibuled; the types of fenders and motors; their lighting and heating. Information as to mileage and track data generally is sought, as also information in relation to paving obligations.

Then follow questions intended to obtain a fair appraisal of the particular plant.

Under the sub-division "Traffic," which is the next phase considered, are taken up questions relating to the total number of fare and transfer passengers; the hours at which cars carrying passengers, etc., are run.

Next come inquiries showing the comparison, if there be such, between the legal maximum speed and the actual; headway schedules; the number of transfer points; and whether waiting rooms are provided at such places.

Then follow:
Were passengers kept waiting at points of stopping because cars were run too infrequently?
Were passengers often obliged to stand in cars?
Were the cars crowded?
Were extra cars run during rush hours?
Were the facilities ample to meet the demands of the public at all times?
What types of cars were used?
Were the cars kept clean and well painted?
Were the cars well lighted and ventilated?
Were the cars well heated in cold weather?
Were the guide boards on the cars easily read and plain?

If advertising space was let, state to what extent both inside and outside of cars.
Was service supplied twenty-four hours in the day?
If for part only, how many hours each day?
Are there any engineering tests or experiments being carried on?
Were there frequent complaints about interruption of service?
Has the street railway service ever been completely or partially cut off? Describe instances.

In addition to seeking information as to extension of lines, how extensions are brought about, and particularly the policy of the company (or municipality) in this regard, the questions following go into the matter of street work. On this subject some of the questions asked are:

Were open trenches and obstructions properly guarded?
Is there an up-to-date map showing the location and nature of all street mains and fixtures?

The purchase of supplies by municipally owned lines is next inquired into. The opening questions here relate to the responsibility for the placing of orders, and for the checking of materials purchased. Among the principal questions are the following:

Were contracts advertised?
How did prices compare with those paid by private companies?
Were the dealers supplying materials connected with the city, county or State government?
In practice, did the manager get the types and makes of things he asked for, or was he forced to take something else?

As a general summing up of the questions thus far propounded there appears under the sub-head, "General Matters," a number of inquiries of such manifest importance that they are given without change of any kind. They are:

Is the system adequately equipped to handle the business?
Is the equipment of modern and efficient type?
Is it in good condition?
Will it be necessary to make extensive repairs or alterations in the near future?
Is the plant kept in clean and neat condition?
Are the works adequately ventilated?
Are the pits, shafts and machinery properly guarded?
Are the offices for payments, complaints and other business conveniently located?
Were passengers' complaints promptly and efficiently attended to?
If any parks or other places of amusement are owned or operated by the company, state what and give size, cost and number of visitors annually.
Is there a system of badging or uniforming the employees so that they may be known to the public?
Is the general morale and discipline of the employees good, bad or indifferent?
Are the employees who meet the public polite and attentive?
Are they neatly dressed?
Do the various departments work in harmony? Is there friction or jealousy, and does one department shirk work, leaving it to be done by another?
Is there an adequate system of telephones?
Are the works and offices properly watched at night?
Is there any system of inspection to prevent workmen of other companies or city departments from injuring the underground structures?
Was there a drafting room maintained?
What system was in vogue to take care of the tools distributed to employees?
Were the different classes of workmen equipped with proper tools? Were the tools kept in order?

FINANCIAL MATTERS.

The inquiry into all of the four subjects under investigation ends with a critical examination of matters falling under this head. The professional accountants engaged in this department of the work are under strict orders to exercise the fullest care and are given special instructions as to the scope and bearings of the principal questions.

Capital stock and bonds, assets, liabilities, receipts, expenses, and profit and loss—each of these elements is made the subject of exhaustive inquiry.

Among the detailed questions in this category are those relating to the reduction or increase of fares, to what manner and to what extent the employees have a proper charging, in the case of municipally owned systems, of each item of expense to the proper account, with particular regard to services rendered by officers of the city government; the keeping of the accounts of the particular plant independent from all others and from the general accounts of the city; the rate of interest paid by the city as compared with the rate paid by private public service companies; the canceling of liabilities, and payment of interest on bonds.

It is also asked whether or not the plant was run at a loss; and if so, how the deficit was met. The manner of auditing is likewise a subject of inquiry, and also a minute examination is to be made of how each issue of stock was disposed of. The schedules end with a résumé intended to show the balance to profit and loss.

As stated above, the schedule of the investigation of

Street Railways is typical of the schedules arranged for the investigation of the three other subjects under consideration—Gas, Electric Lighting and Power, and Water; so that even in the brief résumé here given the reader may get a clear idea of the thoroughness with which the work is being carried on. While it is important that thoroughness of the technical side of the investigation should be shown, it is of no less importance that the experts chosen to conduct that side should be named and the manner of their selection indicated.

These authorities were engaged by the sub-committee previously spoken of, and in each instance the choice was unanimous. They are:

GAS—Alfred E. Forstall, New York; J. R. Klump, Germantown, Pa.; Fred C. Burnett, Toronto, Canada.

ELECTRIC—C. E. Phelps, Jr., Baltimore Md.; Theo. Stebbins, Columbus, Ohio; Alton D. Adams, Worcester, Mass.

STREET RAILWAYS—Norman McD. Crawford, Hartford, Conn.*

WATER—Dabney E. Maury, Peoria, Ill.

ACCOUNTANTS—Marwick, Mitchell & Co., New York; Robt. C. James, Wallingford, Pa.

With regard to the actual work already done, a number of American cities have been visited and considerable data has been collected. The work in this country will continue until May 22, when fifteen members of the Commission will sail for London. By that time it is expected that a large part of the technical work in Great Britain and Ireland will have been accomplished. For more than a month past preliminary work has been in progress, under the supervision of Messrs. M. E. Ingalls, Milo R. Maltbie, J. W. Sullivan, and Albert E. Winchester, members of the Commission.

After spending six or eight weeks reviewing the work of the experts, the members of the Commission abroad will return and complete its examination of American plants and finally make its report to the whole Commission.

* Other experts in this line are now being engaged in England.

THE INVESTIGATING COMMISSION IN ENGLAND.

The following cablegram to the "New York Tribune," refers to the work of the Public Ownership Commission of The National Civic Federation, which is now extending its investigation to England:

LONDON, March 10, 1906.

The National Civic Federation of the United States has sent a body of engineers and accountants across the Atlantic to make an exhaustive study of the practical operations of municipal ownership. The commission, headed by Mr. W. J. Clark, Mr. Milo R. Maltbie, Mr. J. W. Sullivan and Messrs. Klump and James has already broken ground in London for systematic work, and within a fortnight will be making a survey of municipal socialism in Glasgow, London, Manchester, Birmingham, Leeds, Liverpool, Sheffield and other large centers of population. As Mr. Maltbie explains the matter, the investigation has been undertaken as a combination movement by interests opposed to municipal ownership and by converts to the progressive policies. Capitalists alarmed by the results of recent local elections in America and politicians and reformers attracted by the scope and spirit of the new municipal activities in England have agreed to unite in an effort to obtain precise information respecting the financial and mechanical achievements of British municipalities as good government clubs. So the commission of engineers and accountants has been empowered to ascertain the facts in an impartial spirit and to report upon them to the National Civic Federation. The commission will be strengthened by new members, and, as its expenses are met by liberal contributions, it will employ additional experts and will be occupied for several months in a thorough examination of the conditions of local government in the most enterprising British towns. The final report can hardly fail to be of exceptional value. Dr. Albert Shaw was the first American writer to direct attention to the trend of collectivism in British towns; but his book was written a decade ago, and there has been subsequently an enormous enlargement of municipal operations. The American Consul at Hull, Mr. Walter C. Hamm, and other members of the consular service have written excellent reports on these municipal activities; and many journalists and magazine writers have contributed freely to the literature of the subject. An investigation by experts uninfluenced by previous bias or prejudice will be of great utility in informing and enlightening American opinion on a matter of supreme importance.

Mr. Maltbie and his associates will not lack prompters, if they are anxious to have cues behind the scenes. There is a powerful association of English capitalists, economists and taxpayers, which has been conducting a vigorous campaign against municipal socialism and has received the support of "The Times." There is also an organized body of representative municipal councillors, which holds an annual congress and brings the town corporations into working relations for mutual benefit. There is "The Municipal Journal," whose former conductor, Mr. Robert Donald, is now the editor of "The Daily Chronicle," and the municipal reformers have in it a most intelligent advocate and capable organ.

The Progressive members of the London County Council are municipal socialists; and Mr. John Burns, president of the Local Government Board, has been one of the ablest champions of the new principles of collective responsibilities and investments for the common good. The commission can hear in London all that can be said in favor of the new policies and against them; but if I have correctly understood Mr. Maltbie's explanations it will not be influenced by these special pleadings, but will visit the provincial cities and with the assistance of its own experts ascertain how municipal trading in its various forms is operating, how much it costs in local taxation and what profit, if any, there is from it for the reduction of rates. This method of procedure is one which will be heartily commended by all fair-minded investigators.

NEW OFFICERS OF THE NATIONAL CIVIC FEDERATION.

At the annual meeting of the Executive Committee of The National Civic Federation held at the Park Avenue Hotel on March 26, the following officers were elected for the ensuing year:

AUGUST BELMONT, *President.*

SAMUEL GOMPERS, *First Vice-President.*

OSCAR S. STRAUS, *Second Vice-President.*

ISAAC N. SELIGMAN, *Treasurer.*

HON. SETH LOW, *Chairman Conciliation Committee.*

FRANCIS L. ROBBINS and JOHN MITCHELL, *Chairmen Trade Agreement Committee.*

CHARLES A. MOORE, *Chairman Welfare Department.*

RALPH M. EASLEY, *Chairman Executive Council.*

SAMUEL B. DONNELLY, *Secretary.*

In the election of officers only two changes were made from last year. Isaac N. Seligman and Charles A. Moore were newly elected respectively as Treasurer and as Chairman of the Welfare Department.

In resigning as Chairman of this Department, Mr. Vreeland sent the following letter. Mr. Vreeland's resignation was accepted and a vote of thanks was tendered him for his faithful services as Chairman of the Department.

NEW YORK, March 23, 1906.

AUGUST BELMONT, Esq.,

President National Civic Federation.

MY DEAR SIR:—Commencing with the organization of the Welfare Department of The National Civic Federation, I have been its Chairman. At the time I was requested to accept the Chairmanship, I advised the Committee that my duties and responsibilities were such that I could not with justice to my business and personal interests accept any additional responsibilities, but in the interest of organization of this Department on lines with which I was more familiar than others, I agreed to accept such responsibilities, and have continued to do so up to the present time to the best of my ability.

The recent developments in connection with the business interests which I represent have increased my duties and responsibilities, and I therefore must request the Executive Officers of The National Civic Federation to relieve me of the duties devolving upon the Chairman of the Welfare Department, and ask that my resignation be accepted, to take effect upon the election of my successor at the annual meeting to be held in New York City on March 26th, 1906. I shall always be very glad to give to the Department the benefit of my counsel and advice.

With assurances of my support and loyalty to yourself and those associated with you in this important work, I remain,

Very truly yours,

(Signed) H. H. VREELAND.

Apart from the election of officers the most important business transacted at the meeting was the appointment of a Committee of Five on by-laws and constitution. This committee was appointed as a result of the suggestion contained in the annual report of the Chairman of the Executive Council to the effect that a consideration of this subject is necessary in order to meet the change in conditions since the adoption of the constitution and by-laws now in force and to keep pace with the enlarged scope of the Federation. This committee, as appointed by President Belmont, consists of Hon. Franklin MacVeagh, Samuel Gompers, Hon. Oscar S. Straus, Rev. Dr. Thomas R. Slicer and Ralph M. Easley, Chairman of the Executive Council. Mr. Easley's report, offering the suggestion which resulted in the formation of this committee and outlining some of the work of The National Civic Federation during the year, follows:

During the past year, The National Civic Federation, in addition to its industrial work, has taken up three new subjects, namely: Public Ownership, Immigration, and Primary Election and Ballot Reform. As the subject of Public Ownership is taken up elsewhere in this issue of the REVIEW the reference to it in this report is here omitted.

DEPARTMENT OF IMMIGRATION.

A Department on Immigration was organized at the request of the National Conference on Immigration held in New York City under the auspices of the Federation, December 6-8, 1905. That Conference was attended by six hundred delegates appointed by the governors of forty States, mayors of large cities, and leading commercial, agricultural, labor, manufacturers, economic, ecclesiastical and educational organizations.

The membership of the new Department is made up of representatives of all those organizations, making a total of one hundred and fifty. A meeting will soon be held for the purpose of organizing and outlining the scope of the Department. The importance of this subject cannot be overestimated. It is claimed that a million immigrants came to this country last year; and the proper distribution and the making of American

citizens out of this alien influx is a problem calling for the best efforts of our public-spirited citizens. If the South and West need these immigrants, which are over-crowding the cities, one of the practical problems before the new Department will be their proper distribution. Other important subjects for investigation will be Selection and Restriction of white immigrants and the Enforcement of the Chinese Exclusion Acts.

DEPARTMENT OF PRIMARY ELECTIONS AND BALLOT REFORM.

At the National Conference on Primary Elections and Ballot Reform, held under the auspices of the Federation in New York, March 6 and 7, a resolution was unanimously passed, requesting this body to organize a Department to give consideration to that subject. The Conference was very representative. It was attended by delegates from all parts of the country, appointed by Congressmen, Mayors, and municipal and political reform bodies, representing various shades of political opinion. No more important work could be undertaken by our organization than to help secure clean government, whether national, State or municipal.

CONCILIATION DEPARTMENT.

The work of the Conciliation Department the past year has been confined almost entirely to bringing about conferences, at the request of one side or the other, where there were threatened industrial disturbances. The requests have come from twenty-two States and cover almost every branch of industry. About three-fourths of the Conferences have resulted successfully. In some cases they have been secured without much difficulty, simply by getting the right persons to work toward that end. But, in many other cases, a great deal of patience and tact was required by members of the Department. One advantage resulting from the enlargement of the scope of the Federation has been that members of other Departments were available in different cities to help when necessary.

Within the last month, seven very interesting cases have come to the Department. One was a threatened tie-up on a large elevated railway in a near-by city. The representative of the employees called at headquarters and stated that unless he could secure a conference within twenty-four hours, his men would strike. It was necessary to reach both the chairman of the executive board and the president of the railway, through members of our organization. When the matter was laid before them, they expressed surprise that the trouble had progressed so far without their knowledge. They granted the conference, and the difficulty was amicably adjusted. Both sides wrote to the Department, expressing their thanks for its efforts, but marked their letters confidential.

It is thus kind of quiet, delicate work that has proved most effective. Were these cases to be made public, such action would be resented by the parties interested.

WELFARE DEPARTMENT.

The Welfare Department has made great progress the past year. Its membership now numbers over two hundred employers, each one being committed to the policy of bettering the conditions under which his employees work or live. The progress of the work of the Welfare Department is treated at length elsewhere in this issue.

In pursuing this phase of our work the great problem of child labor and of bettering the conditions under which women work, presents itself to the Welfare Department. It is proposed that the Department shall take up those two subjects, and make investigations, either in co-operation with existing organizations, or independently, as may be deemed wise.

INDUSTRIAL ECONOMICS DEPARTMENT.

The Industrial Economics Department, organized a year ago, held one general meeting at which was discussed the question of Individual Liberty. The Department has mapped out a promising programme for the ensuing year.

The non-union versus the union or, what is commonly called the "open and closed shop controversy"; the injunction; the boycott; and the hours of labor are among the subjects that will be studied.

Some new problems confront us in the open and closed shop controversy, which has become acute in nearly every industry where the employees are organized. It was rare for a union to strike two years ago to secure what it termed the "union shop." To-day the demand for the union shop is the cause of numerous strikes. It is claimed that the reason for this change in policy is that, while, several years ago, the open shop meant a non-discriminating one—that is to say, one in which the union and non-union men were given identical treatment—now the open shop practically means a non-union shop. The unions present much testimony to show that there are numerous employers' organizations whose members, while publicly declaring that they will treat union and non-union men alike, are practically forcing every union man out of their employ. If this be true, then, in fighting for what it calls the union-shop, the union is only endeavoring to preserve its existence.

It will be the duty of the Industrial Economics Department to investigate this subject and present all the facts to the public.

On the question of the injunction, organized labor

claims that the courts are lending themselves to the employers by issuing temporary injunctions at crucial moments during strikes, and that although upon a later hearing the injunctions are dismissed they have, in the meantime, served the purpose of the employers to break the strikes. If labor has the right to strike, and no one will deny that proposition, and if the courts are thus made allies of the cause of the employers, it is certainly a serious matter. If it be found true that the injunction is thus abused, the committee investigating this subject will be expected to recommend how the abuse may be corrected without destroying the general principle of the injunction.

Other questions that will naturally come before this Department are: "The Union Label," "Restriction of Output," "The Limitation of Apprentices," "The Minimum Wage," "Piece Work," "Trade Agreements," and "Compulsory Arbitration."

THE CIVIC FEDERATION OF BOSTON.

Following this report Mr. Hayes Robbins, of the Civic Federation of Boston, outlined some of the results of the work of the organization during the year in New England. Mr. Robbins said in part:

The New England Federation organized for business one year ago, with an Executive Committee of 21. This was later increased to 30, and in January last to 42. It was my feeling from the start that we ought to have a definite body of members at large, who should be entitled to attend and vote at our meetings, and feel that they were not merely invited guests, but were officially a part of the work, having some personal concern in its progress and success, and expressly committed to its principles. This last provision was made our basis of membership. We have no financial test; any dues large enough to maintain the work would exclude a large number of our members whose affiliation and influence we desire for other than financial reasons.

It was not an easy matter to pick out the people we wanted as members in the three groups composing the Federation. After a year's campaign, however, we have to-day 547 members, scattered all over the New England States; 239 being employers, 183 representatives of the public, and 125 representatives of labor. Our files of acceptances give us a fairly good index of the strength of sentiment among the broadly representative men of the section, favorable to reasonable methods of industrial dealing.

The fact that our labor membership is smaller than that of the employers is due to the greater difficulty of learning who the influential men are in the large territory covered, but the labor list is steadily growing. The prevailing labor sentiment toward the movement was registered in the emphatic resolutions of endorsement passed unanimously by the Boston Central Labor Union last May, and by the Massachusetts State Branch of the American Federation of Labor last October.

We have also a Conciliation Committee of 15, headed by two of the most capable men in New England for this kind of work—Mr. Louis D. Brandeis and Judge Warren A. Reed, who was formerly Chairman of the State Board of Arbitration, which is perhaps the most effective board in the country, and which was never more so than under his administration.

We are also building up a department of Organization and Education, numbering thus far 41 members, in 32 cities and towns. These members furnish our special points of contact with local situations, and in joining this committee they agreed to give us local information when necessary, and names of people who ought to be interested in the movement.

In the past fourteen months we have had to deal with 24 cases of industrial disagreement, and have taken part in negotiations to prevent trouble where it seemed likely to follow the failure to adjust differences. Details of these cases are on file, but we do not make them public. The difficulty has not been solved in every case by any means, but it may be said of practically all of them that either the trouble has been adjusted or the issue dropped; or, progress has been made toward a possible adjustment after further developments; or, an unforeseen indirect benefit in some co-related matter has grown out of the negotiations; or, the parties have been brought into relations under which the probability of similar friction in the future is materially lessened. President Tuttle testified at our last annual meeting that there never had been a time within his knowledge when there was so little strife or threat of strife within the borders of New England as at present, and expressed the belief that to no one thing was more of that condition due than to the influence this movement has been exerting.

We have held two public meetings, one in April, 1905, and the other in January last. At the latter, our first vice-president, Frank H. McCarthy, of the Cigar Makers' Union, presided, although Mr. Tuttle arrived in time to pronounce the benediction. Governor Guild and his immediate predecessor, ex-Governor Douglas, were both present and spoke; the question of Hours of Labor was discussed by Alfred Mosely, Marcus M. Marks, James Duncan, James P. Archibald, and Louis D. Brandeis. At our meeting of last April we discussed Trade Agreements, Mr. Tuttle presiding, the speakers being Mr. Belmont, Mr. Gompers, William H. Pfahler and John F. Tobin.

We are now forming a new Committee on Workshop

Improvement, to rouse interest in that portion of Welfare Work which deals with conditions affecting the health and comfort of employees within the factory or store. Our chairman for that work is Frederick P. Fish, president of the American Telephone and Telegraph Company, and while the members of the Committee proper will be employers, we are forming an advisory board composed of a few selected employers, labor representatives and technical experts, whose advice and help we think will be valuable. The first two lines of work we expect to take up are, enlisting the co-operation of both employers and employees in applying to workshop conditions certain very sane, practical measures that are being successfully promoted by the Society for the Relief and Control of Tuberculosis; and, in another direction, endeavoring to secure better enforcement of the present sanitary regulations of workshops, helping to promote a wider knowledge of what these regulations are, and if possible, getting increased facilities and help for the State police, who are charged with this work.

We have a small office for headquarters, and a considerable amount of current literature and reports on file, bearing on all phases of the industrial situation; this material is pretty fully covered in an Information Index which is consulted more or less by students and others making special study of these subjects.

We have no regular publication, but have issued four special bulletins dealing with various features of our work. Through the courtesy of The National Civic Federation, all of our members receive the CIVIC FEDERATION REVIEW. In some cases we have supplied speakers for outside meetings, and we are especially fortunate in having within reach for such purposes a number of good, practical, fair-minded men who understand the subject and know how to discuss it. We expect to send a fraternal delegate, by invitation, to the State Convention of the Maine Federation of Labor next June.

Among the men who have been most useful to the work are, first of all, our President, Mr. Lucius Tuttle, President of the Boston & Maine Railroad, than whom no man in New England holds a higher place in public confidence and esteem. His status with working men is fairly reflected, without exaggeration, in the statement which is typical, by one of the conductors on that railroad who wrote us that he was proud to belong to anything presided over by a man who is loved by 25,000 whose labor he directs. Mr. Tuttle's influence and cordial personal co-operation from the beginning have been a tower of strength to us. Then we have Mr. Brandeis and Judge Reed, already referred to; Charles H. Taylor, Jr., of the *Globe*, one of the first organizers of the work there, its first Secretary, and Treasurer for a year; John Mason Little, our present Treasurer; Frederick P. Fish, Major Henry L. Higginson, Senator Crane, Bishop Lawrence and a loyal group of exceptionally able labor representatives, including Frank H. McCarthy and Henry Abrahams, of the Cigar Makers; Frank K. Foster and Park Mitchell, of the Typographical Union; John Golden, of the United Textile Workers; John F. Tobin, of the Boot and Shoe Workers; James Duncan, First Vice-President of the American Federation of Labor; D. D. Driscoll, of the Horse Shoers, and Colin Cameron, of the Carpenters.

THE PROGRESS OF WELFARE WORK.

(Continued from page 13)

"Some of the objections of laboring men to insurance plans have been met by progressive employers, who have arranged to return at least a portion of the dues contributed by employees when they leave the service of the company. When a man has been employed from fifteen to twenty years by one company, and has contributed during that period to the relief fund, he may have placed therein all his savings which he can ill afford to lose when his years of usefulness are near an end. A number of employers have abandoned the obnoxious clause which binds the laborer who belongs to the relief society to release the company from legal liability in case of a serious accident.

"There is a growing tendency among employers to encourage thrift by establishing savings funds. It is difficult for employees to patronize the public savings banks, which are open only during working hours, and, furthermore, it does not appeal to a man to spend 10 cents car fare for the sake of reaching a bank where he may deposit 10 cents.

"Employers who have inaugurated a system of lending money to employees in times of stress have discovered a means of eliminating the 'money shark' from their institutions."

On the general topic of the widely growing interest in Welfare Work attention should be called to the action just taken by The Civic Federation of New England in appointing a sub-committee on workshop improvement comprising five officers and an advisory board of thirty-five. Frederick P. Fish, of the American Telephone and Telegraph Company, is the Chairman of the committee and its object is to promote practical interest in the improvement of such working conditions as affect the health, comfort and convenience of employees in factories, stores and other places where labor is performed.

The National Civic Federation Review

Vol. II. No. 10

NEW YORK, JULY—AUGUST, 1906

TEN CENTS

PUBLIC OWNERSHIP COMMISSION IN EUROPE.

VALUE OF THE INVESTIGATING COMMITTEE'S WORK EMPHASIZED AT THE DINNER OF THE NEW YORK CIVIC FEDERATION.

HAVING practically completed, for the greater part, their study of conditions in the more important American cities as affecting the ownership of such public utilities as gas, water, electric lighting and power, and street railways, members of the Investigating Committee of The Commission on Public Ownership and Operation sailed from New York May 22 on the "Caronia" and are now in Great Britain in the midst of a thorough examination of the facts to be found there bearing upon the various phases of their subject.

The Committee's itinerary during the month of June included Dublin, where the street railway system was investigated; Glasgow, where tramway, electric lighting and gas undertakings were examined; Newcastle, where gas and two electric plants were selected for study; Sheffield, Leicester and Birmingham, where examinations of gas works were made; Liverpool's tramway and electric light undertakings; Manchester's tramway, gas and electric light establishments, and London, where the Committee is now studying tramway, gas, and electric light undertakings, including a trip to examine Bristol tramways, if convenient. The Committee reached London on June 22, where it is to remain until the adjournment of its sessions in England. Headquarters have been established at 9 Arundel Street, Strand, London, in charge of Messrs. Maltbie and Sullivan.

Cable dispatches from Great Britain reporting the progress of the Committee's investigation state that in Glasgow both the "municipalists" and the "anti-municipalists" in the committee are generally impressed with the compactness and perfection of the

Glasgow street railway system. At the banquet to the Committee given by the Glasgow Corporation on June 2, Baillie Alexander, in proposing a toast to The National Civic Federation, asked that the statement that the Glasgow people did not have to pay taxes be contradicted. They paid taxes, he said, but these were more than compensated for by the cheapness of the various public services. Mr. Moffet of Indiana replied that he hoped America would be able to produce such disinterested city councillors as Glasgow had. They had in The Civic Federation a nucleus of this high type. Mr. Parsons of Boston, in proposing a toast to the Corporation of Glasgow, said it was largely a question of civilization. Boston had tried municipal

printing and the experiment was not a great success.

Following the Committee's examination of the Glasgow gas enterprises, Chairman Ingalls was quoted in a cable dispatch as saying that he had been much impressed with the success of municipal ownership in Glasgow and thought the same results could be achieved in America if the right kind of citizens would enter public life. He said: "We have the right kind of citizens, but they all seem to be too busy to take part in the affairs of city government." Of the undertakings he had seen in Glasgow he put the tramways easily first, then the gas supply and, last, the electrical supply system. Mr. Parsons said that the facts that had been ascertained in Glasgow would help them greatly to arrive at a decision whether America had the proper conditions for successful municipalization.

At a banquet given by the Glasgow Corporation on June 4, the members of the Committee expressed themselves as delighted by the cordiality of their reception. Prof. Goodnow said that whether or not the members of the Committee were advocates or opponents of municipal ownership or merely perchers on the fence it was a great pleasure to see what Glasgow had done. The advocates of municipal ownership had come to strengthen their arguments, their opponents had come in a vain endeavor to find weakness and those perched on the fence had come merely to ascertain the truth. The Americans, he added, were credited with suffering with swelled head. For himself, since coming to Glasgow, his head had become considerably smaller.

What has impressed all the members of the

Upper Row (from left to right)—John R. Commons, F. J. McNulty, W. J. Clark, Ralph M. Easley, Talcott Williams.
Lower Row (from left to right)—John H. Gray, Walton Clark, Frank J. Goodnow, Frank Parsons, Edward A. Moffett.

MEMBERS OF THE INVESTIGATING COMMITTEE OF THE PUBLIC OWNERSHIP COMMISSION.

Committee is the remarkably high character of the men constituting municipal governments in Great Britain, who devote as much attention to municipal affairs as men in the United States devote to their private business. At a luncheon tendered to the members of the Committee on June 11 by the city government of Manchester was a councillor who has been a member of the government for twenty-nine years and who retired from business in order to devote all his time and energies to the affairs of the city. The members of the Investigating Committee express appreciation of the kindness and courtesy displayed by everybody with whom they are brought in contact. All the municipal officers and the owners of private concerns show readiness to give them all the facts and figures they desire.

In addition to the Committee's investigation of European cities, an extended examination of municipal conditions has been in progress for some months in the cities of this country, including Chicago, Philadelphia, Pittsburg, Indianapolis, Fort Wayne, Wheeling, Richmond, Allegheny City, South Norwalk, Atlanta, and Norfolk. These investigations of the different cities in Europe and America are being conducted with the sole purpose of collecting the facts—facts that are basal and comparable—as to the ownership of public utilities, and not for the purpose of formulating an opinion as to the wisdom or unwisdom of the action of the various municipalities in adopting the plan of ownership to which each at present adheres.

Various phases of the value and significance of this work of the Commission were emphasized at the New York Civic Federation's dinner to the Commission's Committee on Investigation held at the Park Avenue Hotel on May 21. Hon. Oscar S. Straus presided. Speeches were made by Mr. Straus, Professor Frank J. Goodnow of Columbia University; Dr. Albert Shaw, editor of the *Review of Reviews*; Hon. W. J. Gaynor, of the Supreme Court of New York; Mr. August Belmont, President of the National Civic Federation; Mr. Philip Kelly, of the Theatrical Protective Union; Dr. Talcott Williams, of the *Philadelphia Press*; Mr. Walton Clark, Third Vice-President of the United Gas Improvement Company, Philadelphia; Professor Frank Parsons, President of the National Public Ownership League, Boston; and Mr. Horace E. Deming, Chairman of the Executive Committee of the National Municipal League, New York.

PRIVATE INITIATIVE ON PUBLIC QUESTIONS.

Banquet Address of Hon. Oscar S. Straus,
Vice-President National Civic Federation.

THERE is no surer index of a nation's decay than when a people become indifferent to their own welfare, and shift individual responsibility to governmental control. Just as there is a limit to the sphere of individual action in a body politic, so there is a limit to governmental duties.

The very fact that in this country so much work of a public nature is done by private initiative, by private individuals, and by so-called semi-public bodies, is the best evidence that our body politic is sound and healthy. I do not mean to intimate that in this country we are free from the corrupting influences of selfish greed; on the contrary, the crop is plentiful, but so is the vigilance of the upright citizens who are continually on the alert, and wield the scythe with stalwart arms, and fearlessly lop off the deleterious weeds which spring up in the night and grow afield.

In no country in the world has so much been left to private initiative, not only industrially, but even to a greater extent in the benevolent and philanthropic fields. The very fact that in this country the people from the earliest times have been accustomed not to rely upon the State for the support of their religious establishments, has had a large influence in broadening the scope of individual activities and responsibilities. Much work that in the old world was left to government, national and municipal, has, in this country, been initiated, fostered and supported by private individuals. This has developed its good as well as its detrimental sides. Many of our public works in city, state and nation have been undertaken by individuals, often in advance of the need of a people. Often this has proved speculative and hazardous, and often the results have proved marvelously remunerative. This extraordinary enterprise has paved the way to our rapid commercial development, and expedited the movement of our population from the Atlantic to the Pacific, and from Maine to Mexico.

The so-called "unearned increment," if I may borrow a phrase, has grown more and more valuable with the growth of the population of our cities, and it is becoming more and more a serious question to what extent that "unearned increment" should be, and can safely be utilized so as to profit the municipality or State which has a right to hold these valuable franchises in trust for all the people. The question arises, can these franchises be made to return greater advantages to the people if held, developed, and operated in common, or, if held in common and developed and operated by private individuals, or non-governmental bodies.

Many experiments along these lines have been made, some in this country, but more in the greater European cities. The National Civic Federation has taken up the

consideration of this subject so far as it applies to public ownership and operation of public utilities in municipalities, confining its investigations specifically to passenger transportation, whether by elevated, surface, or underground systems; to the supply of water, gas, and electricity. For this purpose it has invited men competent, as scientific experts of practical experience, and accountants, to study the subject in all its phases both here and abroad. These men are highly qualified by capacity and experience to make the investigation. Some of these men have large interests in, and represent private ownership, and some of them are pronounced advocates of public ownership and public operation. All sides of this question are fairly represented, so that the investigations will be from all sides, and in no case one-sided. The men who have undertaken this subject deserve to be commended for their public spirit, and we are assembled on the eve of their departure for Europe to extend to them our unstinted appreciation for their commendable public spirit in undertaking this important investigation.

The Committee, consisting of twenty-one members, have already made some investigations in this country, and on their return those investigations will be continued, and a full report covering the entire subject will be laid before the public, with such recommendations as they may be able to agree upon—in any event, the facts as they find them will be presented in detail.

In addition to the economic aspect of the question, there is even a more important side, the comparative effect that public ownership and public operation, as contrasted with private ownership and private operation, has upon our body politic.

We are not blind to the fact that the government of our municipalities is often inefficient and corrupt. Some of them have been a disgrace to our free institutions, and evidence is not lacking that a large share of responsibility for these unfortunate conditions is due to the corrupt influences of private ownership in the securing and in the controlling of public utilities. On the other hand, it is claimed by some of our leading writers both here and abroad, that in a democracy few things are more to be feared than a great increase in the number of those who are in the direct employ of the State or the municipality. Lecky says: "The temptation of the representatives to use public money and public works as a means of electioneering, and the temptation of the electors to use their political power as a means of obtaining trade advantages for themselves, will soon become irresistible, and the floodgates of corruption will be open. . . . Public works are in this respect far more dangerous under a democratic government than under a despotism."

On the other hand, it is claimed by other writers of equally high standing that public ownership and operation carries home to every one the importance of good government, and arrays on its side the strong classes in a community which otherwise would be indifferent, and that municipal government improves as its duties are enlarged.

With these general and preliminary observations, I will call upon the gentlemen who represent the several sides of this question, to address you. These addresses will be entirely informal but, therefore, none the less acceptable.

METHODS OF THE OWNERSHIP COMMISSION.

Professor Goodnow, of Columbia University,
Describes the Methods of the
Investigating Committee.

SOME time ago I received by the same mail two books on municipal ownership in Great Britain. If one read one of them he could hardly fail to reach the conclusion that the assumption by the British authorities as to the ownership and operation of municipal public utilities was a great success. If upon the other hand, he, by chance, took up the other book, he did not have to go further than a perusal of its table of contents to see that municipal activity along these lines was, in the eyes of the author, a conspicuous failure. In some respects it is true; the conclusions reached by these writers were due to the fact that where disadvantages had to be balanced against advantages, one gave a greater weight to an acknowledged advantage or disadvantage than the other. To that extent the different results reached were due to an honest and perfectly natural difference of opinion. But still, making due allowance for these reasons, for the difference in the final result reached, one could not put these books down without feeling strongly that "some one had blundered." One almost had a suspicion that some one had committed a more heinous offense than a blunder.

Now, this blundering, or worse than blundering, has been, I think, characteristic of most of the literature on the subject of municipal ownership which has as yet appeared. At any rate, this characteristic of the existing literature has been the one which has been most markedly apparent to him who, not blinded by prejudice nor disqualified by interest, has honestly and earnestly attempted to get at the truth. And it was, as I understand it, the purpose of The National Civic Federation in its establishment of the Commission which has entrusted to us the investigation of this most important

subject to do what it could to make future blunders less easy and future misrepresentations, if I may so call it, more easy of detection.

The question naturally presents itself, What are the methods which have been adopted to attain the desired end? In answer to this question, I may say, those responsible for the management of The National Civic Federation laid down one fundamental rule which those of us who have been most active in the work of investigation have had continually before us. That rule was that we were to ascertain facts. The adoption of this rule prevented, in the first place, this Commission from meeting and after argument and discussion coming to a determination that, in its opinion, municipal ownership and operation of any specific public utility under the conditions existing in the average American city was better or worse than private management. For the opinions of this Commission, however valuable they may be, are not facts.

We are confined to facts. Now, what are facts? What are the facts of municipal ownership? Not knowing much about the facts of municipal ownership except that, like other facts, they were, presumably, stubborn things, the first thing which we did in order to do the work committed to us was to devise methods by which these facts might be ascertained. We determined that they could be ascertained only through the examination of specific plants and, inasmuch as the means at our disposal were limited, by the examination of selected plants. Now, some municipal and some private plants had a general reputation of being successful. Some, on the other hand, were reputed to be unsuccessful. If we should choose all the alleged successful municipal plants and should set them off against the alleged unsuccessful private plants, or *vice versa*, we should certainly obtain a conclusion of facts—choice facts, they might be called.

But such a method of ascertaining facts we had certainly to avoid. I should not have said we had to avoid this. All necessity for avoiding it was removed by the wise action of The National Civic Federation, which so constituted the Commission that almost every shade of opinion and almost every interest or prejudice was represented on it as well as on the smaller committees which have had the burden of superintending the work of investigation. The result was that when it came to choosing the particular plants to be examined, opportunity was open for making any objection which could be made to a selection, because of the fact that it was unrepresentative or incomparable with other selections. Indeed, the places selected have been selected as the result of unanimous action on the part of the committees in charge of the work. It was in this way, then, that the attempt has been made to secure a fair selection of the places from which our facts were to be ascertained.

After the places to be examined had been selected, the question presented itself as to what things we should look for in these places. We soon found that these things might be grouped under one of four heads: (1) Character of service; (2) Financial results; (3) Political conditions; (4) Social conditions, particularly labor conditions.

Having determined that what we wished was to be found under one of these heads, we had to decide how we would actually get at the facts. We very soon determined that we must have for this purpose men who by education were qualified to do the work, and we therefore selected four classes of experts, viz.: engineers, accountants, those acquainted with labor conditions and those who by training and experience were able most easily to get information with regard to other social and political conditions. In the choice of these gentlemen we have been most fortunate. We did not select any one who was not accepted without objection by every member of our sub-committee. We endeavored, furthermore, to get absolutely the best men available, and we found in these gentlemen a willingness, when they learned of the paucity of our resources, to forego a part of the charges which they usually made for work of this sort. The experts whom we have selected have been engaged, some in England and some in this country, in acquiring the information desired, which will be submitted to the members of the committee before they are called upon to state their conclusions.

This is about all I can say upon our work. I would that I could say more, but the conditions which we have been called upon to examine have been so complex, the records, particularly of the municipalities which have been examined, have been kept in such shape, that it has been exceedingly difficult for us to get the information that we have desired. The result has been that it has been impossible to finish the work in this country as soon as was expected. It will have to be taken up again on our return from Great Britain. The work on the other side, as I understand, has made much more satisfactory progress. This has been due partly to the fact that the information desired has been more easily obtainable on account of the longer experience which municipalities have had in the management of public utilities, partly to the greater detail in which the records of their work, in accordance with the provisions of law, have been kept, and partly to the fact that the investigation has been supervised by two of our number who have been able to give their entire time to the

work. Thanks to the indefatigable exertions of Messrs. Maltbie and Sullivan and the gentlemen who have assisted them, so much has been done that we hope the committee will be able to reach conclusions as to the relative advantages of municipal and private ownership in Great Britain after having gone over the field in the time which has by our plans been allotted for this purpose.

OWNERSHIP OF PUBLIC SERVICE CORPORATIONS.

Judge Gaynor, of the New York Supreme Court, Discusses Modern Tendencies.

I HARDLY know what may be appropriate for me to say on an occasion like this; in fact, I feel that bringing any ideas here at all where ideas are the stock in trade, where everybody has ideas, is like bringing coals to Newcastle, where they have more coals than they know what to do with. I feel that I am speaking to philosophers, to men who are considering public subjects seriously, to men who thus far have been of great value to the community.

I think that I may say of this Federation that it has done much in being able to bring together such men as Mr. Belmont on the one side, representing what he represents, and Mr. Gompers on the other, representing what he represents, and that, if The Civic Federation has not made them hail-fellows-well-met, it has disposed them to sit down and discuss soberly important matters between them, and it has thereby accomplished a very great deal for the community. If it had done nothing else it would have done a great deal. Most of the friction in the community on topics which this Federation discusses from time to time on political, industrial and economic subjects, on the topics involving labor and capital and the antagonism between them, arises out of misunderstandings on one side or the other, and from the fact that those representing each side of the subject in this country up to a very recent time have not met together for a discussion with each other; and they could not come to an understanding with each other in any other manner. I say this illustrates the value of The Civic Federation's usefulness to the community in thus being able to bring together these diverse elements.

This Federation is accomplishing a very great deal, and I deem it fortunate that it has now taken up the great subject of public utilities, as to whether or not they shall be owned by the community or by individuals. I deem it fortunate that you have appointed a committee to consider this subject, for the understanding which this committee arrives at will in time be the understanding of this Federation, and that means that it will ultimately become the understanding of the entire community. If this committee can bring in a statement of the facts—not of words, not of rhetoric, but of facts such as we are all so much indebted to Mr. Shaw for in the past—and these facts are presented here and understood by this body, I have no doubt that your final understanding of the matter will "slop over" and become the understanding of the whole community. All great movements spread in that way. If a great masterpiece is produced by an artist some one comes in and sees the work and he perceives that it is a masterpiece, and there is only one person in the world who perceives it. Then he brings in another and he sees it, and so on until at last perhaps twelve persons have seen it and understood it, and their understanding finally prevails and in time becomes the judgment and understanding of all mankind. Now, as to the matter we have in hand, it will be the same way with this committee, so that what they finally ascertain will become the view of the entire country.

The agitation in this country for municipal ownership, and to some extent for municipal management as well, of public service corporations has arisen, in my judgment, out of no hostility toward private management or private capital. We owe much to private management, and it is still a question whether the best service may not be obtained from private enterprise. Private management may in some respects be able to teach us many lessons. But the agitation for municipal ownership has arisen, on the contrary, wholly from the franchises of these public service corporations being over-capitalized or watered, as Mr. Straus has expressed it in his opening address. The community cannot look on this without first a feeling of uneasiness, and then of hostility, and then of open resentment and finally of action against the doubling and trebling over and over of the capital put into these corporations, all of which represents nothing except a perpetual tax by the corporations on the community. We have just seen the corporations in this city bind themselves together in a hard and fast agreement for 999 years on a basis of grossly excessive capitalization, representing the repeated over-capitalization of the constituent companies. Dear me, think of our standing that thing for 999 years! Nine years is more like it. These great gifts, these franchises that are nothing but licenses from the people, are made a drain on the community, by having bonds and stocks issued on them and doubled up, year after year, in all our cities and on our steam railroads as well, until the sum has become colossal enough—I will even

say it even in this presence—dishonest enough to shock the moral sense of the people of this country. There is the seed of this hostility, this feeling toward these corporations.

We have just had a great debate in Washington concerning our national railways. There is no resentment in Washington against capital, but there is hostility to the franchises for these public utilities being made a perpetual tax on the people, as though the recipients had the right to do as they pleased with them. What are the railroads but our public highways! They are as much our public highways as the dirt roads which run alongside of them. The public mind has now come to the understanding of this, and you can't rid the public mind of it. The building of these roads was turned over to private individuals, and the trouble is, not that we have any hostility to capital, but that those who have these gifts have come somehow to understand that they own them for their own profit first and for the public second.

It is a horrible crime for the public highways to carry the freight of one man or group of men at half or any lesser rate than that charged to others, to the aggrandizement of one man or set of men and the destruction of another. Go back to the days of toll gates. What do you think would happen if one man were allowed to drive his cattle on the hoof or his teams through for one-half what another man paid? They would tear down the toll gate; and that is what will happen ultimately to these railroad abuses; the people will tear them down. They will do this peacefully if they can, forcibly if they must. There is nothing more certain than that the people have come to the conclusion that this thing will no longer be tolerated either on the highways of the nation or the highways of the city. They demand that the roads shall be managed for the aggrandizement of no individuals, but for the welfare of all. Highways from the twilight of history have always been built and managed by Government. But from 1840 to 1850 when the iron roads came in some governments for some reasons turned the building and operation of them over to individuals. This was the first time in history that public highways were turned over to the management of private individuals, barring the few toll roads that existed. But nevertheless they were made public highways by government; they were licensed as such, to remain as such. What we call a franchise, for the sake of a better word, was given to the corporations to build and manage them as public highways. I need not say to you that government can take private property only for governmental purposes. This great governmental power of taking private property for public use was given and could be given to these corporations only on the theory that they were engaged in a governmental service or function in carrying passengers or freight which, so long as we know history, was a matter regulated or controlled by government.

And I want to invoke a blessing on the man who, as President of the United States, has seen this great question as you would see it through that pane of glass; who has held it up for the country when no political parties dared to make it an issue; who has forced it before Congress and fought for a final issue in spite of all the abuse and recriminations that have been heaped upon him. Not that I think this law will cure all the ills, but the moral feeling of the people is expressed in it.

When this committee comes back from Europe with the cold facts of the experience of Europe—which is a long experience and where municipal ownership and operation is no new thing, and where it has been solved already—I say, when they get back with their report luminous with facts, and you and I are made familiar with their findings, then your opinion will speedily become the opinion of this whole country. In that way they will accomplish a great good, and I am glad to be here to-night to wish them godspeed.

A LABOR VIEW OF THE COMMISSION.

Philip Kelly, of the Theatrical Protective Union, Views the Commission from the Standpoint of Organized Labor.

AS an after-dinner speaker I am a complete failure, which you will discover before I have finished. I hope, however, that when this Committee returns that I will be one of those who will meet them and extend to them a welcoming hand. If their report is entirely satisfactory it will make a very important chapter in the history of this country. If their report is satisfactory to the people, well and good, but if not, they can rest assured that they will be placed on the gridiron and toasted and roasted to perfection.

Gentlemen, the question of municipal ownership is up. There is no use in denying it. It is discussed in the "L" cars, in the subway and on the surface lines. People discuss it going to church and coming home from church. There are thousands of people in this city and in this country who have not yet made up their minds as to whether it would be a benefit to the people or not to have municipal ownership and operation. Now, as far as the idea has any bearing on the workingman is concerned, I do not think they need have any fear.

Even municipal ownership would not be a complete cure for all the ills that the workingman suffers from at this time. The employees of the Government are not better paid than those of private concerns. The letter carrier in this city works fourteen hours a day, although the law says that ten hours shall constitute a day's work. But they shift them around and the result is they work fourteen hours. I do not know but what I would prefer to work for a private individual or firm rather than for the United States Government under present conditions. I do not think that municipal ownership could affect the labor organizations one way or the other. They are well able to take care of themselves. If they should decide in favor of municipal ownership I believe it would be accomplished in a very short time. But up to the present time, however, no great labor organization has expressed itself positively. It is true that individuals connected with the organizations have expressed themselves for and against the proposition. A lot will, of course, depend upon the report of this committee when it returns from England and Ireland.

Some people say that it would be a dangerous thing if the Government were to have a large number of employees. Is that a fact? I presume that statement is intended to mean that if the Government employs thousands of people in the Civil Service it would become so strong that it could not be turned out of office. Now, England has more employees than any other country in the world, and yet in no other country in the world are some of the governments so short-lived. The Conservative party has been kicked out of power in a relatively short time and the Unionist party lasted only one month. The idea of municipal ownership has some brilliant advocates.

I believe that the only great bodies in this country that have not taken a stand on this question are the labor organizations. But the question is up. The Commission, when it brings back its report, will find that such report will be discussed in the labor organizations throughout the country, and a great deal will depend upon the kind of a report they bring back. I have the utmost confidence in the men who have been appointed on this Commission; they are capable, brilliant, fearless and honest. I know the labor men on the Commission. They are good, straightforward men. The labor men will know that the report our brothers on the Commission bring back will be worth our study and confidence.

THE REMARKS OF PRESIDENT BELMONT.

Head of The National Civic Federation Officially Explains the Commission.

GENTLEMEN, it was my intention, and it was in fact my duty, to be away from New York at this time, but I set everything aside in order to be with you to-night to have an opportunity of saying a few words with regard to this Commission. The gentlemen who have already spoken to you have confirmed what I intended to say, which was that The Civic Federation's purpose was not to obtain an opinion on the question of municipal ownership, but realizing that the subject was before the people, that it was one that was beginning to be discussed, that ultimately it would be the subject of discussion on the stump during our political campaign, and that it vitally concerned the two elements this Federation has striven to bring together, it desired, if possible, to obtain for the public a text-book on the question. I knew all this would probably be said to you, but from the fact that I am the representative of one of the largest traction systems in the country, if not the largest, I thought that I would like to tell you that myself, because it had nothing whatever to do with my personal interest. At a meeting of the Committee I stated that if the results of this investigation furnished an argument for the acquisition by the municipality of the properties which I have been elected to manage, that that would not deter me. On the contrary, as a citizen I welcome a correct interpretation of this subject. As President of the Federation, it was my duty to try to bring about a proper interpretation of the subject.

I did not expect when I came here this evening that any argument would be advanced on that subject. I do not think that it would be delicate on my part to answer those arguments that have been advanced. I could and I should very much like to do so. I would like very much to have these gentlemen who have preceded me this evening and who have based their arguments on certain alleged facts, to seek those facts as zealously as will this Commission. But I want to repudiate in the most unqualified language the insinuation that I manage or that my associates manage these corporations in any other spirit than that of honesty or of correct purpose, and with any other view than that of complying with every letter of the law. But I do think that every corporation and that every corporate manager is entitled to be heard in court first, and that his action should be tested after the verdict of the court and not before. You know to what I refer and therefore it will not be necessary for me to repeat it, and I am sorry that I have to make this statement.

So anxious was this organization that the report should be absolutely impartial that it took every step to free the Commission from any possible relationship to the Federation other than that it should lean upon the Federation for its expenses. The Federation has directed it in no sense excepting to ask that it ascertain facts on the lines laid down by the Federation. That is all they have asked. They have chosen their own Committee and whatever the result of their work it will bear no hall mark of any special interest and least of all has there been any effort to create an argument against municipal ownership of public utilities, and more particularly of transportation. It would have been more than indelicate for me to have promoted any such movement if its object was other than that which Professor Goodnow has stated to you. That is why I wanted to be here to-night, because it has been insinuated by those who desire to discredit this Committee that there was a purpose to dictate to it. I thank you.

SELECTION OF THE COMMISSION APPROVED.

Dr. Talcott Williams, of the Philadelphia "Press,"
Commends the Manner of Appointment.

I HAVE been in doubt since I received the notice of my appointment. I do not belong to the college professor class. I am not a capitalist; but I am a Philadelphian. Perhaps this accounts for the reason of my selection as a speaker to-night. In our city we had a government which left nothing to be desired in the way of fraud. We found out that at our elections there were 70,000 fraudulent votes cast; we knew that it was impossible to stop the white slave traffic; we saw our franchises being sold right and left; we stood all that. But there came a May morning about a year ago when it was announced that our gas bills were to be increased, and we arose as one man and demanded reform. The returns of the election showed on that occasion that there were 110,000 voters who were eager for reform. The reform ticket was elected, and we at last began to conduct our own government. At last, it may be said, that we have a reform movement in Philadelphia. Previously we had tried everything. We owned our own gas works and we liked the proposition so little that we gave them up. Then the company we gave them to we liked so little that we decided to take them back.

Gentlemen, I understand that the purpose for which we are gathered here this evening is to wish this Commission goodspeed on the eve of its sailing, and to express the hope that it will bring back with it the facts. As has been said by the speakers who have preceded me, it is not a question of private ownership; it is not a question of whether this method or that method is slightly more economical in the governing of a city—it is at bottom a question as to whether at any particular period of our history we would not be happier and healthier by a full consideration of the problems affecting the operation of our public utilities, and a determination to solve those problems in the best light obtainable.

I think this Committee has been selected with admirable judgment. In France a committee selected for such an investigation would necessarily have been drawn from the personnel of the existing party in power. A report from such a commission would, in all probability, have been biased and colored to suit the wishes of the party in power. In Germany a royal commission would have made a report that would have been pleasing to the head of the nation. I submit that this Commission in its method of appointment and investigation has been better constituted than it would have been possible to constitute a similar committee in any other country.

We know that in the preparation of this report and that in its submission to the public it is not so much a question of whether taxes should be raised or lowered, but it is more a question as to what is the best solution for giving the people in our great cities an increase in the number of rooms in which the average family is compelled to live; what will give the greatest amount of pure water in the cities, the most efficient form of lighting, and the best kind of transportation facilities. Some compromise, some middle course, may be necessary, but that, I submit, is the main consideration to be sought.

VIEWS OF JOHN DEWITT WARNER.

Among the letters of regret received from invited guests who were unable to attend the banquet was the following:

NEW YORK, May 16, 1906.

Mr. James P. Archibald, Secretary, Committee on Arrangements, 281 Fourth Avenue, New York.

DEAR MR. ARCHIBALD: Acknowledging your note with invitation to dinner to be given to the Public Ownership Commission on the 21st instant on the eve of its sailing, I regret that a prior engagement must make me very late, and more probably deprive me entirely of the pleasure of being with you.

I believe The Civic Federation has taken no other

step so important as that in which this Commission has been appointed; that it can do no greater service than fully to inform our people of the experience of others in this matter; and that the success with which it does this, and the acceptance by our people of its report as a clear and impartial view is likely long to be its best hold on public confidence.

Sincerely,

(Signed)

JOHN DEWITT WARNER.

PERSONNEL OF THE COMMITTEE.

The Fifteen Members of the Committee on Investigation Now in Europe Studying Conditions There.

MELVILLE EZRA INGALLS is chairman of the Cleveland, Cincinnati, Chicago and St. Louis Railroad Company, popularly known as the Big Four. He was educated at Bridgeton Academy and Bowdoin College, and was graduated from the Harvard Law School in 1863. He practiced law first at Gray, Me., but soon removed to Boston. A member of the Massachusetts Senate in 1867. First as president (1870) and a year later as receiver of the Indianapolis, Cincinnati and Lafayette Railroad, Mr. Ingalls conducted this company from a bankrupt condition, with aid of reorganization in 1873 and 1880, and put its successor, the Cincinnati, Indianapolis, St. Louis and Chicago, upon a sound footing, consolidating it with other roads into the Cleveland, Cincinnati, Chicago and St. Louis Railroad. From October 1, 1888, until February, 1900, Mr. Ingalls served as president of the Chesapeake and Ohio Railroad. In the Presidential campaign of 1900 he was one of the leaders of the sound money division of the Democratic party. He is president of the Merchants' National Bank of Cincinnati. In 1903 Mr. Ingalls was Democratic candidate for mayor of Cincinnati. In 1905 he served as chairman of the investigating committee of the Equitable Life Assurance Society.

JOHN ROGERS COMMONS is professor of political economy in the University of Wisconsin. He graduated at Oberlin College in 1888, studied at Johns Hopkins University, 1888-90, became professor of sociology in Oberlin College in 1892, Indiana University in 1893 and in 1895 in Syracuse University, resigning in 1899 to become director of the Bureau of Economic Research. He has served as an expert agent for the United States Industrial Commission and as assistant secretary of The National Civic Federation. Professor Commons is the author of "The Distribution of Wealth," "Social Reform and the Church," "Proportional Representation," "Regulation and Restriction of Output by Employers and Unions," "Trade Unions and Labor Problems," etc.

CHARLES L. EDGAR is president of the Edison Electric and Illuminating Company, Boston, Mass. He graduated from Rutgers College with the degree of bachelor of arts in 1882 and later pursued a post-graduate course in electricity at the same college, receiving the degree of master of arts in 1885 and that of electrical engineer in 1887. Soon after leaving college he became associated with the parent Edison company—the Edison Electric Light Company of New York—and remained with this company until 1887, when he went to Boston. He was chief engineer of the New York Edison Company, resigning to become general superintendent of the Boston Edison Company, which was organized in 1886. Mr. Edgar became in turn, general manager, vice-president and president, which latter office he has held for the last five years. Besides being president of the Edison Electric Illuminating Company, Mr. Edgar is president of the Boston Electric Company, the Somerville Electric Light Company, the Woburn Light, Heat and Power Company, the Newton and Watertown Gas Light Company and other central station companies. These companies are closely associated, and supply gas and electricity to Boston and adjacent towns. For three terms Mr. Edgar was president of the Association of Edison Illuminating Companies. He is president of the Massachusetts Electric Lighting Association, chairman of the Boston branch of the American Institute of Electrical Engineers, and was vice-president of the National Electric Light Association in 1890. At the time of his election to the presidency of the National Electric Light Association in May, 1903, he was first vice-president of that organization.

TIMOTHY HEALY has been active in the labor movement for the past twenty years. Was Master Workman of Local Assembly, 6780 Knights of Labor (Eccentric Association of Firemen, New York City) for several years. Represented the stationary firemen of that city in District Assembly 49 K. of L. and the Central Federated Union. Represented the Knights of Labor of New York City in several conventions of the general assembly of the Knights of Labor, and was president of the Knights of Labor of New York State for two years. For the past ten years Mr. Healy represented the stationary firemen of New York City in the conventions of the State Workingmen's Federation, and was elected and served as a member of the Legislative Committee of the Federation. He was elected president of the International Brotherhood of Stationary Firemen in 1903, re-elected in 1904 for a term of two years, and

represented the organization in several conventions of the American Federation of Labor. Mr. Healy was largely instrumental in having placed on the statute books of New York a law compelling the licensing of stationary firemen in the City of New York, and is also credited with getting an eight-hour work-day and better conditions generally for a greater portion of the stationary firemen of New York City.

FRANK JOHNSON GOODNOW, professor of administrative law and municipal science in Columbia University since 1883, was graduated from Amherst College in 1879, from the Columbia Law School in 1882, and studied also at the Paris Ecole Libre des Sciences Politiques, at Berlin University. He is a recognized authority on municipal, administrative and constitutional law. Among his published works are: "Municipal Home Rule," "Comparative Administrative Law," "Municipal Problems," "Politics and Administration," "City Government in the United States," etc.

WALTON CLARK is Third Vice-President of the United Gas Improvement Company, Philadelphia. At the age of seventeen years he entered the employ of the New Orleans Gas Light Company, where he continued in various capacities connected with the manufacturing and distributing work until the fall of 1883, when, for a few months, he was connected with the United Gas Improvement Company, working for it in the erection of the gas plant at Pensacola, Florida. He returned to the New Orleans company in the spring of 1884, continuing with them until the fall of 1885, when he entered the service of the Jefferson City (Louisiana) Gas Company, performing the duties of superintendent of that company for about a year. Mr. Clark then removed to Chicago, and was connected for a short time with the United Coal and Oil Gas Company, of New York, the owners of the Hanlon-Leady patents. In the fall of 1887 he entered the employ of the Kansas City Gas Light and Coke Company, and about eight months later accepted the position of assistant general superintendent of the United Gas Improvement Company, becoming general superintendent, and in 1904 being elected third vice-president. He is also president of the Equitable Illuminating Gas Light Company of Philadelphia, vice-president of the Rhode Island Company, and is officially connected with a number of large gas, electric and street railroad properties. He is a past president of the American Gas Light Association, a director of the Western Gas Association, and director of Franklin Institute of Philadelphia; member of New England Association of Gas Engineers, Pacific Coast Gas Association, the American Society of Mechanical Engineers, the Engineering Club of Philadelphia, member of the Board of Trustees of the Pennsylvania Military Academy and the Chestnut Hill Academy.

J. W. SULLIVAN, until recently Editor of *The Weekly Bulletin of the Clothing Trades*, has been prominently identified with the labor movement in this country during the past twenty years, most of the time serving in different capacities on the editorial staff of labor papers. He is a member of the Typographical Union. From 1892-95 Mr. Sullivan was general lecturer for the American Federation of Labor on the Initiative and Referendum; has served as a delegate to State and national conventions of the American Federation of Labor, and in 1896 was fraternal delegate of the Federation to the British Trades Union Congress at Edinburgh, and affiliated delegate to the International Co-operative Congress at Paris. He was prominent in the United Labor Party campaigns of 1886-7. Mr. Sullivan is the author of "Working People's Rights," "Direct Legislation," "The Trades Union Movement in America," etc.

MILO ROY MALTBIE is assistant secretary of the Art Commission of the City of New York, and a franchise expert. He was educated in the public schools, Upper Iowa University, Northwestern University and Columbia University, in which latter he received the degree of Ph.D. in 1897. He was University Fellow in Administrative Law at Columbia University, 1895-7, professor of mathematics and economics in Mount Morris College, Illinois, 1893-5; secretary of the Reform Club Committee on City Affairs, 1897-1902; editor of *Municipal Affairs*, 1897-1903, and lecturer in various institutions. He spent the summer of 1899 investigating municipal conditions in Europe for the Reform Club, and in 1903 traveled extensively over northwestern Europe for the Art Commission. Among the many committees of which he is a member the principal ones are the Merchants' Association Committee upon Water Supply, National Municipal League Committee upon Uniform Municipal Statistics, Municipal Art Society Committee upon Street Fixtures, Constitutional Home Rule Committee (secretary), etc. Dr. Maltbie has written frequently upon municipal and economic topics, and is now editing a series of books upon municipal problems for the Macmillan Company.

WILLIAM J. CLARK is foreign manager of the General Electric Company, New York City. He served from 1879 to 1887 as postmaster at Birmingham, Conn., during which time he was frequently called upon by the Post Office Department to act as Post Office inspector. In this capacity he made many important investigations, among them the Star Route frauds, frauds in the Brooklyn Post Office, the famous mail robbery of the Chicago and St. Louis Post Office route in 1886,

THE INVESTIGATING COMMITTEE OF THE COMMISSION ON PUBLIC OWNERSHIP AND OPERATION.

the Jersey City Post Office burglary, and a number of other cases of a similar character. In 1886 Mr. Clark began his street railway career by securing a charter to build a street railway connecting Ansonia, Derby and Birmingham, Conn. The following year he contracted with the Vandepoel Electric Company for the equipment of this line, the first of its kind in New England. This enterprise suggested the reorganization of the Vandepoel Company, and negotiations were conducted, culminating in the sale of the Vandepoel patents to the Thomson-Houston Company. Mr. Clark became connected with this concern in 1888 as general agent of the railway department. He remained in this position until the General Electric Company was formed by the consolidation of the Thomson-Houston and Edison General Electric Companies in 1892, subsequently becoming general manager of the railway department. Later he became general manager of the foreign department, which position he now holds. In the early nineties he effected a reorganization of the British Thomson-Houston Company. He held the title of managing director of this company until the completion of his work, when he returned to the United States. During the present year he has been appointed manager of the General Electric Company's traction department, the recent organization of which has been under his supervision. Mr. Clark was appointed United States Government delegate to the International Railway Congress held at Washington in May, 1905. He is president of the Perforated Music Roll Company of New York and a director in several important concerns. Mr. Clark is also the author of several books, including "Commercial Cuba," published in 1898.

F. J. McNULTY is president of the International Brotherhood of Electrical Workers, with headquarters at Washington, D. C.

FRANK PARSONS is president of the National Public Ownership League, Boston, Mass. He was graduated from Cornell University in 1873; later stud-

ied law and was admitted to the bar in Boston. In 1892 he was appointed lecturer on law at Boston University. From 1897 to 1900 he was professor of history and political science at the Kansas Agricultural College, and in 1900 became professor of political science at Ruskin College, Trenton, Mo. He has also been dean of the university extension department there, and has lectured for the University Extension Association of Chicago. In 1901-2 Professor Parsons was an expert witness before the United States Industrial Commission on the public ownership of railroads, telephones and telegraph. Professor Parsons has made a special study of railway systems and co-operative institutions throughout Europe and America. His publications include: "The World's Best Books," "Our Country's Need," "The Drift of Our Time," "Rational Money," "The New Political Economy," "The Power of the Ideal," "The City for the People," "Direct Legislation," "The Bondage of Cities," "The Story of New Zealand," etc. He is an earnest advocate of the public ownership of monopolies.

ALBERT E. WINCHESTER is general superintendent of the electric works of the city of South Norwalk, Conn.

EDWARD WEBSTER BEMIS, superintendent of the Cleveland, O., waterworks, graduated from Amherst College in 1880; was a pioneer lecturer in the University Extension System, 1887-8; professor of economics and history, Vanderbilt University, 1889-92; associate professor of economics, University of Chicago, 1892-5, and statistician of the Illinois Bureau of Labor Statistics. In 1897 he became professor of economic science in the Kansas State Agricultural College and later director of the department of municipal monopolies of the Bureau of Economic Research, New York. His published works comprise: "History of Co-operation in the United States," "Municipal Ownership of Gas Works in the United States," "Municipal Monopolies," "Local Government for the South and Southwest," and

numerous papers and articles on municipal government, monopolies, etc.

JOHN HENRY GRAY has been professor of political and social science in Northwestern University since 1892. He was educated in the public schools at the Illinois State Normal University, was graduated from Harvard University in 1887 and in 1892 received the degree of Ph.D. from Halle University, Germany. Studied also at Paris, Vienna and Berlin. Professor Gray was instructor in political economy at Harvard in 1887-9; chairman of the World Congress Auxiliary on political science in connection with the Columbian Exposition, Chicago, 1893; chairman of the Municipal Commission of the Civic Federation of Chicago, 1894-6; vice-president of the American Economic Association; expert agent of the United States Department of Labor, 1902-3, to investigate restrictions of output in Great Britain; in 1902 represented United States Commissioner of Labor at International Co-operative Congress, Manchester, England, the United States at International Congress on insurance of laboring men, Vusseldorf, Germany, and at International Congress of Commerce and Industry, Ostend, Belgium. Professor Gray is the author of many papers in economic publications, especially in reference to gas supplies.

EDWARD A. MOFFETT, secretary to the Commission on Public Ownership and Operation, has been identified with the labor movement in the United States through membership in the Bricklayers' and Masons' Union of America, and for a number of years has been editor of the union's official journal, the *Bricklayer and Mason*. He was one of the two experts in welfare work furnished to the Isthmian Canal Commission by the Welfare Department of The National Civic Federation to investigate the needs and opportunities on the Isthmus of Panama, and to make recommendations for the recreation of the workers engaged in canal construction, as well as to arrange to have carried into effect the plans adopted.

THE GENERAL FEDERATION OF WOMEN'S CLUBS.

SIGNIFICANCE OF ITS RECENT CONVENTION AND IMPORTANCE OF THE PROBLEMS UPON WHICH ACTION WAS TAKEN.

BY HELEN VARICK BOSWELL.

THE General Federation of Women's Clubs recently in convention at St. Paul is a strong organization. It holds in its membership women belonging to every profession and calling; it represents the brains and the hearts of America's womanhood. The Secretary of the Federation in her report very pertinently asked: "Is there anything in reason that 800,000 earnest and persistent women could not accomplish in the United States, if they set about it with determination?"

It is precisely because they are beginning to unify and use concerted action upon certain measures that the public is taking notice of so mighty a force, that public men have to reckon with it, and that legislators are waking up to the fact that they want this power with them and not against them. It is very obvious that many Senators and Congressmen are keeping tab on what the Federation women are doing. The President of the United States sent the Convention a telegram relative to one of its pet measures—the preservation of Niagara Falls—in which he says: "I cordially agree with your hope for the immediate passage of the bill, and trust that the clubs will do all in their power to secure favorable action thereon by Congress."

The Convention took action, vigorous and immediate action, on the Purc Food Bill, telegraphing many Senators and Congressmen, of whom the members were constituents, that the Convention desired the votes of their representatives in favor of the bill. Many telegrams in reply were received, pledging the votes of those same representatives. It is doubtless a matter of much gratification to the women that several of the measures so strenuously advocated by them have become law. Other measures, which hold over until next session because of stress of business in the closing hours of Congress, will be pushed vigorously by the clubs belonging to the General Federation, which proposes to neither slumber nor sleep until every effort has been made to accomplish what it has pledged itself to do.

In addition to the stand on legislative matters already mentioned, the Convention put itself on record as favoring the eight-hour day for women workers, and pledged its efforts to obtain State laws to that end, as well as to work for Civil Service Reform.

The General Federation stands for much that is good. It is naturally a force in moulding public opinion, and has strong influence in crystallizing that public opinion into legislative action. There are times when perhaps, in the language of the politician, it may be "viewed

with alarm" as well as "pointed at with pride" because now and then the conservative element does not bestir itself enough and the very radical element, always ready to be incendiary when occasion offers, gets too strong a hold.

The recent Convention, however, showed that the conservatives are really the large majority, for some rather lurid utterances made by certain members during

of the officers and members are well known parliamentarians—but as one little woman said, "parliamentary law is only the application of the excellent common sense of certain men—let women apply theirs in their own convention."

There can be no gathering of such a large number of delegates without some differences of views on certain questions. Such differences arose, but were so well handled as scarcely to cause a ripple in the Convention proper. The fine work was all done outside.

The thing that stirred the delegates above all else was the question of woman suffrage—should or should it not be allowed to come before the Convention? Several weeks prior to the meeting the industrial advisory committee had sent out to the various clubs a copy of resolutions the adoption of which would practically commit the General Federation to the cause of women's suffrage, a question which the president, Mrs. Decker, has personally pledged herself not to allow presented to the Convention.

Although Colorado (Mrs. Decker's State) is a suffrage State and her State constituency is altogether in favor of woman suffrage, it is a tribute of loyalty to Mrs. Decker and to the Federation that the Colorado women stood just as firm for the prevention of a suffrage discussion upon the floor as did the women of New York and other Eastern and Southern States. All felt that it would hurt Mrs. Decker and might disrupt the harmony of the Federation, and in spite of some misguided efforts on the part of too zealous suffragists, the matter was so well handled that it never had a chance on the Convention floor. Mrs. Decker was unanimously renominated and re-elected, and no woman ever continued in office who held more completely the organization in her hand. Two years of her rule had but whetted the appetite of her great constituency for more.

No woman could hail from Colorado and not have the political instinct, and Mrs. Decker is a true daughter of her State. Her political insight is keen and discriminating. She knows public questions; she knows the relation which her organization can and should sustain to those questions, and is watchful lest it should take an untenable position, led on perhaps by an excess of zeal for the public good which sometimes destroys more than it creates. It is Mrs. Decker's desire that unity and harmony shall prevail in the General Federation of Women's Clubs—the greatest organization of women's interests in the world.

SARAH S. PLATT DECKER,
President of The Federation of Women's Clubs.

the conferences on industrial questions were not received with favor, but frowned upon, and the women wanted facts, not imaginative instances.

The Convention compared favorably with any great convention of political parties, and about as much politics is played—in a feminine way of course, and perhaps depending as much on plain common sense and feminine intuition as on parliamentary law, though many

THE IMMIGRATION DEPARTMENT ORGANIZED FOR WORK.

PROMINENT REPRESENTATIVES FROM ALL CLASSES AND SECTIONS ACCEPT MEMBERSHIP ON ITS COMMITTEES.

WHEN the National Conference on Immigration called by The National Civic Federation met in New York City last December, it was the first time in the history of the country that general attention was concentrated upon the problem of immigration. Since then the subject has been brought nearer to the people in innumerable discussions on lecture platforms, in the press and before Congress, so that to-day its growing importance to the welfare of the nation is being pressed home to the citizen. For in this development of various phases of the subject the nation is beginning to realize the meaning and true significance of the immigration problem.

Some idea as to the magnitude of this problem was presented at the National Conference on Immigration by the various speakers. It is reflected in the scope and extent of the subjects there discussed. So numerous were these subjects that it is possible here to indicate only a few of them. They include the character of immigration, assimilation of the immigrant into American national life, the necessity for further restriction, the administration of immigration laws, the distribution of aliens, the demand for immigrants, the effect of immigration upon our industrial, political and broad social life; the part played by the steamship companies, the causes of European immigration, European inspection and examination, proportion of immigrants which become criminal, insane and charitable dependents; effects of immigration upon the native birth-rate, naturalization, the selection of immigrants, Asiatic immigration, etc., etc. This enumeration but faintly indicates the far-reaching ramifications of the innumerable phases of the immigration problem, but at the same time it helps to emphasize the reasons which induced the five hundred delegates in attendance upon the National Conference on Immigration to recommend to The National Civic Federation the formation of a Department of Immigration.

It is in carrying out the formally expressed request of the National Conference, which represented all the States and numerous diversified organizations, that the Federation has established such a department. Its purpose is to undertake a thorough and painstaking investigation of the facts in regard to immigration to the United States. Those who have identified themselves with this very important work as members of the department comprise men prominent in the various walks of life in all States and sections of the country.

The meeting for the organization of the Department was held at the Park Avenue Hotel, New York City, on Friday morning, June 29, and was attended by some fifty members from all parts of the country. Mr. Ralph M. Easley, Chairman of the Executive Council of The National Civic Federation, called the meeting to order and expressed its objects, which were to pass upon the report of the Sub-Committee on Plan and Scope, and to select the officers and committees. Ex-Congressman John DeWitt Warner, of New York, presided and Rev. Dr. Joel S. Ives, of Hartford, Conn., acted as Secretary.

Dr. Leander T. Chamberlain, of New York, as Chairman of the Sub-Committee on Plan and Scope, presented the report of that body. A preliminary report had previously been communicated by mail to all the members of the Department, and some of the suggestions which had come from them were embodied in the Committee's report at the meeting. In presenting the report of this Committee, Dr. Chamberlain reviewed briefly the order of events preceding the meeting of June 29, stating that the Chairman of the Executive Council of The National Civic Federation, acting under instructions of the Federation, had called an informal meeting of the members of the Immigration Department living in the vicinity of New York City for May 4 at the Park Avenue Hotel. Thirty-two members were present, and a sub-committee was appointed to put into proper form certain suggestions concerning the different subjects to be considered by the Department. On May 24 the results of the Committee's work were communicated to all the members of the Department. It was also recommended that the Department meet in New York on some date between June 15 and July 1, and all members were requested to express their views with regard to the recommendations of the Committee. Not far from seventy letters were received in reply. The subjects for the various committees recommended by the sub-committee were cordially approved in these letters, and the date most favored for the general meeting of the department was found to be June 29. Accordingly on June 14 the Chairman of the Executive Council called a meeting for June 29 at 10:30 a. m., at the Park Avenue Hotel. On June 20 the sub-committee sent out its second circular letter reminding all members of the importance of the action to be taken at the meeting of June 29, and soliciting suggestions from those unable to attend, especially suggestions as to the committee on which any

FRANKLIN MACVEAGH, Chairman

member would prefer to serve. To this letter not far from fifty replies were received and the suggestions therein were carefully noted and tabulated.

Dr. Chamberlain next read the concrete results of the sub-committee's labors. The committees provided for in the report are as follows:

Committee on Basic Statistics of Immigration.—While no hard and fast limits can be prescribed for the province of this Committee, it is desired that its verified and rightly tabulated statements shall certainly include those statistical facts which are most important in themselves and most significant as basis of inference. If this Committee succeeds in doing its main work promptly, it may be able to supply to other Committees such information as will greatly aid them.

Committee on the Facts of Supply and Demand.—It is suggested that this Committee set itself primarily to showing the actual relation of immigration to the country's needs, not only as to quantity and quality of supply, but also as to localities to be supplied. Its province will include the facts concerning the sources of immigration, and the distribution of the immigrants. The investigation may well embrace both the past and the present.

Committee on Legislation and Its Enforcement.—As in the case of the Committee on immigration statistics, and on supply and demand, the Committee on Legislation and Its Enforcement will aim to ascertain and present indisputable facts. While expressions of opinion in the form of conclusions are not debarred, the great desideratum is verified, comparable facts. What further is needed in the way of legislation and administrative methods can best be inferred from such premises.

Committee on Naturalization.—The province of this committee includes the history of naturalization in the United States, the legislation which has been passed by the Congress and by the several States and the actual results which have ensued, together with an investigation of the evasions and abuses which have prevented results far more favorable.

Committee on Agencies for Advancing the Welfare of Immigrants.—The primary aim of this Committee also will be statistical—the enumeration and description of all such ameliorating agencies, with the outline of what they have accomplished, are now accomplishing, or are failing to accomplish. Here, too, the exact facts will furnish the best basis for an understanding of what remains to be done. It will be competent for the Committee to investigate agencies which profess to be for the welfare of immigrants, but in reality are shameful frauds.

The International Relations of Immigration.—This Committee will consider whatever action has been taken by other countries with reference to the emigration of their people, and will also consider whether there may not be such international agreements between this and other countries as shall promote the best interests of both the nations affected.

Committee on Oriental Immigration.—On no subject is there more need of verified statistics and authentic facts. This Committee will naturally have to deal with the history of Oriental immigration leading up to the Chinese Exclusion Act, and the effects of the same.

Committee on Finance.—Although the labor of the various Committees is gratuitous, there will still be con-

siderable expense connected with the gathering and publication of the desired information. An adequate fund should be provided.

The officers elected by the Department are as follows: Chairman, FRANKLIN MACVEAGH of Chicago.

Vice-Chairmen, Dr. LEANDER T. CHAMBERLAIN of New York, President of the Evangelical Alliance of the United States.

N. J. BACHELDER of Concord, N. H., Master of the National Grange.

DANIEL J. KEEFE of Detroit, President of the Longshoremen, Marine and Transportworkers' Association.

THOMAS F. PARKER of Greenville, S. C., President of the Southern Immigration Society.

THEODORE B. WILCOX of Portland, Oregon, former President of the Trans-Mississippi Congress.

L. BRADFORD PRINCE, of Santa Fe, N. M., President of the Historical Society of New Mexico.

Secretary, Dr. FRANK JULIAN WARNE of Philadelphia.

Treasurer, ISAAC N. SELIGMAN of New York.

It was also provided that there should be a State Vice-Chairman from every State, Territory, and the District of Columbia, to be selected by the Executive Committee. This Executive Committee consists of the following members:

Executive Committee.

JOHN H. HOLLIDAY, President Union Trust Company, Indianapolis.

JAMES B. ANGELL, LL.D., President University of Michigan, Ann Arbor.

CHARLES RIDGELY, Vice-President Ridgely National Bank, Springfield, Ill.

Dr. ALBERT SHAW, Editor *Review of Reviews*, New York.

SAMUEL GOMPERS, President American Federation of Labor, Washington, D. C.

JOHN M. STAHL, President Farmers' National Congress, Chicago.

SAMUEL MATHER, of Pickands, Mather and Company, Cleveland.

R. A. MITCHELL, Agent of the Dwight Manufacturing Company, Alabama City, Ala.

G. GUNBY JORDAN, President Eagle and Phenix Mills, Columbus, Ga.

Prof. HENRY C. ADAMS, University of Michigan, Ann Arbor, Mich.

JAMES R. MACCOLL, Lorraine Manufacturing Company of Pawtucket, R. I.

Rev. JOEL S. IVES, Secretary Missionary Society of Connecticut, Hartford.

JOHN DEWITT WARNER, Attorney, New York City.

TERRENCE V. POWDERLY, ex-Commissioner of Immigration, Washington, D. C.

HON. JESSE TAYLOR, Jr., Member National Council of the Junior Order United American Mechanics, Jamestown, O.

C. T. PLUNKETT, Secretary Berkshire Cotton Manufacturing Company, Adams, Mass.

Hon. JOHN W. NOBLE, ex-Secretary of the Interior, St. Louis.

Hon. CHARLES A. SCHIEREN, ex-Mayor of Brooklyn.

WARREN S. STONE, Grand Chief Brotherhood of Locomotive Engineers, Cleveland.

THEODORE MARBURG, Baltimore.

JAMES BRONSON REYNOLDS, Washington.

P. H. MORRISSEY, Grand Master Brotherhood Railroad Trainmen, Cleveland.

Prof. J. W. JENKS, Department of Political Economy Cornell University, Ithaca, N. Y.

F. D. COBURN, Secretary of Agriculture, Topeka, Kansas.

NATHAN BIJUR, Attorney, New York City.

JAMES O'CONNELL, President International Association of Machinists, Washington, D. C.

PRESCOTT F. HALL, Attorney, Boston.

JOHN HENRY SMITH, Utah.

SAMUEL SPENCER, President Southern Railway Company, New York.

Rev. THOMAS R. SLICER, Pastor All Souls' Church, New York City.

J. G. SCHONFARBER, Assistant Maryland Bureau of Statistics, Baltimore.

Rev. ADOLPH ROEDER, Orange, N. J.

S. A. HUGHES, General Immigration Agent St. Louis and San Francisco Railroad, St. Louis.

Z. P. SMITH, Editor *The American*, Raleigh, N. C.

JOHN WILLIS BAER, President Occidental College, Los Angeles, Cal.

Dr. A. J. BROWN, Secretary Presbyterian Board Foreign Missions, New York.

JOHN F. TOBIN, General President Boot and Shoe Workers' Union, Boston, Mass.

JOSEPH E. FLETCHER, President and General Manager Coronet Worsted Company, Mapleville, R. I.

W. FAIRBANKS, Secretary and Treasurer Sherman Cotton Mills, Dallas, Texas.

HUGH F. FOX, *New Jersey Review of Charities and Corrections*, Plainfield, N. J.

D. G. AMBLER, Jacksonville, Fla.

JAMES W. KINNEAR, Attorney, Pittsburg, Pa.

GEORGE L. SEHON, Superintendent Kentucky State Children's Home, Louisville, Ky.

J. W. SULLIVAN, Editor *Clothing Trades' Bulletin*, New York City.

L. BRADFORD PRINCE, ex-Governor of New Mexico, Santa Fe, N. M.

JOHN MITCHELL, President United Mine Workers of America, Indianapolis.

THEODORE B. WILCOX, President Portland Flouring Mills, Portland, Oregon.

JOSHUA STRANGE, President State Farmers' Congress of Indiana, Marion, Ind.

THEODORS AHRENS, Capitalist, Louisville, Ky.

Judge NORMAN J. KITRELL, Houston, Texas.

The membership of the various committees, as reported by the Committee on Nominations and accepted by the meeting, follows:

Committee on Basal Statistics.

Dr. WALTER F. WILLCOX, Department of Political Economy and Statistics, Cornell University, Ithaca, N. Y.
Hon. ROBERT WATCHORN, Commissioner of Immigration, Ellis Island, N. Y.
NATHAN BIJUR, Attorney, New York.
Dr. LEANDER T. CHAMBERLAIN, President of the Evangelical Alliance of the United States, New York.
FRED W. ATKINSON, Ph.D., President Polytechnic Institute, Brooklyn.
Dr. EDWARD DWIGHT EATON, ex-President Beloit College, St. Johnsbury, Vt.
Prof. HENRY W. FARNAM, Yale University, New Haven, Conn.
JAMES J. STORROW, Boston.
Prof. GEORGE GRAFTON WILSON, Brown University, Providence, R. I.
Dr. J. H. HOLLANDER, Department Political Economy, Johns Hopkins University, Baltimore.
ANTHONY HIGGINS, Attorney, Wilmington, Del.
Rev. JOEL S. IVES, Secretary Missionary Society of Connecticut, Hartford, Conn.
J. W. SULLIVAN, Editor *Clothing Trades' Bulletin*, New York City.
Hon. CHARLES A. SCHIEREN, New York.
Dr. ALBERT SHAW, Editor *Review of Reviews*, New York.
JAMES SPEYER, Banker, New York.
P. H. MORRISSEY, Grand Master Brotherhood Railroad Trainmen, Cleveland, Ohio.
Prof. EDWARD A. STEINER, Iowa College, Grinnell, Iowa.
HORACE WHITE, First Vice-President American Economic Association, New York.
CHARLES F. PIDGIN, Chief Bureau of Statistics of Labor, Boston.
CYRUS L. SULZBERGER, New York.
KENYON L. BUTTERFIELD, President Rhode Island College of Agriculture and Mechanic Arts, Kingston, R. I.
F. L. MAXWELL, Mound, La.
Dr. WATSON L. PHILLIPS, Clergyman, New Haven, Conn.

Committee on Supply and Demand.

Hon. CHARLES S. HAMLIN, Attorney, Boston.
Hon. EDWIN R. GERBER, Mayor, Reading, Pa.
ELIOT NORTON, Attorney, New York.
W. F. MASSEY, Editor *The Practical Farmer*, Philadelphia.
MAX MITCHELL, Superintendent Federation of Jewish Charities, Boston.

Dr. LEANDER T. CHAMBERLAIN, First Vice-Chairman

ALEXANDER E. CASE, Attorney, Marion, Kansas.
T. K. BRUNER, Secretary North Carolina Department of Agriculture, Raleigh, N. C.
THOMAS F. PARKER, President Southern Immigration Society, Greenville, S. C.
WILLIAM D. MAHON, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
FERDINAND STRAUSS, President Leopold Morse Company, Boston.
THOMAS W. SLOCUM, New York.
S. A. HUGHES, General Immigration Agent of the St. Louis and San Francisco Railroad Company, St. Louis.
B. A. LARGER, General Secretary United Garment Workers of America, New York City.
SAMUEL SPENCER, President Southern Railway, New York.
J. G. SCHONFARBER, Bureau of Statistics and Information, Baltimore.
WARREN S. STONE, Grand Chief Brotherhood of Locomotive Engineers, Cleveland.
JOHN M. STAHL, President Farmers' National Congress, Chicago.
JOSHUA STRANGE, President State Farmers' Congress of Indiana, Marion, Ind.
N. J. BACHELDER, Master of the National Grange, Concord, N. H.
J. W. SULLIVAN, Editor *Clothing Trades' Bulletin*, New York City.
F. D. COBURN, Topeka, Kansas.
WILL B. POWELL, Shadeland, Pa.
Hon. WILEY TINDOLPH, Minneapolis.
JAMES J. HILL, President Great Northern Railway, St. Paul, Minn.
JOHN MITCHELL, President United Mine Workers of America, Indianapolis.
Hon. E. J. WATSON, Commissioner Department of Agriculture and Immigration of South Carolina, New York.
T. V. POWDERLY, Washington.

Legislation and Its Enforcement.

Prof. J. W. JENKS, Department of Political Economy, Cornell University, Ithaca, N. Y.
Prof. H. A. GARFIELD, Princeton University, Princeton, N. J.
PRESCOTT F. HALL, Attorney, Boston.
Hon. JESSE TAYLOR, National Council Junior Order United American Mechanics, Washington.
Rev. ADOLPH ROEDER, New Jersey State Civic Federation, Orange, N. J.

DANIEL J. KEEFE, Third Vice-Chairman

THEODORE MARBURG, Baltimore.
Hon. JOHN DEWITT WARNER, Attorney, New York.
SAMUEL GOMPERS, President American Federation of Labor, Washington.
Prof. HENRY C. EMERY, Department of Political Economy, Yale University, New Haven, Conn.
H. W. FAIRBANKS, Secretary and Treasurer Sherman Cotton Mills, Dallas, Texas.
JOSEPH LEE, Boston.
SAMUEL D. JONES, President Chamber of Commerce, Atlanta, Ga.
WILLIAM HUBER, President United Brotherhood of Carpenters and Joiners of America, Indianapolis, Ind.
G. GUNBY JORDAN, President Eagle and Phenix Mills, Columbus, Ga.
MAHLON N. KLINE, President Trades League of Philadelphia.
PARK MITCHELL, State Federation of Labor, Manchester, N. H.
MARCUS M. MARKS, New York.
Dr. ALBERT SHAW, Editor *Review of Reviews*, New York.
HENRY WALLACE, Editor *Wallace's Farmer*, Des Moines, Iowa.
WILLIAM B. WEEDEN, Providence, R. I.
S. W. MEEK, *The Times-Dispatch*, Richmond, Va.
JOSEPH F. VALENTINE, President Iron Molders' Union of North America, Cincinnati.
Prof. JOHN H. MACCRACKEN, New York University, New York.

Committee on Naturalization.

JOHN H. HOLLIDAY, President Union Trust Company, Indianapolis.
Hon. JOHN FITZGERALD, Mayor, Boston.
Rev. ADOLPH ROEDER, New Jersey State Civic Federation, Orange, N. J.
JEFFREY R. BRACKETT, Director School for Social Workers, Boston.
JAMES W. KINNEAR, Attorney, Pittsburg.
Hon. ALEXANDER T. CONNELL, Mayor, Scranton, Pa.
Hon. JOHN E. FROST, Topeka, Kansas.
J. J. HANNAHAN, Grand Master Brotherhood of Locomotive Firemen, Peoria, Ill.
Hon. EDWIN R. GERBER, Mayor, Reading, Pa.
ANTHONY HIGGINS, Attorney, Wilmington, Del.
JAMES P. HOLLAND, Secretary Stationary Firemen, New York.
Z. P. SMITH, Editor *The American*, Raleigh, N. C.
HAMILTON HOLT, Editor *The Independent*, New York.
JAMES O'CONNELL, President International Association of Machinists, Washington.
Hon. L. BRADFORD PRINCE, President The Historical Society of New Mexico, Santa Fe, N. M.
FREDERICK B. SMITH, President Wolverine Manufacturing Company, Detroit.
JOHN F. SMULSKI, City Attorney, Chicago.
Hon. W. D. WASHBURN, Jr., Minneapolis, Minn.
W. L. MOYER, President Mechanics' and Traders' Bank.
W. O. FAYERWEATHER, Paterson, N. J.
L. LAMBERSON, President The Pioneer Loan and Land Company, Warren, Minn.
ADOLPH LANKERING, Hoboken, N. J.

Agencies for Advancing the Welfare of Immigrants.

ELIOT NORTON, Attorney, New York.
JAMES P. ARCHIBALD, New York.

OFFICERS CHOSEN FOR THE INDUSTRIAL ECONOMICS' DEPARTMENT.

NICHOLAS MURRAY BUTLER AT ITS HEAD—LEADERS OF THOUGHT AND ACTION ARE MEMBERS OF THE EXECUTIVE COMMITTEE.

PRESIDENT BUTLER of Columbia University has been chosen by the Executive Council of The National Civic Federation to head the Department of Industrial Economics. Mr. D. L. Cease, Editor of the *Railroad Trainmen's Journal*, is its Secretary. In addition to these officers there is a general executive committee consisting of leading representatives of the large universities, of the bar, the church, capital, labor, the general public and well-known editors of the daily press and of the principal monthly periodicals and reviews. This executive committee consists of the following:

LAWRENCE F. ABBOTT, *The Outlook*, New York City.
C. L. BAINE, Editor *Shoe Workers' Journal*, Boston.
SAMUEL BOWLES, *Springfield Republican*, Springfield, Mass.
LOUIS D. BRANDEIS, Boston.
Rev. J. M. BUCKLEY, Editor *The Christian Advocate*, New York City.
J. A. CABLE, Editor *Coopers' International Journal*, Kansas City, Kans.
HOMAR D. CALL, Secretary and Treasurer Amalgamated Meat Cutters, Syracuse, N. Y.
E. B. CLARK, Editor *Railroad Conductor*, Cedar Rapids, Iowa.
Prof. JOHN R. COMMONS, Department of Political Economy, Wisconsin University, Madison, Wis.
CHARLES A. CONANT, Treasurer Morton Trust Co., New York City.
JOHN BANCROFT DEVINS, Editor *New York Observer*, New York City.
OTTO M. EIDLITZ, Chairman Board of Governors Building Trades Employers' Association, New York City.
Dr. CHARLES W. ELIOT, President Harvard University, Cambridge, Mass.
AMOS K. FISKE, *New York Journal of Commerce*, New York City.
JOHN C. FREUND, Editor *The Music Trades*, New York City.
JOHN P. FREY, Editor *Iron Molders' Journal*, Cincinnati.
RICHARD WATSON GILDER, Editor *The Century*, New York City.
CHARLES S. GLEED, Attorney, Topeka, Kans.
SAMUEL GOMPERS, *American Federationist*, Washington, D. C.
JOHN E. GREEN, Editor *Bradstreet's Journal*, New York City.
GEORGE HARVEY, Editor *North American Review*, New York City.
CLARK HOWELL, Editor *Atlanta Constitution*, Atlanta, Ga.
Most Rev. JOHN IRELAND, St. Paul, Minn.
Prof. J. W. JENKS, Professor Political Economy, Cornell University, Ithaca, N. Y.
FREDERICK N. JUDSON, St. Louis.
D. J. KEEFE, President International Longshoremen's Association, Detroit.
CHARLES W. KNAPP, *St. Louis Republic*, St. Louis.
JOHN B. LENNON, Editor *The Tailor*, Bloomington, Ill.
GEORGE C. LORIMER, Editor *Saturday Evening Post*, Philadelphia.
ST. CLAIR MCKELWAY, Editor *Brooklyn Daily Eagle*.
V. EVERIT MACY, Capitalist, New York City.
WILLIAM D. MAHON, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
BRADFORD MERRILL, Editorial Staff *New York World*.
JOHN MITCHELL, President United Mine Workers of America, Indianapolis.
C. R. MILLER, Editor *New York Times*.
EUGENE A. PHILBIN, Attorney, New York City.
ROLAND PHILLIPS, New York City.
Rt. Rev. HENRY C. POTTER, New York City.
SERENO S. PRATT, Editor *Wall Street Journal*, New York City.
EDWARD ROSEWATER, Editor *The Bee*, Omaha, Neb.
S. M. SEXTON, Editor *United Mine Workers' Journal*, Indianapolis.
Dr. ALBERT SHAW, Editor *Review of Reviews*, New York City.
JAMES SPEYER, New York City.
Prof. F. W. TAUSSIG, Department Political Economy, Harvard University, Cambridge, Mass.
BENJAMIN IDE WHEELER, President University of California.
TALCOTT WILLIAMS, *Philadelphia Press*.
CARROLL D. WRIGHT, President Clark College, Worcester, Mass.
O. R. YOUNG, Editor *International Steam Engineer*, New York City.

The program and scope of the work for the Department is to be outlined by a sub-committee consisting of Nicholas Murray Butler as Chairman; D. L. Cease as Secretary; Dr. Albert Shaw, James Speyer, Eugene A. Philbin, Dr. J. M. Buckley, Talcott Williams, Prof. Henry W. Farnam, S. M. Sexton, S. S. Pratt, V. Everit Macy, John Greene, and J. W. Sullivan.

The breadth of view and impartiality with which the Department is to approach its investigation of the broad field before it is reflected in the notable address delivered by President Butler, the head of the new Department, at the recent commencement exercises of Columbia University. President Butler said:

"A spirit of unrest is abroad, not only in our own land, but in other lands as well. So far as this un-

NICHOLAS MURRAY BUTLER, Chairman

rest has an intellectual foundation, it appears to be the conviction that the eighteenth century formulas and axioms upon which our social and political fabric is so largely built do not work as they were expected to work. So far as this unrest has an economic foundation, it appears to be dissatisfaction with actual and possible rewards for industry. So far as it has a political foundation, it appears to be a perception of easily demonstrated inequalities of power and influence and of an equally easily demonstrated inequality of benefits from Governmental policies.

"That this unrest has been and is being used by ambitious men for their own selfish ends and for gain by journalistic builders of emotional bonfires is certainly true; but it will not do to dismiss this spirit of unrest with a sneer on that account.

"It has passed far beyond the bounds of the dreamers and visionaries, the violent-minded and the naturally destructive. Men accustomed to honest reflections and themselves possessed of property, always the sheet anchor of conservatism, have come under its influence. Policies that not long ago were dismissed as too ex-

D. L. CEASE, Secretary

treme for serious discussion are now soberly examined with reference to their immediate practicability. What has brought about this change?

"An answer is not far to seek. An increasing number of men have come to distrust the capacity of society as now organized to protect itself against the freebooters who exist in it. An increasing number of men believe and assert that law and justice are powerless before greed and cunning, and they are the more ready to listen to advocacy of any measure or policy, however novel or revolutionary, that promises relief. Their imaginations, too, cannot help being affected by the appalling sight, so often called to our attention of late, of that moral morgue wherein are exposed the shriv-

eled souls and ruined reputations of those who have lost in the never-ending struggle between selfishness and service that goes on in the human breast.

"The first duty of the trained and educated mind when it faces conditions such as these and must take a definite and responsible attitude toward them, is not to lose its balance, its poise, its self-control. It is worth while to look back at the majestic figure of Lincoln, crowned now with immortality's laurel, tranquil amid far angrier seas than ours.

"Not much is to be gained by passionate denunciation of principles and men, if there is no clear perception of where the difficulty lies and of what it is that is to be remedied. A first step, then, is an analysis of the conditions complained of and their genesis. I lay particular emphasis upon their genesis, for most re-builders of society are singularly neglectful of history. Their lip service of evolution does not often carry them to the point of considering our present institutions—social, economic, political—as evolved, and, therefore, as having the weight of years of human experience behind them.

"Looking back over a thousand years or more, it is plain that civilized man has traveled far. An examination of his progress will show, I think, that it rests mainly upon three principles, gradually evolved and erected into institutions: Civil and industrial liberty, private property, and the inviolability of contract. Upon these as a cornerstone rests what we know to-day as civilized human society. That our society has its evils, terrible and dangerous, cannot be denied. That greed for gain holds an appalling number of men in its grasp and that the moral tone of large business undertakings is painfully low are only too evident. But it is quite too rash a conclusion to infer that society must be destroyed and its cornerstone displaced before those evils can be remedied. It may be true—and I think it is—that the difficulty is not so much with the tried and tested principles upon which society rests as with the honesty and intelligence with which those principles are worked. The abounding prosperity of our country with its untold opportunities for material success, the loosening of the hold of some of the old religious and ethical sanctions of conduct, and the weakening of parental control and discipline, have united to place upon American character a burden which in too many instances it has not been able to bear."

The same general topic was touched upon in the address delivered by President Butler to the students of Columbia University at the opening of the last college year. He said:

"Just now the American people are receiving some painful lessons in practical ethics. They are having brought home to them with severe emphasis the distinction between character and reputation. A man's true character, it abundantly appears, may be quite in conflict with his reputation, which is the public estimate of him. Of late we have been watching reputations melt away like snow before the sun; and the sun in this case is mere publicity. Men who for years have been trusted implicitly by their fellows and so placed in positions of honor and grave responsibility are seen to be mere reckless speculators with the money of others and petty pilferers of the savings of the poor and needy. With all this shameful story spread before us, it takes some courage to follow Emerson's advice not to bark against the bad, but rather to chant the beauty of the good.

"Put bluntly, the situation which confronts Americans to-day is due to lack of moral principle. New statutes may be needed, but statutes will not put moral principle where it does not exist. The greed for gain and the greed for power have blinded men to the time-old distinction between right and wrong. Both among business men and at the bar are to be found advisors, counted shrewd and successful, who have substituted the penal code for the moral law as the standard of conduct. Right and wrong have given way to the subtler distinction between legal, not-illegal and illegal; or better, perhaps, between honest, law-honest and dishonest. This new triumph of mind over morals is bad enough in itself; but when in addition its exponents secure material gain and professional prosperity, it becomes a menace to our integrity as a people."

It will be the effort of the Department by means of national conferences and through careful and impartial investigations to throw light on some of the important present-day problems—social, political, and industrial—by giving to the public a sane and unbiased statement of actual conditions. It is believed that such a plan, by presenting the opinions and experiences of authorities and experts on all sides of the problems to be considered, will go far to enlighten public opinion and to assist in arriving at a decision based upon the merits of each case rather than upon *ex parte* argument or presentation. A definite program on plan and scope will be announced later.

THE TRADE AGREEMENT IN FIVE GREAT INDUSTRIES.

ITS PRESENT STATUS IN THE COAL FIELDS, ON THE GREAT LAKES, IN THE IRON AND STEEL INDUSTRY, ON STREET RAILWAYS, AND IN THE FALL RIVER COTTON MILLS.

SOME indication of the value of the trade agreement is shown by recent developments in five important industries of the country—in the coal fields, in the iron and steel industry, on street railways, in the various occupations along the Great Lakes, and among employers and employees of the Fall River cotton mills. These recent events would seem to strengthen the belief of students of industrial conditions that the trade agreement is the only practical present-day method for averting industrial wars. It is true, of course, that the trade agreement machinery is by no means perfect, but it is the only rational method which human ingenuity has devised for regulating the relations between employers and employees. While the progress of events may at some future day bring forth something better, the present hope of the nation for working out some kind of harmonious relations between labor and capital must depend upon this trade agreement machinery.

One of the most important events of recent years tending to emphasize the great value of this conference method of settling differences between capital and labor is the outcome of the negotiations between the anthracite mine workers and the hard coal operators following the termination of the award of the Anthracite Coal Strike Commission. This award was made in 1903 after a five months' investigation of the general labor conditions in the three fields and following the memorable strike of 1902. It was to continue for a period of three years and this expired on March 31 last. Several months previous to its expiration the mine workers and operators held several conferences with the object of arranging some mutually satisfactory basis for a continuance of their working relations. No agreement was reached, however, before the expiration of the Commission's award, and, in consequence, the officials of the United Mine Workers of America ordered a temporary suspension of work in the hard coal fields. This suspension was brought to a close by an agreement entered into in New York City on May 6 between the representatives of employers and employees in the hard coal industry.

This agreement provides for a continuance until March 31, 1909, of the award of the Anthracite Coal Strike Commission of 1902 and of any action which has since been taken pursuant thereto either by the Board of Conciliation, which the award created, or otherwise. The Board of Conciliation is continued with three operators and three mine workers as members, and with provision for an umpire in case of a disagreement among the members. Work was resumed in the three hard coal fields on Thursday, May 10, after a suspension continuing through forty days.

As to the trade agreement in the soft coal fields, it will be recalled that for several months preceding March 31 two meetings were held of the Interstate Joint Conference of the central competitive territory, including western Pennsylvania, Ohio, Indiana, and Illinois, and that they finally adjourned the latter part of March without employers and employees in this industry being able to enter into a working agreement for the scale year following April 1. Prior to the adjourn-

ment of the last session of the convention leading operators of the western Pennsylvania district consented to grant the compromise wage increase demanded of the union officials and, in consequence, for the first time since 1898, a separate agreement without the sanction of the Interstate Joint Conference was entered into in that district. Since then officials of the United Mine Workers of America and representatives of the various operators' associations in Ohio, Indiana, and Illinois have been carrying on numerous conferences in each State

the four States of the central competitive soft coal fields (western Pennsylvania, Ohio, Indiana, and Illinois), and the States in the Southwest territory, which latter comprise Missouri, Kansas, Arkansas, Indian Territory, and Texas. In all the States approximately 200,000 mine workers have been idle the greater part of the time since April 1.

Advocates of the trade agreement method of agreeing upon wages and conditions of employment were very much discouraged when it was finally announced

last March that the Interstate Joint Conference of the middle western coal States had failed in its operation for the first time within the past eight years. So determined was the opposition of some of the operators to a renewal of an agreement which carried with it a wage increase that it all along appeared extremely doubtful if a satisfactory restoration of the principle could be effected. Throughout all the subsequent negotiations and uncertainty, however, the diplomacy of President Mitchell of the United Mine Workers has been a potent factor in keeping intact at least the district agreement. Not only has he been confronted with the determined opposition of certain groups of the employing class, but he has had to face internal dissension within his own ranks. That he has succeeded in carrying his organization through what undoubtedly has been a most critical period in its existence, the trade agreement principle, without losing irretrievably is another tribute to his proved able leadership.

This successful outcome of negotiations between the officials of the miners' union and the operators of the different coal producing States in renewing the district agreement may be regarded as a forecast of an early restoration of the Interstate Joint Conference in both the central competitive and the Southwest territory. So valuable has been this joint conference machinery to the uninterrupted prosperity of the coal interests of the country for the past eight years that it is to be hoped it will again become a potent factor in the future relations between employers and employees in this great industry.

President W. D. Mahon, of the Amalgamated Association of Street and Electric Railways of America, is another labor leader who has recently demonstrated the efficiency of the trade agreement in settling issues between employers and employees. During the past several

months he has signed for his organization articles of agreement with the Old Colony Street Railway Company, the Boston and Northern Street Railway Company, and the Scranton Railway Company. Each of these agreements provides in substance that the employing company, through its proper officers, shall treat, when occasion therefor may arise, with those of their employees in their collective capacity who may for the time being be members of said association through the properly accredited officers and the committees of said several divisions, and the officers of the Amalgamated Association. The contracts also cover such questions as wages, hours of employment, suspensions, discharges, extra pay for overtime, free transportation for employees, arbitration of differences between officers of the company and its employees, and like general con-

JOHN MITCHELL

W. D. MAHON

P. J. MCARDLE

JAMES TANSEY

for the purpose of renewing the district agreement. In all of these States the mine workers have made concessions as to the conditions of employment, and the operators have restored the wage scale of 1903, which latter carries with it an increase of about five and one-half per cent in wages over those paid the past two years. This, in general, is the agreement signed by western Pennsylvania operators, and such provisions have now been adopted in the agreements signed in the other coal producing States excepting parts of Ohio and the central Pennsylvania district, where the suspension at this writing continues. Thus the officials of the United Mine Workers of America have practically brought to a termination the suspension of coal mining inaugurated in twelve of the coal producing States of the country on April 1, including

ditions of employment. An interesting clause in the contract of the Old Colony Street Railway Company provides as follows:

That the company will do nothing to prevent or discharge any employe from becoming or continuing to be a member of said association, and shall in no way discriminate against a member thereof because of such membership; and that said association shall not discriminate against any person in the employ of said company because of his refusal to join said association or to continue a member thereof; but if any member of said association is expelled or suspended from his membership for a violation of any of the provisions of this agreement, the company, being satisfied that said expulsion or suspension was for such reason and was justifiable, shall dismiss said employe from its service.

The agreement with the Old Colony Railway Company is for a period of four years from and after the first day of October, 1906, with provision as to a consideration and revision of the wage schedule at stated intervals. The agreement with the Boston and Northern Street Railway, which began on June 1, 1906, is also for a period of four years.

A significant feature of the agreement between the Amalgamated Association and the Scranton Railway Company is that it has been made to cover a period of ten years, its date of expiration being April, 1916, and "during that time there shall be no strike or lock-out, provided, however, that on the first day of April, 1909, and on the first day of April, 1912, the question of wages and any other grievances which may be in contention shall be taken up for adjustment." The Amalgamated Association has also recently signed agreements with street railway corporations in East St. Louis, Detroit, Oakland (California), and on both elevated and surface lines of Chicago.

Following a settlement of the strike inaugurated on the Great Lakes May 1 by the International Longshoremen, Marine and Transportworkers' Association for the purpose of securing recognition for the Mates' Union, President Daniel J. Keefe of the Longshoremen's organization has succeeded in entering into agreements with the Dock Managers' Association covering wages and conditions of employment for the ensuing year. The agreement is practically a renewal of last year's wages and conditions. A significant feature of the Longshoremen's agreement with their employers is that it is not subject to ratification by a referendum of its members, it being entered into by representatives of the union who possess full power without restriction. Usually the subjects of the agreement are referred to committees of the union, representatives of the latter themselves presenting to these committees the employers' side of the case. The acceptance of the agreement is by unanimous vote based upon the previous ascertained will of a majority, the rule of the majority thus being made binding upon all members of the Association. Any matter not covered by the agreement as well as disputes as to the construction of the contract are subject to arbitration.

It is, perhaps, true to say that the Longshoremen's Association covers more territory and as many, if not more, different occupations than any other labor organization in the world. While its agreement with employers is uniform, it comprises not less than thirty-nine divisions of trade. This association was organized in 1882, and since 1895, according to its officials, the wage scale of its members has been advanced an average of sixty per cent. The organization includes tugboat captains, engineers, firemen, marine firemen, oilers, water tenders, divers, longshoremen, lumber inspectors, elevator employes, tally men, grain inspectors and others, the wages of individuals of these different classes ranging from about \$2 to as high as \$15 a day. This is one of the labor organizations whose trade agreement machinery has worked successfully through a period of wage reduction, the decrease having been accepted in the 1903 joint conference.

One of the many interesting phases of the operation of the trade agreement within this organization is that every member of the union is furnished with and carries in his pocket a copy of the contract entered into by his representatives.

A renewal of the agreement between the Amalgamated Association of Iron, Steel and Tin Plate Workers and the Western Bar Iron Association has been effected by President P. J. McArdle and representatives of the employers in a wage conference held at Detroit in June. The scale for the past year was practically renewed, there being but few slight changes, the employers refusing the twenty-five cent increase in wages to puddlers which was voted by the Cincinnati convention of the Amalgamated Association. The slight changes made were in regard to working conditions and customs rather than changes in the wages. The new scale became effective July 1, and attached to it is the continuous working clause. The firms composing the Western Bar Iron Association include such companies as the Shenango Iron and Steel Company, Union Rolling Mill Company, Empire Rolling Mill Company, American Car and Foundry Company, Lake Erie Iron Company, Helmbader Forge and Rolling Mill Companies, Ohio Falls Iron Company, American Roll-

ing Mill Corporation, Vincennes Iron and Steel Company, Highland Iron and Steel Company, Fort Wayne Iron and Steel Company, Youngstown Sheet and Tube Company, and the Interstate Iron and Steel Company.

The Republic Iron and Steel Company, all of whose mills are union plants, was not represented at the Detroit conference and accordingly is not a party to the agreement entered into there, but at a conference with the officials of this company held at Pittsburg later by national representatives of the Amalgamated Association the provisions agreed to were practically those of the Detroit agreement.

President McArdle has also been successful in entering into an agreement for another year with the American Sheet and Tin Plate Company, one of the subsidiary companies of the United States Steel Corporation, covering wages and conditions of employment for sheet and tin plate mills. The wages the past year are continued. At this writing conferences are being carried on between officials of the Amalgamated Association and representatives of the independent sheet and tin plate mills.

Another great industry of the country which illustrates the operation of the trade agreement principle is that of cotton manufacturing in New England. Through negotiations between representatives of the Fall River Manufacturers' Association and President Tansey and other officials of the Textile Council, the latter representing the employes, there has been a restoration of the 1904 wage scale. It will be recalled that in July of that year a reduction in wages of twelve and one-half per cent was made, which was followed by a disastrous six months' strike. Before restoring this wage reduction last month to become effective on July 2, the Manufacturers' Association offered to guarantee to the employes a weekly dividend of five per cent, but this proposition was rejected by the five unions. It provided that until more suitable conditions exist by the cutting of the new crop of cotton, the Manufacturers' Association, beginning June 18 and continuing until October 1, 1906, would guarantee a weekly dividend of not less than five per cent on the present wage, with a further guarantee that if the margin in any one week exceeded this five per cent increase, they would pay an additional dividend upon the same terms as in the agreement of October 30, 1905.

An interesting phase of the Fall River situation is that the sliding scale scheme for wage increases has been abolished, temporarily at least. This was introduced in this industry in October, 1905, with the design of preventing a strike, which it was successful in doing, and it was hoped at the time that the principle would work there as successfully as it has operated in the anthracite industry following the establishment of the sliding scale scheme by the Anthracite Coal Strike Commission in 1903. Whether the sliding scale has been abolished for all time in the textile industry, or merely suspended, will depend on future developments.

SOCIALISM IN AMERICA—WHAT IT MEANS.

AMONG the contributions to the *New York World's* symposium on "Socialism in America—What it Means," published in the issue of that newspaper of May 8, is the following by the Editor of *The Review*, which contains a correction of the widely circulated statements attributed to the late Senator Hanna as to the dangers of Socialism:

To the Editor of *The World*:

I have received your circular letter asking for my opinion as to the meaning of Socialism in America and its relation to American institutions. I observe that it begins with the statement that six years ago Senator Hanna, then Chairman of the Republican National Committee, expressed the conviction that Socialism would be the chief political issue of 1912.

I am aware that this statement of Senator Hanna's, originally published in the Socialist papers, has been going the rounds of the press for a considerable time, notwithstanding the fact that it was often emphatically contradicted by him, and in spite of the fact that his opinion was exactly the reverse. In an interview in the *Chicago Times-Herald*, Dec. 2, 1900, Mr. Hanna, in reply to a question from a man in New York regarding the dangers of Socialism, answered:

I am not a bit afraid of Socialism, and will tell you why. There are two things that will prevent it. One is the American school system; the other is the Roman Catholic Church. That great Church is just as much against Socialism as the Protestant churches, as I happen to know, and in the last campaign appeals to class hatred were frowned upon by the highest dignitaries and most influential men of the Catholic organization. As long as this restraining force continues to operate you need have no fear of Socialism dominating America.

In addition to the anti-Socialist forces of the Church and the schools Senator Hanna also recognized the transcendent importance of the opposition of organized labor. The Socialists themselves recognize this and are exerting every effort to "capture" the trade unions or to "smash" them.

Mr. Jack London, President of the league organized for the purpose of teaching Socialism to the young men in the colleges, forcibly states this policy when he says:

The Socialists turn their energies on the trade-union movement. To win the trade unions is well-nigh to win the victory. Instead of antagonizing the unions, the Socialists proceed to conciliate the unions. "Let every good Socialist join the union of his trade! Bore from within and capture the trade-union movement." To-day the great labor unions are honeycombed with Socialists. At work and at play, at business meeting and at council, their insidious propaganda goes on. Night and day, tireless and unrelenting as a mortgage, they labor at their self-imposed task of undermining society.

This "boring-from-within" policy has been adopted by the Debs Socialists. The other branch of Socialists, known as the De Leonites, boldly undertake to "smash the unions" from without by open attacks, in which effort, strangely enough, they are warmly seconded by certain employers' organizations.

But what is more important than the purpose of the Socialists toward the unions is the attitude of the unions toward the Socialists. Out of 125 national organizations affiliated with the American Federation of Labor, representing 2,000,000 wage-earners, it is safe to say that not over five are controlled by Socialists, and these are crafts of comparatively small membership. The great railway brotherhoods of engineers, firemen, trainmen, conductors, etc., are every one strongly anti-Socialist.

The "boring-from-within" faction made its biggest fight to capture the American Federation of Labor in Boston in 1903. On this occasion, at the close of a masterful speech, Samuel Gompers, President of the Federation, dealt Socialism this stinging blow:

I want to tell you Socialists that I have studied your philosophy; read your works upon economics, and not the meanest of them; studied your standard works, both in English and German—have not only read, but studied them. I have heard your orators and watched the work of your movement the world over. I have kept close watch upon your doctrines for thirty years; have been closely associated with many of you, and know how you think and what you propose. I know too what you have up your sleeve, and I want to say that I am entirely at variance with your philosophy. I declare to you I am not only at variance with your doctrines, but with your philosophy. Economically you are unsound; socially you are wrong; industrially you are an impossibility.

A vote was then taken, resulting in 2,147 for Socialism and 11,282 against. In 1904, at the annual meeting in San Francisco, the Socialists' resolution was so overwhelmingly voted down that a poll was not demanded. In 1905, at Pittsburg, the "borers-from-within" did not even propose a vote.

The De Leonite Socialists have tried all kinds of plans to "smash-the-union" from without, the latest one being to organize an independent labor body to oppose the American Federation of Labor. Neither the De Leonite policy of "smashing-from-without" nor the Debsite policy of "boring-from-within" has had any appreciable influence on the American Federation of Labor.

It is easy to take election returns and make great claims of Socialistic strength. The Socialists well understand that Mr. Debs's vote of 400,000 was a personal, not a Socialist victory. For example, the single-taxers throughout the country, who have no more use for Socialism than they have for smallpox, voted for him. That this is well recognized by Socialists any reader of their papers can readily discover. They lament that the members of their party are less than 5 per cent of the voters, or less than 250,000. One paper has been calling the attention of the party to "the States where there was the greatest increase of the Debs vote," and urging the Socialists to do their utmost "to capture those who were just voting their first vote, in order to get them really into the party."

But what is more significant than Debs's 400,000 votes as bearing on the growth of Socialism is the result of the elections last fall and this spring. In six States which elected one or more State officers last fall the vote fell far below Debs's vote in 1904. Nebraska fell from 7,412 to 3,421; Ohio from 36,260 to 17,795; Pennsylvania from 21,863 to 10,390, etc.; while in Massachusetts, where two or three years ago there were a number of Socialist mayors, to-day there are none, and the Socialist vote is speedily growing less.

The cry of Socialism is "to help the workingman." From a poll made recently by one of the leading labor journals of the men who are doing the talking and writing for Socialism it was found that nine-tenths of them were newspaper writers and men in the professions. The great mass of workmen themselves recognize that under the regime of Socialism their "last state would be far worse than their first."

On the Part of the Public.

Grover Cleveland, ex-President of the United States, Princeton, N. J.
Andrew Carnegie, capitalist, New York City.
Cornelius N. Bliss, ex-Secretary of the Interior, New York City.
Oscar S. Straus, member of the Court of Arbitration at The Hague, New York City.
Charles W. Eliot, President Harvard University, Cambridge, Mass.
Nicholas Murray Butler, President Columbia University, New York.
Seth Low, publicist, New York City.
Archbishop John Ireland, of the Roman Catholic Church, St. Paul, Minn.
Bishop Henry C. Potter, of the Protestant Episcopal Church, New York City.
Charles J. Bonaparte, Secretary of the Navy, Washington, D. C.
David R. Francis, ex-Secretary of the Interior, St. Louis, Mo.
Isaac N. Seligman, of J. & W. Seligman & Co., New York City.
James Speyer, of Speyer & Co., New York City.
V. Everit Macy, capitalist, New York City.
Ralph M. Easley, Chairman Executive Council, New York City.

On the Part of Employers.

Henry Phipps, Director United States Steel Corporation, New York City.
August Belmont, President Interborough Rapid Transit Company, New York City.
Clarence H. Mackay, President Postal Telegraph Cable Company, New York City.
Lucius Tuttle, President Boston & Maine Railroad, Boston.
W. A. Clark, President United Verde Copper Company, Butte, Mont.
Frederick D. Underwood, President Erie Railroad Co., New York City.
Frederick P. Fish, President American Telephone and Telegraph Company, Boston.
Francis L. Robbins, President Pittsburgh Coal Company, Pittsburgh.
H. H. Vreeland, President New York City Railway Company, New York City.
Samuel Mather, of Pickands, Mather & Co., Cleveland.
Charles A. Moore, of Manning, Maxwell & Moore, New York City.
Franklin MacVeagh, of Franklin MacVeagh & Co., Chicago.
Charles H. Taylor, Jr., ex-President American Newspaper Publishers' Association, Boston.
Dan R. Hanna, of M. A. Hanna & Co., Cleveland.
Marcus M. Marks, President National Association of Clothing Manufacturers, New York City.
Otto M. Eidlitz, Chairman Board of Governors, Building Trades Employers' Association, New York City.

On the Part of Wage Earners.

Samuel Gompers, President American Federation of Labor, Washington.
John Mitchell, President United Mine Workers of America, Indianapolis.
E. E. Clark, Grand Chief Conductor, Order of Railway Conductors, Cedar Rapids, Iowa.
James Duncan, General Secretary Granite Cutters' International Association of America, Quincy, Mass.
Daniel J. Keefe, President International Longshoremen, Marine and Transport Workers' Association, Detroit, Mich.
Warren S. Stone, Grand Chief International Brotherhood of Locomotive Engineers, Cleveland.
P. H. Morrissey, Grand Master Brotherhood Railroad Trainmen, Cleveland.
William D. Mahon, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
William J. Bowen, President Bricklayers' and Masons' International Union, Indianapolis, Ind.
J. J. Hannahan, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
James O'Connell, President International Association of Machinists, Washington, D. C.
John F. Tobin, General President Boot and Shoe Workers' Union, Boston.
Joseph F. Valentine, President Iron Molders' Union of North America, Cincinnati.
James M. Lynch, President International Typographical Union, Indianapolis.
Dennis A. Hayes, President Glass Bottle Blowers' Association of the United States and Canada, Philadelphia.
William Huber, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.

The Public Ownership Commission.

The spirit in which the investigation by the Commission on Public Ownership and Operation has been conceived and brought into existence by The National Civic Federation; the personnel of the Commission; the method of its selection; and the value to the public of the work the Commission has undertaken, were emphasized in the addresses at the banquet to the Commission's Committee on Investigation given by the New York City Federation on May 21. The Commission, as is well known, has taken up the consideration of public ownership and operation of public utilities in municipalities so far as it applies specifically to passenger transportation (whether by elevated, surface, or underground systems), and to the supply of water, gas and electricity. For this purpose it has invited men, competent as scientific experts of practical experience, and accountants to study the subject in all its phases, both in this country and in Europe.

"These men," said Hon. Oscar S. Straus at the dinner to the Investigating Committee, "are highly qualified by capacity and experience to make the investigation. Some of these men have large interests in and represent private ownership, and some of them are pronounced advocates of public ownership and public operation. All views of this question are fairly represented, so that the investigation will be from all sides, and in no case one-sided." As expressing the views of organized labor, Mr. Philip Kelly, of the Theatrical Protective Union, in his address, said: "I have the utmost confidence in the men who have been appointed on this Commission; they are capable, brilliant, fearless, and honest. I know the labor men on the Commission; they are good, straightforward men. The labor men of the country will know that the report our brothers on the Commission bring back will be worth our study and confidence. I believe that the attitude of organized labor toward municipal ownership will largely be determined by the report of the Investigating Committee."

The method of selecting the Commission was endorsed by many of the speakers, this thought being expressed as follows by Dr. Talcott Williams, of the Philadelphia Press: "I think this Committee has been selected with admirable judgment. In France a committee selected for such an investigation would necessarily have been drawn from the personnel of the existing party in power. A report from such a Commission would, in all probability, have been biased and colored to suit the wishes of the party in power. In Germany a royal commission would have made a report that would have been pleasing to the head of the nation. I submit that this Commission, in its method of appointment and investigation, has been better constituted than it would have been possible to constitute a similar committee in any other country."

As to the value of the investigation undertaken by the Commission, all the speakers at the banquet referred at greater or less length. Hon. W. J. Gaynor, of the New York Supreme Court, said: "This Federation is accomplishing a very great deal, and I deem it fortunate that it has now taken up the great subject of public service corporations, as to whether or not they shall be operated publicly or privately. I deem it fortunate, and nothing is more certain, than that the understanding which this Committee arrives at and that which will in time be the understanding of this Federation will ultimately become the understanding of the entire country." On the same point Dr. Albert Shaw, Editor of the *Review of Reviews*, said: "This Committee can bring back information that will be very useful. It will bring back information that will inspire a zeal for changing our conditions where changes are demanded, and for further study. * * * The men of this Commission are men of very high authority. The work they will do will be of great value to the country. The Civic Federation is to be highly congratulated on having secured their services. They are as competent a body of men as could be got together anywhere in this country. * * * There are a great many ways, direct and indirect, in which the work of this Committee is bound to be of great value, and I am sure its deliberation will result in untold good to our country."

The value of the work undertaken by the Commission was also emphasized by Hon. John DeWitt War-

ner in his letter to Secretary Archibald replying to the invitation to attend the dinner. Mr. Warner said: "I believe the Federation has taken no other step so important as that in which this Commission has been appointed; that it can do no greater service than fully to inform our people of the experience of others in this matter; and that the success with which it does this, and the acceptance by our people of its report as a clear and impartial view, is likely long to be its best hold on public confidence."

Whatever are to be the definite results of the labors of the Commission, *The Review* believes that the report which is to be made will take a place in the front rank among the powerful forces at work to determine ultimately the issue of this great national question.

Labor in Southern Cotton Mills.

Presented elsewhere in this issue is the report of the recent investigation made by Miss Gertrude Beeks, Secretary of the Welfare Department of The National Civic Federation, into the social and industrial conditions of employes of Southern cotton mills. The subjects covered are the conditions under which the operatives work, homes of employes, education of children, recreation, hours of work, and child labor.

The questions involved in the problem of child labor are presented in a most illuminating manner, the investigation revealing important phases of the subject not generally recognized. It shows that children are numerous in one of the three departments of the mills—the spinning room—but the testimony is refuted which pictures the majority of the employes as being emaciated children of five and six years. Elements contributing to child labor, as shown by Miss Beeks, are the desire of the parents, who previously employed their children upon the farms, to have them work in the mills; the extreme scarcity of labor; the difficulty of securing immigrants for the South, and the fact that in the cotton industry the individual wage is too low for the father to support the family by his labor alone. Conspicuous also among these elements must be included the absence of proper State methods of caring for orphans and paupers, and the lack of laws on compulsory education, birth registration, marriage license, and factory inspection, as well as the low age limit of the child labor laws of South Carolina and Alabama.

From the standpoint of Welfare Work, the well-lighted and well-ventilated mills afford comfortable work-places for the employes; and the employers also provide good homes at nominal rentals, recreation in a variety of forms, kindergartens and schools. In fact, their efforts to ameliorate the conditions of the employes demonstrate a realization of the moral obligation felt by the manufacturers, and credit should be accorded them not only for giving food and shelter and an industrial training to the illiterate whites of the South, but also for steadily raising, through their welfare work, the standard of citizenship.

Labors' Political Policy.

In a recent issue of the *Railway World* the statement is made, under the caption "Labor Leaders Differ About Politics," that President Gompers, of the American Federation of Labor, appeals to union men to take an active part in politics, while President Mitchell, of the United Mine Workers of America, says that to carry politics into the crafts would be to create discord and endanger the organization. The above is one illustration of the general misinterpretation which has been given to the political program of the American Federation of Labor as being the preliminary step to the launching of a national labor party. It is true the leaders of the American Federation of Labor are appealing to their followers to take an active part in politics, but not as members of a distinct and separate party. As we understand President Gompers's announcement at this stage of the movement, they intend first "to help their friends and punish their enemies" in every case where this is practicable. But in cases where they have only "a choice between enemies," if it is found expedient

they will nominate men of their own principles on independent, labor or some other ticket which will lend itself to their interests.

The political policy of the labor leaders is very similar to that of the Municipal Voters' League of Chicago, which has resulted in changing a notoriously bad city council to a fairly representative and decent body. The League only found it necessary to secure the nomination of independent candidates in a very few instances. The idea is a practicable one. It is as legitimate for organized labor to look after its interests as it is for organized employers or any other group interest to work for their own advantage. The National Manufacturers' Association, if one may judge from the literature with which its energetic secretary is bombarding the manufacturers of the country, is carrying on a political campaign along somewhat the same lines.

The Wage-cost of Miners' Suspension.

There are two general statements relative to the recent controversy in the bituminous and anthracite coal fields made by newspapers unfriendly to organized labor which are so palpably absurd that it hardly seems worth while to answer them. One is that the anthracite miners lost \$12,000,000 in wages by their recent forty days' suspension. This is not true, because it is well known that in anticipation of a strike so much coal had been mined (for which extra employment the mine workers were paid) that even if there had been no suspension there would have been a lack of employment throughout the summer months totalling at least the number of days covered by the shut-down.

The other point is that the suspension in the bituminous coal fields resulted in no benefit to the unions "because they only got a restoration of the 1903 scale." This statement is true but the implication is false. The wage increase was a gain and a very real gain. It meant so much in dollars and cents that the operators were willing to risk a fight rather than grant it. To say that an increase in wages averaging more than five cents per ton and amounting to millions of dollars in the aggregate is not a real gain is ridiculous. A comparison of the money cost to the mine worker of the actual time lost by the suspension with the 5.8 per cent wage increase for two years makes the former amount rather insignificant. What is even more to the point, the mine workers stand to hold the restored rate indefinitely, which at once adds to the importance of the gain.

The Federation's Immigration Department.

Among the dominant forces which have been at work in the upbuilding of the American Republic none stand forth to the present generation in a brighter halo than the resultant operation on these shores of European immigration. We believe this much is conceded by all thoughtful observers of American history. But in the rapid transformations which come about in the development of a nation it is also true that those forces which at one time worked to the nation's upbuilding may operate to the destruction of some of its most prized institutions. This apprehension is held by some as to the present-day effects of alien immigration to the United States and it is finding expression in various channels, conspicuously in newspapers, magazines, and books, and in the formation of organizations having for their expressed objects the further restriction of immigration. Three of these organizations—the Immigration Restriction League, the Japanese and Korean Exclusion League, and the Junior Order United American Mechanics—are explained elsewhere in this issue. Naturally the basis of their operation is their respective interpretation of the effects of immigration.

The real effects of immigration on our industrial, political and broad social life are not easily to be ascertained. In no realm of human knowledge are the facts more elusive. But these facts are just what are absolutely necessary before there can be a correct understanding as to the right solution of such a grave problem. As long as there are disputes as to what are the facts as to immigration we cannot hope for the proper

direction on this subject of the energy and ability of those public spirited citizens who strive to find the right way to the advancement of the general welfare. A striking illustration of the widely varying interpretation of the facts relating to immigration to the United States, and that, too, on a point which, it would seem, should be beyond dispute, is at hand. It relates to the character of immigration. In a circular recently issued to members of the Junior Order United American Mechanics by the Dayton Council of that organization is contained the following:

Will we American citizens allow the Dago, the other riffraff of Southern Europe and the "Coolie" laborers who will work for a matter of nothing and live on the refuse of the cess-pool and the garbage-dump to replace American labor and take our earnings back to foreign lands, or assist more filth and vice to land on our shores? A large per cent. of immigration is made up of outcasts, criminals, anarchists, thieves and off-scourings of the earth, who are forced to leave their own land, and still are allowed to land upon American soil. Isn't it time that we begin to take measures to stop this inflow of foreign scum? Every true American, naturalized or native-born, regardless of nationality, partisan or sectarian affiliation, will answer, Yes!

In direct contrast with the above we have the following word picture from Immigration Commissioner Watchorn, of the Ellis Island immigration station at New York, which we reproduce from an interview in a recent issue of the *New York Times*:

We cannot have too much of the right kind of immigration; we cannot have too little of the wrong kind. We are seeing to it that we get the right kind—of that I am certain. Consequently I believe that increased immigration of the kind we are admitting to our shores makes for the National weal.

The prime cause of immigration is the letters foreigners in this country write to relatives and friends and to foreign newspapers. These letter writers have thrived, and they spread the news of their success abroad. The result is an influx of bright, ambitious men and women, the brawn and backbone of any country.

Aliens arriving through Ellis Island last year brought with them money aggregating \$938,660. Shake more than 800,000 Americans together and send them abroad, and I doubt if they would make as good, certainly no better, showing.

Of the 41,412 immigrants arriving here last January, 34,363 were between the ages of fourteen and forty-four years—formative years of youth and manhood; splendid years. Of the January total 5,272 were under fourteen years of age, and only 1,837 were over forty-four years of age. So what did we get, therefore? Was it not the youth and strength and vigor and ambition of foreign lands?

So far as the steamship companies are concerned I may say that they are very loath to inaugurate innovations, but sooner or later, for one reason or another, they come to our way of thinking. One very important fact that they have lately digested is that it does not pay for them to ship any old sort of an immigrant to this country. The reason why they have come to know this is that we catch the undesirable aliens at this island and make the company take them back at its own expense, plus also the cost of maintaining them while they are in this port. We sent back so many persons in this way that the steamship companies finally issued letters to their agents all over the world saying that it was absolutely useless for them to send on would-be Americans who were ailing in body or mind, or who were otherwise ineligible to land under the immigration laws of the United States. The refusal of steamship companies to carry undesirable immigrants is one of the greatest checks upon pernicious immigration that I know of. Last year, for instance, the various steamship companies refused to bring 20,000 aliens to this country, not through any deep regard for our laws, of course; but simply for their own interests, knowing that we would have sent them back even if they had brought them here.

Not only is the character of our present immigration in dispute, but also innumerable other factors which go to make up the immigration problem. There are controversies, for illustration, as to the exact percentage of immigrants which remains in New York; as to the proportion of aliens in our penal and re-

formatory institutions, in our almshouses, and in other ways dependent upon public and private relief; as to the ultimate effect of immigration on wages and general labor conditions; and as to the effects of immigration upon the political and broad social life of our cities, States, and even the nation itself. These and other factors of equal importance to the solution of the immigration problem must be known beyond question if we are to control and direct the immigration stream to the advancement of the general welfare. And the one essential to their correct understanding is an organization which seeks these facts, without personal interests of any kind to serve, without preconceived opinions to support, and with the sole purpose of ascertaining those facts which alone are basal and comparable.

It is in this spirit that the Immigration Department of the National Civic Federation, an account of which is presented on another page of this issue, has been organized. The work of the Department will at first be directed along the line of securing basal facts, and to this end seven distinct committees have been created to deal with statistics, supply and demand, legislation and its enforcement, naturalization, agencies for advancing the welfare of immigrants, international relations, and Oriental immigration. The work of these committees will undoubtedly be of great value to a correct understanding of the immigration problem. Possession of the facts which go to make up the immigration issue will present to the nation a starting point for working out by legislation a more satisfactory line of action than is possible at the present time.

Reformers and "Reformers."

Mrs. Martha Moore Avery, in the announcement elsewhere in this issue of the Industrial Bureau which she and Mr. David Goldstein are launching, does well to call attention to the fundamental differences between reformers who want to reform and "reformers" who want to destroy. While we may not agree with all the methods employed by some of the noted journalistic reformers of the day, we can give them credit for honest intentions to really make conditions better. But when we find that a reformer is a pronounced Karl Marx socialist, it is well to scrutinize his statements and methods, because that philosophy teaches that conditions must become worse before they can be made better. It follows, therefore, that his purpose is to make the situation "worse" as fast as possible. One noted socialist "reformer," a member of a number of organizations for ameliorating social conditions, was recently decrying charity organizations when some one said: "Suppose they are not perfect; they are the best we have. Were it not for them a great many working people would starve." Her reply was: "Let them starve. The quicker they starve the sooner will society become aroused at the intolerable conditions and hasten the revolution which will usher in the Socialist State."

Three subjects that furnish a great deal of material for socialist propagandists are tenement houses, sweatshops and child labor. In the last decade great progress has been made in all three fields, but the socialists continue to picture the conditions which existed ten and twenty years ago. It is their fixed policy never to concede progress along any line of activity. With them an isolated case is always typical. However much we may disagree with their philosophy, we must admire their energy and persistence. They manage to become identified with every organization where there is any chance of exploiting their doctrine. Frequently an organization will be found to be shaped and controlled by a group of socialists, although that group may be a very small part of the organization. The public-spirited citizens who compose the larger part of the organization and who furnish all the funds for its work, have no idea that they are being used by socialists, and that they are "rubbing elbows" with people who not only do not believe in the institutions of our country but also are working to destroy them. If the new Industrial Bureau will point out to the country just who these people are it will perform an important public service.

WELFARE WORK AND CHILD LABOR IN SOUTHERN COTTON MILLS.

COMPULSORY EDUCATION AND AUTOMATIC SPINNING MACHINERY WILL AID IN SOLVING THE PROBLEM OF CHILD LABOR.

[For the purpose of learning what manufacturers of cotton goods in the South have done to ameliorate the conditions under which their employes work and live, Miss Gertrude Beeks, Secretary of the Welfare Department of the National Civic Federation, recently visited fourteen cotton mill towns in South Carolina, Alabama and Georgia. This included an inspection of the mills as well as an investigation of the social conditions. The cotton industry having been developed to the greatest extent in South Carolina, the largest number of mills was visited in that State. Children being employed, the question of child labor was naturally involved in the inquiry. While her report shows that there are isolated cases of very young children at work, as well as too many under twelve years, the legal age in South Carolina and Alabama, credit has been given the employers for their efforts to educate the children and to secure proper legislation which would aid in abolishing the evil of child labor. The question has been handled as a broad, economic problem—clearly recognizing the industrial evolution of the South since the destitution left by the Civil War.]

This is the first opportunity afforded the general reader to learn from a disinterested, practical investigator, the truth about conditions in the Southern cotton mills. Much literature has been published on this subject, frequently emanating from a source interested in creating socialistic propaganda rather than depicting facts. Miss Beeks not only frankly criticises where the employers are at fault, but also tells of their remarkable, beneficent efforts. The qualifications of Miss Beeks for undertaking such an investigation are unquestioned. Probably no other woman in this country has had as wide, practical experience in dealing with all phases of the problems connected with the employment of labor, and provision for its well-being in stores, mills, factories, mines, on railroads—and in fact wherever labor is employed.—EDITOR'S NOTE]

By MISS GERTRUDE BEEKS.

IN reporting upon this investigation the following subjects are covered: Condition under which the operatives work; homes of operatives; education of children; recreation; hours of work; and child labor.

Half a dozen cotton mill villages may be located in one town. Each mill has its group of operatives' homes or village within close proximity. The term "operatives" means employes in cotton mills. While other mill settlements were inspected, trips through the interiors of mills were confined to the following eighteen:

Monaghan Mills, Greenville, S. C.
Victor Mills, Greers, S. C.
Pelzer Mills, Pelzer, S. C.
Belton Mills, Belton, S. C.
Cox Manufacturing Co., Anderson, S. C.
Brogan Mills, Anderson, S. C.
Greenwood Mills, Greenwood, S. C.
Grendel Mills, Greenwood, S. C.
Saxon Mills, Spartanburg, S. C.
Olympia Mills, Columbia, S. C.
Saxon Mills, Spartanburg, S. C.
Olympia Mills, Columbia, S. C.
Victoria Mills, Rock Hill, S. C.
Arcade Mills, Rock Hill, S. C.
Manchester Cotton Mills, Rock Hill, S. C.
Graniteville Mfg. Co., Graniteville, S. C.; near Augusta, Ga.
Dwight Mills, Alabama City, Ala.
Massachusetts Mills of Georgia, Lindale, Ga.
Exposition Mills, Atlanta, Ga.
Eagle & Phenix Mills, Columbus, Ga.

A MILL BACK YARD

Observations of the general living conditions were made at the villages of the following mills:

Spartan Mills, Spartanburg, S. C.
Drayton Mills, Spartanburg, S. C.
F. W. Poe Mfg. Co., Greenville, S. C.
Granby Mills, Columbia, S. C.
American Spinning Company, Greenville, S. C.
Bath Mills, in South Carolina, near Augusta, Ga.

FRONT YARD OLD MILL ERECTED IN 1845

Langley Mfg. Co., in South Carolina, near Augusta, Ga.
Warren Mfg. Co., in South Carolina, near Augusta, Ga.

Piedmont Mills, Piedmont, S. C.
Lorraine Mills, Gastonia, N. C.
Griffin Mills, Griffin, Ga.

In addition to those mentioned, officials of the following mills were interviewed:

Carolina Mills, Greenville, S. C.
Brandon Mills, Greenville, S. C.
Batesville Mills, Greenville, S. C.
Reedy River Mill, Greenville, S. C.
Capital City Mill, Columbia, S. C.
Richland Mills, Columbia, S. C.
Apalachia Mills, Apalachia, S. C.
Ninety-six Mills, Ninety-six, S. C.
Gluck Mills, Anderson, S. C.
Union Mills, Union, S. C.
Woodruff Mills, Spartanburg, S. C.
Fairfield Cotton Mills, Winnsboro, S. C.
Wylie Mills, Chester, S. C.

Testimony showing the same general conditions at the Avondale and Pell City in Alabama; and the La-

MODERN MILLS WITH MONITOR AND SAW-TOOTH ROOFS

nette, Whittier, Decatur, Muscogwe and Trion mills in Georgia, was offered by reputable persons.

These mills are located, with a few exceptions where they are at the extreme lower end of the hilly country, in the noted Piedmont region—the highlands east of the Blue Ridge Mountains. The greatest cotton mill activity in the South is, therefore, in one of the most healthful territories in the country and where there are, usually, pleasant breezes which afford natural ventilation for mills upon the elevations. South Carolina has the greatest number of spindles. The statistics for 1904 show the leading States to be:

South Carolina.....	2,928,000 spindles
North Carolina.....	2,192,000 "
Georgia	1,475,000 "
Alabama	820,000 "

In Virginia, Tennessee, Mississippi, Maryland, Louisiana, Texas, Arkansas and Missouri there is some cotton manufacturing but comparatively little, the number of spindles in each State running from 300,000 down to 16,000.

For this investigation mills were selected not only with reference to their relative importance, but a special effort was made to inspect those toward which public attention has been particularly directed in the criticisms of sensational writers.

SPRAY FOR COOLING MILL

CONDITIONS UNDER WHICH THE OPERATIVES WORK.

In general it may be said that the mills are unusually well lighted and ventilated, heated in winter and cooled in summer. The saw-tooth roof is used to give a perfectly lighted, modern weave room, and the monitor roof, which insures better ventilation than the flat roof, is found quite often. The employers have been quick to utilize modern devices, such as the exhaust system for the removal of the lint; the cold-water spray instead of the hot-water spray in summer, to humidify the atmosphere for manufacturing purposes; and the blower system for heating in winter and cooling the air in summer. Some, who heat with hot air, use the cold-water spray both winter and summer and have proved

by its use that heat is not essential to the successful manufacture of cotton goods. The aim is to keep the temperature at 70 to 75 degrees. That is probably feasible, excepting in a few old mills in the lowlands. But there and in the uplands, in exceedingly warm weather, some progressive employers have cold water sprayed on the roofs or sides of the mills exposed to the sun. The custom at one place visited is to put ice in the chamber through which the fresh air is drawn into the mill, while in another the air is passed through cool water. The claim that the operatives are more comfortable in the mills during the summer than they were when engaged in the hot sun on the farms

is justifiable. The introduction of electric motors in many mills to take the place of overhead shafting and belting has aided in reducing the amount of dust in the atmosphere. The custom of having pure, cool drinking water easily accessible in the work rooms, is general. One employer was having the ribbed windows replaced with clear glass, "to please the employees because they like to look out." He supplemented the statement with "I would, too." In two mills there are splendid emergency hospital rooms, with operating tables, and even stretchers. Another mill man goes so far as to provide the trained nurse to visit all families where there is illness in the village, which materially aids in preventing the spread of contagious diseases; and one has an isolation hospital for use during epidemics. Medical attendance, at a nominal fee, is pro-

CARDING DEPARTMENT REQUIRING MEN

vided quite generally through special arrangements with physicians.

The only points of criticism relative to negligence in providing for the comfort of the employes in the mills are bad ventilation and poor janitor service in connection with the toilet arrangements, and lack of elevator service.

Some of the toilet rooms are in the ends of the mills and are well ventilated by windows and the exhaust system, but others are in the centers of the mills with no provision for ventilation. To explain their unclean condition, it was claimed that the operatives, being migratory and moving constantly from one village to another, only remain in one mill long enough to learn the first lesson in cleanliness. The feeling of discouragement relative to the difficulty of educating what the mill men term that "rough class of people" to the proper use of such conveniences would be amusing to the employer who has had to solve the problem with immigrant labor. It should be comparatively easy to so educate the native English-speaking operatives in the southern cotton mills. But, the question of janitor service is left to superintendents and foremen. Elsewhere it has been proven that when the expense of janitor service is charged to the various departments, the foremen who are required to keep down the cost of manufacturing neglect their "housekeeping" duties; and that employes will not make proper use of unclean, unsanitary arrangements. When the unclean condition of the toilet rooms, which with one exception was inexcusably bad, was called to their attention, several of the mill presidents immediately undertook to improve the method of caring for them. The system in force in the excepted mill at Lindale is thorough. Janitors clean the arrangements twice a day, using an antiseptic and a liberal supply of hot soap suds. All the mills have wash sinks which the employes are supposed to use for their ablutions. Until recently such sinks were regarded everywhere as modern conveniences. It was interesting to observe that the employes

ONE FAMILY

want something better. In one mill the operatives have supplied their own individual wash basins which are in rows on the window sills in the work rooms. In another, although the employer has been thoughtful in supplying soap, as usual towels are not furnished and the operatives were observed using the manufactured product in lieu of them.

While the use of elevators to conserve the energy of employes has not become general in this country its need is greater in the cotton mills than elsewhere. The reason is that the spinning rooms, where child labor is found in the main, are usually on the top floors—frequently on the fifth. The employers claim that they have more accidents in connection with the elevators than from the operation of the machinery, but the freight elevators could be guarded so that the employes might be transported safely to the spinning rooms when going to work in the morning and at noon-time. The use of the elevator should be given to all employes on the upper floors because the age limit does not exceed twelve years and no young girl between twelve and sixteen years should be obliged to climb several flights of stairs.

SUPERINTENDENT WHO BEGAN WORK AT EIGHT YEARS

At the entrance of a mill located in a large town the immense crowd of "dinner toters," who carry lunch to the members of the family employed there, indicates the need of a lunch room. In a smaller way that need was also evidenced at a mill in a large city where some of the weavers were observed eating their luncheons which were placed on the looms; and one boy was sitting in the wash sink next to the window eating his midday meal and reading a newspaper. The desirability of introducing rest rooms in the mills was made plain

A GROUP FROM THE SPINNING ROOM

when girls were found sitting upon the landings of the staircases waiting for work. But it may be generally stated that the mills visited are unusually sanitary, comfortable work places.

HOMES OF THE OPERATIVES.

In making this investigation, the criticisms of sensational writers were constantly kept in mind. One of these criticisms relates to the unsanitary homes of the operatives. The writer states:

Each house was encircled by a wooden veranda, and the order of housekeeping described itself before the eyes, as a whisk of the broom which carried all dirt from the kitchen to the porch, and another whisk which landed it on the ground, bedecked, in consequence, with old tin cans, decaying vegetables, pieces of dirty paper, rags and chicken feathers. The outer room was a kitchen, though it might, except for the stove, have been mistaken for a hen-coop. The chickens pecked their way about the dirty floor, venturing as far even as the table upon which

SPINNING ROOM WHERE CHILDREN WORK

From stereotype. Copyright, 1902 by Underwood & Underwood, New York
WEAVING ROOM

stood the meager remains of the noonday meal. The second and the inner room had each a bed—an unmade bed I was going to say, but, how, indeed, could a bed be made without either sheets or pillows? Two grimy counterpanes were flung in disorder across the mattresses.

To learn the facts relative to such statements, an incessant effort was made to see the worst as well as the best conditions. The village, universally regarded as the worst, was carefully inspected, and it cannot honestly be claimed that the homes of the operatives living there are as unhealthful as those of the inmates of the tenements in our great cities. This village, it is true, was a sad contrast to those of progressive employers who are gradually forcing the others to come up to their standard. The houses are merely clapboarded. The interiors are usually sufficiently spacious. Although the lots are not as large as elsewhere because the mill is in a good-sized town, there is ample space for ventilation. A most serious criticism is the fact that the employer in this village has not provided a general cow shed or pasture, the employes being permitted to keep the cows in their yards—and they insist upon keeping cows, also occasionally, pigs. Sometimes the live stock is directly under the bedroom window. Of course, this is unhealthful and aids in contaminating the well-water. The general aspect of the village is unsightly. The absence of paint, trees, gardens, and other elevating influences makes this village comparatively undesirable. But, while all are not model settlements, the conditions pictured in the para-

OPERATIVES GOING HOME TO LUNCH

graph above quoted do not exist in this or any of the other villages visited. It may be stated that generally the premises are extremely neat in the cotton mill villages, and that only in the homes of new arrivals from the primitive districts are the interiors of the cottages unclean. Many a housewife could take lessons in cleanliness from the home of the average

PRIMITIVE MOUNTAIN HOME

AFTER GOING TO THE MILL

mill operative. Where they still exist, the old clap-boarded houses are being remodeled with weather boarding, or torn down and replaced; some of the new homes are being finished with walls of wood fibre; and where not included in the original plans, porches with railings are now being added, the employers considering that such improvements give greater comfort to their tenants.

The impossibility of gaining a correct impression of conditions by cursory observations was clearly evidenced by the following experience:

The first view of the cotton mill settlements was gained between Gastonia and Greenville, along the Southern Railway, where the homes showed the lack of paint. One of the questions asked the first mill man interviewed was why they had not learned the value of utilizing paint. He replied: "It is the custom to decorate every three years and this is the year for painting." This was shown to be the fact as the investigation was pursued for many of the homes just had been or were being painted.

The moral tone of many of the villages has been greatly improved by lighting the streets with electricity. In some instances the interiors of employees' homes are thus illuminated. Simple bath rooms with zinc tubs have been introduced in some of the houses. Some employers have gone so far as to make ice and deliver it to the homes at low prices.

Unsanitary surface wells, which have been the cause of illness in the past, have been and are being replaced by water systems, and the employers are preparing to make another important improvement, that of the sewer system, although in many villages there are excellent plans for removing the refuse weekly—for example, the pan system of Manchester. One president is expending a considerable sum upon oil each year for the marshy tracts which are gradually being drained and put under cultivation in order to make the village, unwisely located by his predecessor, more healthful.

Some of the villages are exceedingly beautiful, both as to the artistic appearance of the buildings and the landscape effects. In some cases, while the homes of the operatives are comfortable and sanitary, they are built from a stereotyped plan. One president said: "It is much easier to give a contract for the building of homes of one kind, especially when there is great haste to get the mill into operation. It is hard to give time to think of houses when one has to purchase ma-

OPERATIVE'S HOME, PARSONAGE AND CHURCH

chinery and equip the mill. Besides, it is cheaper, because a builder will take a contract for less than would be possible if he were to attempt to construct different types of houses." But in a number of villages the architecture is widely diversified and individuality is encouraged, notably at Alabama City. Ordinarily the lots are seventy-five by one hundred seventy-five feet. There are garden plots with prizes for vegetables and flowers, and one mill man is planning to erect greenhouses that the employees may keep their flowers in winter. Several of the mill villages are located in beautiful forests, and at other places employers are planting trees annually with a view of securing ample shade within a few years. In one the mud, so disagreeable in that section during the rainy season, has been obviated by the use of chert. The water immediately runs off the walks and roads thus macadamized. Still another public duty has been relegated to the employers, for the last resting place as well as the temporal home is provided by them, and in some of the villages the cemeteries add to their beauty. In one village where the mills have been in operation for twenty-four years, even former employees are permitted to bury their dead in the private cemetery.

The homes are rented by the employers to the employees at two to five dollars a month for houses of four to eight rooms. The rentals meet the cost of repairs, improvements and taxes. One man stated: "We charge rental for the homes because we think the employees respect themselves more." The rents include not only water, vegetable and flower gardens, but in some cases electric light, free cow pastures, cow sheds and pig pens. The people are very timid and will not live in the towns where the mills are located, nor will they attend the general churches. This makes it necessary for the employers to build villages surrounding the mills. Several mill presidents have equipped model tenements for the residences of the Welfare Workers which serve as examples to the operatives. Hotels or

A MILL VILLAGE

"inns," where the price of board is nominal, have been provided for the clerical forces, and, in a few cases, for unmarried operatives. In one village of 1,800 residents, 800 being operatives, the company expended \$125,000 upon homes and \$20,000 upon social buildings for their benefit. Here, in addition to the \$2,000 which the company is taxed for educational purposes, it expends \$2,000 annually.

EDUCATION OF CHILDREN.

Before going into the cotton mill communities, the operatives could not be reached by civilizing influences. Through the Welfare Work of the cotton manufacturers, the children of Americans of Revolutionary ancestry, largely Tories, have been given the benefits which make for the best citizenship. Through the humane instincts of the mill owners, educational opportunities have been secured to them. These men have either assumed the function of the State by providing educational facilities or have been instrumental in securing legislation for school purposes whereby they are the largest taxpayers. Kindergartens and schools are supported in whole or in part by all. The public school system in the South is still in an imperfect condition, and, furthermore, State appropriations are insufficient to maintain the schools longer than four months in each year. In one village where the population is 5,000, 2,200 being operatives, 750 children are being educated at the present time by the mill owner. The salaries paid annually to the twelve instructors, including the Welfare Worker and domestic science teacher who assists her, amount to \$7,000. In some other villages the mill owners pay the greatest amount of taxes to support the schools for the regular term of four months, and then, in addition, maintain them entirely at their own expense for an additional four months. In South Carolina one-half of the three-mill tax for education is applied toward schools for negroes, although they do not pay one-half of the taxes. The colored parents send their children to school more generally than the white people, partly because they are more ambitious for them and partly

THE LAST MILL TENEMENT

HOUSES WHICH REPLACED OLD TENEMENTS

because there is small opportunity of securing work for colored children.

The employers erect the school buildings in the majority of the villages, as well as the homes for the teachers. The elevating influence of a new kindergarten was illustrated by the good care given the modern conveniences installed in it. This was in pleasant contrast to the conduct of the pupils in the ordinary tenement used for the initial experiment. One president said: "When our kindergarten began the work, the children would throw stones at persons going about the village; now they take off their hats." Frequently, half of the children will go to school for a period, and then alternate with the other half later by working in the mills. The children who attend the entire school period frequently go into the mills during the summer months to permit the other children of the family who are operatives to rest from work. For the children who work in the mills regularly there are night classes in arithmetic, reading and writing. Night classes for feminine employees afford instruction in cooking and sewing.

The overseers, who usually come up from the ranks, as a rule are not sufficiently intelligent to utilize all of the modern appliances. Industrial training on a large scale will be possible within a few months at Columbus, Georgia, where the leading mill president gave a tract of land and a large sum of money to secure, as a part of the public school system, such technical training. In

PAINT AND TREES ABSENT

CONTRASTING VILLAGE

Spartanburg, S. C., there is a Science Hall which was endowed by one of the pioneer mill men now deceased. The leading mill president in South Carolina secured a set of educational stereopticon lectures furnished by the State of New York, which is loaned to the other mills in that district. These lectures are free and largely attended. All of these movements show the constant efforts made by the mill men to elevate the operatives.

There are libraries supplied by the employers and churches for the support of which they contribute entirely or in part; and there are well-patronized savings banks. There are other provident funds, the one most general being the "Burial Union." The operatives pay ten cents a month and in case of death the family receives fifty dollars. This also entitles the beneficiary to benefits as follows: At the death of a parent over sixty, \$20, and a child under eight, \$10. In one instance the \$20 benefit paid from the fund in a Georgia mill was for the death of a mother-in-law in Texas. The death benefit for the children, does not, as elsewhere, increase child murder. The future value of the child as a wage earner is of greater importance to the parent than the amount of the death benefit.

RECREATION.

Included in the general effort to provide recreation for the employes there are separate social halls or auditoriums on the top floors of the school houses, theatres, roller skating rinks, gymnasiums, bowling alleys, armories for the military companies of the operatives, meeting rooms for the various lodges and employees' bands, halls for Sunday sacred concerts, athletic fields, childrens' playgrounds with gymnasium outfits, tennis courts, picnic grounds, outdoor dance pavilions and swimming pools. Of course all of the recreative activities listed are not in one village, although a majority will be found in each. One village was visited on the Saturday which opened the athletic season. The initial ball game was played by the Monaghan and the Victor teams, and the mill presidents were as much interested in the outcome as were the operatives. In one town where the employer utilized the cemented tank of water necessary for manufacturing purposes for a swimming pool during the summer season, he was, to quote his own words, "regarded by the prominent citizens as being crazy." He expended \$300 in equipment, including a fence, seats, spring board and dressing rooms. The operatives are allowed the use of the swimming pool free of charge. The citizens of the town are charged ten cents for the privilege of patronizing the pool. The first receipts met the cost of three porcelain bath tubs for the employes in the mill and now they are turned into an amusement fund of the operatives, toward which they add a material amount. Another has a lake of clear mountain water covering six acres. Upon its banks is a natatorium for the employes which cost \$1,500. The dance pavilion has not generally been introduced because of the extreme religious tendencies of the operatives, but it has proved a very successful and elevating source of diversion wherever it has been tried. In one village the pavilion is located in a beautiful park where moonlight picnics are frequent. The music is supplied by the employes' band. Moonlight festivals are sometimes enlivened by prize contests for the most beautiful girl, the most popular man, or the fattest baby in the village, the proceeds being used for a new carpet or organ for the church or toward some other improvement for the benefit of the employes. In another village there is a central band stand near a bubbling spring, and there are seats under the great trees where the residents may sit to listen to the music Saturday evenings. In several places tracts have been set apart for development into parks. "We limber them up Saturday nights after the week's work," said a Welfare Worker when she was showing the recreation hall used for dancing. At Pelzer, where the population is five thousand, the president stated: "Amusements are as necessary for the people as food." In certain villages the mills are shut down one day in the year for an

annual picnic, and although holidays are not as numerous in this section as elsewhere, it is customary to have a Fourth of July celebration and Christmas entertainment at which the operatives and members of their families receive gifts.

HOURS OF WORK.

All the employers who were interviewed clearly demonstrated the realization of their moral obligation toward the operatives in their employ. This was further evidenced by their voluntary action in reducing the hours in South Carolina.

At present* the operatives work sixty-six hours a week. At their own request, the work is divided so that they have a twelve-hour day for five days in order to secure the Saturday half-holiday. The village rising bell is rung sometimes as early as 4 a. m. and frequently at 4:30 a. m. for the purpose of awakening the housewives to prepare breakfast for the operatives who are expected to be in the mill by six o'clock. Owing to the long hours, the operatives are too greatly fatigued evenings to avail themselves, to any extent, of the educational classes or the opportunities for recreation. This is thoroughly realized by the mill owners, and it is now proposed in the State of South Carolina to reduce the hours voluntarily. Seventy-three mill presidents determined, at a meeting in Greenville, S. C., June 5, upon a gradual reduction from sixty-six hours a week to sixty, the change to begin July 1, 1906.

CHILD LABOR.

Far too many children were found employed in the mills, but it is necessary to examine the cause before offering criticism. Until industry was organized, child labor was prevalent upon the farms. Labor for the

make affidavit that their children have reached the age of twelve, there is no inclination on the part of the superintendents and foremen—who are responsible for keeping the mills in operation to their fullest capacity—to doubt the truth of such statements. Even where children under twelve are allowed to work there are many idle machines, due to the scarcity of labor.

In reference to this, one superintendent in Georgia stated: "When competitors are working to get help from one mill to another, it is pretty hard to say to a man: 'You shall not work your children.' The only way to handle this question is through compulsory education which will place all the mill men upon the same basis."

At that mill it has been the custom for years to require parents to sign the following certificate when seeking employment for their children:

I hereby certify that my child.....wasyears old on the..... day of.....and that I am (or am not) dependent on his (or her) labor for a living.attended school for.....months during the year preceding the date of this certificate, and can read and write.

He said: "While we did not in the past employ children shown by these certificates to be under twelve, or who appeared to us to be under twelve, I shall frankly state that we have not observed that rule since labor became so scarce."

A president in South Carolina gave the following testimony: "Six hundred and fifty children are in our schools at the present time, whereas there should be one thousand, and I want some way of having the parents keep their agreements, made with us when they take employment, to send to school all children between the ages of five and twelve. This plan has been in operation for fourteen years. But it is now impossible to force the parents to keep their agreements, for they can go elsewhere and get work so readily." An inspection of the agreements showed a large proportion signed with the parents' mark. This gave evidence of the probability that such uneducated parents would not realize the value of education for their children.

There was ample testimony to show that, before the scarcity of labor became so extreme, mill men sent families away from their villages when parents refused to send their children to school.

This South Carolina man also said: "More attention should be given to providing adequate primary schools, and funds now diverted to 'colleges,' the equivalent of the ordinary high school, could be more usefully employed for a time, and we should have compulsory education."

In another South Carolina town the most progressive mill man has for some time, in lieu of State statistics, had a census taken twice a year for the purpose of listing births and securing the ages of the children. The object is to keep at the mills the records of all the families, so that children under age may be prevented from obtaining employment.

The situation is further complicated in South Carolina by the lack of a marriage license law. Two young people who enter lightly into the marriage state may separate after the birth of several children. The husband will drift to another mill village and marry again. There is nothing left for the children of the first marriage to do but go into the mills, or the intolerable almshouses. The bigamy, due to the absence of divorce law, brings with it an attendant lessened family responsibility.

That an earnest effort is being made by the mill presidents to improve these conditions is indicated by the passage of the following resolutions, in addition to the one relative to the reduction of hours, at the important meeting previously mentioned:

That this Conference urge upon all the cotton manufacturers of South Carolina to carefully and faithfully observe the age law limiting the employment of children to those twelve years of age and older, and forbidding the employment, except under lawful conditions, of children under twelve years of age.

OPERATIVES' WASH BASINS

GENERAL COW SHED PROVIDED BY EMPLOYER

LIVE STOCK UNDER BEDROOM WINDOW

ment of the South, remedial legislation has not kept pace with the industrial progress. Nor has public sentiment educated the parents (who have lacked opportunities for education themselves and, therefore, believe, that it is unnecessary for their offspring) to the point of sending the children to school instead of the mills.

On observing the general prosperity which has been wrought through the cotton industry the question arose as to whether it would have been better to have left the people in pauperism and illiteracy than to have taken them into the manufacturing districts where they could secure an industrial training with pay which would insure a livelihood, be uplifted by the elevating influences and secure an education for the majority of their children.

In South Carolina and Alabama child labor laws have recently been secured which provide that no children under sixteen can work in the mills at night, and none under twelve in the day time, with the exception of the child of a widow who furnishes an affidavit to the effect that the support of the child is needed. In that event a child as young as ten may work. In Georgia there is a gentlemen's agreement among the mill men which contains the same provisions.

The child labor law in South Carolina has been in existence three years. It increased the age limit gradually. During the first year under the law children were allowed to work at ten; the second year at eleven; and the third year at twelve. The twelve-year limit has been in operation only one year. To make the child labor laws precede compulsory education was to place the cart before the horse. Unfortunately, the child labor laws do not provide for factory inspection, compulsory education or truant officers. Therefore, they are practically inoperative, largely because of the extreme scarcity of labor and the competition among the mills for families. The unit of labor is the family and not the individual, and in view of the fact that there is no birth registration law, when the parents

SCHOOL CHILDREN AS "DINNER TOTERS"

A MILL PRESIDENT AND KINDERGARTEN PUPILS

That this Conference of Cotton Manufacturers earnestly approve the passage of a compulsory school law in South Carolina to apply to all children under twelve years of age, and also recommend the enactment of a law requiring the registration of all births, and also a law requiring marriage certificate before any marriage ceremony can be performed in South Carolina.

That the Chairman of this Conference appoint a committee of seven, who shall prepare a circular letter to be printed and placed on the desk of each member of the Senate and House of Representatives of the South Carolina Legislature, urging upon them the enactment of these three laws.

In Alabama, although there are laws requiring the marriage license and birth registration, as well as the child labor law, there is no factory inspection nor compulsory education and the situation is identical with that in South Carolina. The leading mill man in the State claimed that he has a notary public in each department of the mill who requires the parents to swear to the ages of the children when they go into the mills, and he said: "If we had factory inspection, the parents could be prosecuted for perjury and locked up when they swear falsely."

In South Carolina one informant stated: "Our child labor law has given us a class of children loafing that

we do not know what to do with! We sent affidavits from magistrates relative to convictions of youthful criminals who got into mischief when loafing, which enabled us to have the law passed authorizing the establishment of a State Reformatory for boys."

CONDITIONS NOT AS BAD AS DEPICTED.

When inspecting the mills, extreme surprise was occasioned by the invariable statement of the mill men upon entering the spinning room: "Now, *this* is where the *children* are!" This frankness was entirely unexpected, as was the opportunity of free access to every department of the mills. It must be remembered that the mills visited included the ones most severely and frequently attacked.

In making observations the following criticisms of the sensational writers on the subject of child labor were constantly borne in mind:

1. Night work. The "necessity of throwing cold water in the faces of the children to keep them awake." The "wearing of underwear woven in Southern mills where tiny children are allowed to work all night long."
2. "Extreme emaciation of the children. Hall starved and deformed."
3. "No child who has worked in the mill can ever learn to read and write."
4. "A child in the mill never talks to anyone."
5. "Children half naked."
6. Discipline. "Children kicked by overseers."
7. Accidents, with the claim of the "loss of fingers by hundreds of children."
8. "Children working through the noon hour."
9. Consumption. "When an autopsy is performed the lungs are found to be filled with lint."
10. "A child walks seventeen miles a day doffing."
11. "Diminutive or adjustable machinery."

These points are discussed below in the order in which they are listed.

(1.) A persistent effort was made, but without success,

SIX HUNDRED FIFTY OPERATIVES' CHILDREN IN MILL SCHOOL

to find a mill running a night shift. A member of the Child Labor Committee in Georgia "had been told by a friend who had heard from another leading woman in the State" that water was thrown in the faces of the children during certain hours of the night at the Trion Mills. As it was not possible to go back to the Trion Mills, a letter was written to the "leading woman" requesting information on the subject, although when investigating in the vicinity of those mills it was learned that there had been no night work in that district for ten years. Her reply follows:

I am very glad you wrote before quoting me, as your informant was mistaken. I never said anything about throwing cold water in the faces of the children at any mill, much less at the Trion

SCHOOL RECESS

Mill, one of the best regulated in the country. The information got mixed in this way: There was at one time a mill in Rome where I said I had seen a child thrown upon her bed at 10 a. m. in an exhausted sleep because of night work. That mill failed and I think the new management has better regulations.

The writer who spoke of "underwear woven by tiny children at night" showed complete ignorance of the product of the Southern mills, which is largely confined to coarse sheetings and drills for Oriental countries, print cloths, fancy white goods for shirt waists, gingham and outing flannels. There are no fine muslins, lawns or cambrics—the materials used for underwear—manufactured in that section of the country.

In South Carolina leading mill presidents stated that there *might be* some small yarn or knitting mills running at night—possibly half a dozen of the 200 mills in that State—but not a single mill man regarded night work as feasible or profitable, nor was there one operating a night shift. The picture so commonly drawn by sensationalists showing the necessity of dashing cold water in the faces of the children, indicating that to be the general condition, is absolutely false. The general testimony is to the effect that night work is not profitable because it produces too many "seconds," i. e., second-grade quality of goods, and the proportion of output is less because of the drowsiness of the help. In one town the destruction of a mill by fire threw a great many operatives into idleness. The president of another mill adopted night work for the purpose of giving those people employment, but he did not make a cent of profit.

Some of the points raised by mill men against night work were: The machinery gets tired—the particles crystallize and the belting breaks; night work is non-productive because there is so much bad work which cannot be traced to the employees at fault; the night shift leaves the machines in bad condition for the day shift and *vice versa*, because the operatives take no

interest in their machines when jointly used, and all of this creates friction among the employees. When a day shift only is run, each operative is responsible for the condition of his machine. A further objection made by an employer was: "Night work is awful from the moral standpoint."

While night work may have prevailed ten years ago—and it must be remembered that the industry has been developed largely within the past ten years—as the size of the mills has been increased night work has been dropped. The leading cotton manufacturer of Alabama

A PRIMARY CLASS

AFTER SCHOOL RECESS

stated that the reason some mills had it was because a man starting a new mill in a small way with only a hundred thousand dollars in the plant found it difficult to make profits and thought he would realize more out of the investment by running two shifts. The quest for mills running at night was continued up to the end of the investigation without success. It was always a question of hearsay. The scarcity of labor would render the securing of shifts for night work impossible, even if it were desired.

(2.) With reference to the claim that the children are "half-starved, deformed and extremely emaciated," that "their appealing eyes gaze at you from out their pale, bloated brows," that "the memory of faces such as theirs cling in the mind with lingering tenacity; faded masks of withered flesh," and that one "presented the appearance not of a child, but of a gaunt man shrunk to diminutive size," issue must be taken. It is true that children with rosy cheeks are not to be found in the mills, and that they are more or less pale, but there were only two children in the eighteen mills visited who could have been called thin, not in the faces, but their arms were very slight.

The pale complexion, which all mill operatives have, cannot be attributed entirely to work in the mills, but is due largely to the lack of nourishing food. Before leaving the farms, "side meat" and corn bread—a mere mixture of corn meal and water baked—and, as a luxury now and then, molasses, constituted the chief articles of food. As farmers they did well if they had twenty dollars in cash during the year for expenditures. Although their incomes increased, to them fabulously, upon going into the mills, the mother, as well as the other members of the family who could work, was so engaged. With no one to care for the home the family subsisted mostly upon cold canned foods. Domestic science teachers are employed by many of the mill men now to instruct the people how to prepare

A KINDERGARTEN CAKE WALK

properly the food. One employer said: "Our people need more than anything else some system for teaching them how to live."

One of the mill presidents in making an effort to convince a radical that the people are better off in the mill towns than they were in the isolated rural districts, took her for a trip into the mountains. His account illustrates well the conditions under which the primitive mountaineers live:

I showed her a typical mountain family in which there were eight children. The man had a cabin of one room with no stove, four miles from the mill and three miles from church. The oldest child was fourteen, had been to school once, and said he knew his letters. The man had three acres and did a little farming, and sometimes hauled timber at fifty cents a day. I asked her what that family would do if the man should die. (I think you must remember that the primary thing in existence is meat and

bread). She stated that the people were better off here in the good mountain air than in the mills, and I told her I thought air was pretty thin diet.

(3.) That "no child who has worked in a cotton mill can ever learn to read and write" was refuted by families of children where half attend school while the other half work in the mill. This testimony was procured from the children in their homes, in the schools and in the mills. Girls of eighteen to twenty-one who had worked in the mills during childhood were going to the company's night school and learning to read and write. One boy of seventeen was observed in a day school in the primary class making satisfactory progress.

(4.) That "a child in the mill never talks to any one" was shown to be highly absurd not only by the willingness of the children but by their ability to answer all the questions put to them.

(5.) "Children half naked!" That depends on what the term means, but in any event such a radical statement does not describe properly the condition in which the children are found. The majority of the children are stockingless and shoeless when at the mills, but are otherwise very properly clad. The children in the schools are so well dressed as to cause surprise, and when seen on the streets Sundays and holidays all the children are well attired.

(6.) That the children are "kicked and shaken by the overseers" and otherwise severely disciplined cannot be applicable to the general situation. It is always possible that there may be a brute among foremen, but the children in all the mills were exceedingly playful, undisciplined and even destructive. In several spinning rooms they were playing tag around the spinning frames, showing a lack of discipline that would not be tolerated in other districts.

(7.) The picture of the "child of eight which has just had the two larger fingers of the right hand torn from their sockets at the greater knuckles," and the statement that the accident was "but one of hundreds," led to an investigation of the accident records which showed that in one mill where there are 1,400 employees there had been but one accident in four months—a child of eleven lost the first joint of the second finger in picking waste from the gears, which a fellow worker had uncovered, in violation of the strict rules which provide that the operatives shall not clean their machines when in motion. This was pitiful, indeed, but the records showed comparatively few accidents. There is no danger of accident whatever from the part of the machinery upon which the employees are engaged in spinning. In some of the mills the gears have been covered both top and bottom so that it is absolutely impossible for the children to get their fingers caught. This should be done in all the mills, whether there are children employed or not. But it is not fair to say that there are hundreds of cases of children of eight years of age losing their fingers.

(8.) That the children work during but not "through the noon hour" might be proved in isolated cases. The automatic looms are sometimes permitted to run through

the noon hour, because when the thread breaks the loom will stop and no harm can be done to the product. This, it was admitted, may tempt some of the weavers, generally adults, to go back into the mills after taking twenty minutes for lunch because it is piece work, although it was not observed in any mill, and several were visited at that time of day. In any event, this could not apply to the children as they work in the spinning

SHOOTING THE CHUTES AT THE MILL KINDERGARTEN

room and it would not be possible to keep that machinery in operation without a full complement of operatives. There, too, the largest proportion of children are not even spinners, but their assistants, i.e., *doffers* who never work through an entire hour. The children were found playing about the spinning room at the noontime, at twenty minutes past twelve, and when asked why they did not go home to lunch each replied: "I done been." The shade of the spinning room seemed to be preferable to the noonday sun. The machinery, however, was not in operation.

(9.) That consumption has made great inroads upon the health of the children because of the lint in the mills could not be substantiated. In one mill where there are a thousand operatives, reputable persons said that there had been one case of consumption in that village during the last year and the only other case was

KINDERGARTEN MAY POLE

five years ago. In another smaller village there was found one case of tuberculosis, that of a young girl about sixteen. Inquiries were made throughout the trip, but these were the only cases observed; and, in view of the devices for ventilating the mills, it does not seem possible that the lungs can be "imbedded in lint."

(10.) A careful calculation as to the distance which a doffer boy would be required to walk in the performance of his duties during one day, made at one of the largest mills, shows the average to be four miles, and the longest distance he could possibly travel (and he would be going out of his way to do that) to be four and one-half miles instead of the seventeen claimed by the "sensational writer." At a smaller mill the distance does not exceed six thousand six hundred feet.

(11.) It has been claimed that diminutive or adjustable machinery has been manufactured expressly for the use of children in the mills. This is an absurd statement made by so-called sociological experts. The machinery in all cotton mills is the size regularly built for adults, and it is impossible that the product could be manufactured otherwise. Quite as preposterous is the statement that the "children are hidden at work in secret places." In the first place, children were at work in plain sight in all the mills, and in the second place the different processes of manufacture are so systematized that it would be impracticable to divide any department in order to secrete youthful operatives.

INSTANCES OF CHILD LABOR.

The main processes of manufacture in the cotton mill are carding, spinning and weaving. For the products usually manufactured in the South, the carding and other incidental operations require about one-seventh of the total number of employees, the spinning three-sevenths and the weaving three-sevenths in mills where the automatic looms are used. But there are "exceptions to the rule" and so many complex conditions that a definite statement cannot be made with reference to the proportion of operatives in a single department. In some mills there may be one-third of the operatives in each division. The junior operatives of a mill will be found in the spinning room where they are engaged in spinning, doffing and sweeping, principally the last two operations. When the bobbins upon the spinning frame become filled with the yarn, it

IN THE KINDERGARTEN VEGETABLE GARDENS

is the duty of the doffers to replace them with empty bobbins. Usually this is light work, but in one mill children from ten to twelve doff in the roving room where the bobbins are very heavy. There are youthful sweepers also in the weave room. In one mill they are required to drag the bags of waste a long distance for final disposition. Many of the spinners are over twelve, but children between the ages of ten and twelve are numerous in the mills. In four of the eighteen mills inspected, representing a total number of fifteen thousand employees, there were observed seven cases of children undoubtedly under the age of seven years spinning, cleaning bobbins, or putting ends in the balls of yarn. Three of the cases were in one mill which is a financial failure, partly because of the old machinery; and it may be said that two, which were in another, were the only cases of very young children in that mill. The remaining two extreme cases were found in the other two mills—one in each.

The president also made the tour of the first one inspected of these two mills. He said: "Let us go to the spinning room first," and the freight elevator was used for our transportation to the top floor. When it stopped at the entrance to the spinning room, he ejaculated in a surprised tone: "Well!" Right in front of the elevator a little child, who was spinning, was climbing upon the frame to reach the broken threads for the purpose of tying them. When asked the probable age of the child, he said: "Six years." He immediately thereafter inquired of the child its age. The reply came, "Eight." Later, he took the superintendent to task for permitting the child to work. In four additional mills there were some very young children spinning,—one in one mill and a few in each of the others. It would have been impossible to secure the number of children between ten and twelve years in the mills, as it is so difficult to learn the correct ages. The effort was to get a general observation of the situation, and particularly to learn whether or not there was a tendency on the part of the mill men to employ large numbers of children as young as five, six or seven. Clearly this was found not to be the case. It was claimed that very young children are permitted to be in the mills only when the magistrate certifies that "they must work or they would starve," and that they were either orphans or children of widows. It was also generally claimed that, with the exception of orphans who absolutely required the work in order to secure a living, the young children observed in the mills "were not on the pay-roll, but had gone in to help their mothers, who were widows, or were employed after three o'clock, at the close of school, to help their sisters and brothers." Of course, this adds to the pay envelope of the mother, sister or brother helped, and thus indirectly they were on the pay-roll. The regular operatives were given when thus aided, for instance, eight sides of the machinery to operate instead of six. There are also instances where the children are required by the mothers who are operatives to be in the mill after school that they may thus care for them instead of having them in danger alone at home or on the streets.

When the State has provided no proper way to care for the poverty-stricken, it is a debatable question how far criticism should be offered for their presence in the mills. The following instances were cited by reliable persons, some of whom were and some were not identified with mill interests:

"One child of a widow who was unable to work, seven years of age, paid by a mill man to sweep, although inefficient."

"One little girl in the mill with her grandmother, otherwise she would have to go to the poorhouse, which would be unfortunate, as the almshouses here are exceedingly disagreeable."

erate soldier and his daughter in this village. We let them have one of our homes free and allow the daughter to go to the mill to work intermittently—she cannot leave the old man every day—to enable her to make enough to support them."

Another said: "I have a woman in the No. 1 card room who was left a widow. Her husband died of consumption. She asked to be permitted to have her child

OPERATIVES BOWLING

in the mill with her. It was either a question of running her out or allowing her to do this. The woman makes a good living."

Several mill men stated that there would always be some child labor, for "We will always have to provide work for the poor"; and that "if we did not let the children work it would be utterly impossible for some men to care for their very large families."

OPERATIVES' CLUB HOUSE

Attacks should not be leveled at the cotton mills alone. Child labor on the farms, in the homes and in the mills always existed, and the condition is the same, generally speaking, to-day, although it should not be.

While there is an obligation on the part of society to render impossible the employment of children of tender age, and the age limit in the South should be higher,—certainly fourteen years—it must be remembered that the majority of the children in the mills are above the age usually pictured by writers upon the subject of child labor. Furthermore, while the spinners must work continuously during the day, the doffers work only twenty minutes out of thirty-five. Non-continuous work must be a point considered when estimating the injury of employment to the child. Very frequently the

tlings for the doffers when needed. Where finer yarns are spun, because it takes longer to empty the bobbins, the rest periods are longer. Outside of one mill the president has a gymnasium bar for the use of the sweeper boys who are not continuously employed.

In the weave room the work is of such a nature that only adults can properly perform it. But among the fifteen thousand employees there were observed weaving in one mill two children who were probably under the age of twelve, and in another two of probably twelve years. The other main operations, in the card and picker rooms, require men.

The superintendent of one of the mills,—a fine specimen of manhood now forty years of age was once a child laborer. He began work in a cotton mill at eight, was a spinner at fourteen, and had charge of the spinning room at sixteen. As other even more successful men in the South to-day, such as merchants, doctors and bank presidents, worked in the mills when young and secured their early education in the schools supported by the mill owners, it would be just as fair to point to this superintendent who began work at eight as typical of the conditions in the cotton mills as it is to take one or half a dozen extreme instances of child labor and make them picture the general conditions. Neither would be true. That the young workers, however, do grow into responsible positions was evidenced by another superintendent who said: "We have a number of fellows who were doffers and have been promoted to high positions. Almost all of our loom fixers were weavers. Many of our boys have gone elsewhere as overseers." In this mill there were three

spinners,—girls over fourteen, who had gone into the mill as young children and were the picture of health.

A child of twelve in the spinning room can earn more than its father in the picker room, but the wages of a single member are insufficient to support a family, which is always of good size. In one mill village an interesting family of five was visited. The oldest child was going to school and the next in age was working in the mill, but expressed a preference for school. The two alternate going to school and working. The other children are too young to work. The father is employed in the cloth room of the mill and the mother cares for the home. In another mill there was a splendid boy of fifteen years, who with his mother, another son of nine and an infant had gone to the village two years before. The boy, then thirteen, was put to work in the mill; the family got in debt \$75; the nine-year-old boy would go to the agent of the mill and say: "We've nothin' t'eat." The agent took care of them and they gradually paid their debts. The boy-head of the family is pointed to with pride by the agent of the mill, who claims that he will make a head man of him.

SOME OF THE PROBLEMS INVOLVED IN CHILD LABOR.

The farming element, which constitutes the dominating influence in the legislatures, does not yet realize the necessity of providing ample taxation for schools. The resources of the several States visited would permit greater appropriations for the public welfare. Child labor legislation without compulsory education laws has proven inoperative. This is due to the unwillingness of the parents to send their children to the schools in preference to the mills. With inadequate school facilities where the child labor law has been observed, the children become demoralized in running the streets. When convicted of crime they are chained to hardened criminals, and their downward course is assured. Through the influence of club women a reformatory has recently been secured in Georgia and one is authorized in South Carolina, which will prevent the mingling of juvenile offenders and adult criminals in those two states. But until compulsory education, for which the mill owners have been agitating more than five years, is secured, with adequate school facilities, the argument that the children are better off in the mills where they gain self-reliance and an industrial training cannot be refuted.

While the vagrancy laws, which the mill men would be glad to see strengthened with "spikes," are practi-

FOURTH OF JULY CELEBRATION

Another instance of how the mill men help to take care of the poor, although not a case of a child under age, was given as follows: "There are an old Confed-

fifteen minutes usual between doffings in the coarse goods mills are devoted to base ball outside of the mill, the floor superintendent going to the window and whis-

cally unenforced, the tendency of fathers to live on the earnings of the children has greatly decreased, due largely to the creation of public sentiment against it. Where there are idle fathers, they are chiefly invalids or drunkards.

Child labor has been accentuated by the scarcity of labor due partly to the high price of cotton, which has lured many of the families back to the farms where they rent a few acres for a season; or one crop of cotton, which is mortgaged in advance. They are called "croppers," because as farmers they move annually, and the roving characteristic is so marked that after becoming operatives they move frequently from one mill village to another. Sometimes the employer will be enabled to hold a family by permitting it to move from house to house,—even across the street. This story was told by a jester: "The people change their abiding place so often that when a wagon stops at his door, the man with half a dozen chickens will find them already on their backs with their feet crossed to be tied."

The work people are so independent and quick to move to a mill where their young children will be employed with the other members of the family, that the temptation of the superintendent with idle machines is very great. Undoubtedly the shortage of labor inclines the superintendents to employ more children than they would otherwise. It also causes them, as one put it, to "become rascals by stealing labor from one another." The employers are trying to teach the people to become home-makers by having their living conditions as attractive as possible. One of the three presidents active in bringing about the movement for shorter hours stated: "The need for recreation is very great. At the end of the year after the people have come to the mill, they only know about twenty others in the village. By arranging time and opportunity for recreation so that they will become acquainted, we hope to secure an attachment for the village to decrease the migratory tendency."

When some of the manufacturers were asked why they did not discontinue the building of more mills than could be "manned," the reply came that they must "fill orders" and would take their chances on being able to get enough help by drawing from other mills.

The scarcity of labor is not only caused by the increase in the number of mills, but by the hesitation on the part of immigrants to enter the South. This is due partly to the sensational literature which has painted such dark and unforbidding pictures.* This literature which has been published supposedly in the interest of the children, has operated against them and actually accentuated child labor. The immigrants are further deterred by rumors relative to numerous murders and few convictions. Commissioner Watchorn states this general inclination well when he says: "Immigrants seek places of which they have heard the most favorable all-around reports." Another element contributing toward the lack of a sufficient number of operatives is the rise in wages which has enabled the women to leave the mills and become home-makers. Furthermore, it is claimed that wages have advanced thirty to fifty per cent in five years, more rapidly than have increased the needs of the people. Their needs must be increased to equal the rise in wages to get them to work steadily. Even where the premium plan of adding to the wages for regular attendance has been tried in the spinning room, it has been found ineffective. Of the total number of operatives upon the pay-roll there are always from fifteen to twenty per cent "loafing," as the people can make enough in four days to live six. One president stated that "the people are not sufficiently ambitious to care to work all the time, but as we are throwing about them elevating influences their needs are growing greater and the next generation will be all right." Naturally, the increasing of the needs of the people to the consuming power of their wages would be a slow solution of this problem, even though "the next generation" may be "all right" in some of the long-established villages such as the one mentioned.

*One such effort received the "blue ribbon." In Belgium, as the best Sociological production, and was used by certain interests abroad to discourage immigration to the South.

OPERATIVES' BAND

Several mill owners estimated that if all the operatives listed upon their pay-rolls would work day in and day out, there would be an adequate supply of labor. When asked why they did not reduce the wages to meet this "scarcity due to higher wages" and thus force the operatives to work full time, it was stated that competition among the mills for labor would not permit.

It must be remembered that wages for individuals in the cotton industry are low as compared with other skilled trades, both in New England and the South, and a statement with reference to the present high wages can be only relative. When the mountain people first went into the mills, although the wages were much lower than now, the total amount earned by a family so far exceeded its earnings upon the farm that it meant almost fabulous riches. The solution of the child labor problem through a further increase in wages would be a slow process, for the wages of the adults would have to be sufficiently high to permit them to

MATCH GAME BETWEEN MILL TEAMS

support their families; and taking into consideration cheaper living, the wages are now apparently as high as in New England in the same line of manufacture, but there while the families work in the mills there are greater opportunities for the fathers in skilled trades outside. The Southern manufacturers also claim that they must compete in the world market—with the wages much lower in Italy, France, Germany and England, while in India they are but a small fraction of what is paid elsewhere.

If one of the solutions is immigrant labor, it will have to be family labor, owing to the nature of the work. The work in the spinning room, at present so largely performed by children, should be taken up by young women over fourteen; the other adult members of the family being employed in other trades outside or in different capacities in the mills, a living wage would be secured. The individual immigrant would not be attracted by the wages which can be paid in the South when he can go to the Northwest and secure a higher rate. Nor does he take into consideration final results due to cheaper living, but he sees the amount of wages paid by the day. Immigrants of few nationalities would mix with the native whites, and it therefore seems that they must go principally to the new mills or to the city mills, thus driving the natives into the country districts.

It was interesting to learn that the greatest scarcity of labor occurs in the spinning room where the children work. For business reasons purely, if for no others, the employers do not desire child labor because the spinning machine is the most delicate and expensive in the mill, and the higher the grade of intelligence to manipulate that machine, they claim the better will be the product and the greater the amount of output. Furthermore, the children are very destructive,—broken bobbins frequently were observed scattered upon the mill floors by the doffers. Again, the loss through wasted material caused by unskilled labor is greater in the spinning room than in the preceding processes because it is so near the finished product. To prove the economic value of older operatives, one employer, who manufactures colored goods, said: "We want children over fourteen because the younger ones cannot tell the difference between the shades." Even the sweeper boys are inefficient because of their youthfulness, and one mill president has introduced negro adults to sweep the floors, while another has substituted superannuated white men. Another said: "It is to our

interest to keep the children out of the mills, for otherwise they will not grow up to be strong men." The leading mill men go so far as to say that *they do not believe children should work under the age of sixteen*; that that would be the ideal condition which they would welcome.

The scarcity of labor in the cotton mills cannot be reduced by the use of negro labor. While reliable information shows that negroes are used in the tobacco factories, where they simply have to strip the tobacco leaves, and have made good locomotive firemen and yard switchmen upon the railroads, it has been proved thoroughly that they cannot be used successfully in the cotton mills. While there is no reason why negroes could not be trained to be good operatives, it has been shown that in the cotton mills they could make enough in two days to meet their needs and that they would not work the balance of the week. Furthermore, it is the characteristic of the negro to roam at night. Being drowsy, therefore, during the day, the rhythm of the machinery puts him to sleep.

The child labor problem may be met partly by the invention of machinery to displace the children. A letter from the president of the Saxon mills in South Carolina, calling upon The National Civic Federation to aid in this matter is quoted here:

If your organization can influence the Draper Company or other leaders in inventions to perfect machines to doff the spinning frames and to catch up and insert between the rolls the broken sliver, you will in my judgment be aiming straighter at the mark of the final solution of the child labor problem than any one who has yet interested themselves in it. I wish sincerely that you could put the whole influence of your organization upon an agitation of the need of automatic machinery in the spinning room where the problem is, in the judgment of many, no more difficult than has been solved in both the weaving and drawing-in rooms, and the need is far greater.

He suggested prize competitions to bring the question to the attention of inventors generally. The automatic looms and drawing-in frames are so marvelous as to be uncanny, and surely it is possible to provide for doffing by machinery, which would reduce the number of operatives required for that work. The drawing-in frame takes the place of seventeen girls, and will perform in eight minutes work that used to require about four hours.

The automatic loom, which has lessened the number of operatives required for weaving has an adjustment for supplying mechanically fresh bobbins filled with yarn when those in use have become empty. This operation is not dissimilar to the process of doffing.

One of the greatest needs is the creation of public sentiment in favor of the modern legislation required, which at the present time is advocated and understood principally by the employers. Generally speaking, the agitation has been promoted by well-meaning but misguided theorists who have not acquainted themselves with the conditions under which the people work or the business management and financial problems of the mills. The legislation needed in South Carolina is:

Compulsory education with provision for truant officers;

Factory inspection to strengthen the child labor law; Amendment of the child labor law to increase the age limit from twelve to fourteen years;

Birth registration; and marriage license law. With the exception of the last two subjects listed, the requirements are the same in Alabama, and in Georgia even the child labor law is yet to be secured.

For the present, the cotton mills are industrial training schools as well as refuges for the unfortunates. Too much praise cannot be given to the mill owners who, in spite of the unfair criticism which has been made, are not only giving food and shelter and an industrial training to the illiterate descendants of the first inhabitants of the colonies, but, through their Welfare Work, are a great civilizing influence and are steadily raising the standard of citizenship.

SWIMMING POOL

DANCE PAVILION

TO SUPPORT TRADE UNIONISM AND OPPOSE SOCIALISM.

AN INTERVIEW WITH THE FOUNDER OF THE NEW NATIONAL BUREAU AS TO ITS ORGANIZATION AND SCOPE.

FROM recent announcements in the daily press comes the information that a new industrial bureau to uphold trade unionism and oppose Socialism has just been organized in Boston by the well-known writers and lecturers on socialism, Martha Moore Avery and David Goldstein. Mrs. Avery was formerly a socialist and one of the most ardent supporters of the doctrines of the party. For several years, beginning some fifteen years ago, she took an active part, through her writings and from the platform, in advancing socialistic propaganda. Later, convinced of the complete fallacy of socialist principles, she became an out-and-out opponent of all their doctrines. In organizing the Boston School of Political Economy, of which for some time past she has been the head and director, Mrs. Avery inaugurated the movement she had in view of opposing socialism by a broad plan of education.

Mr. Goldstein who, for a number of years, has been associated with Mrs. Avery in her educational work, also began as an ardent supporter of socialism, only later to become one of its most bitter opponents. The reasons for this change in attitude Mr. Goldstein gives as follows in the Preface to his recent book "Socialism: The Nation of Fatherless Children":

The casual reader would, no doubt, reading in the public press the notice of my withdrawal from the Socialist party, conclude that that action was prompted by the thought of a day. Such, however, is far from the facts in the case. Having for years been interested in the study of economic principles, rather than in the acquaintance of socialist data, I naturally gave my attention, outside of propaganda proper, to acquiring a knowledge of the economic principles which socialism is alleged to rest upon. I came long ago to a realization that the mouthing of the name of Karl Marx was no guarantee of economic knowledge. Seven years ago, together with a few of the then comrades, we organized the Karl Marx class, for the study of his (Marx) work "Capital." Three years ago, having outgrown the work of the socialist master, we changed the name of the class to the Boston School of Political Economy, and took up the study of the original work of the Director, Martha Moore Avery. I know, now, that this was the point at which I began intellectually to move away from the socialist propaganda.

The parting of the ways, from moral standing ground, was more abrupt. The Herron episode furnished the occasion—I resented the attitude taken by the socialist press in regard to George D. Herron's divorce and his "socialist marriage," which had disgusted me—especially for the reason that it could not be denied that he, Mr. Herron, was a socialist leader who was fast mounting to the very top of the ladder in socialist favor. It was at a public meeting held in Boston at which the then editor of the *Haverhill Social Democrat* was the speaker. After he had finished his address in praise of George D. Herron, whom he had lauded as being in power and virtue second only to Jesus Christ, in the discussion which followed, together with Martha Moore Avery and one or two others, the author gave voice to strong condemnation of the lecturer's opinions and to the general tone of the socialist movement throughout the country. It was being sharply forced upon me that that which I had so long fondly believed to be socialism was not socialism at all. It was a severe blow to me—I was cut from my moorings—I could not tell for some months to come whether it was but a personal episode or whether I must in fact regard it as the deliberate position taken in strict accord with socialist philosophy—I had thought my lifework would be given to the cause of socialism, consequently the conflict in my mind and heart was great.

Mr. Goldstein's long experience in the ranks of organized labor qualifies him to speak of socialism in its relation to the great movement of trade unionism. Through close association with socialist leaders on the platform and in "hand to hand fights upon the floor of trades unions," he became thoroughly familiar with the tactics employed by socialists in their persistent efforts to gain control of the trade union movement. He believes emphatically that there is marked evidence to show that upon economic ground the battle to sustain industrial progress will come to an issue between the American Federation of Labor and the railway brotherhoods on the one side, and the socialist organizations on the other.

It is fortunate that two persons so well equipped as Mr. Goldstein and Mrs. Avery, are to be associated in the work of the new national Bureau to combat the dangerous and disruptive influence of socialism. When asked concerning the organization and scope of the Bureau, Mrs. Avery stated them to be as follows:

The object of the National Bureau is the creation, collection and analysis of literature which has for its purpose the defense of national principles vs. those of socialism. The promotion and endorsement of reforms, social, commercial, financial and industrial, with the condemnation of the opposing program of revolutionists whether conducted by socialists or anarchists.

Our propaganda has thus a positive and a negative aspect. The defence of the family as against the encroachments of divorce and free love, which issue, ever before us, has been recently emphasized by the Gorky incident.

To defend the principle of individual responsibility, which alone safeguards the integrity of citizenship; as against the denial of free will which lies as a basic doctrine of socialism.

To defend the rights of private property in capital as against the socialist demand that all industrial, commercial and financial capital shall be owned and operated by all the people collectively.

To advance the interests of those trade unions who work upon the principle that the interest of capital and labor may best be promoted by trade agreements, as against the socialist demand for the abolition of the "wages-system."

To inculcate those heroic virtues which come as the fruit of religion, as against the socialist-atheist psychology which is captivating the lesser man under the prospect of material ease.

Foreseeing the necessity of this undertaking the book on socialism above referred to has been published by Mrs. Avery and Mr. Goldstein. It contains quotations from more than one hundred socialists of international standing, these quotations being taken from socialist books, magazines, documents and papers "which are openly hostile to American institutions and which persistently assail those principles which lie as the foundation stones of Christian civilization." This book is receiving the endorsement of men of all classes of society. Mr. Samuel Gompers, President of the American Federation of Labor, wrote to the author as follows: "I beg to say that I have read with keenest interest your book on 'Socialism, the Nation of Fatherless Children,' and have no hesitancy in saying that the book is not only timely, but an excellent contribution to the literature on the labor question and the labor movement. It tears the mask of hypocrisy from

MARTHA MOORE AVERY

the face of those who have long pretended to be friends of the trade union movement, and yet seek its destruction or diversion to an improper purpose. I have found your book a ready reference to the many hostile utterances and action of pretended friends." "With the Upton Sinclair frenzy at white heat," said Mrs. Avery, "and the Gorky incident not yet faded

from the limelight, the time is ripe for the classification of what may be called the 'muckrakers' and for a work which should be undertaken to point out that reformers, however sensational their methods or however interested their personal motives, do not attack the foundations of Christian civilization. Within this limit, because their intention is safe, even illy advised propaganda must be ranked with the sound and sober efforts to perfect our National Institutions, which, being grounded upon First Principles are acceptable to all ages.

"On the other hand, this work must show that however seriously some socialists may take themselves or their alleged science, because it is their deliberate intention to destroy what they are pleased to call the 'present system,' namely, private property, the family, the State and religion, they are thus necessarily classed with others of lurid tongue and with bomb throwers. The means employed are indeed different, but Revolution is the object which they all desire.

"No right-minded man can deny the popular cry for Reform,—for something and for many things that shall improve and perfect American institutions, but the principles upon which they are grounded are sound, for God, not men, created them. But it is these principles which it is the express mission of socialism to overthrow. By its very inner constitution the Revolution must first of all strew the human path with the wreckage of faith. Faith in the morality of the individual man; faith in the sanctity of the home; faith in the honor of our native land; faith in the goodness and justice of God must give place to the 'socialist mind' to materialism, to animalism, sugar-coated with idealism. This is the debris of which socialist barricades are building. This was the socialist law, laid down in '48 when Karl Marx with the key of 'Surplus Value,' which unlocks all time and all things, explained the means to the socialist goal. I quote from Karl Marx in 'Secret Societies of Switzerland.' 'We content ourselves at present with laying the foundations of revolutions and shall have deserved well when we shall have excited the hatred and contempt for all existing institutions. We wage war against all prevailing ideas about religion, country, State and patriotism.'

"Reform or Revolution shall be the test, for a reformer though never so extravagant in his speech, does not counsel the overthrow of the existing order. The Revolutionist does.

"The Revolutionist stands against those principles which the greatest minds of all ages have held. Consequently if one would know what a socialist means he must hold the mirror up to that degenerate nature from which free-will and individual responsibility have been taken. For this cult declares that it is environment which creates morals as well as manners; that man is a non-moral being. So any vile means to their end may be used. August Bebel, than whom no living man is higher authority in the world-wide socialist movement, defends this policy in these words: 'We want the wounds of the body social kept in a festering condition in order to allow the class distinctions to become as acute as possible.'

"This advice is carried out! Eugene V. Debs while rolling over and over eloquent phrases calls upon American workmen to arm in defense of the working class against capitalism. Our neighbor, Canada, recently barred from her mails the socialist paper containing this effusion, but we allow the Revolution breeder to do its deadly work with a circulation of 300,000. Oppression of the weak exists and it must be righted, but is this the means and is Revolution the end?

"Evidently Mr. Upton Sinclair, the latest socialist star, is of that opinion. He tells with shocking frankness the whole story of how to win the Revolution in his book, *The Jungle*, and how it was written. Its purpose was to 'blow the top off the industrial teakettle.' We have his word for it. So long ago as 1903 in the month of May, through the columns of the *Independent*, Mr. Sinclair took the general public into his confidence as though it were his Father Confessor, with this difference, that he was not penitent. By his article entitled 'My Cause' he laid bare his inner motives. They have a first and a second term. First, to sell his intellectual wares, and second, to advance socialist propaganda, the news sensation resting on duplicity.

"Mr. Sinclair has indeed, by his trick, 'got even,' as he said he would, with the literary world; he has choked it with his own stuff for a time. He wanted \$1,000 to live on while he wrote his now much talked of *Jungle*. So he created one *Arthur Stirling*, a young poet, who could not find a publisher for his masterpiece. So quite consistent with socialist philosophy he took his life in his hand and went to—hades. Our author perpetuated the scheme of the poet's existence

and of his demise upon the general public through the New York newspapers. They were betrayed into the hoax by the aid of Mr. Sinclair's friends (socialists of course), who reported the imaginary death by the imaginary drowning of the imaginary poet. The first point had been gained. *Arthur Stirling* had by death won a hearing for Mr. Sinclair, who, a few months

DAVID GOLDSTEIN

later, offered for sale the imaginary *Journal of Arthur Stirling*. Thus Mr. Sinclair found a market for his mind and a thousand dollars for his pocket.

"But this was not the end! Mr. Sinclair, who had sacrificed his honor—that is, a man who does not hold the socialist philosophy would have done so—and then he stepped forward to sacrifice his reputation. When 'My Cause' was published, socialists thought it great fun and good means in reaching the revolution. 'I knew,' said the author of *The Jungle*, 'that the hoax would cost me my reputation and the respect of all decent people, but that did not matter, for I have not been favored with the acquaintance of many decent people, and am not obliged to hear what the world thinks of me. Besides, I would cheerfully have robbed a house or sandbagged a millionaire had my task been possible in no other way. My one desire was to raise a sensation, first to 'sell the book, of course, and, second, to give me a standing ground from which to begin the agitation of my cause.'

"The integrity of his evidence regarding the story of *The Jungle* is as good and no better than the authorship of *Arthur Stirling*, his life, poetry, death and *Journal*. For upon the word of Mr. Reynolds not one of Mr. Sinclair's charges, which were placed before the commission to investigate the packing houses, was substantiated. 'Evidence' all coming from socialist sources vanished into thin air when proofs were wanted by the Beef Trust Commissioners, Messrs. Niell and Reynolds. Disgusting and filthy as the conditions were found to be, and loudly calling for no lesser remedy than the recommendation of the President—for 'inspection from hoof to can'—for the pure food bill—nothing was found equal to the packing of dead or diseased flesh of cattle, nor comparable to the horror of rendering human bodies into food products.

"But then the motive of the President is Reform, while that of *The Jungle* and its socialist sources is Revolution—there is a difference as wide as heaven from hell.

"Mrs. Ella Reeve-Cohen-Bloor, a most radical advocate of socialism for many years, whose testimony in support of Mr. Sinclair's charges backed out step by step as it was pressed for proof after proof, plainly states her purpose in 'muck-raking' in the concluding words of her 'Evidence' in the *New York World* of June 3. She says: 'The real remedy will be the public ownership of all these great food industries.' In other words, the confiscation of industrial capital; the means, scandal; the end, revolution! Socialists accept no moral responsibility for breaking down the barriers of truth; anything is all right that will hasten the 'Cause.'

"It is the same with the moral and social relations," says Mrs. Avery. "Socialism defends a code that is neither religious nor rational. As a case in point one may note the address before Congregational ministers in which Mrs. J. Phelps Stokes advocated socialist principles without reserve. For under her treatment religion utterly lost its identity. She exclaims with something of dramatic force: 'By what right, whether divine or human, am I and my sisters compelled to exhaust body and soul that other human beings may be idle, wasteful, and even destroy their own souls in vicious or thoughtless living?' No right indeed! But this is lacking in logic. If this should be the motive for one's work, that 'other human beings may be idle,'

etc., one would thus be a sinner and in grievous need of conviction of repentance and of mending one's ways. This elevated boot is kicking at the wrong fact. It misconceives the character of religion by applying the standard of worldly success to the measurement of Christian grace, since when did religion say that it was a mark of spiritual life to take 'uppermost seats'? For that good men ride in automobiles and that bad men go afoot. As a matter of fact the religion of Jesus Christ is as hard for the rich to practice as for the poor, although for opposite reasons. Now if Mrs. Stokes were as careful of environing 'my sisters' with a moral psychology, as she seems anxious for their material welfare, her defence of the Gorky 'marriage' would not have seen the light of day. But this was a perfectly correct defence of socialist philosophy, and it is by the key notes, or the theme rather, of one's utterance that must give out the understanding as to whether one is for or against national institutions. For quite contrary to socialist theory vanity and lust, not poverty, is the cause of divorce and free love, or if you please the basis of 'socialist marriage.' So not only is the misconduct of some church goes a scandal to the faith in Almighty God, but vastly more so is international socialism which enters the political arena as a means of thrusting out religion and ushering in atheism—or chaos rather. But God is not mocked.

"Our choice is our own, but for those who believe in their home and their country it is worse than folly to support that movement which has for its object the destruction of the family, and the nation. To this end we are pledged, to the analysis of reforms and the revolution."

SOCIALISM ON NEW YORK'S EAST SIDE.

From the Jewish Gazette.

HERE is an interesting news-dispatch which appeared on Tuesday morning in several hundred newspapers throughout the United States:

St. Paul, June 6.—Mrs. Rheta C. Dorr, Chairman of the Industrial Committee of the National Women's Federation, has caused a sensation here by her declaration that in her part of New York, the lower East Side, she did not think she knew "a man or a thinking woman who is not an avowed Socialist or Anarchist."

In one of the several papers in which we saw this item it appeared under the headline:

"ALL EAST SIDERS ANARCHISTS AND SOCIALISTS."

The statement was made at the convention of the National Federation of Women's Clubs.

Mrs. Dorr, who speaks of "her" East Side, is one of the many "friends" who during the past decade have been intruding into its privacy, destroying its homelies, causing radical and irreconcilable differences of opinion to arise between parents and children, nullifying the influence of Judaism as a code and guide of life upon the younger generation of Jews, training and developing a breed of "higher dependents," prigs and cads, humiliating the self-respect of the East Side Jew, and grinding out her experiences, experiment, researches and discoveries into highly remunerative "copy" for newspaper and magazine articles and books, in company (or is it in competition?) with Robert Hunter, J. English Walling, Ernest Poole, John Martin, Hutchins Hapgood, John Spargo and others too numerous to mention. In other words, she is one of the self-appointed "uplifters" of the East Side who have degraded its good name.

Mrs. Dorr is a well-meaning woman, no doubt. Her intentions are good, we are sure, but the road to the habitat of Satan is paved with good intentions. The road to new Sheol that is being prepared for the refugee from persecution and massacre—the gate of exclusion—has, undoubtedly, been paved for a goodly distance by just such books as those written by the Hunters and Spargoes and by such statements as that made by Mrs. Dorr.

Needless to say, the statement is absurd on its face. Not only is it absolutely false that all East Siders are Anarchists and Socialists, but it is equally absolutely false that any very considerable number are enemies of society or desirous of overthrowing the Constitution of the United States. The facts are quite the reverse; most East Siders are neither Socialists nor Anarchists. Of the latter category there are so few that the proportion could be expressed only in decimal number of the fifth or sixth remove; of the former, the number is variable, according to the improvement of the financial condition of the East Side. As a fact, Socialism is fast losing strength on the East Side.

Of course the lady did not say that all East Siders are Anarchists or Socialists. The unscrupulous telegraph editors and headline writers make that implication. What she said was that she did not think she knew "a man or a thinking woman on the lower East Side who is not an avowed Socialist or Anarchist." We believe her; she met none but these, for the reason that being what she is, an intruder and meddler, she would not meet the thinking Jews and Jewesses of the East Side. She met only the "conscious" and "convinced" of the settlements, and her East Side horizon is bounded by the University Settle-

ment, the College Settlement, the People's Institute and the Corning Clark House. The few Jews and Jewesses whom she may have met are that breed who look up to the "uplifters," and being, in one way or another, dependent upon them, imitate them apishly, and repeat their pater, parrotlike. She did not, could not have met East Siders who represent the heart and spirit of the East Side.

THE WESTERN FEDERATION OF MINERS.

The Socialistic Labor Organization of the West Opposes Trade Union Principles.

AN account of the Western Federation of Miners is presented in *The Outlook* of May 19 by Mr. William Hard, who endeavors to interpret the principles of that organization as expressed through its various channels of operation. The differences between the principles of the Federation and those of most other labor organizations, and in particular of the trade unions, are strikingly presented in a comparison of the Federation, which is composed largely of metaliferous miners in the States west of the Mississippi River, with the United Mine Workers of America, whose membership is confined to coal mine workers. After characterizing the latter as "a business enterprise" and the former as "incidentally a business enterprise but fundamentally a philosophical agitation," Mr. Hard says:

The United Mine Workers accepts the present industrial system and regards the employer as its partner. The Western Federation of Miners denounces the present industrial system and regards the very existence of the employer as an evil. The United Mine Workers is interested mainly in the division of the proceeds of the present industrial system between itself and its partner, the employer. It wants to increase its own share of the proceeds, and it wants to reduce its partner's share. The Western Federation of Miners, on the other hand, is interested mainly in the elimination of the employer. It wants more wages, of course, but if it should succeed in establishing a scale of even a hundred dollars a day it would still be bound by its principles to spurn the relaxing comforts of prosperity and to nerve itself to a continuation of the struggle.

Referring to the internal policy of the Western Federation and to its attitude toward the trade agreement principle of settling and preventing differences between labor and capital, Mr. Hard says:

The internal policy of the Western Federation of Miners is consistent with its published principles. The most important part of this policy is an aversion to the signing of contracts with employers. A contract is regarded as a manacle. It binds one union when another union might need its help. Presumably if a contract could be signed by the whole working class of the United States with the whole employing class for the term of a year at a fixed scale of wages, the Western Federation of Miners would not seriously object. But in the absence of such a possibility it seems to the Federation that contracts interfere with the mobility and flexibility of the working class.

In brief, the Western Federation opposes the evolutionary process in the construction of the industrial state and would substitute revolutionary methods for its destruction. It would wipe out in its entirety and by revolution the present industrial state along with all the good it has brought to present-day society, instead of retaining this good through eradicating industrial evils, which can best be done by evolutionary processes. Such socialistic principles (the Federation has openly avowed political action through the Socialist party as the industrial cure-for-all) are fundamentally opposed to all the teachings of history as to the process through which social institutions are best formed. And in consequence they are antagonistic to the orderly and natural development of the broad American social state.

In explanation of the radicalism which prevents the Western Federation of Miners from joining the American Federation of Labor, the central national labor organization with which most American trade unions are identified, Mr. Hard says in part:

The American Federation of Labor tolerates "craft autonomy." That is, when there are several crafts in the same industry the American Federation of Labor usually allows the members of each craft to maintain their own union, if they so desire. The teamsters, for instance, in the packing industry have a union of their own; and so have the firemen; and so have the carpenters. These men want separate unions, and the American Federation of Labor consents. The leaders of the Western Federation of Miners believe that such a division into crafts is fatal. They demand that labor be organized, not according to crafts, but according to industries.

Since the publication of Mr. Hard's article in *The Outlook* the Western Federation of Miners has held

its thirteenth annual convention at Denver, beginning May 28. In their accounts of the convention the Denver newspapers report that 175 delegates were in attendance compared with 300 and 400 delegates in former years. The *Denver Republican* states that "as the roll call of unions progressed it was announced many times that there was no representation." Official reports to the convention, however, stated that a considerable number of unions had joined the Federation since the incarceration of three of its officials in the county jail at Boise, Idaho, for alleged complicity in the assassination of former Governor Steunenberg of Idaho. Among these officials are the President of the Federation, Mr. Charles H. Moyer, and the Secretary, Mr. W. A. Haywood.

This Denver meeting has resulted in a serious split in the Federation over Socialism. It came about through a dispute as to the seating of delegates of the Butte union, the latter being the founder of the Federation as well as its strongest union. The convention seated two members from the Butte union whom the latter had repudiated as delegates because of their Socialistic belief, the Butte union having strongly opposed Socialism. Seven of the thirteen delegates from the Butte union immediately "bolted" the convention and refused to take part in its proceedings.

IMMIGRATION RESTRICTION ORGANIZATIONS.

Objects of the Junior Order United American Mechanics, the Immigration Restriction League, and the Japanese and Korean Exclusion League.

THE recent remarkable growth in the number of immigrants annually coming to the United States has seemingly given an impetus to the activity of those organizations in this country which have to do with the restriction of alien immigration to our shores. These organizations have of late directed much of their influence toward the halls of Congress with the view of securing additional restriction legislation, and are also renewing their efforts along the lines of educating the public to their view of the situation. For the purpose of indicating the objects and principles of these organizations information is presented in this article as to the Junior Order United American Mechanics, the Immigration Restriction League, and the Japanese and Korean Exclusion League. These are not the only organizations that favor additional immigration restriction, as such a policy is endorsed by labor organizations and others, but to our knowledge they are the only ones organized for this definite and distinct purpose.

The constitution of the Immigration Restriction League states the objects of that organization to be as follows:

The objects of this League shall be to advocate and work for the further judicious restriction or stricter regulation of immigration, to issue documents and circulars, solicit facts and information on that subject, hold public meetings, and to arouse public opinion to the necessity of a further exclusion of elements undesirable for citizenship or injurious to our national character. It is not an object of this League to advocate the exclusion of laborers or other immigrants of such character and standards as fit them to become citizens.

Since the organization of the League in 1894, among its most important activities have been those directed toward embodying in legislation what is known as the educational test. In 1895 it prepared what later became known in Congress as the "Lodge bill," which provided, among other things, for an addition to the excluded classes of "all persons between fourteen and sixty years of age who cannot both read and write the English language or some other language." This bill passed both Houses of Congress, but was vetoed by President Cleveland on March 2, 1897. The League's bill was reintroduced in the Fifty-fifth and Fifty-seventh sessions of Congress, the language of the excluding clause being changed to read as follows: "All persons over fifteen years of age and physically capable of reading who cannot read the English language or some other language; but an admissible immigrant or a person now in or hereafter admitted to this country may bring in or send for his wife, his children under eighteen years of age, and his parents or grandparents over fifty years of age, if they are otherwise admissible, whether they are so able to read and write or not." So far the League's educational test has not been embodied in legislation. The League's other activities include tests made in New York City as to the illiteracy of Hebrew immigrants and the recent conduct of an inquiry as to the need in the South of immigrant labor. Its headquarters are in Boston, and its Secretary and Treasurer is Mr. Prescott F. Hall.

Another out-and-out immigration restriction organization which, however, confines its activities to the problem as presented by Oriental countries, is the Japanese and Korean Exclusion League, with headquarters at San Francisco. This organization has been in existence a little over one year, but it was only on May 6, last, that its principles were formally enunciated

in the preamble to a constitution. This preamble sets forth the principles of the League as follows:

Two unassimilable races can not exist perpetually in the same territory. Contact between such races results in the extermination of that one which, by reason of its characteristics, physical or mental, is least adapted to the conditions of life prevailing in the given territory.

The conditions of life are, in the last analysis, determined by the conditions of labor. Consequently, the question of adaptability, as between two unassimilable races, must be resolved in favor of that race the characteristics of which most nearly conform to the conditions of labor.

The labor of to-day in the United States is a machine, as distinguished from a manual process. That race, therefore, which by its nature is best suited to complement the machine, as the essential factor of production, is in that respect the superior race, and therefore best adapted to the conditions of American industrial life.

The Caucasian and Mongolian races are unassimilable. Contact between these races must result, under the conditions of industrial life obtaining in the United States, in injury to the former, proportioned to the extent to which such contact prevails. The preservation of the Caucasian race upon American soil, and particularly upon the Western shore thereof, necessitates the adoption of all possible measures to prevent or minimize the immigration of Mongolians to the United States.

With these principles and purposes in view, we have formed the Japanese and Korean Exclusion League, and we urgently invite the active co-operation of all American citizens, to the end that the soil of the United States may be preserved to the American people of the present and all future generations, that they may attain the highest possible moral and material standards, and that they may maintain a society in keeping with the highest ideals of freedom and self-government.

Mr. Walter MacArthur was the representative of the Japanese and Korean Exclusion League, as well as of the State of California, at the immigration conference of The National Civic Federation held in New York City last December.

The Junior Order United American Mechanics, "a loyal, patriotic organization, fraternal and beneficial, strictly non-partisan and non-sectarian," claiming to have 1,600 subordinate councils and over 200,000 members in forty-one States, presents the following in its declaration of principles regarding immigration:

We recognize the landing upon our shores of the ignorant, the vicious and the lawless of the old world as a constant menace to our institutions, and believe that it should be viewed with alarm by the loyal and patriotic citizens of the entire country.

We announce an honest welcome to all immigrants who come hither seeking to better their condition and intending to become earnest and law-abiding citizens of our country. But we maintain that there is no room in this land for the anarchist, the nihilist or the escaped criminal, or for any one who is not willing to pledge allegiance to our flag and nationality, and to place the allegiance due it above that conceded to any other power, civil or religious. We know our flag to be powerful enough to shield and protect them as well as us in the exercise of both civil and religious liberty.

First place among the four objects of the Order is given to the following: "To maintain and promote the interests of Americans, and shield them from the depressing effects of unrestricted immigration; to assist them in obtaining employment, and to encourage them in business." No applicant shall be eligible to membership in the Order except he be "A white male citizen of the United States of America, born within its then territory or domain, or under the protection of its flag."

For the conduct of a campaign, principally along educational lines, designed to bring about remedial legislation relative to naturalization and a further restriction of immigration, the Order the past year placed in the hands of its National Legislative Committee the sum of \$50,000 and appointed a special committee, with headquarters in Washington, to carry on this work in charge of Mr. Jesse Taylor, of Jamestown, O., as its secretary. This committee aims to secure the co-operation of all fraternities, societies and organizations interested in the work. Through this committee the Order prepared a bill (known as House bill No. 17491) which has been reported to the House from the Committee on Immigration and Naturalization. Its general purpose is the restriction of immigration, and it embodies an increase of the head tax, an educational test, heavier fines on steamship companies for violations, more rigid inspection of immigrants, etc. Within the Order there has recently been organized a permanent immigration restriction league.

"TAKE YOUR CHOICE."

From the American Federationist.

NO DOUBT some of our readers have heard the thoughtless assertion that certain labor men in the Civic Federation truckle to the employers and other men of means, who also are members, and these labor men have for that reason been urged to quit that association. Of course, those who know could not very well take issue on the question and do not now. But because that side has been frequently urged and coming upon another view which has been recently published, it is believed that it also will prove "mighty interestin' readin'." The great love (?) which the Post-Parry Citizens' Alliance has for trade unions and trade unionists is well known. That conglomeration, impregnated with the virus of trade union-phobia, publish a weekly sheet which they misname the *Square Deal*. In that publication they print an editorial which we republish for the benefit of all whom it may concern. It is as follows:

"We quote from a press report of the last national convention of the United Mine Workers, held in Indianapolis, the following beautiful tribute to the Civic Federation, from the lips of John Mitchell:

Referring to The National Civic Federation, of which he is a member, President Mitchell declared that his association with the gentlemen composing that organization had always been turned to the advantage of the United Mine Workers. The Civic Federation, he said, was composed of twelve honorable gentlemen, who were themselves employers of labor. The cardinal principles of the Civic Federation were to maintain friendly relations with organized labor. This organization favored the trade agreement, and in recognizing the trade agreement had recognized organized labor. "True," he said, "it has men like Eliot, but if we all thought alike there would be no organized labor and no mine workers' organization. There would be no necessity for them." President Mitchell was warmly applauded when he concluded.

While we and other observers must agree with Mr. Mitchell that the Civic Federation is the most useful ally the closed-shop unionists have, we are rather inclined to think that he was "feeling his oats" overmuch when he boastfully proclaimed the fact. Doubtless the most politic Samuel Gompers was filled with chagrined apprehension when he read this ingenious utterance, and realized that it was a most indiscreet exposure, menacing the continued existence of the tin-horn trust of which he and Mitchell are the chief engineers. For Mr. Gompers knows, as Mr. Mitchell ought to, that the Civic Federation can be useful to the labor grafters' guild only in so far as it can make the public believe that it is intended to secure square and fair dealing between the unions and the rest of the world, that it will lose all influence just as soon as the public finds that it is merely the facile instrument in the hands of the closed-shop combine.

That it is that facile instrument in the conspiracy against the free workingmen of America has long been apparent to those who have studied its methods or thoughtfully read its magazine, or who know that in its action the wishes of Gompers and Mitchell are always first consulted and made the governing rule by its executive manager.

There are many good men and true on the various boards and committees of the Civic Federation who owe it to themselves to see that the absolute domination of the labor trust leaders, which makes that organization their creature, is done away with, so that ~~the other side~~ shall at least have a hearing. If they can not accomplish this they should resign. The Federation is doing business under false pretenses. The cunning of Gompers and Mitchell have brought this about. It registers their will and gives the weight of its influence only as they demand. Can any member of the Federation point to a single instance where its action in connection with labor questions had not been dictated by Gompers and Mitchell?

Do not the good men and true—honorable, broad-minded Christian gentlemen, like Dr. Eliot, John H. Patterson, and others, who are advertised as among its official membership, and whose names give it weight; do not these gentlemen know that when a labor question or proposition concerning the relations between employers and workingmen is presented to the executive manager of the Civic Federation his first question is whether it has been put before Gompers and Mitchell, and as to what they think of it, with, when necessary, the positive declaration that nothing will be done by the Federation without the approval of these two men? If these good men and true do not know this, it is time they learned it, for it is a fact well known to others.

The names of the many eminent and patriotic Americans on the official list alone give the Civic Federation weight and influence. That weight and influence is used to promote the conspiracy against the free workingmen of America, at the head of which conspiracy are Gompers and Mitchell.

Would it not be well for these well-meaning persons who have been used by Gompers and Mitchell as stalking-horses to look into things a little?"

PUBLIC OWNERSHIP COMMISSION AT NEWCASTLE-ON-THE-TYNE

THE PUBLIC OWNERSHIP COMMISSION IN GREAT BRITAIN.

IMPORTANT CITIES VISITED, PLANTS INVESTIGATED, OFFICIALS AND EXPERTS INTERVIEWED, AND AN OUTLINE OF THE INVESTIGATING COMMITTEE'S FUTURE WORK.

FIFTEEN members of the Committee on Investigation of the Commission on Public Ownership and Operation of The National Civic Federation, who sailed for Europe on May 22, having completed their work abroad, returned to the United States in August. Their investigation in European cities was facilitated by the itinerary having previously been arranged by Messrs. Maltbie and Sullivan, two members of the Commission, who, with eight experts, had preceded the Investigating Committee three months. The members of the Committee began their work at Dublin and concluded their labors at London.

In all their examinations the Committee consulted with the engineers and accountants. Not only did these technists accompany the Committee upon its visits to the many plants inspected, but they were also engaged—in pairs, the one the nominee of the "pro," the other of the "anti" members—in completing the critical examination of the plants coming under their respective jurisdictions. These experts were: Street Railways—Norman McD. Crawford, of Hartford, Conn.; Gas—J. H. Woodward, of London, J. B. Klumpp, of Germantown, Pa., and Wm. Newbigging, of Manchester; Electric Lighting and Power—A. E. Winchester, of South Norwalk, Conn., and J. B. Klumpp. Messrs. E. H. Turner, of Manchester, and Robert C. James, of Wallingford, Pa., were the accountants.

Labor conditions in the plants chosen for investigation were studied by Prof. John R. Commons, of Wisconsin University, and J. W. Sullivan, Editor of the Clothing Trades Bulletin of New York. Legislation and franchises were studied by Milo R. Maltbie, of New York.

The data these experts were required to obtain had been indicated beforehand in very comprehensive schedules, described in the April number of THE NATIONAL CIVIC FEDERATION REVIEW. The committee will be largely guided by these and the American schedules in framing its final report.

The cities visited and the class of plants examined by the Committee were as follows:

Dublin—Street railways, private.

Glasgow—Street railways, public; electric, public; gas, public.

Newcastle-on-Tyne—Electric, private (two companies); gas, private. Manchester—Electric, public; street railways, public; gas, public.

Leicester—Gas, public. Sheffield—gas, private.

Birmingham—Gas, public.

London—Electric, public and private (five plants); street railways, private (two plants); gas, private.

Liverpool—Electric, public; street railways, public.

Norwich—Street railways, private.

At Glasgow the Committee's work was especially promoted by the fact of its having the very friendly cooperation of so noted an exponent of municipal ownership as Manager Dalrymple of the City's Tramways. At London similar assistance was rendered by Sir Clifton Robinson, whose interests in private companies is not exceeded by those of any other man in Great Britain.

Hearings were held at London, at which leading exponents of company management were heard. Among those who attended these hearings were Lord Avebury, Mr. Sydney Morse, President of the Chamber of Commerce; Mr. Emil Garcke, of the Industrial Freedom League; Mr. Dixon H. Davies, Solicitor to the Great Central Railway; Mr. Wm. L. Madgen, and Mr. Robert P. Porter, of the London Times. The principal exponents of municipal ownership were also heard. Among the latter were Mr. T. McKinnon

Wood, leader of the Progressive party of the London County Council; Mr. J. Allen Baker, Chairman of the London Municipal Tramways; Mr. Robert Donald, Editor of the *Municipal Journal* and Managing Editor of the *London Daily Chronicle*; G. W. Spencer Hawes, Member of the Institute of Electrical Engineers.

From the very beginning great interest was manifested in the work of the Commission. Boards of trade, private companies, city governments, labor leaders, members of Parliament, officials of the Imperial Government, representatives of ratepayers' associations—all seemed interested, and every facility was placed at the command of the Committee.

The general sentiment was that the report of the Commission should be of no less value to the people of Great Britain and Ireland than to the people of America. The fact that so many men drawn from different walks of life, and of such diversity of opinion, could be gotten together and dispatched upon so important a mission, was much commented upon, as was the further fact, that they had set out to determine the actual conditions in each case, by employing a corps of engineers and accountants. In short, the Commission and its sponsor, the National Civic Federation,

be promptly furnished members of the Committee; that Dr. Maltbie prepare a history of parliamentary action in relation to the municipal utilities under investigation; Prof. Goodnow, a report on political conditions in the municipalities of the United Kingdom as compared with such conditions in the United States, same to include a discussion of the relation of said political conditions to public and private operation of the particular municipal utilities; Profs. Bemis and Parsons, and Messrs. Walton Clark and Edgar, either jointly or individually, such statements for the plants investigated here and abroad; that the schedules for each plant be collated in a clear, concise statement for the use of the Committee in drafting its report; that the officers of the Committee prepare a general statement of conclusions and recommendations that may be used as a basis of discussion and adoption with such emendation as the Committee may order, etc., etc.

In this country the work of investigation is almost completed. The cities that have been visited are: Wheeling, Allegheny, Indianapolis, Chicago and South Norwalk; a number of other cities have been examined by the experts and by members of the Committee whose work has been specialized. The experts employed in

the American investigation are: Gas—Fred C. Burnett, of Toronto, and A. E. Forstall, of New York; Electric Lighting and Power—C. E. Phelps, Jr., of Baltimore, and Theo. Stebbins, of Columbus, Ohio; Water—Dabney A. Maury, of Peoria, Ill.; Accountants—Marwick, Mitchell & Co.

A report upon the Massachusetts method of regulating the electric lighting industry is being prepared by Alton D. Adams, of Worcester, and C. I. R. Humphreys, of Humphreys & Glasgow, New York.

Expert work, not technical in character, in relation to the plants selected, is being performed by Prof. John H. Gray, of the Northwestern University; and Walter L. Fisher, of Chicago, has prepared a report upon the history of the municipal lighting plant of that city; Prof. Leo S. Rowe, of the University of Pennsylvania, has made a similar report on the gas question in Philadelphia. The special investigation of labor conditions is now being completed by Prof. Commons and Mr. Sullivan.

Cleveland, Philadelphia, and one or two other large cities will be visited by the Committee shortly. The subcommittees provided for

in the resolution referred to will then complete the duties assigned to them. This will be followed by one or more meetings of the Committee, at which its report will be drafted.

At the present time the work of collating the matter contained in the completed schedules—the data gathered by the experts—in such a way as to make its assimilation more easy, is now being proceeded with.

It is expected that the Committee will be ready to report to the entire Commission about the first of the year.

As the trade agreement has been found to be one of the most important factors in maintaining industrial peace and stability, and in giving the unions a standing which enables them to take part in determining wage rates and shop conditions without continual recourse to strikes and the expenditure of large sums for carrying on an industrial warfare, it is most essential that they should indicate a determination to at all times comply with the terms of their contracts.—*Iron Moulders' Journal*.

Upper Row (from left to right)—John R. Commons, J. H. Woodward, R. C. James, Wm. Newbigging, Milo R. Maltbie. Lower Row (from left to right)—E. H. Turner, Albert E. Winchester, Norman McD. Crawford, J. W. Sullivan, J. B. Klumpp.

BRITISH AND AMERICAN EXPERTS ENGAGED IN THE INVESTIGATION.

were warmly commended for having undertaken a work of such manifest importance to cities.

The Committee was entertained by the Lord Mayor and other officials of London, the Lord Provost and heads of departments of the Glasgow city government, and by the several other cities visited. A dinner was also given by the Association of Tramways Managers of Great Britain and Ireland, and a luncheon by Mr. Alfred Mosely. The Hon. Whitelaw Reid, Ambassador to the Court of St. James, also entertained the Committee at luncheon. Not only were these affairs highly enjoyable from the social standpoint, but, through the speeches and conversations, they also proved to be the source of much valuable information.

The Future Work of the Committee.

The last meeting held in London adopted a resolution outlining a plan for the accomplishment of the remaining work of the Committee. This resolution provides:

That as schedules are completed copies of same to

PROBLEMS PRESENTED BY INCOMING ALIENS.

STATISTICAL INFORMATION IS CALLED IN QUESTION BY WELL-KNOWN EXPERTS AT THE FEDERATIONS' CONFERENCE ON IMMIGRATION.

STATISTICS generally accepted as representing the facts as to many phases of the immigration problem came in for a vigorous and searching analysis by experts in this branch of knowledge at the annual meeting of the Department of Immigration of The National Civic Federation held at the Park Avenue Hotel in New York City on September 24. All "sides" of the immigration issue, including the two most radical views, were represented, and as a result of the analysis of statistical tables there was a general feeling among those attending the conference, many of them from widely separated sections of the country, that the first and most important work to be undertaken by the Federation's new Department was the correction of much of this alleged statistical information. Franklin MacVeagh, of Chicago, Chairman of the Immigration Department, presided at the meeting. Following the general session there were separate meetings of the seven committees of investigation which are charged with the direction of research work.

Mr. Prescott F. Hall, Secretary of the Immigration Restriction League, in an extended discussion at the general session of the immigration bills now before Congress, alluded as follows to the lack of information: "I think all who have studied this subject for any length of time feel very much the scarcity of accurate statistics on the immigration question. I certainly do. And it is one of the very encouraging things about the formation of this Department that we can

connection Mr. Hall said: "The flow of immigration is not entirely normal and is not the natural seeking of our shores by the immigrant, but to a certain extent, and to a large extent, I believe it is artificially stimulated. If that is so, there is more reason why we should on this side take steps to stiffen our existing laws, because the steamship companies will take any person whom they can possibly get through. If we stiffen up our laws they will be driven to seek a better class of immigrants and, therefore, the theory of the present laws, i.e., that the steamship companies practically enforce them, will be carried out more in the way in which it was originally intended to be carried out." The additions to the excluded class provided by the Senate bill include those suffering from tuberculosis, feeble-minded persons, persons of poor physique, children under seventeen years of age unaccompanied by parents, and "any person whose ticket or passage is paid for with the money of another person, or who is assisted by others to come." Of this last provision Mr. Hall said: "Under the present law any friend or relative may send for an immigrant. The object of this clause is to limit the privilege of sending to such persons as are under some legal or moral obligation to support such immigrants after they arrive. It is estimated that upward of fifty per cent of the present immigration is assisted. The effect of this is that a lot of persons come who probably would not come except for that assistance, that is to say, in many cases the more energetic and serviceable members of a family come over, and after getting a footing here, they send for their friends and relatives who probably would not be able to come alone. It goes without saying that a class which is obliged to be assisted to come cannot be the equal of a class which would come of its own accord; and the class of assisted individuals includes a great many persons who sooner or later come upon the public for support in various ways."

Referring to the section relating to the subject of fines upon steamship companies, Mr. Hall said: "Under existing laws a penalty of \$1000 is imposed upon the steamship lines which bring over immigrants suffering with a loathsome or dangerous disease, if it could have been ascertained at the port of departure that they had that disease. The proposed laws impose fines upon steamship companies in certain additional cases, namely, if they bring idiots, imbeciles, feeble-minded and insane persons, or epileptics. The theory, as I said, of the present law is that the rejection of aliens at the ports on this side will not of itself be a sufficient inducement to the steamship companies to examine immigrants carefully at the port of embarkation or at the time they purchase the tickets. Experience, however, shows that the steamship companies will take everybody that can possibly pass muster, and that in fact they bring numerous diseased persons. This fine was put into the act of March 3, 1903, with the object of stopping that practice as to diseased persons. But in 1904 \$31,000 in fines were collected from the steamship companies under this section, and in 1905, after a year's experience, \$27,300 in fines were collected, and the Commissioner-General's report for 1905 of the number of diseased persons brought in by the steamship companies shows that this provision, as it stands in the law of March 3, 1903, is not adequate to accomplish the purpose for which it was intended, as there was an increase of forty-one per cent in the diseased persons brought over the previous year. The object of the section in the proposed measure is to extend the classes which the steamship companies should be obliged to weed out."

As to the demand for labor throughout the country, Mr. Hall stated that, while it is true we need more farm laborers in various sections of the country, the same is true with farm labor in England. "It is not purely an American matter," he said, "for in some parts of Europe it is the same. It arises in the United States from the seasonal character of the work. Immigrants are desired a few weeks of the year to harvest the crops, and the rest of the year there is nothing to do, so that the total rate of wages during the year for agricultural work is less than for contract work in the large cities. As long as that is the case it will be impossible to get immigrants to remain permanently in the farming regions. The kind of immigrant who will go to those regions and take his family there and settle there, and who has some means, and who will permanently take up land there, is the kind desired in the various States. That is not the kind we are now receiving to any extent."

"My friend, Prof. Willcox, has recently published an article in which he attacks the proposition that there is a tendency of recent immigrants to congregate in

the city slums. I do not consider myself competent to discuss that question without a great deal of study, but I would like to point out that for present purposes of restriction it makes very little difference whether the tendency to settle in the slums is a tendency of persons who come here to remain, or whether it is a tendency to be found there. If you have a large stream of immigrants passing through your large cities there will be an excess of certain kinds in the city all the time. For the purpose of relieving that condition and of considering the question of purely exclusion and restriction, it makes, to my mind, very little difference whether there is in fact this special tendency to stick to cities. The eastern seaport cities will in such a case be overcrowded by a certain class of immigrants in any event."

While approving of medical inspection abroad and the employment of secret service agents, Mr. Hall stated objections to Consular inspection of immigrants. He approved heartily of the proposed educational test in the measure now before Congress. He said that the purpose of this illiteracy test is not at all based upon the view that a man is necessarily a better immigrant because he can read and write, but that, as a matter of fact, statistics show that the class that can read and write is on the whole a better class than that which cannot. He stated that the illiteracy test would not necessarily cut down the volume of immigrants, but that it might do so; it would, however, tend very much to raise the quality; and "if one million

MR. PRESCOTT F. HALL

Secretary of the Immigration Restriction League.

hope after a time to get more accurate and reliable statistics. Until that time we have, of course, to take such as we have for what they are worth."

After emphasizing the need and pressing demand for legislation that would further restrict immigration, Mr. Hall analyzed in detail the various sections of measures now pending before Congress. He justified an increase in the head tax, proposed by the Senate bill, from \$2 to \$5, on the ground that there was need for more money to carry out efficiently the work of the Immigration Bureau. Among improvements in the service needing more money, he referred to better facilities for inspection, additional expenses for the distribution facilities proposed, the cost for medical inspection abroad, better paid and more inspectors, the district-attorneys' offices in enforcing present immigrations at Southern ports, additional appropriations for district-attorneys' offices in enforcing present immigration laws, the expense of further and more complete statistical investigation and reports, and the need of more money to meet the cost of deportation. In addition to these proposed expenditures justifying an increase in the head tax, Mr. Hall stated that there is the practical argument that if we are interested at all in the reduction of the amount of immigration, an increase in the head tax will have an effect in that direction.

The clauses referring to the excluded classes were discussed and endorsed by the speaker, and the stimulation of immigration was denounced. In this latter

MR. NATHAN BIJUR

Vice-President of the United Hebrew Charities.

immigrants a year are sufficient for us, why not get one million of the best instead of one million less good. It is not merely a question of suffrage, although that enters into it, but it is a question of assimilation, as an immigrant who can read has many channels of assimilation open to him which a man who cannot read doesn't have."

Besides the Senate bill there is also before Congress what is known as the Gardner bill. The two are somewhat similar, although the House bill contains one or two provisions not in the Senate bill. One of these defines still further a class of immigrants designated as those "liable to become a public charge," and provides for a money test. This was approved by Mr. Hall.

In calling attention to a number of diagrams reflecting statistical information as to the effect of past immigration, Mr. Hall referred to illiteracy, stating that in 1905 the native white population had an illiteracy of 4.6 per cent; foreign whites of 12.9 per cent. "In other words," he said, "immigration to a certain extent tends to keep people illiterate in this country. Illiteracy has been going down, but it has not been going down as fast as it would if we had had an illiteracy test for immigrants in the last fifty years. One-fifth of those in the country at the present time cannot speak English."

Mr. Hall showed diagrams which aimed to present facts as regards crime among native whites of native parentage, foreign whites, and native whites of foreign

parentage. One diagram referred to juvenile prisoners compared with the population of school age, and another showed the male prisoners per million of voting age in 1890. In commenting upon these diagrams Mr. Hall said: "You observe that to a certain extent the children of foreign-born parents are more criminal than immigrants themselves. That means, for a generation or two at any rate, not only is there a great burden upon our penal institutions, but it takes a little while for these unfortunate tendencies to be eliminated. It may be by the fifth or sixth generation this phenomenon will disappear, but for the time being it is in full force, and as immigration is keeping up and increasing, we have that problem constantly before us. That the children of immigrants are more than twice as criminal as the immigrants themselves is due in part to the fact that the immigrants coming into a new country have very often got into hard circumstances and are very largely less favorably situated than the native element. But at the same time, no matter what the cause, the facts remain that they are here and that they constitute that burden."

"In regard to the insane a census bulletin recently issued shows that the foreign-born furnish one and three-quarter times their normal proportion of insane. And another census bulletin shows they furnish three times their proportion of paupers. The fact that the immigrant is a large and increasing burden upon our institutions is evidenced by the testimony of those who come in practical contact with them, namely, the charity organizations. I have recently been in correspondence with the Boards of Associated Charities throughout the country, and I have here a list of endorsements of this Senate bill from widely scattered communities. California, the South, the middle States, and the East alike favor this measure."

"There is one thing upon which my opponents and I can agree, and that is, that we want to get down to definite facts and not rely upon arguments and generalizations. We do not want to argue that, because railroad dividends are high, there is no use in excluding laboring people. We have so far got a certain body of statistics together, such as they are. If they are not correct, we want to improve upon them."

"A great deal has been said about the traditional policy of this country, and just to remove a possible misunderstanding about that I would like to revert to the fact that at the very beginning of this country the people who founded it—Washington, Jefferson and Madison—were all strong restrictionists. As far back as 1826 the State of New York passed a law restricting immigration. Several other States passed laws restricting immigration about the same time. In 1882 the Federal Government took up the subject and since that year has been continuously strengthening the immigration laws. Now, if by a traditional policy is meant the policy of doing nothing, I maintain that that is not the true fact. Our traditional policy has been that of wise and conservative action in regard to such elements as we allow to come in and that is the present status of things to-day. We now exclude sixteen classes of people, and the present Senate bill is not something new of itself, although some of its provisions are new, but is an act calculated to carry out just what the original immigration act of 1882 was passed to accomplish. The present law does not accomplish it. There have been loop-holes. The act of 1891 stopped some. The act of 1893 stopped others. The act of 1903 was still better, but if the Senate bill now pending were to be passed, it would do nothing more than what was originally proposed in the act of 1882, as shown by the debates in Congress. We already have had one elaborate investigation into this subject—that of the United States Industrial Commission—who through its experts have made careful investigations up to the time of publication of their report. We need further data, but to my mind there is no reason for delay in passing what has been characterized as the very mild and moderate measure of these bills. We can at least do that. Then we can study further and see whether anything more is desirable."

THE NEED OF FACTS AS REGARDS IMMIGRATION.

Representative of the United Hebrew Charities Points Out Reasons for Questioning Our Present Immigration Statistics.

NATHAN BIJUR, Esq., Vice-President of the United Hebrew Charities, said that in his study of the question of immigration the first thing that confronted him was the absence of accurate and complete statistics. He said he could not understand how men could draw conclusions and be willing to advocate legislation based upon such conclusions, when at the same time they admit that they have not the facts adequate to the forming of conclusions.

"The question of immigration," he said, "if it be analyzed, I suppose in the last stage comes down to

that the only arguments that survived even superficial scrutiny were generalizations like the reference to the competition of the immigrant with the American workingman, and the fear that something might happen some day if the present immigration continues. He referred as follows to some of the more current statements against immigration: "First, we are told that the immigrant is dependent upon public support in greater ratio than any other part of the population. Now, it would not be surprising if he were, because the immigrant is a poor man. He comes here from other countries to improve his condition. He, of course, occupies the lowest financial stratum of the social structure. That is, he is doing the hard work. Of course, you expect to find among the poorest people the greatest amount of dependence. That is nothing wonderful. I know, everybody knows, that the poor

are more dependent than the rich. If you want to abolish poverty, take that up, but do not mix up social problems and say they have something to do with immigration unless you think that by keeping out all immigration you won't have any more poverty. I do not think that the experience of any country has brought out facts that would justify any such inference. If you find that the immigrant is more dependent than the rest of the population I should say that would be a very natural thing. But do you find him so dependent that it is really something startling? Do you find him so dependent that you think he is unduly dependent and that you are getting what is known as a pauper class?"

Mr. Bijur referred to the report of the Bureau of Immigration for 1904 purporting to show the relative proportion of foreign-born and natives in the charitable institutions of the United States, the proportion being 30 "alien" dependents out of each 1,000 alien population compared to 5 out of 1,000 of the naturalized and 2½ out of 1,000 of the native. In commenting upon this, Mr. Bijur says: "That statement has gone through the entire literature of immigration statistics, and it is absolutely a baseless statement. It has not the ghost of a foundation and never had. The first crucial trouble is that it does not define aliens. It is generally understood as referring to people who have been here only five years. It does not say how these statistics were taken which gave the figures 30,000 alien dependents, but I made investigation of both those figures. Now, remember, this is the very basis on which it has been charged repeatedly that the present immigrant is distinguished from the immigrant who came here and was so desirable in the thirties, forties and fifties—and that the present immigrant is so undesirable. Let us see. The census of 1900 shows that there were but 1,000,000 males foreign-born of voting age in the United States unnaturalized, and that is the same number as the 1,000,000 aliens with which the Bureau's report compares the 30,000 alien dependents. In other words, the report referred to has only as many aliens with which to compare the body of dependent aliens with as there are males of voting age, foreign-born, not naturalized, or what we might call political aliens. On the other hand, this 30,000 of alien dependents is made up of men, women and children, and is

made up of men, women and children who have been in this country all the way from five to seventy years, as the report of the New York State Board of Charities for 1905 plainly pointed out. They took nine hundred and thirty-nine cases of inmates in the almshouses which were tabulated by the Commissioner-General of Immigration and they found that five hundred and forty-four of these were women and that more than seventy-five per cent of all the cases in the almshouses tabulated in the government report had been in the country five years, and some forty, fifty and sixty years.

"But suppose the figures were correct; suppose someone had been able to get statistics about the whole body of persons in this country less than five years, and had found that the people who had been in this country less than five years were more dependent than all the rest of the people. That is of no practical importance at all. The question is, Are the people who

OFFICERS OF THE IMMIGRATION DEPARTMENT OF THE NATIONAL CIVIC FEDERATION.

this: Are we getting any benefit, or are we getting any harm from immigration? Not do 16,000 diseased people come to our shores in thirty-six years, because, of course, if you have immigration, you will have diseased immigrants. The specious claim that fifty per cent of the immigrants that come in here are 'assisted' does not impress me a bit; because four-fifths of the whole population is assisted since we have about one male wage-earner to every family of five. There is nothing startling about any statement of that sort when you come to analyze it. If this statement is intended to convey the impression that fifty per cent of the present immigrants are paupers and are 'assisted' to come over by other persons than their relatives,—it is a base calumny. The question is, What has anybody now to present in the way of facts bearing on the benefit or the disadvantage to the country of immigration and of to-day's immigration in particular?" Mr. Bijur said

have come into this country during the last five years more dependent than the people who came into this country at some other period were during their first five years. It is not pertinent to compare the present condition of people who came here during the last five years with that of people who came here thirty years ago, and who, I hope, now are millionaires. The fact is that the people who came in during the last five years have not had their chance yet. Give them a show. In other words, that whole statement which through repetition has spread broadcast throughout the country the impression that the present immigrant is more dependent than the immigrant who came in the past, is just nothing."

In commenting upon statistics of crime, and in particular as to male prisoners per 1,000,000 of voting population in 1890, Mr. Bijur said: "Now, remember, to begin with, the immigrant is generally over fourteen years of age. The large proportion of immigrants is grown-up. The proportion of children among the immigrants is very much smaller than among the general population. And remember also that the proportion of crime is very much larger among grown-up people than it is among children. Now then, when you find that there is a greater criminality among the immigrants than there is among the rest of the people, that must be so; it follows, as the night the day, that criminality among immigrants must be in higher proportion than with the rest of the population—just assuming the immigrant is like we are."

"Again, what are the crimes included in your statistics? Have you, as was done with some Massachusetts data, excluded crimes arising from drunkenness, so that the immigrant of 1860 should seem to be more law-abiding than the present incomer? What are the 'crimes' for which juvenile prisoners were convicted? Were they the kind of 'crime' for which the children of the poor are always convicted—the petty offenses of throwing banana skins on the street, and of breaking windows in play—all such offenses that go with a poor population. Yes, we know it is that. Moreover, you would expect to find a greater ratio of crime among the poor than among the rich. You are not discovering anything when you discover those things. You are not getting one whit further than the old story that the immigrant is poor,—in fact, he would probably not come here if he were not poor."

"Now, the other side of the picture—the value of the immigrants to the country. To bring up 1,000,000 people to the age of the immigrants coming to us each year would admittedly cost over five hundred million dollars. We are getting five hundred million dollars annually brought to the country through immigration. Does any one pretend that the criminal and dependents among the immigrants cost us five hundred million dollars annually? If we are going to work with statistics, if you think this question can be solved with statistics, then let us have them all. Let us have both sides of the picture. Then, how about the consumption? There are 1,000,000 immigrants and they are consumers; they are not all dependents; they are not all in the almshouses and the prisons. And as consumers they are adding more to the prosperity of the country. Has anybody figured on that? No. No one bothers about that. Here is a daily growing home market which puts into the shade all our eagerly-sought and dearly-bought foreign markets."

"Now, what I hope will be done by this Department of the Federation is that it will gather together all the facts, such as they are, the best statistics available from everywhere and put them down and say: 'Well, so far as we have been able to gather anything, this is what we know,' and then let us sift them and see how reliable they are. When we find a government report which does not mean anything, say so, and say why. When we find statistics of crime which have left out certain classes of criminals, let us say so. Show what the difference would be if they were put in, and go on through and collect all these things and put to the credit of the immigrant all the facts that are to be put to his credit, as well as charge him with all the things that ought to be so charged. Now, that has not been done by anybody. Everyone who has discussed

this subject has discussed it from the point of view of the advocate. Let us formulate great general facts. We can formulate a general line of facts based upon fair statistics. Although, of course, we can probably never have statistics isolated and correct in this topic like the ascertained facts in physiology, in chemistry, in geology and in other more or less exact sciences and subjects. I have not had my statement challenged yet, that up to date, there have been no arguments to present against our present immigration based upon reliable data."

ASSIMILATION AND IMMIGRATION.

Professor Willcox Calls Attention to Important Phases of Statistics of Crime.

PROF. WALTER F. WILLCOX, of Cornell University, whose analysis and explanation of census statistics has made him one of the leading statistical

It is now 400,000,000. At that time there were practically no people of European stock living outside of Europe. At the present time there are 100,000,000 of European stock living outside of Europe. In other words, the population of the world of European stock has increased 270,000,000 in the last one hundred and fifty years, and a very large part of that increase must be held to be due to the fact that Europeans during that time were allowed to follow the line of least resistance, or to seek their own advantage, even though it called upon them to leave their home or place of residence. We are wont to forget that this is not purely an American question; it is also a European question.

"We are wont to forget that although millions of people are coming to us from Europe, yet the population of Europe at the present time is growing faster than it ever grew before in history. And it is growing faster because of the reaction of these other countries, not merely of the United States but of South America and Australia, which are sending their benefits back to Europe. Practically, this increase of Europe is the whole increase of the population of the world, so far as we can tell, an increase of the people whom, on the whole, we are wont to regard as the leaders of progress."

"It seems to me that these facts establish a strong presumption in favor of the traditional policy of the United States. On the other hand, I think all persons must admit that there might be an excessive immigration into the United States; in fact, it might become so great as to become detrimental to the welfare of this country. Where we would draw the line we cannot say, but if the influx of immigration became, instead of 1,000,000 or so a year, 5,000,000 or 10,000,000 a year, I think most of us, perhaps all of us, would admit that it was too great."

Prof. Willcox stated that what appeared to him to be the central problem was whether or not immigration to our shores is too great. He was inclined to put the question of immigration as being: Is the process of assimilation keeping pace with the process of immigration? In attempting to answer this question, he stated that the first thing to know is how large is our present influx of population, that is, how large is our present current of immigration. This point Dr. Willcox discussed more fully in his paper before the Committee on Basal Statistics, which is presented on another page of this issue.

In referring to statistics which purport to show that the tendency to commit crime on the part of foreign-born people is decidedly greater than on the part of the native population, and that this tendency also manifested itself among the children of the foreign born, Prof. Willcox said: "It should be noted that crime, or rather imprisonment for crime, is much more a city phenomenon than a country phenomenon. I do not mean to say that the city population is more criminal, but that arrest and imprisonment for offenses are more common in the city than in the country. It will, therefore, be expected that those parts of the population living largely in cities would show, in the total population of the United States,

a larger proportion of prisoners than those living in the country. Furthermore, the tendency to commit crime is largely a question of age. The criminal age is from fifteen to thirty years; consequently we should expect to find, as we do find, that those elements of the population which, like the children of our immigrants are very largely of criminal age, would have a high criminal tendency. Hence it is not at all surprising to see on the face of the figures that the children of immigrants show a much higher criminal tendency. But I should doubt whether, if you could make your comparison age for age, you would find anything like that difference. The apparent inference then is, first, that the immigrants and the children of immigrants are very largely in cities and the native population largely in country districts; and, secondly, that the children of immigrants are especially of the age when crime is most likely to occur."

CHAIRMEN OF THE COMMITTEES OF THE IMMIGRATION DEPARTMENT.

Mr. Norton is Chairman of the Committee on Agencies for Advancing the Welfare of Immigrants; Prof. Willcox that of Basal Statistics; Mr. Hamlin of the Committee on Supply and Demand; Mr. Holliday on Naturalization; Prof. Jenks on Legislation and Its Enforcement; Dr. Lefavour on International Relations, and Mr. Reynolds on Oriental Immigration.

authorities in the United States, said he felt disposed to accept the principle that the presumption on this question of immigration is in favor of the traditional policy of the country. "The burden of proof," he contended, "must be held to rest with the other side. I believe this for the reason that our policy has worked so well in the past, both for this country and other countries. If we go back, say two or three hundred years, the right to change one's place of residence according to one's judgment of the advantages or disadvantages was not a recognized liberty of the individual. That liberty has gradually established itself in the countries of Europe and in the United States. I take it that no country has done more to establish that liberty than has the United States."

"Now, what about the results of that policy? It seems to me one may say, very briefly, that about one hundred and fifty years ago the population of Europe, according to our best knowledge, was about 130,000,000.

"You notice that the persons indicated by the diagram are not criminals. We are constantly confusing prisoners with criminals. Suppose a person in New York is arrested for intoxication in the streets. The question whether he goes to prison depends chiefly on whether he has \$10 in his pocket to pay the fine. It is very largely true that the statistics of prisoners are the function of the economic standing of the people concerned. If we had the figures, not of all persons arrested for crime, but simply of all who are tried for crime, they would show a difference. I confess I have been unable to find in the figures properly qualified the evidence that there is any considerably greater tendency on the part of immigrants themselves to commit crime than there is on the part of the native population. I think there is a greater tendency on the part of the children of the immigrant as compared with the children of the native."

IMMIGRATION AND HOMICIDE.

Professor Loeb also Points Out Important Statistical Errors as Regards Crime Among Immigrants.

ANOTHER criticism of current statistical information was that of Prof. Morris Loeb, who referred to recent tabulations showing the tremendous effect of Russian, Italian and Slavic immigration upon homicide. "The statistics are really very startling," he said, "so startling that there was evidently something wrong. The presumption was that homicide was taken to stand for criminal tendency, while, as we all know, in New York City for instance, a man who allows a brick to drop from a roof which hits somebody accidentally, that man is arrested for homicide. Homicide was taken synonymously with murder, and I find that homicidal statistics were taken to stand for murder statistics. The conclusions drawn of homicide, when you are unable to differentiate in various parts of the country between accidental killing and murder, are wrong. I do not suppose the foreman of a mine in Arizona can be arrested for homicide if it happens that half a dozen 'Dagoes' or 'Greasers,' as they call them, were blown up by an accidental discharge of dynamite in the bottom of a mine, whereas a foreman in New York would be arrested for any fatal building accident. The question was also entirely eliminated, whether, as in the South, a man would be arrested for homicide if he took part in a lynching bee. And there were no attempts made to discriminate between homicide and murder proper. Nevertheless, within six months those statistics are going to be quoted in favor of restriction."

"But there is another side to it that strikes me very forcibly, and that is this: According to the statistics, which are absolutely erroneous as far as showing actual criminal tendency, the worst offenders were three classes—Italians, Mexicans and Chinese—who stood highest in the proportion per one hundred thousand. It struck me at once that the Chinaman was pretty inoffensive, and the proof came in immediately. Ninety-six per cent of all the Chinamen in the United States are males between twenty and sixty years of age; whereas only twenty-four per cent of the inhabitants of the United States at large are of that age, which has just been shown by Prof. Willcox is the age of crime. Of course, if ninety-six per cent of the Chinamen happened to be of an age when the criminal tendency is strongest, whereas only twenty-four per cent of the entire population of the United States are of that age, you would expect the Chinaman to suffer by a comparison based on these statistics. The same thing is true as regards the Italians and the Mexicans. I was struck by something else, and that was this: In Arizona and New Mexico and the entire territory which was taken from Mexico during our war of 1849, all people are called Mexicans if they speak Spanish, whether they are Mexicans or whether they have been in the United States for two or three generations. Now, all these persons are imprisoned in Arizona and New Mexico and southern California as Mexicans. Nevertheless, there is no way in the United States census to find out how many real Mexicans are in the country, because the United States census disregards the immigration from Mexico as a part of the immigration into the country. Furthermore, among the nationalities which are called very bad on account of this homicidal tendency, I find there are many seamen, and that the man who is arrested on the border, or arrested in a seaport for a crime committed on board ship, or in some low drinking dive on the seashore, will be accredited to that nationality as a criminal, whereas he was never entered as an immigrant. Those figures alone produce such an effect that I cannot see how anybody with a conscience can go ahead and accuse these poor lambs of dirtying the water for the wolf who is drinking upstream."

A LABOR VIEW OF IMMIGRATION.

John Mitchell, the Mine Workers' President, Tells of Its Effects in the Coal Industry.

AMONG others who discussed different phases of the problem was Mr. John Mitchell, President of the United Mine Workers of America. Mr. Mitchell stated that he approached the problem not as a student or an

expert, but as a practical workingman who has from daily experience observed the effect of practically unregulated immigration. "In this period of unprecedented industrial prosperity," he said, "the people of my trade are given the opportunity to work about 200 days per year. There is certainly something the matter when a man who offers to work 300 days a year is permitted to work only 200 days, and if during this time of great industrial activity, a trade or an industry is only permitted to work 200 days per year, what will they be permitted to work in times of either financial or industrial depression?"

"It is a matter of grave concern to the 600,000 men who mine coal in the United States whether or not there is to be some reasonable restriction made upon the admission of aliens into this country. I think that the restriction ought to be upon the broadest possible lines. I think that we should have due regard for those who are less fortunate than ourselves who live in other countries. I think that we should be careful not to permit ourselves to be under even the suspicion of seeking to keep immigrants from landing here because of national or religious prejudices, but I do believe that there ought to be some qualifications, that there ought to be some educational qualifications; that it should be required by our government that those arriving upon our shores should have sufficient money to enable them to select their employment. It is certainly not fair nor just to the American workingman, or to those who have come here some years ago, that a newly arrived immigrant should be forced, by his own necessities, to take the first job offered to him. If this is to be, it means that he takes the job of someone who preceded him here, or who was born in this country. I think it is not unreasonable, with the large population we have and with our own citizens irregularly employed, for us to afford to them who are here the first and best consideration."

"I believe that by fixing a high standard—a reasonably high standard—as a condition of admission to this country, we are not only protecting our higher standards of life and labor here, but we are fixing a higher standard for those who are abroad. If men must have a reasonable education, if they must have a reasonable amount of money in order to be admitted to our country, the chances are that the countries of the Old World will raise their standard to meet our requirements, and in that way we are not only conferring upon our own people that protection to which they, as citizens of this country, are entitled, but we are fixing a higher standard for those who live in the countries of the Old World."

IMMIGRATION AND THE MACHINISTS.

President O'Connell Says the Immigrant Competes for the Place of the American Workingman.

MR. JAMES O'CONNELL, President of the International Association of Machinists, stated that when men are competing for a living for themselves and their offspring, "then we feel it, then we know something about immigration. It is not academic or statistical with us then. I have the honor of representing an organization of 100,000 skilled mechanics, and we feel the immigrant proposition every day. We meet it every day in our own way. We meet the man who comes in every day and stands at the shop door. We have to compete with him. He is not competing with us, we are competing with him, and if we are successful, all right. If we succeed in assimilating that gentleman to our way of thinking, well and good. But if we don't? The question of assimilating the immigrant is one of years and years."

"We are very materially affected by immigration. Our wages, the condition of our families, the way our families are cared for and fed is gauged by immigration; the schooling of our children is dictated by immigration. It is gauged by the fellow who is competing with us and that fellow comes largely, of course, from among the immigrants. We have our own citizens and our own people who are in competition in a way, but it is the man who has come here and is met at the shore by the fellow who is bidding for him—practically by the owner of these men, as is now being done by the greatest public work a government is undertaking—offering so much and so much, selling Chinamen by auction at nine cents an hour. I say, we are the ones who suffer from immigration—our people, our wives, our children; our standard of living is based, is pitted against immigration. We meet immigration here and there and everywhere. In the mining district, in the mechanical trades, in the clothing industry, the allied industries, and in all the industries in which the human being is engaged in our country to-day, we meet with immigration. We feel that our standard of living is kept down. We feel the need of better protection against immigration (not that we have any desire to keep out the desirable immigrant, and I cannot say to you what is desirable immigration to your satisfaction, although I think I know what I mean by that). We want fair opportunities here and we do not want an unfair competition. In other words, we do not want a tariff upon the product and no tariff upon competition with our labor. We want protection from all sides, and I do not say this in a political sense."

THE DEMAND FOR LABOR.

A View of the Situation as Presented by Conditions on the Pacific Coast.

IN discussing the statistics concerning juvenile delinquents, Mr. Hugh F. Fox of New Jersey, stated that as they were sixteen years old he did not think anyone who had studied the question would be willing to base any conclusions upon them. "Sixteen years ago," he said, "juveniles were arrested for all sorts of things that are not considered crimes to-day and they were dealt with in an entirely different fashion; in fact, the whole attitude of the police and the judiciary in regard to the so-called juvenile incorrigible and delinquent of sixteen years ago would to-day be considered semi-barbarous. The whole progress in this question during the last ten years makes the data of sixteen years ago practically the data of the dark ages. I do not think we can base any conclusion that is of value in relation to the immigration problem on such data as was obtained in 1890 on that question."

Mr. Fox referred at some length to conditions in New Jersey with regard to the dependent and delinquent classes and of the agricultural conditions with reference to labor and immigration in New Jersey and along the Pacific Coast. Referring to the hop business in Oregon, Washington and California, Mr. Fox said: "We are now almost at the end of harvesting. Telegrams have been coming to us frantically from all our agents and buyers and brewers interested with us in the ranches, telling us that they have not enough pickers to harvest the crops. This condition has been getting worse each year, partly because the Chinamen who came in before the Exclusion Act have been prosperous, and the Chinaman to-day is successfully competing with the American, the Englishman and the Scotchman as a hop-grower in the Pacific Coast States. He is running large ranches and is himself in many cases employing white labor. Now, I know it is said that that is casual and occasional and seasonal labor. That is true to a certain extent. There is enough of it in harvesting fruit and in the hop and similar industries to keep men employed three or four months. There is ample opportunity to-day for the man who goes there as a seasonal laborer to get small pieces of land, and by farming not only to earn his living during the other nine months but to become in a few years very prosperous. The fact is you cannot separate the immigration problem from the land problem in that part of the country, and I presume elsewhere. Until the last few years that country contained a large number of men who were land poor, because of the policy of the government in giving away quarter sections of extremely rich and valuable land that was very carelessly farmed. I do not attempt to state what bearing this has upon the immigration problem further than this, that it is perfectly clear there are large sections of the country to-day calling for labor and having no prejudice against its nationality, and that it will be a very long time before the country will be so filled up that the demand for such labor will be at all diminished."

IMMIGRATION AN INTERNATIONAL QUESTION.

DR. CHARLES FLEISCHER, of Cambridge, stated that it seemed to him feasible for the Department to start a project for getting the different nations of Europe interested with us in this immigration problem, and thus lifting it to the plane of an international question. "It is not simply the going and coming of many of these immigrants but the fact of the conditions stimulating immigration to America that raises the question to the plane of internationalism. Knowing America as I know her, through history and through personal acquaintance, I see America as a nation somewhat different from other nations in that we are avowedly humanitarian. Therefore, in justice to our national characteristics as well as to our history, it seems to me that we cannot develop an attitude of hostility toward immigration here and at the same time be indifferent to the causes abroad which stimulate this migration. For instance, we cannot say that we have no right to interfere in the internal conditions of Russia and at the same time try to keep out the Russians who are moved to migrate to America by those very internal conditions that obtain in Russia. Such an attitude of indifference to the causes that stimulate migration is false to our history."

A SOUTHERN VIEW OF IMMIGRATION.

MR. THEODORE AHRENS, of Kentucky, presented to the Department a Southern view of immigration. He said in part: "I do not think that this country has reached the point where it does not require further immigration. Speaking for my section of the country, that is, the South, I am sure we do need more immigration. As a manufacturer, I feel to-day the necessity of the absolute want for labor. This condition exists not only in Kentucky, but in Alabama and other Southern States. We could use a million more immigrants a year, but we want them to be of the best kind. I believe we can get one million immigrants a year of the desirable class. I think we ought

to throw around our immigration laws such restrictions as the bill before Congress proposes, at least the most of them. I believe that every healthy man, woman or child who comes to the United States, whether they have \$25 or not, should be admitted, because this country was built up by just such people. The great majority, such as the Irish and Germans and all other people who came here twenty-five or fifty years ago, never had \$25 or \$50 that one clause of the proposed legislation provides for. I am in favor of keeping out the criminal classes, consumptives, epileptics and people who are not fit to take care of themselves."

PROPOSED IMMIGRATION LEGISLATION.

REV. ADOLPH ROEDER, of New Jersey, in referring briefly to the point raised as to the effect of immigration upon the number of days employed by the coal miners of the country, stated that it might be possible for this condition to be due rather to the control of coal production and transportation by the railroads. In speaking of the additional restrictions to immigration imposed by the bills now before Congress, he stated that he doubted very much whether the head tax, or the linguistic provision, or other sections of the bill, will seriously interfere with the number of immigrants to the United States. He said: "I think there will be almost as many. I hope there will be. And I think they will be of a better class, which would be good for their own sake, because it puts a lot of people at a disadvantage when they are thrown into a country where they cannot distinguish between liberty and license. In the removal of unintelligent men from the sway of a monarchy where they are well controlled and held well in hand, there is always danger of that removal resulting in the feeling of license and in the increase of the sense of personal liberty which does not exist. Personally, I favor these rather slight restrictions proposed in the bills now before Congress."

Among the other speakers at the conference were Mr. Franklin MacVeagh of Chicago, Prof. J. W. Jenks of Cornell, James W. Kinnear of Pittsburg, Mrs. Florence Kelley of New York, and Mr. D. G. Ambler of the Jacksonville (Florida) Board of Trade.

WELFARE WORK IN POWER STATIONS.

From the Paper Trade Journal, New York.

One of the most interesting phases of modern industrialism is the increasing attention paid by large establishments to so-called welfare work, for the betterment of the conditions under which the employees labor. Activities of this kind are in no sense confined to the rank and file of the employees, but are in many instances broadly beneficial to even department heads. In electric railway circles a great deal has been done along this line to improve the living conditions of employees directly occupied in the handling of cars; companies have fostered esprit du corps and strengthened many a motorman and conductor's position in life by liberal contributions to benefit associations, by supplying various necessities at less than cost, etc. Sometimes the power plant has been overlooked in these commendable activities, and it is the purpose of these comments to point out several ways in which welfare work can be extended to this part of the system.

In far too many plants the chief engineers are unprovided with any sort of office facilities worthy of the name. Of course, a power house is no place for mahogany desks, Turkish rugs and Louis Quinze chairs, but where a man is obliged to prepare careful and regular records of the power cost in detail, something in advance of a nail keg or an oil barrel is sure to be appreciated in lieu of a handsome desk. Again, power houses are sometimes lacking in anything but the most elementary sixteenth century sanitary facilities; lockers are conspicuous by their absence; or there is no place where an engineer or fireman can wash himself and then enjoy a meal which has to be taken when on duty. The provision of hot water for this purpose, a mirror and a few brushes are certainly appreciated by deserving men, and cost little from the company's standpoint. Power plant attendants are not averse to good personal appearance on the way home from work, any more than are the draftsmen in the main office. Another point is worth securing: the provision of enough men so that each power-house attendant can take a day off once in seven or eight days, instead of being hemmed in to continuous service all the year round. Bonuses for reduced cost of power generation are helpful in some plants, and promotions from within when capable men for advancement can be secured from the company's own force are usually much appreciated by employees of the right sort. One or two technical journals supplied by the company ought to be available at the power house for all employees, and all reasonable encouragement should be given to power-house men engaged in night duty or outside efforts of any kind to become more efficient workers. It is in no carping spirit that we mention these points, but in many plants the working conditions may be improved by very simple and inexpensive methods.

OUR GAIN IN POPULATION THROUGH IMMIGRATION.

STATISTICS AFFECTED BY CHANGES IN DEFINITION—ATTENTION DIRECTED TO HUNDREDS OF THOUSANDS RETURNING EACH YEAR TO EUROPE.

BY WALTER F. WILLCOX

THE meaning of any statistics depends largely upon the meaning of the unit in which the statistics are expressed. It is a common but fallacious assumption that a word used as the name of a statistical unit has precisely the same meaning that it has when used in popular speech. In the present case the word "immigrant" has had and to some degree still has different meanings, which may be called respectively the popular or theoretical meaning and the administrative or statistical meaning, and these two should be carefully distinguished.

In the popular or theoretical sense an immigrant is a person of foreign birth who is crossing the country's boundary and entering the United States with intent to remain and become an addition to the population of the country. In this sense of the word an alien arrival is an immigrant whether he comes by water or by land, in the steerage or in the cabin, from contiguous or non-contiguous territory, and whether he pays or does not pay the head tax. The essential element is an addition to the population of the country as a result of travel and the word thus covers all additions to the population otherwise than by birth. A person cannot be an immigrant to the United States more than once any more than a person can be born more than once. It is a characteristic of this meaning that it does not alter.

The word immigrant in its administrative or statistical sense is not defined on the reports of the Commissioner-General of Immigration, but from that source and from the instructions and other circulars issued by the Bureau the following statements regarding its meaning have been drawn:

1. The administrative or statistical meaning of immigrant is not fixed by statute law but is determined by the definitions or explanations of the Bureau of Immigration and those are dependent upon and vary with the law and administrative decisions.

2. In the latest circular of the Bureau immigrants are defined as "arriving aliens whose last permanent residence was in a country other than the United States who intend to reside in the United States." This definition seems to agree closely with the popular or theoretical one.

3. But the foregoing definition is modified by a subsequent paragraph of the same circular which excludes from the immigrant class "citizens of British North America and Mexico coming direct therefrom by sea or rail." So the official definition is substantially this: An alien neither a resident of the United States nor a citizen of British North America, Cuba or Mexico, who arrives in the United States intending to reside there.

4. The only important difference between these two definitions is that the statistical definition excludes, as the popular definition does not, citizens of British North America, Cuba and Mexico. As the natives of Canada and Mexico living in the United States in 1900 were 14.2 per cent of the natives of all other foreign countries, it seems likely that the figures of immigration for the year 1905-06 should be increased about 14.2 per cent in order to get an approximate estimate of the total immigration into the country during the year just ended.

5. Perhaps the most important difference between the popular or theoretical and the statistical definition of immigrant is that the former is unchanging and the latter has been modified several times by changes of law or by modifications of administrative interpretation.

6. Until January 1, 1906, an alien arrival was counted as an immigrant each time he entered the country, but since that date an alien who has acquired a residence in the United States and is returning from a visit abroad is not classed as an immigrant. This administrative change has brought the statistical and the popular meanings of immigrant into closer agreement, but in so doing has reduced the apparent number of immigrants more than ten per cent and has made it difficult to compare the earlier and the later statistics.

7. Until January 1, 1903, an alien arriving in the first or second cabin was not classed as an immigrant, but rather under the head of other alien passengers. This change likewise brought the two meanings of immigrant into closer agreement, but also made it difficult to compare the figures before and after that date. By a mere change of administrative definition the reported number of immigrants was increased nearly twelve per cent.

8. Until the same date an alien arrival in transit to some other country was deemed an immigrant, but since that date such persons have been classed as non-immigrant aliens. This change also makes the figures before 1903 not strictly comparable with later ones. About three per cent of those who were formerly

classed as aliens have been excluded since 1903. The alteration has brought the two definitions closer together, but in so doing has entailed administrative difficulties which lead the Bureau to favor a return to the former system or at least to favor collecting the head tax from such aliens in transit.

9. An immigrant in the statistical sense is a person liable for and paying the head tax. But to this there are two slight exceptions. Deserting alien seamen not apprehended are liable for the head tax which is paid by the company from which they desert, but such cases are not included in the statistics. Citizens of British North America, Cuba and Mexico coming from other ports than those of their own country are reported as immigrants, but do not pay the head tax. Obviously both are minor exceptions hardly affecting the rule. In the popular or theoretical meaning of immigrant this head tax is not an element.

10. Probably other changes of definition have occurred of recent years. No attempt has been made to exhaust the list. The general tendency of the changes has clearly been toward a closer agreement of the popular and the statistical meanings. But they have probably tended to make the increase of immigration indicated by the figures greater than the actual increase, and to that degree to make the figures misleading. If the Government Bureau of Immigration and Naturalization could make a carefully studied estimate of the extent to which such changes in the official reports really modify the apparent meaning of the published figures, it would render a valuable service.

11. A committee like the present can hardly make such an estimate or go further than to point out that for the reasons indicated the official statistics of immigration are likely to be seriously misinterpreted and are constantly misinterpreted by the public.

The official statistics of immigration being subject to all the qualifications indicated and reflecting so imperfectly the amount of immigration as ordinarily or popularly conceived, the question at once arises. Can any substitute or any alternative be proposed? What the public is mainly interested in, I think, and what it commonly but erroneously believes is indicated by the official figures of immigration, is the net addition to the population year by year as a result of the currents of travel between the United States and other countries.

Alternative figures for the last eight years, a period which closely coincides with the last great wave of immigration now at or near its crest, may be had by comparing the total arrivals and departures in the effort to get the net gain. The results appear in the following table:

Fiscal Year	Total Passengers Arrived	Total Passengers Departed	Total Immigration	Arrivals Minus Departures	Per Cent That Net Increase Makes of Immigration
1898..	343,963	225,411	229,299	118,552	51.8
1899..	429,796	256,008	311,715	173,788	55.8
1900..	594,478	293,404	448,572	301,074	67.0
1901..	675,025	306,724	487,918	368,304	75.5
1902..	820,893	326,760	648,743	494,133	76.3
1903..	1,025,834	375,261	857,046	650,573	75.9
1904..	988,688	508,204	812,870	480,484	59.3
1905..	1,234,615	536,151	1,026,499	698,464	68.1
1898-1905			4,822,662	3,285,372	68.1

The figures indicate that the net increase of population by immigration during the last eight years has been slightly more than two-thirds of the reported immigration. But these figures of net increase should be increased by an estimate of the arrivals by land from Canada and Mexico. As the Canadians and Mexicans by birth residing in the United States in 1900 were 14.2 per cent of all residents born in other foreign countries, this would indicate an influx of 466,000 Canadians and Mexicans, a figure probably in excess of the truth, since the currents have probably been setting Canada-ward of recent years. I estimate, therefore, that the net increase from immigration 1898-1905 has been about 3,750,000 instead of 4,820,000, as might be inferred from the Reports of the Bureau of Immigration. The actual increase would then be about 78 per cent of the apparent increase.

[The above article was presented as a paper by Professor Willcox before the Committee on Basal Statistics of the Federation's Immigration Department. It should be regarded as provisional, and is published not alone for its value and interest but also with the hope of eliciting criticisms or corrections.—THE EDITOR.]

WHY THE AMERICAN FEDERATION OF LABOR WENT INTO POLITICS.

THE VIGOROUS CAMPAIGN OF THE NATIONAL MANUFACTURERS' ASSOCIATION AND OTHER EMPLOYERS' ORGANIZATIONS PRACTICALLY FORCED IT.

THE entrance of organized labor into active participation in national politics, the wisdom of which has been seriously questioned by many friends of the labor movement, is the direct outgrowth of the contest which has been waging the past several years between the trade unions, as represented in the American Federation of Labor, on the one side, and manufacturers, as organized in the National Association of Manufacturers and in the Citizens' Industrial Alliance, on the other. The public, while noting here and there in the press indications of this activity of the National Manufacturers' Association and the vehement half-page advertisements of the Industrial Alliance in which organized labor is attacked, nevertheless the public generally realizes but faintly, if at all, what the real extent of this opposition to the labor movement has meant. Organized labor itself, of course, understands it thoroughly and fully measures the strength of this opposition. Its leaders at every turn in Congress meet the officials and attorneys of these hostile organizations, and spend weeks in open combat with them before the committees. The columns of the manufacturers' journals are filled with denunciations of organized labor, its leaders and all its policies.

One feature of the campaign as carried on by the officials of the National Manufacturers' Association has been the sending of letters to their members which, although marked "confidential," do not fail to reach the labor journals, whose editors publish them to show the tactics of their opponents. To show the nature of this kind of opposition, we present some of these letters:

THE NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA.

General Offices: 170 Broadway (Maiden Lane and Cortlandt Street.)

NEW YORK, Feb. 20, 1904.

Confidential.

DEAR SIR: Our fight against a favorable report of the Eight-Hour bill by the House Labor Committee in Washington is getting warm, and we ask you, as a manufacturer and employer with a vital personal interest as well as a patriotic interest in beating this arbitrary and dangerous socialistic proposition, to help us.

Hon. _____ of your State is, as you know, a member of this House Labor Committee. While we understand that he is a brave and patriotic man, who will not be afraid to do what is right in this behalf when it comes to a vote in the committee, we naturally wish to have him supplied with as many facts, reasons and arguments against the bill as possible from home in order that any such thing as a weakening on his part might be absolutely prevented; for it is not only certain that every vote in the committee will count, but it is of course of the utmost importance that our friends in the committee should realize that they are right, from the beginning of the fight to the end of it, and that they can well afford to stand by the substantial people of their State in helping the fight to be made, in their own time and in their own way of course; for we certainly want to be friendly enough to our own friends not to ask them to expose themselves unnecessarily.

Therefore, if you should write such a letter—the Congressman's address is House of Representatives, Washington, D. C.—and will make it strong and will not hesitate to make it long and full of reasons, and put some of the feeling into it which we believe all manufacturers and employers entertain at the present time in reference to this coercive labor proposition, a most valuable and perhaps a most essential service will have been done. We should all of us very naturally feel chagrined if the member of the committee from your State should fail, on account of a lack of interest from home, to do his part. Kindly do us the honor and the service to write us what you have done in order that we may have as much information as possible and thus may co-operate with you as effectively as possible.

Yours most respectfully,
MARSHALL CUSHING,
Secretary.

THE NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA.

General Offices: 170 Broadway (Maiden Lane and Cortlandt Street.)

NEW YORK, June 15, 1904.

Confidential.

DEAR SIR: We should like first to recall your generous and essential service of last winter; for I assure you positively that our fight for free industrial conditions before the various committees of Congress could not have been successful without the assistance of all our friends everywhere.

There is now a service of vital consequence that you can do for the cause. As you know, the Democratic national convention meets in St. Louis on July 6. It

is evident that devotees of Bryan anti-injunctionism and of Hearst eight-hourism—to coin the words—will seek to cause the reaffirmation of the anti-injunction plank of the last two platforms, and, possibly, additional labor planks—for eight hours and almost any kind of socialistic legislation may be endorsed. In fact, it is not safe to assume that these propositions will be kept out of the platform, except by the most diplomatic and resourceful and persistent efforts which you or your association, as an association and as individuals, in common with all of our friends everywhere can make. You have the right to make these efforts; and we ask you, a little more earnestly than we have ever asked anything of you before, to make them.

This labor question is industrial, not political. In your opinion, as well as ours, of course, no party has any business, whether from the standpoint of patriotism or of mere politics to seek to make any such demagogic appeals. I ask you to believe that the whole country feels so nearly as we do on the question, and that public men of both parties are given to feel so nearly as we do on the question, that you are safe in assuming that your efforts, collectively and individually, addressed to any or all of the delegates to St. Louis with whom you are acquainted, or can get in touch, whether on the resolutions committee or not, whether from your State or not, whether known to be friendly to our cause or not, would have the right effect.

These planks will not be left out unless we make the effort. Please do everything on earth that you can, perfectly secretly, without any publicity of any kind, simply scoring with each and every influential person whom you can think of having anything to say about the matter. And please advise me what you have done and are doing, in order that I may co-operate with you as effectively as possible.

Yours most truly,
MARSHALL CUSHING,
Secretary.

THE NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA.

General Offices: 170 Broadway (Maiden Lane and Cortlandt Street.)

NEW YORK, December 8, 1904.

Strictly confidential.

DEAR SIR: You have not replied to our recent letter. It is our fault; we didn't write you strongly enough.

The simple question is whether your own valued company will not join the other manufacturers of the country in providing an absolute insurance against destructive and even revolutionary labor legislation at Washington and at the different State capitals. We believe that you will.

Nobody has ever questioned that it was the National Association of Manufacturers that beat the Eight-Hour and Anti-Injunction bills in Washington last winter. We have got to beat them again this winter, for Mr. Gompers insists that both bills shall be pressed and Senator McComas, of Maryland, agrees.

Not only is the National Association your only guarantee against the enactment of such revolutionary schemes, subversive of the very principles of our government, but the whole tendency towards collectivist and paternal legislation needs to be stopped, and it is this immense and successful movement of manufacturers which alone, apparently, can do it.

I want again to ask you to join us. If we double our strength, we treble or quadruple our power; but we have to be right, and you can help us to keep right. We have many friends in your industry. Will you not join them, and us, in the good cause? You will get your money back, anyway, in business advantages.

Please let me hear from you. I won't permit you to be disappointed. Yours most cordially,
(Signed) MARSHALL CUSHING,
Secretary.

THE NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA.

General Offices: 170 Broadway (Maiden Lane and Cortlandt Street.)

NEW YORK, February 27, 1905.

Confidential.

DEAR SIR: We take the greatest pleasure in causing to be mailed to you (from this office under Congressional frank) a copy of the Eight-Hour report, so-called, just submitted by Secretary Metcalf to the Labor Committee of the House. As you will doubtless recall, it was managed last spring—at the close of the most remarkable manufacturers' campaign ever seen in Washington—that this whole question should be referred to the Department of Commerce. The Labor Bureau, under the direct supervision of Colonel Wright, has now completed this inquiry. Not only does the report sustain our contention at every point

(that the compulsory eight-hour day by act of Congress would be uneconomic and even destructive to the industries of the country and a radical or even revolutionary recognition of a wrong principle of government interference at the behest of "labor"), but the reference of the question itself establishes a precedent which possibly is just as valuable; namely, the possibility of referring such questions for investigation by the proper department itself hereafter, a thing which has never even been attempted until our Association took it up. This matter has already been referred to on the first two pages of our American Industries of February 15, as well as in the editorial columns, to which we respectfully refer you; but we ask you to read and preserve the report itself as one of the most significant industrial documents thus far issued.

The House Labor Committee in executive session Thursday laid this report on the table. Its only friend who was present—Congressman Caldwell, of Illinois, (beaten for re-election)—moved to report the bill favorably, but by the watchfulness of our friends it was laid on the table, and thus the notorious Gompers Eight-Hour bill dies with this Congress. In this, however, as in the Anti-Injunction campaign, the labor lobby may be expected to be just as active as ever in the next Congress. But the Association will also be just as active.

We do not believe there is any calculating in money the value of this work which the Association is doing, which, of course, would be impossible if our individual members everywhere did not follow the work closely and back it up promptly and generously whenever we ask them to do so. In fact, it is always their support without which success could not be attained.

Yours most cordially,
(Signed) MARSHALL CUSHING,
Secretary.

LABOR'S BILL OF GRIEVANCES.

This active campaigning on the part of organizations representing employers and manufacturers became so strong in Congress that in March, 1906, what has come to be known as "Labor's Bill of Grievances" was presented to President Roosevelt, and to the Speaker of the House of Representatives and the Chairman *pro-tem* of the Senate by prominent labor officials represented in the American Federation of Labor. These grievances grew out of the refusal of Congress to enact into legislation certain demands of organized labor, including the enactment of the Eight-Hour law; legislation to safeguard the American workman from the competition of convict labor; relief from induced and undesirable immigration; protection of seamen from involuntary servitude; redress from repeated violations of anti-trust and interstate commerce laws; protection from the questionable use of the injunction, and insistence of the right to petition on the part of government employees. In closing their Bill of Grievances the representatives of organized labor said: "Labor now appeals to you, and we trust that it may not be in vain; but if, perchance, you may not heed us, we shall appeal to the conscience and the support of our fellow citizens."

Following this appeal, and soon after the close of the last Congress, the Executive Council of the American Federation of Labor issued an address "to all organized labor and friends in the United States" in which was set forth the political program of organized labor. Following a general analysis of present-day industrial and political conditions, the address quotes a resolution adopted by the National Convention of the Federation as long ago as 1897, as representing the attitude of the organization towards politics. This resolution stated that "the American Federation of Labor most firmly and unequivocally favors the independent use of the ballot by the trade unionists and workmen, united regardless of party, that we may elect men from our own ranks to make new laws and administer them along the lines laid down in the legislative demands of the American Federation of Labor, and at the same time secure an impartial judiciary that will not govern us by arbitrary injunctions of the court, nor act as the pliant tools of corporate wealth." The program stated that "within the past few years claims and promises made in platforms or on the hustings by political parties and politicians, and especially by the present dominant party, have been neither justified nor performed. Little attention has been paid to the enactment of laws prepared by us and presented to Congress for the relief of those wrongs and the attainment of those rights to which labor and the common people are justly entitled and which are essentially necessary for their welfare. Several Presidents of the United States have, in their messages to Congress, urged the passage of equitable legislation in behalf of the working people, but Congress has been entirely preoccupied looking after the interests of vast corporations and predatory wealth.

Congressmen and Senators in their frenzied rush after the almighty dollar have been indifferent or hostile to the rights of man. They have had no time, and as little inclination, to support the reasonable labor measures, the enactment of which we have urged, and which contain beneficent features for all our people without an obnoxious provision to anyone." The relief asked for not having been granted, the program goes on to state that the American Federation of Labor determined upon taking the issue into active politics.

Perhaps the one question above all others that has engaged most strenuously the fighting strength of what may be termed the hostile camps of capital and labor is commonly known as "Government by Injunction." The public generally has little conception of the significance of this issue, being unconscious of the fact that it involves fundamental principles as to the rights of man and the rights of private property. How important these issues are to the future welfare of the nation can best be indicated by presenting a summary of the testimony before the House Judiciary Committee last spring on the anti-injunction issue. Some eight bills treating of this subject were before the Committee. The hearings, however, centered around the bills which aim to limit or define the power of Federal courts in issuing injunctions in labor disputes.

In general, the proposed legislation emphasizes four remedies for the injunction issue. One is the division of contempt of court into two classes—direct and indirect—the latter including an injunction or order of the court, and permitting those accused of contempt who come in this class to have a trial by jury. Another proposed measure makes certain acts innocent; takes certain acts which are lawful for one to do out of conspiracies when done by more than one; that is, it makes legal those acts which are legal for one to do if done by several in a trade dispute. Acts declared to be innocent are not to be restrained or enjoined. One of the proposed measures declares the right to do business to be not a property right.

Another form of proposed legislation provides that the adverse party shall have an opportunity to be heard before an order is granted. This provides that in cases involving or growing out of labor disputes neither an injunction nor a temporary restraining order shall be granted except upon due notice to the opposite party, after hearing, which may be *ex parte* if the adverse party does not appear at the time and place ordered. In support of this bill the railroad brotherhoods have committed themselves, the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen, the Order of Railway Conductors, and the Brotherhood of Railroad Trainmen being represented in its behalf at the hearings before the House Committee.

Its principal point is that it does not seek in any manner to diminish the power of the court as to the injunction—that is, as to the character of the injunction or as to its power for punishment of violation. It simply goes to the question of the notice before any writ shall be issued. Representatives of the brotherhoods state that they did not regard the Gilbert Bill as a complete remedy for the abuse of the injunctive power by some judges, but they believe it to be a step in the right direction.

The position of organized labor, as represented in the American Federation of Labor, is presented in the testimony of Mr. Samuel Gompers, its president. He contends that there is not now upon the statute books one line that by its fair interpretation is a warrant for the issuance of injunctions in labor disputes. He claims that under the operation of the issuance of the injunctions, the very things they might do as men and as citizens, they are denied the right to do as work-

ingmen. "The injunctions treat us as a class; the injunctions apply to us as workingmen, and apply to no other members of the common country," he says. The enjoining of men from committing any criminal act, Mr. Gompers contends, is an improper exercise of the power of the equity court; "yet some of our opponents," he says, "would have it appear that we favor criminal acts, or that we favor their commission. But we contend that the writ of injunction was never intended to be issued to enjoin men from committing any unlawful or criminal act; that both our country and our States provide for the apprehension and the trial by a jury of persons who commit such acts to ascertain whether such person has been guilty of a criminal act and to punish him if he is found guilty, and that organized civil society has constituted a police force, large or small as the circumstances may warrant, for the apprehension and prevention of any criminal act.

injunction was issued—or, rather, many injunctions were issued—prohibiting persuasion, and not even designating what kind of persuasion. We can understand that there is such a thing as persuasion glibly used by the tongue and a club held in the hand; and no one can at all justify such persuasion as that. But even so, in such a case the injunction should not lie, because such an attempt is a threatened assault upon the person, for which there is a law to prevent, to apprehend, to try, and to convict and to punish. But there is a persuasion—that persuasion which is commonly understood in our language—which no man can deny the right to exercise by another. . . . I hold that the workmen have the right to go to any workman employed by anybody, whether in a strike-bound establishment or otherwise, and if such a workman has no legal contract with his employer, and it would not violate the terms of a contract, the associated workmen have the legal right to offer this man inducements to

quit his employment and go to work with them in some other establishment, or not to work at all, for the time being. They have the right to 'lure away' and 'wean away' from an employer a workman, and to offer him money inducements, so that he may quit that employment and work for another, or to go idle for a period, in order that a certain lawful, honorable purpose may be achieved. And yet the injunction is issued against workmen for doing that very thing; and for doing it after the injunction has been issued they have been sent to jail."

President Gompers states that organized labor objects to the fact that the courts have read into the law new features. "We are suffering," he states, "from court-made law rather than statute law," and he indicates that the purpose they have in view in offering their bill "is that the law and its purpose shall be as it existed prior to the existence of these modern injunctions in trade disputes arising between employers and employed." He states that his contention is that there has not been one injunction issued that is not in contravention of fundamental rights. He states that he holds that the things which are enjoined and which are in themselves unlawful the courts should not issue injunctions against, because there is already a remedy for them at law. He says further: "We hold that the issuance of an injunction is an extraordinary remedy which is to be resorted to only when the end to be reached can be obtained by no other legal process. That there is a legal remedy for the things which an injunction can enjoin goes without saying, but it is the purpose of the opponents of our legislation on this subject to get rid of the trial by jury in the regular process of the law. Their purpose is to make the judge who issues the injunction both the judge, the jury, and the executioner, and, indeed, to take away from the workman enjoined the constitutional right of being tried before a jury of his peers for any crime or unlawful offence with which he may be charged."

So long as it involves personal liberty Mr. Gompers states that he goes so far as to contend that the courts have not any fundamental power or rightful power to issue an injunction to restrain an unlawful act distinguished from a criminal act. Where it is affecting property Mr. Gompers states that he is in entire accord with the best conception of the writ of injunction; but when it involves personal liberty, the freedom and the exercise of lawful rights guaranteed to the citizen, then he holds that under no circumstances should the writ of injunction apply; and, further, he says it does not apply except to workmen when engaged in a dispute with employers.

"Writs of injunction," he says, "in so far as they enjoin acts forbidden by law, are superfluous, erroneous, and a waste of time and money."

(Continued on page 16)

MR. JAMES W. VAN CLEAVE,
President of the National Association of Manufacturers.

MR. SAMUEL GOMPERS,
President of the American Federation of Labor.

MR. MARSHALL CUSHING,
Secretary of the National Association of Manufacturers.

MR. FRANK MORRISON,
Secretary of the American Federation of Labor.

"The representatives of labor appearing for and advocating the enactment of an anti-injunction bill, and an effective one—I want it to be clearly understood—neither directly nor indirectly nor remotely aim to attack the writ of injunction as a writ. We recognize its importance and its value and efficiency and appropriateness and effectiveness within the limits of its original purpose, and that is to protect property rights when there is no other remedy at law."

President Gompers states that what the American workingmen want is an effective bill that shall remove the condition that has selected them as workmen specially to have injunctions issued enjoining them from doing things that apply to no other man, woman, or child. Referring to trespass, unlawful acts, and criminal acts, Mr. Gompers states that no one can defend them and claim honest citizenship in our country. "But the doing, as I say, of the most ordinary things that men do in their every-day lives are more and more coming to be touched upon by injunctions. One

OTTO M. EIDLITZ, Chairman Board of Governors, Building Trades Employers' Association, New York City.

On the Part of Wage Earners.

SAMUEL GOMPERS, President American Federation of Labor, Washington.
JOHN MITCHELL, President United Mine Workers of America, Indianapolis.
JAMES DUNCAN, General Secretary Granite Cutters' International Association of America, Quincy, Mass.
DANIEL J. KEEFE, President International Longshoremen, Marine and Transport Workers' Ass'n, Detroit, Mich.
WARREN S. STONE, Grand Chief International Brotherhood of Locomotive Engineers, Cleveland.
P. H. MORRISSEY, Grand Master Brotherhood Railroad Trainmen, Cleveland.
WILLIAM D. MAHON, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
WILLIAM J. BOVEN, President Bricklayers' and Masons' International Union, Indianapolis, Ind.
J. J. HANNAHAN, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
JAMES O'CONNELL, President International Association of Machinists, Washington, D. C.
JOHN F. TOBIN, General President Boot and Shoe Workers' Union, Boston.
JOSEPH F. VALENTINE, President Iron Moulders' Union of North America, Cincinnati.
JAMES M. LYNCH, President International Typographical Union, Indianapolis.
DENIS A. HAYES, President Glass Bottle Blowers' Association of the United States and Canada, Philadelphia.
WILLIAM HUBER, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.
TIMOTHY HEALY, President International Brotherhood of Stationary Firemen, New York City.

The Federation's Annual Meeting.

The annual meeting of The National Civic Federation will be held in the Assembly Rooms of the Park Avenue Hotel, New York City, Wednesday and Thursday, December 12 and 13. The subjects for discussion will be "The Income Tax and the Inheritance Tax," "Government by Injunction," and "Child Labor."

Among the speakers on the first-mentioned subject will be Andrew Carnegie, August Belmont, William D. Guthrie, Charles W. Eliot, President of Harvard University, Archbishop John Ireland, Oscar S. Straus, Samuel Gompers, President of the American Federation of Labor, N. J. Bachelder, Master of the National Grange, Franklin MacVeagh, Melville E. Ingalls, and Nicholas Murray Butler. Other speakers will be Alfred Mosely, who is to present the English tax system, Professor Hermann Schumacker, of the University of Berlin, who is to talk on the German system, and George Foster, ex-Minister of Finance of Canada, who will present the facts as regards the Canadian Income and Inheritance Tax.

"Government by Injunction" will be discussed by John Mitchell, of the American Federation of Labor; H. R. Fuller, representing the Railway Brotherhoods; George R. Peck, ex-President of the American Bar Association, and General Counsel of the Chicago, Milwaukee and St. Paul Railway; Walter Drew, Commissioner of the National Iron Erector's Association; Louis D. Brandeis, Esq., Frederick N. Judson, Esq., and Seth Low.

In the discussion of "Child Labor" there will be represented the officers of The National Child Labor Committee, representatives of the trade unions from among those occupations in which child labor is most prevalent, representatives of employers' and manufacturers' organizations, labor commissioners, factory inspectors, and representatives of women's organizations.

That these are three vital questions at this time will not be denied. The general demand, finding expression in so many circles, that there should be some curb placed on huge aggregations of wealth, certainly calls for thoughtful consideration by those who believe in the perpetuity of our democratic institutions. Shall we have a graduated Income Tax, and a graduated Inheritance Tax? If so, should there be exemptions, or should every income be taxed alike? Will an Income Tax produce "a nation of liars"? What has been the experience in Europe?

The importance of the problem "Government by Injunction" lies in the fact that organized labor believes that the courts are being used by employers in a partisan way to prevent or break strikes. The employers, while admitting that there may be abuses of the character complained of, claim that the remedy is not along the lines sought by the unions. The merits of the question are fairly well outlined in an article appearing elsewhere in this issue. The question is "Can the abuses complained of by organized labor be remedied without destroying the beneficial principle underlying the injunction?"

The question on Child Labor to come before the meeting is largely this: What is the real extent of the evil, and is everything being done that is possible to do to meet it? As to the character of the evil there is practically no divergence of opinion; as to its extent there is a wide difference of opinion. Many speakers and writers on the subject declare that there are two million children working in the factories, mines, mills and in mercantile and street trades, etc., under fourteen years of age, and that child labor is on the increase. Others claim that these figures are gross exaggerations, and point to the 1900 census which shows in round numbers 1,750,000 children "under 16 years" of age engaged in gainful occupations. But of this total number the same census shows, it is claimed, that there are 1,065,000 engaged in agriculture, and 500,000 in round numbers who are over fourteen years of age, which reduces the total number which it is sought to protect by legislation, to less than 200,000. It is claimed on the one side that there are twelve thousand boys under fourteen years of age in the anthracite coal breakers, whereas officials of the state of Pennsylvania, after investigating the matter, claim that there are not over 8,100 all told under sixteen, and that with

only 760 of them is there any doubt about their being over fourteen,—the age beyond which no attempt is made to prevent employment.

Whether there is a disagreement on the number or not, there will doubtless be an agreement among the speakers at the coming meeting that whatever the number of children of tender years engaged in gainful occupations, they should not be permitted to work if they are under fourteen years of age.

The executive committees of the various departments will meet on the evening of the 12th, and in addition to discussing important questions relating to their respective fields of endeavor, will plan their work for the coming year.

The Conciliation Department will organize its work in a way that will enable it to be in touch with every industrial center and to carry on during the coming year a great deal of educational work along the line of Conciliation, Arbitration and Trade Agreements.

The Executive Committee of the Immigration Department will consider the various projects which have been advanced for the distribution of immigrants and which have in view relieving the congestion of aliens at particular points and at the same time meeting the demands of those sections of the country where immigration is so much desired.

The Welfare Department, in addition to considering the Employers' Liability Act, the question of Safeguarding the Lives of Employees, and Industrial Insurance, will plan its campaign for bettering the conditions of employes in the public service, national, state and local. A special committee the past year has been investigating the conditions under which our public employes work, and will recommend that as active efforts be put forth in their behalf as the Department has hitherto taken in the interests of employes of private establishments.

The Immigration Problem.

It was pointed out in the preceding issue of THE REVIEW that widely varying and antagonistic views are being entertained on the immigration question because of the absence of the facts. In that issue we quoted opponents of immigration as claiming that a large per cent of immigration is made up of "outcasts, criminals, anarchists, thieves and off-scourings of the earth," and in contrast with this we presented another view by a high authority who claimed our immigrants to be "bright, ambitious men and women, the brawn and backbone of any country." Through immigration, Commissioner Watchorn also said, the United States is receiving "the youth and strength and ambition and vigor of foreign lands."

Another and a much more comprehensive view as to controverted facts on the immigration question was presented by well-known experts in this line of knowledge at the conference of the Immigration Department of The National Civic Federation held in New York City on September 24. Many of the statistics generally accepted as accurate were shown not to represent correctly the actual situation. Some of these statistics—even government statistics which usually go unquestioned—were so vigorously combated that many at the Conference expressed their surprise that thinking people should have gone so long without taking some steps to remedy the conditions. So important was this feature among other objects of the Conference that a number of speakers made reference to it in their addresses. Mr. Prescott F. Hall, secretary of the Immigration Restriction League, expressed his views on this point as follows: "I think all who have studied this subject for any length of time feel very much the scarcity of accurate statistics on the immigration question. I certainly do. And it is one of the very encouraging things about the formation of this department that we can hope after a time to get more accurate and reliable statistics."

Another of the speakers, Nathan Bijur, Esq., Vice-President of the United Hebrew Charities, stated that in his study of the question of immigration, the first thing that confronted him was the absence of accurate and complete statistics. He said: "What I hope will be done by this department of the Federation is that it will gather together all the facts, such as they are,

the best statistics available from everywhere, and put them down and say: 'Well, so far as we have been able to gather anything, this is what we know,' and then let us sift them and see how reliable they are. When we find a government report which does not mean anything, say so and say why. When we find statistics of crime which have left out certain classes of criminals, let us say so. Show what the difference would be if they were put in, and go on through and collect all these things and put to the credit of the immigrant all the facts that are to be put to his credit, as well as charge him with all the things that ought to be so charged. Now, that has not been done by anybody. Everyone who has discussed this subject has discussed it from the point of view of the advocate. Let this department formulate great general facts."

The Committee on Basal Statistics of the Immigration Department has undertaken to perform this important service. Prof. Walter F. Willcox, of Cornell University, one of the leading statisticians of the United States, is Chairman of this Committee, and its personnel is made up of other leading statisticians and prominent students of immigration questions. A conception of the character of the work this Committee has undertaken and the scientific spirit with which its members are imbued is indicated in the paper by Prof. Willcox, which is presented elsewhere in this issue. We commend this paper to the thoughtful attention of our readers.

Welfare Work Among Railway Men.

Improvements in safety appliances, the increase in block signals, the construction of double tracks, the progress in locomotive and car construction, and the adoption of new devices have all tended the past twenty years or more to minimize the dangers of railway travel. All these mark a phenomenal advance in the direction of safeguarding the traveling public from accidents. At the same time there are not wanting indications which point to the necessity of greater emphasis being placed on the "human" element, especially as regards the men in charge of the trains. Only in very recent years has the attention the subject demands been given to caring for the physical qualifications of engineers, firemen, and trainmen.

In the recent reports of the Interstate Commerce Commission dealing with the causes of railway accidents, the "human" element occupies a prominent place. It is plain that the physical qualities of the men in charge of trains must be in as perfect condition as possible, if accidents are to be prevented. It is upon this principle that many railway companies are now working. They are requiring their men to abstain from alcoholic beverages, from tobacco and the like which scientifically are known to affect the sight, the nerves, and in general the self-possession of the men. Many railroads are also requiring their trainmen to undergo rigid physical examinations. For preserving in their best working order these physical qualities, railway managements are providing rest and recreation houses for the trainmen at various important points along their lines.

In no other occupation is modern welfare work for employes more necessary than among railroad men in charge of trains. Almost any single accident of any importance results in a money outlay on the part of the railway company more than sufficient to provide efficiently for the care of their trainmen, and we believe that if this one fact could be impressed upon the attention of railway officials it would be a sufficient argument to induce them to undertake welfare work to an even greater extent than is now being done.

But it is not the money cost to railroad companies, in the destruction and damage of property and in the expense of lawsuits growing out of railway accidents and wrecks, that is the element of prime consideration when such a vital subject as welfare work among railway employes is up for discussion. Of far more importance is the assurance to the traveling public that by such consideration of the physical welfare of employes, traveling on American railroads, as far as the human element is a factor, is made safer. Such a result is doubly assured by well-organized and well-conducted welfare work among railway employes. An idea of what is being accomplished in this direction by

one railroad can be gained from Dr. Latta's article on "Rest Houses for Railroad Men," which appears elsewhere in this issue. It emphasizes two essential factors in successful welfare work—responsible organization and competent management. Similar work among other railroads will be described in succeeding issues of THE REVIEW.

The Ownership Commission Abroad.

The announcement in detail on another page of this issue of the investigations of the Commission on Public Ownership and Operation indicates that this very important undertaking is approaching its termination. The article presents an account of the work performed in the important cities of Great Britain, and refers to the social aspect of the Commission's visit, which should be regarded as an important side of the Committee's studies, inasmuch as the social events enabled them to become better acquainted with those experts and officials in Great Britain who are recognized as among the ablest men in the different lines of work coming within the province of the Commission. It is of interest in connection with the Commission's visit abroad to read of the general expressions of approval of the task undertaken by this body, much of the success of the work of the Committee being due to the courtesies extended to the members. For the efforts of the distinguished foreigners who placed every facility at the disposal of the Committee, the thanks of the members are due.

The coming month of December will probably see the completion of all the special investigations of the different cities as outlined by the Commission, with the probability that by the first of the year the Committee of Investigation will be in a position to present its completed report to the entire Commission. As soon as the Commission has passed on the report finally, it will then be made public. We believe it will have considerable effect upon future discussions of the Public Ownership problem, and that it will be a work of reference for many years to come to those concerned in the various questions involved.

Socialism and Trade Unionism.

The attention of our readers is directed to the synopsis on another page of this issue of the very able articles against socialism written by Mr. James A. Cable, editor of the *Coopers' International Journal*, and published in recent issues of that paper. It will not only surprise, but we believe it will interest our readers to see how clearly and forcibly a workingman disposes of socialistic doctrines, which presumably are being put forth for his benefit. Mr. Cable sees through the confusion between trade unionism and socialism which has grown up in the minds of many, and is able to distinguish between the two. In fact, Mr. Cable, instead of conceding the two as being identical, clearly shows that there is nothing in harmony between the two, despite the fact that some trade unionists profess socialism. The keynote of the whole discussion may be summarized briefly in the author's statement as follows:

"One of our correspondents challenges us to show reason why the trade-union and the socialist movements cannot be harmonized. The reasons are clear. The two movements are seeking opposite ends.

"By reason of its defects the socialists seek to overthrow the present order.

"By correcting its defects, the trade unions seek to make the present order endurable.

"Now, if the trade unions succeed in making the present order endurable, the aim of socialism is thereby defeated; whereas, if the socialists succeed in overthrowing the present order, the aim of the trade unions is defeated. As the success of the one means the failure of the other, the two are diametrically opposed to each other."

This clearly-stated distinction between trade unionism and socialism is commended to the thoughtful attention of our readers, and in particular do we recommend its study to those who have been in the habit of confusing the two and of regarding them as only different names for the same things.

MRS. J. ELLEN FOSTER, by direction of President Roosevelt, has been detailed from the Department of Justice to investigate the conditions under which women and children work throughout the United States. Mrs. Foster has had years of experience in philanthropic work that peculiarly fit her for this position. She was among the first women of the country to practice law, and most of her clients were moneyless and defenceless women and children. She has been prominent in reform movements and usually has had charge of crystallizing sentiment into practical results.

In 1900 Mrs. Foster was appointed by the late Secretary Hay as a representative of the United States to the

International Red Cross Conference at St. Petersburg. Last year she accompanied the Taft party to the Philippines and made a special report to President Roosevelt on the condition of women and children there. She has but recently returned from a trip around the world, in the course of which she studied the condition of women and children in India and China.

The selection of Mrs. Foster for such work commends itself to the general public, for while full of generous sentiment, she is a student of economics and has the logical mind that looks at all conditions in the light of reason.

MISS HELEN VARICK BOSWELL, well known to club women of the country as a forceful public speaker, has recently been appointed Chairman of the Industrial and Child Labor Committee of the New York State Federation of Women's Clubs. Miss Boswell had charge of the session of this important committee during the convention held at Saratoga the early part of this month, and she was highly complimented for the excellence of her program, and for the fairness with

which it represented the different phases of the industrial question.

Miss Boswell has had some years of experience in public work, having organized numerous clubs, and is always fortunate in holding the confidence of the many club women who are her associates. She completed her law course at the Washington College of Law of the District of Columbia, and has found her legal knowledge of great assistance in her public work.

Miss Boswell is connected with the National Civic Federation and during the winter will give a number of lectures before the women's clubs of the country for the Welfare Department of the Federation.

WELFARE DEPARTMENT

CHARLES A. MOORE, Chairman.

REST HOUSES FOR RAILROAD MEN.

PENNSYLVANIA'S PROVISION FOR THE WELFARE OF ITS CONDUCTORS, ENGINEERS, FIREMEN AND TRAINMEN.

By SAMUEL W. LATTA, Chief Medical Examiner.

VERY few persons, outside of the railroad people, have any idea what a rest house is or its purpose. I shall explain its origin and the benefits that are derived from it.

In its early days the Pennsylvania Railroad, like all pioneers, experienced great difficulty in not having its train crews where they could be reached readily when needed. This was particularly the case where the men were at the end of the runs and away from their homes. The idea was conceived, therefore, of having rest houses or bunk houses, and they constituted the forerunner of all the welfare work initiated by the company.

The first rest house, as far as I can learn, was established prior to 1875. There was an old hotel building in Philadelphia which our company bought, renovated and fitted up as a rest house for its freight men, that being then a terminus of the freight runs.

Special trains and extra sections of regular trains require special crews. There is no knowing when they will be needed. Emergencies arise, particularly in the night, and it is necessary to be able to locate the men quickly. Freight yards and termini are frequently located at isolated places distant from residential centers and difficult of access to boarding houses. Adequate accommodations are necessary for the crews, arriving and departing at all hours of the day and night, at prices within their reach. In instances, as in Philadelphia, as much as thirty thousand dollars was expended on such a house to allow the men all the comfort and health that is necessary for them to do their work properly.

In many cases the company has rented a room or rooms in private houses, and in some instances an entire house to ensure the comfort and welfare of its employees. In the large yards, situated distant from proper

A description of one of the rest houses may give a fair idea of them all. The house in Philadelphia, at 1605 and 1607 Filbert Street, is under the care of a competent number of necessary helpers to make the beds and keep the place plentifully supplied with bed linen, soap and towels, while a librarian looks after the library and game room. Over \$30,000 were expended on the site and furnishing of this house; it costs \$400 to \$500 per month for service, all paid by the company. Everything in this building is absolutely free to the men. The house contains reading, game and diversion rooms, a day bunk room, a room for day lounging, bedrooms, locker rooms, and so forth. There are seventy-two beds for night use; sixteen couches for day use; nine hundred eighty-three individual lockers, wherein the men hang their clothes; fifteen stationary washstands; and eight lavatories on different floors; the library contains 1,286 books circulating among the fam-

READING ROOM (Pennsylvania R. R.)

ilies of the men at the rate of three hundred a month; the games furnished are dominoes, checkers and chessmen; the reading room is supplied with Philadelphia and New York newspapers, and various weekly and monthly periodicals. One thousand men avail themselves daily of the privileges of this room; some of them on local runs visit it several times a day. It furnishes a delightful place for rest and recreation while waiting for duty calls. Any one can occupy a couch during the day. Any one desiring a bed for the night must register. He goes to the attendant in charge and states that he is going on duty on a certain train. His name is registered opposite the bed in which he is going to sleep, as well as the time and number of the train for which he is to be called. He is given a check for the bed, and when he goes to the room the colored man in charge allows him to occupy that bed. At the proper time in the morning or during the night he is called for his train. This

LIBRARY IN PHILADELPHIA REST HOUSE, (Pennsylvania R. R.)

accommodations, rooms are furnished with chairs and lounges for the use of the yard men. In large freight and transfer stations rooms in which to wash, and to keep and change their clothes, and places for them to eat their lunch are furnished. Some have reading rooms supplied with newspapers and periodicals.

At many isolated places where only one, or at best a few crews have a lay over, cabin cars are used for the freight crews. These are fitted with six bunks, a stove and utensils for cooking, and answer well as substitutes for rest houses. Every freight train has its cabin, and, whenever necessary, the crews can sleep in the cabin, provided with all necessary means of comfort.

GAME ROOM (Pennsylvania R. R.)

DAY BUNK ROOM (Pennsylvania R. R.)

building is sanitarily as near perfect as it can be made. The plumbing is first class; the ventilation is as near perfect as it can be with due regard to dangers of drafts. The beds are taken apart and bedding and rooms are thoroughly aired every day. Every effort is made to render these bedrooms absolutely clean, healthy and safe.

The Pennsylvania Railroad has a rule that everything provided on the road must be of a certain stan-

LOCKERROOM AND NIGHT DORMITORY (Pennsylvania R. R.)

dard; there are a standard track and standard trucks, and so in the rest houses there are standard beds. Each bed is a good iron cot with woven springs; and the mattresses are of excellent quality. The company pays special attention to the cleanliness and sanitary conditions of the rooms. The men take pride in going to them, and they show visitors around and comment upon what is done for their health and comfort.

In some places the rest houses are connected with the dispatcher's office by means of electric wires. Those for the wreck-trainmen are all connected in that way. The wreck-train houses are all the property of the company. The operator touches a button which rings a gong in each man's bedroom and in five minutes the train is on the way. (When at their homes the men are reached by callers, their residences being carefully

LUNCHROOMS (Pennsylvania R. R.)

kept in the trainmaster's office and every change promptly noted. When a train is to be made up, the caller is given the names and residences of the men and he calls them for that particular train).

At many places the rooms are only used for resting between hours of labor. Then they are equipped with chairs and tables, to make them convenient places for the men to eat luncheons brought from their homes. In some a cook stove makes possible hot coffee. In many small yards, such as are between here and Philadelphia—at Newfield Junction for instance—shanties are provided in which the men keep their clothes and lunch baskets. Each has a key to the building, which is kept locked.

At the large yards we have the big rest houses. Recently there were established very large classification yards at a point called East Altoona, where it was necessary to erect two rest houses. One contains a hundred fourteen bunks for the use of the engineers and firemen, and the other seventy-four beds for the trainmen. I will read you a quotation from a letter that I had from the superintendent of that division: "At East Altoona there are nine rooms fitted up for sleeping rooms. Each of eight of these rooms has eight beds, the ninth room, being somewhat larger, contains ten beds. The beds are made of iron and are single; they are all furnished with Ostermoor mattresses and springs; each bed has two sheets, pillow with pillow case, and blanket; there are a spittoon and chair furnished each bed and at the head there are three hooks in the wall on which to hang the clothes. There

DRINKING WATER CAN IN ENGINE (Pennsylvania R. R.)

This cooler is made of .80 inch tank steel; the inside covering is made of .022 inch galvanized iron and there is a space of $\frac{1}{4}$ inches between the outside and inside cases filled with granulated cork. The bucket fitting inside is made of .022 inch galvanized iron and has a capacity $3\frac{1}{2}$ gallons.

is matting through the center of each room and between each bed."

It will be seen from this that on completion of this yard the necessary provisions were made for the comfort of the men.

The needs of the men are closely looked after, and the same consideration for the care and comfort of the men is shown, whether it involves but one crew or more. On the lines east of Pittsburg and Erie there are fifty such places where two thousand men are given free beds every night. It is difficult to give the number of resting or loafing places furnished. Some seventy-five thousand dollars have been expended on furniture and over thirty thousand dollars are spent annually for maintenance. Now, the lines west of Pittsburg are gradually introducing the necessary bunk and rest houses at all points where they may be required.

The men must have means of diversion. Saloons coming into existence to supply it, gave rise to conditions from which serious results often followed and called for means to overcome them. Indeed the moral welfare of the employees, particularly the passenger and freight men, was a matter of great seriousness to the officials of the Pennsylvania Railroad from its very earliest days. The company has on its payrolls about two hundred ten thousand men, counting the lines east and west of Pittsburg, and its operated and controlled lines. To successfully conduct the business the morale of this great army of workmen must be at least above normal.

A clear brain is needed to safely operate trains freighted with precious lives and priceless commodities. In the furnishing of the rest houses, not only did the

WASHROOM AND Y. M. C. A. REST HOUSE (Pennsylvania R. R.)

company supply the essentials, such as the beds, closets for clothes, lavatories and restaurants, but it also furnished means for amusement, such as newspapers, periodicals, libraries, and games. Some of the houses have rooms fitted with mechanical appliances for instruction in airbrakes, and injectors, and instructors are provided to teach the men. This instruction is very useful, for they have to apply that knowledge in their work, and every man who uses them has to undergo examination in the use of airbrakes.

From a small beginning the rest houses have grown to what they are at present. Some of them are managed entirely by the company, others by the men themselves, and some are under the care of the Railroad Y. M. C. A. Some of them furnish beds free; others charge a nominal sum, like ten cents a night for the bed, and food is furnished in the restaurants at cost.

Arrangements are made at some places with private parties to furnish meals at small cost within the means of the men. Where that is not possible the cabin car,

Y. M. C. A. REST HOUSE AND HOSPITAL ON ONE OF THE GOULD LINE

equipped with cook stove, utensils and means to prepare food and hot coffee, is provided. At points, such as on the Philadelphia, Baltimore and Washington division, in addition to the bunk rooms we furnish a cook house. This is not unusual where the terminus is at a distance from places where board can be obtained.

In Broad Street Station, Philadelphia, there is a railroad men's dining room, at which a first-class meal is served for fifteen cents. Any employe in uniform can go there and get his dinner. He gets roast beef and two vegetables, bread and butter, dessert and coffee for fifteen cents. So along the road, scattered all over, wherever there are restaurants under the control of the company, special rates are made for trainmen. On a dining car the conductor and crew can get a dinner for twenty-five cents, such as you will receive at a dollar.

The company realizes that anything which provides for the physical and mental welfare of the men, rendering them more content, not only benefits the men, but also the company, in that it receives from the employes better and more loyal service. Where men have left the employ of the Pennsylvania Railroad, engaging with some other company under different conditions, they have returned to our company. An experience of more than twenty years with the railroad has convinced me that the company receives large returns on its investment by the excellent service received from its men and the loyal support that the employes delight in giving.

Interrogations and answers follow:

Q. Is there any compulsory element? Are the men compelled in any way to use the restaurants and rest places?

DR. LATTA: They are obliged to be where the company can put its hands on them. We never had any one raise objection to occupying these rooms, especially when they are free; but I do not think they would regard it as compulsory, except in so far as we want to have the men where we can put our hands on them. If they choose to take board at outside places we do not object. We simply provide these places and, if they choose, they occupy them.

Q. Why do you charge for lodging in some places and not others?

DR. LATTA: I don't believe I can answer that question; I don't know why it is done. I know it is a fact. In some places the houses are managed by the men and are located at the request of the men. It may be that the house is not absolutely necessary there, but is put up for the accommodation of the men, at their request, and they manage it. We provide the heat and light in all cases. I would like to say in this connection that I do not think our men approve of houses not under the control of the company, if it can be helped. I know they would rather that the company or they should manage them than the Y. M. C. A. One of the reasons is that the men they send there to handle them are not experienced; they are not familiar with railroad men. You have to learn to know railroad men—they are not like other people in a great many respects; you have to learn their peculiarities and know how to meet them. A branch Y. M. C. A. is established at some point and given charge of a rest house, and they send some young fellow out there as secretary who doesn't know anything about railroad men; he doesn't know railroad men and he has to learn, and the men don't like that. I suppose one reason is that the company does it for nothing; the company does a great deal for nothing. But no scheme for the benefit of the masses will succeed without responsible organization and competent management. Such essential features have marked the successful progress of the institutions of the Pennsylvania Railroad.

HOW THE RAILROAD MEN REGARD SUCH CONVENIENCES.

Not long ago a locomotive fireman, while in New York City, expressed great enthusiasm for the work of the Welfare Department of The National Civic Federation, but he feared that the railroad workers of the country would perhaps be overlooked by the department, and he had many convincing things to tell as to why special interest should be taken in the work of railroad employes. He said:

"In this railroad world of ours there are a great many men working and working hard for a living, and particularly with engines. As the conditions are which confront the men continuously in this great service, there is one crying need, and that is rest rooms, places where the men can go while waiting for the return of their engines to their initial starting point, that they may have rest sufficient to give them the life that is necessary for them to carry on their work. The rest room should be a place sufficiently warm and equipped with the necessary arrangements to bring comfort to the men, in the way of bathrooms, shower baths, and also individual washbowls.

"When I speak of rest rooms, I mean rooms where bunks could be furnished for the men who have from two to five hours of uncertainty when they are waiting to return with their trains. They should be near the terminals so that the men could be spoken to at any time that it might be necessary in the way of calling them to their work. Some roads have such

houses. The Central Railroad of New Jersey has several bunk houses. They have nice, clean cots, and all the facilities in the world for the men to lay over from 12 to 24 hours. They have nice stoves and there is an opportunity for the men to do their own cooking. This is one of the roads which has provided in this way for the comfort of their men.

"The Pennsylvania Railroad does so well by its employes that they are always contented, for they get everything they need. It used to make other men feel bad to think that the Pennsylvania men got everything and we on the other roads got nothing, but other roads do something now. The C. B. & Q., the C. & N. W., Grand Trunk, Union Pacific, Southern Pacific System, Santa Fe System, Central Railroad of Georgia, and the St. Louis & Southwestern Railroad have some rest houses.

"The need for these rest houses is continually felt. I had a remarkable experience last December at one station which is a new freight terminal. Of the six houses at that place, I found four were saloons and two were large boarding houses. All the employes—five divisions—put up in these houses—sixty crews. I never saw such a drunken lot of men in my life. They threw their money away in these saloons, because there was no other place for them to go to cat or sit down. In another town I think it is not too much for me to say that every dollar that the men earn goes to the saloons, because the only places where they can get lodgings are the saloons. As only railroad men go into this particular town, it is very evident that the saloons get their patronage only.

"There are roads in this country where the men start out and do not get back home for a month.

"The men start from *a* and go to *b*, then they go from *b* to *c*, then back to *b*, and from *b* to *d*, for instance:

"There is no use in this sort of thing. The company could manage so that the men would not be away from home so long. It is a matter of arrangement. The Pennsylvania Railroad has a very different method, and it is just as easy to arrange the runs as they have arranged them. The men are often kept out longer than they should be because the motive power has run down and the railroad companies have not kept it up properly. One reason why the work consumes so many hours is because the engines are so large and the fuel is of poor quality, being mixed with snow and dirt often in bad weather."

That the life of the fireman is a hard one and that he needs all that can be done for him in the way of welfare work is graphically shown by another fireman: "Where the men work fourteen hours a day they have the best jobs. My run is 165 miles every day six days in the week. It is one of the good jobs. Only 17 per cent of the men can 'hit the ball,' that is, stand up and do their work. It is only recently that the work has been so hard—all in the past six years. In many of the large engines in the West the fire is so hot and the space so narrow that many of the men require leather blankets from the waist to the knees to protect them—to keep their clothing from burning. The men are subjected to extreme heat and extreme cold. It is said that only one man in six who enters the position of fireman ever becomes an engineer; five fall by the wayside because health fails, or the eyesight is affected from the intense heat and looking into the bright light.

"Railroading has been revolutionized in the last six years and all the work lightened except that of the fireman. That has become almost unbearable.

"THE WAY SOME MEN WASH IN ALL KINDS OF WEATHER"

"THE FIRST THING A MAN WANTS AFTER LEAVING HIS ENGINE IS A BATH AND A GOOD SQUARE MEAL"

"Seventy per cent of the men are in the freight service, where the runs are long and uncertain. It is not unusual for them to be out fifty hours, and in extreme cases they have been on duty as many as seventy hours, so you see their comfort especially requires consideration. One of our worst accidents occurred where the engineer on a freight train, who had been on duty thirty-two hours without rest, went to sleep while waiting on a siding for a passenger train to pass. His crew left the train and it slipped down on the main track and was struck by the passenger train."

One of the "crack" engineers of the country, who ran a fast train for twenty years, tells that many of the men lie down in their engines to sleep.

"Many a time I have slept alongside of mine on the ground. Often the men lie on the hot sand at the roundhouse or in the sandhouse or a handy box car in warm weather will offer the best accommodations.

"One very great need has been a place not only where the men could rest, but where they could clean up and were welcome. Most of our men come in from 8 to 12 P. M. and there is no place to go except the saloons. They are always welcome there.

"In a certain town in Indiana of 900 inhabitants there are thirteen saloons in full blast. In an Illinois town of 3,000 population there are twenty-two saloons. Both are railway terminals. There is not even a place for a man to wash his dirty face and hands when he comes in tired.

"On many roads as soon as the men ask for any conveniences for their comfort the reply comes: 'We pay so much for so much work.' We try to make an employer see it is the best investment which he can make because, if a man coming in from a good hard trip can get a bath, he is refreshed, but if he does not get a chance to change his clothes, a chance to bathe, and a chance to sleep, he starts out again tired. The first thing a man wants after leaving his engine is a bath and a good square meal.

"At many terminals, if the men come in after midnight there is no place to go except the saloons to get a bite to eat. There is a piano going in each saloon

A MODEL WASHROOM WITH VENTILATED LOCKERS

NEW MEXICO REST HOUSE NAMED BY THE MEN, "ROSE COTTAGE"

and it is very attractive to the men. After thirty or forty hours on the road a man has a bad taste in his mouth. Nothing looks well to him. The world is all wrong. Then, if he can get something dainty and well cooked to eat he feels quite different.

"The men worked three years to get a building on a certain road on the promise that one would be put at every terminal if this one should succeed. The company put \$12,000 in that building alone. The environment was beautiful and it was a nice building, but it was wretchedly managed. For instance, there was a running brook, and it would have been easy enough to have thrown the refuse into it, but it was simply pitched into the yard, emitting an unhealthy and disagreeable odor.

"Then a man would get dirty coffee which had been boiled all day, tough steak and some potatoes that had been cooked in cottolene. He knew exactly what he would get three times a day if he went there. Every Sunday we had chicken for dinner. A man would bet \$10 that he would get a wing. I don't know how many wings the chickens had, but I never got anything but a wing!

"In that building they put in nice shower baths, six tubs, a reading room, library, gymnasium, game room, restaurant and beds at ten cents, but they put a young fellow in charge who was entirely unfitted for the position. At first 165 men went there to rest and refresh themselves, but this man did not keep the place clean. The food was not cooked well and the men were made to feel that they were in the road all the time. That grinds in on the soul of a workingman more than anything else.

"It grew worse and worse, and finally the beds were not even made. We got into beds that were not changed sometimes for a week. After a few rounds like that the men said, 'If we have to live in dirt, we might as well go back to the saloons.' Inside of a year that building, which we had tried so hard to get and which had so much that could have been made of benefit to the men, was wrecked purely through mismanagement by the man put in charge."

Another fireman makes a special plea for drinking water. He says: "The men should have cans on their engines for drinking water. They have them on the New York Central. I asked for water cans, and the superintendent said, 'What is it that you firemen don't want?' On another road the company was asked to provide water cans for all engines and to furnish ice

"A CAGE IN THE BUNK-HOUSE YARDS OF THE SOUTHERN PACIFIC RAILWAY at an Arizona terminal. Well adapted to the warm climate. Legs of cage in cans filled with water to prevent entrance of bugs. The cages are made of screen on account of mosquitoes and because it is much cooler for the boys to sleep out of doors down on the desert. The men have washstands and bathtubs."

between the months of April and November. The general manager read that paragraph in the proposed contract and said, 'Furnish water and ice coolers! Why not ice cream through the months of July and August?' I told him that would be satisfactory. I got the coolers but not the ice. If the men do not have water they go and fill up on beer at the end of the runs just to quench their thirst."

In regard to rest houses, the fireman says:

"A bad feature about these places generally is that there is no attendant. Wash rooms and lodging rooms are not kept as clean as they should be. I went into one boarding house where a man had died and the room was given to another man without even changing the bed. There should always be an attendant to see to it that the bedclothes are changed. Consumption largely comes from the fact that it is contracted from the bedclothes. In the last four years our death and disability rate has shown a great increase of consumption.

"On our road, with the exception of a bunk room, in one city, which is not near the terminal, the men have no place to sleep except in stock or waste rooms, which are damp and cold. The men simply lie on the floor, with not even a cushion for their heads.

"The men should also have a place to keep their clothes and the rest house should be near enough so they can get to the trains easily. They cannot carry clothes in the engine, especially if the engine cabs leak.

"The work of the firemen is very dirty and frequently they have no place to wash up. They usually have to eat in all their dirt. In one of our round-houses the men have a small trough with cold water, right out in the roundhouse, but they cannot use this because it is so exposed. They would be obliged to remove some of their clothing in order to wash themselves satisfactorily. Being overheated, they cannot do so except in warm weather, because the roundhouses are cold, and the men would be compelled to disrobe almost in the open air. Besides, the wipers use the wash place in the round house and the water is never drawn—no pretension being made to keep the trough clean.

"Up to two years ago they used to give two pounds of waste a day to clean our hands and now we only have a quarter of a pound a day with which to clean the engine and our hands and faces. It won't do for the fireman to give his engineer any,—he can't spare it! You are supposed to clean your engine. You have to do that! As for wiping your face with it, it is out of the question!

"Another great reform in this work would be if all railroad companies would institute lunchrooms or eating places along the lines where it would do away with the necessity of men carrying food that they are compelled to retain in air-tight pails from ten to fifty hours. Surely after fifty hours this food is unfit to eat."

Another engineer says:

"All engineers and firemen know that the great needs for the betterment of their labor conditions are decent places to sleep, wash, eat and have some simple recreation as an offset to the enticements of the saloon. The continued change of officers on railroads in the last six years has had a tendency to prevent greater improvement in conditions. Every man in the operating department does everything possible to curtail expenses, but even where they are desirous of introducing these beneficial features for the men they have no time to consider them."

A MODEL HOSPITAL CAR.

The hospital car of the Erie Railroad is provided for use when, in case of an accident, passengers or employees are injured and the nearest hospital is so far away that operations on the spot become necessary to save life or relieve suffering. It has been pronounced by surgeons to be the most complete and perfect hospital equipment possible in a car.

THE ONLY PLACE OF SHELTER FOR THE MEN UPON WHOSE ALERTNESS PUBLIC SAFETY SO LARGELY DEPENDS

The car, which is 60 feet long, is divided into two compartments. It has an operating room 15 feet 10 inches in length equipped with an operating table having a movable head and foot extension in the center, an instrument sterilizer on the right and a surgeon's basin on the left. The car also has two lockers fully equipped with surgical instruments and stocked with bandages, plasters, sponges and all anesthetics, antiseptics, astringents and other medical and surgical necessities. Sliding doors four feet wide on either side with portable steps permit an easy entrance with a stretcher to the operating room, which has six windows, two windows in each door and a large window in the roof over the operating table. All are of ground glass and provided with white rubber roller curtains. Two 4-flame acetylene gas lights, a single flame over the wash basin and a portable lamp furnish light in the operating room at night. A gravity water system to furnish both hot and cold water from tanks just under the roof of the car is provided. The flow of water can be regulated by a surgeon with a valve operated by the foot, thereby avoiding the necessity of handling any of the equipment. Head lining and inside finish are of a composite board entirely without beading, molding or carving which might serve as places for the collection of infectious matter. White enamel paint is used as a finish and the floor is covered with white rubber tiling.

Two sliding doors with ground glass windows lead to the ward-room. It is 43 feet 4 inches in length, and equipped with 11 brass bedsteads, a lavatory and saloon. It has white rubber tiling on the floor, composite board sides, painted in white enamel, and white rubber curtains between the beds, which are provided with spring and hair mattresses, rubber sheets, and bed clothing. Equipment boxes underneath the car are provided with crutches, splints, army stretchers, surgical implements, wrecking tools, and other accessories.

There are six-wheel trucks, insuring the utmost freedom from vibration, on which rests the steel under-frame. Steel platforms at either end of the car, with gates which can be closed against the curious, are provided. Three-stem couplers and draft gear ease the movement of the car.—*Erie R. R. Employees' Magazine.*

INTERIOR OF HOSPITAL CAR

"DUGOUTS." THE WAY SOME RAILWAY MEN SLEEP IN NEW MEXICO ASLEEP IN HIS ENGINE

THE FEDERATION OF LABOR IN POLITICS.

(Continued from page 9)

neous, and unnecessary, and they have no function to perform. In so far as writs forbid acts which the law does not forbid they are erroneous and their future issuance should be prohibited." In demanding anti-injunction legislation, Mr. Gompers states that organized labor asks for nothing extraneous, nothing that is unjust or improper. He says: "We want no immunity from the law for any crimes or unlawful conduct of which any man in the labor movement may be guilty. I grant you that here and there some man may be gathered into the fold of a union of labor who, either from a perverted mind or from wrongs which he has suffered elsewhere or here, may do a thing which no man can defend and which no union man will defend. But you must bear in mind that the organized workmen of America have not always the choice of material."

VIEWS OF EMPLOYERS' REPRESENTATIVES

In addition to the position advocated by representatives of the railway brotherhoods and that taken by the American Federation of Labor, and opposed to these two, is "the other side." This latter is that held generally by employers, and it is in favor of the *status quo*. In advocating this policy before the House Committee, Mr. James A. Emery, representing the Industrial Citizens' Association of America, and other employers' organizations, expressed his belief that "in its actual effect upon the protection of property and personal rights, which we believe an equity court contemplates, the ultimate effect of such legislation, with the moral weight which it would have upon the legislatures of the States, considered merely as a matter of expediency, would be a course of very serious danger by the withdrawal of effectual remedies, adequate protection, which these courts have given during all the time that Federal courts in the operation of Congressional legislation have had jurisdiction of these matters, and would also operate to affect the action of States dangerously."

Because the power of injunction has been abused by the courts is no argument, he claims, for taking away that power, and he states that it is an exceedingly dangerous position to make the chief argument directed in favor of the proposed legislation the abuse of discretion upon the part of Federal judges. He says: "The powers of the court in existence at the present time have been very frequently used because there has been very frequent occasion for their use. There has been an occasion to protect property by virtue of the right of injunction, and of personal rights involved because of the fact that a continuous attack has been made upon those personal rights; and this is not merely the view of the persons who, by virtue of their interests in the offered legislation, might be assumed to be prejudiced, but it is the view of members of the judiciary, of public men who have had occasion to make themselves familiar with the facts, and of tribunals of a moral character, which from time to time have had an opportunity to present their views upon the question."

"In a labor dispute it is continually laid down as though that were a dispute by itself or was to be governed by different rules in morals and in law; that a man has a right to go to another who disagrees with him as to the advisability, the expediency, or the justice of the strike, and on the streets, in the cars, wherever he finds opportunity to approach him, to keep insisting upon his view and compelling the other to accept it. Gentlemen, if we did not have any other jurisdiction of the equity courts except to restrain a nuisance it would at least seem under that that not only was it necessary that such a power should be exercised to restrain it, but it would be exceedingly unwise to adopt legislation that would seem to prevent the issuance of an injunction to prevent the annoyance of another."

"Legislation that would have as its purpose the deprivation of Federal courts of that power which they possess to-day to fit the remedy to the wrong would be a long step in the direction of taking from the courts and throwing into the field of politics, if you please, the essential principles upon which the Republic itself is founded, and those essential principles, the protection and vindication of which are not merely necessary for the protection of this Government, but of all government and all civilized society—the right of a man to work, the right of a man to sell his labor, the right of a man to enter into a labor market and buy labor offered freely and willingly to him, the right of a man to live his life free from annoyance, the persecution, the intimidation, the coercion, and even the undesirable persuasion of others—is a right that partakes of the very essentials embraced in our Declaration of Independence—the right of life, liberty, and the pursuit of happiness—which principles were laid down by the fathers of our country, as the essential things upon which the Republic rests."

Another bill which representatives of the American Federation of Labor supported before the House Committee is entitled "A bill to regulate the issuance of restraining orders and injunctions and procedures thereto, and to limit the meaning of 'conspiracy' in certain cases." According to the provisions of this bill no restraining order or injunction is to be granted in labor controversies unless necessary to prevent irreparable injury to property or to a property right for which there is no adequate remedy at law. It is further provided that "for the purposes of this act no right to continue the relation of employer and employee, or to assume or create such relation with any particular person or persons, or at all, or to carry on business of any particular kind, or at any particular place, or at all, shall be construed, held, considered or treated as property, or as constituting a property right." In Section 2 of this act it is provided that no "agreement between two or more persons concerning the terms or conditions of employment of labor, or assumption, or creation, or the termination of any relation between employer and employee, or concerning any act or thing to be done, or not to be done, with reference to, or involving or growing out of a labor dispute, shall constitute a conspiracy or other criminal offense, or be punished or prosecuted as such, nor shall the carrying out of any such agreement be restrained or enjoined, unless the act or thing agreed to be done, or not to be done, would be unlawful, if done by a single individual; nor shall the entering into or carrying out of any such agreement be restrained or enjoined, unless such act or thing would, if done or not done, be of the character described in the first section of this act."

ARGUMENTS FOR AND AGAINST THE FEDERATION'S BILL

Mr. T. C. Spelling, who appeared before the committee as the representative of the American Federation of Labor, stated that this bill was submitted as a substitute for the other bills which the representatives of the Federation had been supporting. The presentation of testimony and the discussions following the submission of this bill centered largely around two points. One was whether the right to do business was a property right, and the other related to the constitutionality of the measure.

On the first-mentioned point, Mr. Spelling argued that no man has anything resembling a property right to carry on business of any kind, or to any extent, anywhere in the world. He claims that a property right is nothing distinct from property. The great dividing line, he says, is between personal and property rights. The right to carry on business is not, in his opinion, a property right when it is divorced from the question of good-will in a particular business. He claims that it is not a fair assumption that any State has decided that the right to do business is property. It is not a final settlement of the matter even if one State or more than one State has done it. He believes that Congress has power to say that the right to do business shall not be considered or treated as property for the purpose of this act. He says: "This being an act to regulate, or limit, the use of Federal process, the questions of the property right under State laws and views of State courts have no relevancy. Congress either has this power or it has not. If it has the power, this enactment is a supreme law of the land. There is no question whatever of a taking of property without due process of law. To say that 'for this purpose' certain things shall not be 'considered, held or treated' as property, is merely to set a definite limit to the power to issue certain extraordinary court process. It is no infringement upon any property right nor the impairment of any State law, nor the invasion of State jurisdiction. Any State courts which hold the right to do business to be property may adhere to that view and enforce it, because we cannot by this or any act control the jurisdiction of functions of State courts." He claims that what is sought under this bill is the lopping off of unwarranted judicial extension of the words "property," or "property right," and "conspiracy." He denies the claim of opponents of the measure that the right to labor is property as much as he denies their claim that the right to do business is property.

Opponents of the measure, most of them representing associations of employers, contended before the Committee that the right to do business is a property right, and it was claimed that the enforcement of such a measure would be in effect to deprive a person of property without due process of law.

Walter Drew, Esq., representing a number of Citizens' Alliances, says the first thing the bill would take away, if it became a law, would be the good-will of the business, "a species of property which in this country is sacred, inviolate, and is protected by our courts." He states that every court, State and Federal, announced the doctrine that good-will is property, subject to contract, to be bought and sold and dealt with as any other species of property. He claims that the right to assume or create the relation of employer or employee has become an established doctrine of our courts, mainly at the instance and behest of laboring

men themselves that labor is a commodity to be bought or sold in the open market like any other commodity, and that the right to buy and sell it is a property right, like any other property right, to be protected by our courts. He claims that the bill not only confiscates property, but confiscates the highest kind of property. "As well attack our system of credit," he says, "as to attack the good-will of our business institutions."

Mr. Daniel Davenport states that the measure "assumes by act of Congress to declare that to be not property which by the laws of every State in the Union—I state it without qualification—is property within the meaning, or, as the term is used, in legal and equitable proceedings, and under the recognized system of jurisprudence in force in this country." He claims that any attempt on the part of Congress to declare that which by the laws of the several States is property, shall not be property, when it comes to the question of whether it should be protected by the courts, would be an unconstitutional exercise of authority by Congress.

LYMAN ABBOTT ON SOCIALISM.

DR. LYMAN ABBOTT, editor of *The Outlook*, in an editorial on Socialism, explains what he considers to be its spirit, doctrine and method. After stating that *The Outlook* is in hearty sympathy with the spirit and largely in sympathy with the doctrine of Socialism, Dr. Abbott dissents from its method. On this point he says:

"We dissent from the method and to some extent from the doctrine of State Socialism—that is, of that form of Socialism which would make the State the chief if not the sole employer of industry—for two reasons:

"State Socialism assumes that the evils of society are primarily in the organization of society; so that if the organization were changed, the evils would disappear. In fact, society never will be better than the individuals who compose it. A sound ship can never be made of rotten timber. Individual reformation and social reconstruction must go on together.

"State Socialism assumes that all functions of society should be carried on by one organization, name-

DR. LYMAN ABBOTT,
Editor of "The Outlook."

ly, the State. In fact, society can better perform its various functions by separate organizations. Putting the Church under State control did not make a free Church. It is more free since it has been taken out from State control. Putting industries under State control would not make the industries free. The industries of the free State of Congo are under State control, and industrial despotism is nowhere in the world so bad as it is in the free State of Congo. The Socialist replies that Socialism assumes a democratic State to organize and carry on democratic industries. But in assuming that the State will be democratic when the strong men of the State are incited by covetousness as well as by ambition to control the State, they assume as true what history proves to be false. To take industry out of the hands of a Carnegie and put it into the hands of a Croker would not make industry free, although Croker were kept in power by popular suffrage and Carnegie were not.

"In estimating the value of Socialism the student should keep clearly in mind this distinction between its spirit, its doctrine, and its programme. He should not be ready to accept its programme merely because he believes its doctrine and admires and shares in its spirit."

THE LITTLE MOTHERS' AID ASSOCIATION.

A MOST PRACTICAL AND SUCCESSFUL EFFORT TO LIGHTEN THE BURDENS OF WOMEN AND CHILDREN IN TENEMENT HOUSES.

By HELEN VARICK BOSWELL.

DICKENS put a great deal of wisdom into the mouth of his quaint character of Chops the Dwarf, and Mr. Chops remarked on one occasion anent Society: "It isn't so much that a person goes into Society, as that Society goes into a person." That is about the way it is with Philanthropy and Mrs. Clarence Burns. She didn't deliberately go into philanthropy, but it went into her so deeply as to take root and blossom forth in the most beautiful welfare work that has ever come to cheer the hearts and better the condition of little daughters of the wage-earning women of the tenements, who have thrust upon them by sad necessity the cares and responsibilities of the mother, when she leaves them to look after the smaller children while she is earning the wherewithal to feed and clothe them.

The Association, of which Mrs. Burns is president, has named this child "The Little Mother." You may see her in the streets, alleys, backyards, and on doorsteps, caring for the baby, amusing her toyless flock as best she can, and you pass her in the street as, with basket or bucket on her arm, she carries food, fuel or beer to her family. Her tiny hands do the cooking, scrubbing, washing, mending; her little feet run the errands and after the toddling babies all the long, weary day.

These children are robbed of childhood's natural heritage of joy—they are unpaid laborers, about whose hardships no sensational writers are filling pages in the magazines, though they are often dwarfed and deformed by burdens too great for their years—but burdens which are cheerfully borne. The other day I noticed one of the little mothers trying to join a group of children who were following a piano organ. The other little girls were dancing and running, and doing all the things she wanted to do, but there around her neck were the arms of that Moloch of a baby—a regular Old Man of the Sea. If she could just follow along and hear a little of the music was all she hoped for, for you can't dance or run carrying a baby, and such a thing as deserting it never entered her loyal little heart. Her faithfulness is often pitifully demonstrated when she is relieved of the burden for a little while and taken out to Holiday House at Pelham Park for a week's rest. Recently a little deformed girl there was asked why she wakened so early in the morning, and why she did not seem to be enjoying herself more, and she timidly said that at six o'clock she always commenced to worry some, thinking of her mother who started out then to scrub offices, and wondering how the other children were getting along without her. She herself had reached the advanced age of nine years.

Another little girl of twelve, also very wakeful in the early morning, told the attendant she was used to waking early, because in hot weather she always got up at four o'clock and took the baby out and wheeled it about from four to six, so it could get some cool air—at six she came in to get breakfast for the others. Oh, those "others," who are always on the faithful Little Mother hearts. Many of these little girls never get any rest until illness actually overtakes them, and they are sent to the hospital. One of these recently told Mrs. Burns, who was visiting her, that it was the "first rest I've ever had"; and like Little Dorrit's poor Maggie she thought an "orspital was a 'cavinly place!"

Now what are some of the practical features of the work which Mrs. Burns and her associates are doing to lighten the load of the Little Mothers and to fit them to do more easily the things they have to do, and later to become useful members of the community?

In the first place the Little Mothers' Aid Association ranks among the five biggest charities of New York City, and while called a charity, and though much money is given to carry on its uplifting work, yet there is no question of pauperizing in the bounty bestowed by it. No child is made conspicuous by her needs, and self-respect and ambition are stimulated. By promptitude, diligence, kindness, every Little Mother can earn a certain number of good marks at each lesson which she attends at the several houses conducted by the Association, and as these accumulate she is enabled to purchase from the clothing department articles sufficient to supply her wardrobe—she is a purchaser and not a pauper. Fifteen good marks can be exchanged for a pair of stockings, twenty-five for underclothes, sixty for a dress, eighty for shoes. For these marks she gets a certificate, which she uses to make her purchases, and while it might not be exchangeable for silver and bank notes at the United States Treasury, it is a standard medium of exchange at the Little Mothers' Aid Association. Instead of personal things, the marks will buy cooking utensils, and soap and other things for laundry work—and the un-

MRS. CLARENCE BURNS,
President of the Little Mothers' Aid Association.

selfish "little women" spend many marks in articles of this kind.

The establishments at which the work is carried on are "Happy Day House," 236 Second Avenue, Manhattan; "Pleasant Place," 16 Greenwich Street, Manhattan; "Up-town Branch," 108 Lawrence Street, near 128th Street, Manhattan; "Sunny Side," 84 Pacific Street, Brooklyn.

At each of these houses "Homemaking Circles" are maintained where the Little Mothers of the neighborhood are taught to make and mend their clothes, to purchase, prepare and serve food in an economical, wholesome and appetizing manner—to fix up something really good for "Papa's dinner pail" that doesn't cost any more than the things he used to buy; to care for their health and that of the household. Singing, calisthenics and recitations are also taught. The marked improvement in the morals and manners of

"LITTLE MOTHERS."

the children in these localities has proven the value of the individual training received. Many instances are on record where through the influence of the Little Mother who is getting the benefit of such training, temperance, thrift and integrity have been permanently established in homes, and bad habits overcome with good.

The sewing and laundry classes are always well attended and the cooking classes, needless to say, are

always full, for the children "eat up" all the plain but good things which they are taught to cook and no feast of Lucullus was ever half so well enjoyed. The teaching of these industries is adapted to the needs and limitations of the humblest homes. Inexpensive decorations for the family table are suggested that beauty as well as thrift may be fostered in the home. Take the record of one year for instance: From October to June 1,568 meals have been served by the cooking classes; in the sewing classes 10,482 lessons were given to the eager little maidens.

At the several houses, the small brothers and sisters are gathered daily in the day nursery while their Little Mothers are learning to be more useful to them. These little ones are clothed and fed and bathed, and kindergarten games are played, and they are a happy lot.

The bright rooms of these houses, where the children, often for the first time in their lives, experience the gracious influences of home and instruction, are a happy refuge from the storms of winter and from the stifling heat during the summer months.

It takes much time, thought, and executive ability to keep such a work going and to aim always to enlarge its beneficence. There are no salaried officers. The only ones paid are the servants, the superintendents and the cooking teachers. A woman physician volunteers her services and goes at certain hours to the houses where the girls can consult her, and often visits them and their families in their tenement homes.

This Association was organized years ago by Mrs. J. H. Johnston, who is its honorary president. Mrs. Burns is the active and untiring and energizing force of the work at present, and her associates marvel always at the amount she accomplishes. No woman in all New York City better knows the needs of the poor, no woman is more thoroughly en rapport with the lives of the tenement dwellers, but years of such work have only sweetened Mrs. Burns' faith in humanity, and belief in the institutions of America. She knows the uplift movement of the times, for she helps to make it, and in herself and as exemplified in the Little Mothers' Aid Association, brings a living refutation to the wails of the Socialist that "whatever is, is wrong."

There is need for a great fund to carry on this work, and every year a bazar is given at the Waldorf-Astoria for which hundreds of interested women work unceasingly, and which nets thousands of dollars. Individuals often do much to give joy to the Little Mothers. Mr. Frank Tilford celebrates his own birthday by giving an excursion to Coney Island each year to seven hundred of them. He gives Christmas festivals to hundreds, and Easter and other holiday festivals are held. At Easter each child is also given a potted plant, which is a source of much interest to the household.

During the past summer 6,335 children were taken on outings. Many ailing and crippled children are kept for weeks at the summer home, Holiday House, Pelham Park, where good food, sunshine, air and proper exercise have done much toward restoring health. Often women of wealth invite to their country places twenty or thirty of these Little Mothers for a visit, and the various Guilds and Fresh Air Funds also help the work.

And the efforts of this Association are not confined solely to the Little Mothers—there are also two clubs designed for the recreation and culture of the parents of the Little Mothers. The afternoon and evening meetings of these clubs are well attended; socially and intellectually they are more than successful, and many are the kindly little deeds done by the parents to show their appreciation of what the Association is doing. So from aged grandparents, of whom quite a number come under the influence of the work, to the infants of the Ex-Little Mothers, of whom many are included, the Aid is a daily blessing and lives up to the motto it teaches the children:

"To do all the good I can,
To all the people I can,
In every way I can."

[The Little Mothers' Association, whose work is described in this article, is fortunate in having as its president one who has led in many other successful endeavors—Mrs. Clarence Burns. Mrs. Burns has been active, among other things, in the women's clubs, in urging the establishment of industrial schools, and is at present organizing a movement to establish a hotel in New York for working girls. As the recently-elected chairman of the Industrial Committee of the General Federation of Women's Clubs, Mrs. Burns represents the combined efforts of eight hundred thousand women to better the conditions for women and children.—The Editor.]

A TRADE UNIONIST'S OBJECTIONS TO SOCIALISM.

REASONS FOR ORGANIZED LABOR'S HOSTILITY TO "AN UNTRIED, IRRATIONAL, UNDESIRABLE, IMPOSSIBLE, NON-UNDERSTANDABLE THEORY."

IN the five recent issues of the *Coopers' International Journal*, the official organ of the Coopers' International Union of North America, an interesting discussion has been carried on by the editor and certain members of the union on the subject of socialism. It appears that in this union there are a number of socialists who, following out the policy of "capturing the trade-union movement by boring from within, attempted to use the *Coopers' Journal* for free printing and distribution of socialist propaganda. They proposed an amendment to the constitution of the union "to open the *Journal* to a discussion of socialism, giving its advocates equal space with its opponents," which proposition, by the way, has been overwhelmingly defeated. Pending the final vote on the question by the union, the editor voiced the sentiments of the conservative members in a series of articles from which we quote the following extracts. After the preliminary statement that the editor was, for a brief time, a member and secretary of a socialistic section and that "it is due to an impartial study of the subject that he is not now in the socialist ranks, the editor of the *Journal* says:

"No two understand socialism alike. It is not a science, it is an untried, irrational, undesirable, impossible, non-understandable theory which never has been a reality and never will be. As a political threat it may at some time have an effect for good in broadening and liberalizing the policies of dominant political parties, but as to its hopes of overthrowing the present form of government and substituting itself as a government, that will simply never happen, and the man who bases his hopes on such an absurdity is to be pitied for wasting his life's energy in a cause that is hopelessly lost from the very beginning. The American people want a system which offers reward for and opens opportunity to energy, thrift and talent. Whatever claim may be made by the socialists, their theory when analyzed offers nothing of the kind. It is calculated to discourage the possessors of these sterling qualities.

"If the time, money and energy spent in advocacy of this will-o'-the-wisp was devoted to the cause of trade unionism, which is striving every day of the year for actual reforms and improvements in our day and generation, the defects in government could be overcome, and there would be less oppression and more comforts for those who earn their bread in the sweat of their brows here and now. If a socialistic government were instituted to-morrow, we could not get rid of selfish men. We could not hang the selfish for there would not be rope enough. Since we could not get rid of them under a socialist government, it is safe to conclude that as the greedy and the selfish prey upon the less intellectual now, so would they do under socialism. 'If man's inequality is wrong,' says the *New York Mechanic*, 'then find fault with man's Creator.' Socialism cannot cure imperfections created in God's wisdom, and, moreover, men are being born and will continue to be born into the world with these imperfections every day. There being nothing in socialistic theorizing, therefore, which promises to cure man of inequalities and imperfections to which he is heir by nature, it fails, because it approaches no nearer to the seat of man's imperfections than does our present or any other form of government.

"There never was a time in any country when all the people could unite in one political or religious faith. The working people of America, however, regardless of political or religious leaning, can be united in the belief that the hours of labor are too long and the remuneration too small. It is possible for all of them, or at least a great portion of them, to be united on this issue regardless of political or religious differences.

"If the socialists are granted the right to inject their politics into the union, the Republicans and Democrats must have the right to inject theirs. If politics may be injected, so may religion, and if an effort is to be made to inject all these creeds and theories into the trade-union movement, the end of the labor movement is not far off. Instead of being a nation of united working men and women, this would be a nation of political and religious factions, each seeking to undo what the other is striving to do and neither of them accomplishing any good. The man who would steer labor's ship upon the rock of political and religious disaster is not a safe pilot and those who hope for smooth sailing in the labor movement had better beware of such piloting.

"Socialism analyzed means, if it means anything, governmental control of everything, which carries with it abolition of the individual initiative and individual liberty. The history of all countries and all governments, including our own, demonstrates beyond successful contradiction that governmental power is oppression. We in this country, as well as those in other countries, are suffering now from too much governmental power. What we want, then, is not increased governmental power, but less of it, so that we may exercise and enjoy more liberty and freedom.

"Prior to last year's convention it was the custom with the American Federation of Labor to give the socialists all the time and opportunity needed to expound their doctrine and present their theory. So patient was the Boston convention of that body in 1903, that fourteen hours were spent in debating the question of socialism, about ten of which were taken up by the socialists themselves, and after all this talk their resolutions failed of passage by a large majority. Since that

MR. JAMES A. CABLE.
Editor *Coopers' International Journal*.

time they have been losing strength every year in the A. F. of L. Their oratorical effort, and defeat, at the San Francisco convention in 1904 is accurately described by Luke Kennedy in the following letter to the *New York Mechanic*: 'They put forward their most masterful and brilliant orators, used obstructive and filibustering tactics, in fact resorted to every trick and scheme to accomplish what they had been looking forward to for years—the endorsement of their party by the A. F. of L.—and they were buried beneath an avalanche of "pure and simple votes."

"As to how strong the socialists were at the recent convention of the A. F. of L. held in Pittsburg, Pa., we will take the word of socialists who were there. The *Cap Makers' Journal* (strictly socialistic) describes the action of said convention on a socialist resolution as follows: 'Suffice it to say here that the last American Federation of Labor convention was a very "harmonious" affair—in fact, so "harmonious" that when President Gompers ruled our resolution out of order on the absurd ground that it dealt with "party politics," there was hardly a delegate to contradict him. All other important resolutions, introduced by delegates Berger, Lavin and others (socialists), were snowed under in about the same fashion, without much ado.'

"The relative positions of the trade-union and socialist movements are very correctly summed up by *Progressist*, of Ticonderoga, N. Y., in the following editorial: 'Organized labor is stronger in America than ever before. The cry for the open shop, and the heated denunciations of the "Parryites" of the boycott, the closed shop and the sympathetic strike is met on every hand by examples of the wisdom of collective bargaining on the part of workmen when dealing with their employers and the continuance of union shops by cooler-headed employers. Unionists are also coming to understand more fully every day how impracticable are the dreams of the socialist leaders and how fallacious are their arguments."

In proof of the statement of the hostility of organized labor to the demands of socialism, the editor of the *Journal* cites the resolutions adopted by the last convention of the Massachusetts State Convention of Labor to the effect that "we recognize as the most despicable attack yet made upon the life of our national body, that organization launched in Chicago, June, 1905, known as the Industrial Workers of the World, headed by socialists of international reputation."

We regret that lack of space prevents quoting in full the opinions of the editor of the *Coopers' Journal* as expressed in this series of articles. On three or four of his telling points, however, we summarize as follows his statements:

"Socialism proposes to solve the problem of wealth and poverty by abolishing wealth and reducing the en-

tire race to a condition of poverty. It proposes to solve the question of righteous living by abolishing Christianity and reducing the race to a state of unrighteousness. It proposes to solve the problems of civilization by reducing the race to an uncivilized state. In other words, they hold that since the very inception of humanity, the race has been moving forward on wrong lines, and that every step so far taken must be retraced, so that under the guidance of socialist minds, which cannot err, civilization may again come forward on right lines and make no mistakes.

"Socialists repudiate municipal ownership just as they do every other reform, because it is 'palliative' and serves to reconcile the people to the present order of things, thereby prolonging the coming of the revolution which they hope for and dream about, which they claim will give to the people complete socialism. Municipal ownership is by no means a part of the socialist platform. Prospective socialists are frequently led to believe that it is, but when safely landed in the socialist bailiwick they are carefully taught that municipal ownership is only a palliative which retards instead of advances the progress of socialism.

"There can be no fusion between voters who want reforms in government and socialists who demand the overthrow of the republic, because they are seeking opposite ends. Moreover, the socialist party stands fundamentally pledged against fusion or compromise of any kind. The socialist position is clearly stated by *The Appeal to Reason* of April 28, 1906, when it says: 'There is no such thing as reform. Elimination is the only remedy.'

"The socialists claim that the Church of God having evolved from capitalistic environment, is a capitalistic institution, which with all other institutions of to-day must finally fall when the much-heralded revolution is inaugurated. They contend that the Christian religion is an invention of the masters for the purpose of distracting the minds of the workers from their true conditions so that they will not rebel against the capitalistic system."

The editor of the *Coopers' Journal* points out clearly and truthfully the absolute incompatibility of socialism and religion, by quoting as follows from the writings of recognized authorities on socialism:

"Dr. Averling, a socialist of high rank (who was the 'free love' husband of Karl Marx's daughter) accepted the world over as an authority on socialism, says: 'Whether anything or nothing is done, little that is of lasting value can be done until men and women fairly face the fact that the terrible condition of our poor is due, as are so many other ills, to the two curses of our country and time—Capitalism and Christianity. In Christianity we see not only a supporter of the greatest of social evils, but a system that by its fundamental principles vitiates human thoughts and distracts the attention of mankind from the natural and actual.'

"Bax, who is probably recognized as the highest authority on socialism, in his 'Ethics of Socialism' says: 'According to Christianity and the ethics of religion, of introspection generally, regeneration must come from within, must begin in the heart and mind of the individual. The ethic and religion of modern socialism on the contrary, looks for regeneration from without. From material conditions and a higher social life.'

"*Avanta*, the organ of the Italian socialists, refers to Christianity as the 'dirt heap of modern thought,' and says, 'the civilization of social democracy will never be foul itself with Christianity.'

"*The Comrade*, edited by John Spargo, a socialist periodical published in New York, in its issue of May, 1903, says: 'Christianity is not big enough, not pure enough, nor noble enough to measure our great world-faith. Socialism-Christianity would be socialism destroyed.'

We do not hesitate to say that if these articles were read by every student of the question, there would be a much clearer perception of the distinction between trade-union principles, which uphold American institutions, and the doctrines of socialism, which aim to undermine and destroy them. On this point the editor of the *Coopers' Journal* says:

"One of our correspondents challenges us to show reasons why the trade-union and the socialist movements cannot be harmonized. The reasons are clear. The two movements are seeking opposite ends.

"By reason of its defects, the socialists seek to overthrow the present order.

"By correcting its defects, the trade unions seek to make the present order endurable.

"Now if the trade unions succeed in making the present order endurable, the aim of socialism is thereby defeated; whereas, if the socialists succeed in overthrowing the present order, the aim of the trade unions is defeated. As the success of the one means the failure of the other, the two are diametrically opposed to each other."

ONE OF

WHAT THE CHARITY ORG

GREAT UPLIFTING AGENCIES.

SOCIETY HAS ACCOMPLISHED IN RECENT YEARS AS TOLD GENERAL SECRETARY.

GENERAL SECRETARY, NEW YORK CHARITY ORGANIZATION SOCIETY.

THE society has obtained from private individuals an amount of relief which has enabled three to ten thousand families to found a quarter of a century ago a fair proportion of the population otherwise have become dependent self-respecting persons, and enabled them to support of widows and toward such persons, with strangers when the latter were

The evidence of the work made on behalf of the Society, that it has fully taken care of the families who applied for assistance or whose needs were made known by third parties can be found, of course, for the most part only in its family records. One who has worked year after year on one of the district committees or as a friendly visitor knows that these things have been accomplished: that the sick have been furnished with medical attention, nursing, medicines, special diet and, when necessary, with protracted convalescent care; that pensions have been raised for widows with dependent children and continued until the children were old enough to work; that absconding male heads of families have been brought back to the discharge of their natural responsibilities; that employment has been procured; friendly encouragement and oversight freely given, not for a day but for months or years; that children and mothers have been sent to the country and to the seashore, and that scores of other similar services have been rendered, some of which require substantial financial outlay while others have demanded that personal attention which in busy New York it is far more difficult to secure.

Ten years ago an experienced charitable worker said to one who was just turning into this field, "Study your case-work. Fix your attention on the individual family." That was excellent advice and any charitable society may rightly be judged only by its success with the individual families who come under its care. What the society has accomplished then, first of all, is to give intelligent, sympathetic, and efficient care to the very large number of individuals and families whose needs are brought to its attention.

In the next place it has cleared the streets of New York of professional beggars. Due credit is to be given to the legislature for its strict laws, to the police department, to the city magistrates for convictions and sentences, to the Workhouse for holding its prisoners, and attempting to give them suitable employment, and to citizens generally for individual co-operation. The Charity Organization Society, however, directed the educational campaign against mendicancy and imposture, made the complaints effective, supplied the information necessary to conviction, and prevented premature discharge for a consideration. It has given a helping hand to mendicants desirous of giving up the shameful life of a parasite and entering on that of self-support and self-respect, and finally, while convincing the whole fraternity of yeggman-panhandlers and ordinary mendicants throughout the country that New York is unsafe territory in which to operate, has yet through its publications and correspondence helped to make other communities less "safe" and has therefore not lessened local burdens at their expense. It has done more for these mendicants individually than has ever before been done for any similar class here or abroad. As the foundation of its work for them and for the city, the Society has insisted that there must be such persistent and intelligent police work that it shall be impossible to live by begging whether from passers-by, at the basement door or by ingenious letters of introduction.

Just now there is a relaxation in the police co-operation owing to the abolition of the Mendicancy Detail—as a part of a general policy of doing away with special details, and there is a corresponding increase in the amount of begging. This reaction will, however, surely be promptly met either by the restoration of this particular detail, which unlike some of the others was engaged in distinctly police work, or by some other plan which the Police Commissioner may devise to take its place.

Verging on and often actually constituting imposture and fraud are the activities of many groups organized in the name of charity. The service which the Society rendered for several years in keeping its members informed as to the standing and management of charitable institutions, and the legitimacy of appeals for support especially from new enterprises, led to the recent establishment of the Bureau of Advice and Information. On request advice will be given to prospective donors concerning plans for founding new institutions; to managers of charitable enterprises regarding needed reforms, new buildings, changes of location and other

DR. EDWARD T. DEVINE.

matters of like character. The Burke Foundation, various hospitals and sanatoria for consumptives, the removal of children's institutions to the country, the organization of charity in Havana, and the relief work in San Francisco may be mentioned as illustrations of the wide range of undertakings upon which such advice and assistance has recently been requested.

The most important achievement of the Society in recent years was the inauguration and carrying through to complete success of the movement for a new tenement-house law and for the creation of a distinct municipal department to enforce its provisions. When the need for advanced legislation was unsuccessfully urged upon the local municipal assembly in the summer of 1899 there was little or no popular interest in the subject, and no outer evidences whatever that the time was ripe for the beginning of an agitation which, within two years, would place upon the statute books a radical and sweeping law by the side of which the Society's original suggestions appear insignificant indeed. The credit for this reform belongs very largely to two individuals: Robert W. de Forest, President of the Charity Organization Society, and Lawrence Veiller, who in 1899 was Secretary of the Society's Tenement House Committee. The Society made an energetic campaign through the public press, before the local and state legislatures, in and through trade unions, settlements, churches, and all kinds of philanthropic agencies, and finally, by means of the tenement house exhibition of February, 1900. As a direct result of these efforts a state commission was authorized by the legislature and appointed by Governor Roosevelt. Of this commission Mr. de Forest and Mr. Veiller were respectively chairman and secretary, and its labors were brought to a triumphant conclusion by the enactment of the laws which they recommended. No changes have since been made except at the request or by the consent of the friends of the law, whose views have been presented when occasion required by the Tenement House Committee, which the Society has kept in existence as a means of co-operating with the municipal department, and, whenever necessary, enlightening the public in regard to proposed beneficent or vicious legislation.

The Committee on the Prevention of Tuberculosis has waged unrelenting war on this preventable disease during four years. Notable as is its publication of the "Handbook on the Prevention of Tuberculosis" and an illustrated "Directory of Institutions" dealing with tuberculosis, the public instruction through the issue of hundreds of thousands of cards printed in several languages with simple directions as to how to protect one's self and others against this disease, has been an even greater service. How to care for the sick and to guard those who surround the patient, and the simple and effective modes of home treatment have been contrasted with the cruel waste and certain detriment from the use of whiskey and other stimulants and of patent medicines. No other class in the community has been more quick to appreciate the import of this work or more prompt and effective in their assistance than the trade unions.

Self help and thrift have been encouraged by the Society through the organization of the Provident Loan Society in 1893, and the Penny Provident Fund in 1889.

The former is an independent stock company formed to enforce fair conditions in the business of pawning personal property. Those under the necessity of temporarily raising funds upon such collateral are given a private and respectable opportunity to obtain loans at reasonable rates. It now transacts a business of seven million dollars a year. The Penny Provident Fund has over three hundred branch offices, largely conducted by volunteers and sanctioned by school authorities, through which savings of from one cent upward are received and credited by means of stamps pasted in card-books furnished free and redeemable at regular hours at face value. Last year 90,746 people saved \$106,100 in this way. Incidentally, many stores and banks have been influenced to extend commercial facilities at a much lower amount than had formerly been thought practicable and an impetus has been given the project for a post-office bank.

Fresh air work has won recognition and approval throughout the country. One of its earliest successful divisions was the Creche started by this Society in the shadow of the Statue of Liberty for the benefit of mothers with babies whom they could not leave or send away and who could not afford to stop work to accept a longer trip than one day. The Edgewater Creche, a separate organization, has succeeded this work, and now conducts it in conjunction with the Society.

The Charities Directory, a fully-indexed, classified and descriptive guide to the philanthropic, religious, and educational resources of the city, has passed through sixteen annual editions and comes to be more and more used and relied upon. While the mention of a particular institution in the book does not imply endorsement of its purposes, management or methods, still care is exercised to exclude all those about which the Society feels it necessary to warn its members.

The most important of the Society's publications is "Charities and The Commons," the weekly journal and magazine of philanthropy and social advance. The outgrowth of the Society's bulletin of information to members, it now combines six independent efforts at public enlightenment and interest in social righteousness. When at this stage of the twentieth century lunatics are chained to logs in one section of our country, caged naked in sheds in another, and beaten for their imbecility in a third; when an entire large city is scourged with fever bred by neglect; when a great state votes down protection of its future citizenry against lucrative exploitation, there is need of spokesmen and of an organ for them that will stand out sturdily as "Charities and The Commons" has done for new opportunities, new plans, and new hopes for those who are drawn down by their unfavorable environment or heredity.

In order to raise both the standard of efficiency and the standard of remuneration in social work the Society in 1899 started the Summer School of Philanthropy mainly for experienced workers who wished to obtain fresh and broader views of their sphere. It was successful from the first. Three years ago an afternoon course was established to be carried on all winter for the benefit of those at the time actually engaged in work in New York and with especial regard for New York conditions. One hundred and fifty-six employees of the local charities, public departments, settlements, and churches were enrolled. But the plan was found to be insufficient and the endowment of the School by Mr. John S. Kennedy in the following year made possible the adoption of the present plan by which the course has been placed on a professional school basis and the entire time and attention of the students for one year is required for successful prosecution of the course. Fifty-eight students were registered for the last academic year.

A feeling of bewilderment is the first thing that comes to the consciousness of the average good citizen on being approached for alms. What is he to do? Kindly but firmly direct the applicant to the Joint Application Bureau maintained jointly with the Association for Improving the Condition of the Poor. It is open from 9 a. m. to midnight every day of the year for the reception of applicants for aid and the care of the homeless. All homeless people referred to either society are assisted sympathetically and constructively through this bureau. Persons applying for aid may be referred here by anyone, whether a member of the Society or not, and an applicant who calls without reference will be equally well received.

The woodyard and laundry maintained by the Society are nearly self-supporting by their revenues. Both are of great importance to the work as furnishing sufficient and satisfactory tests of the sincerity of earnestness of applicants and temporary occupation while employment is being sought. The salutary effect of remuneration for services is in marked contrast with the giving and acceptance of gratuity even under the best circumstances. The laundry also trains unskilled hands

which are capable of earning only one dollar a day at rough cleaning into skilled laundresses for whom there is an unlimited demand at from \$1.50 to \$2.50 a day.

From these tests the fit pass on to work which they are assisted to obtain. And the unfit? Until recently they were borne with more or less grace as a necessary burden on either the public treasury or the more specialized aid of private societies. The Special Employment Bureau of the Charity Organization Society is adjusting the remaining abilities of men who are handicapped either by a physical or social affliction to certain kinds of adapted employment. Whatever the form of affliction, such persons find it almost impossible to secure respectable remunerative occupation for themselves. The commercial employment agencies find it too expensive to make sincere efforts in their behalf. After five months' trial it may be said that this bureau is successful and its continuance will be warranted if friends of the idea will meet the necessary expense.

Matrons in the precinct police stations, female factory inspectors for industries employing women and children, a Municipal Lodging House for wayfarers, extension of legal aid to the poor, the Council of Fresh Air Charities, inception of the National Child Labor Committee, and the National Association for the Study and Prevention of Tuberculosis are examples of results accomplished by this Society, or in co-operation with others, which space does not permit me to enlarge upon.

The result of the movement inaugurated by this Society and carried to completion by the gift of an individual citizen for a Charities Building to house all of the charitable organizations of the city and thus to insure closer co-operation and better understanding exists in handsome and tangible form. Such societies as this building was designed to accommodate are especially encouraged to take space in it rather than in a foreign environment by reduction of 20 per cent on commercial rentals.

Although the Society has sought to subordinate its relief rather than to advertise it, the total amount which it expends as intermediary has constantly increased. The part which it plays in the support of the dependent is indicated by the fact that "for the relief of widows and small children" it now annually expends about twice as much as the Society which bears that name and which for more than a century has devoted its entire energy and resources exclusively to that worthy object. The Provident Relief Fund which was started by friends of this Society to supply relief to families for whom there is no existing special agency has recently become one of its regular departments. The disbursements for relief are at present from three to five thousand dollars a month.

It must not be overlooked, however, that these sums represent but a small part of the total obtained from churches, national societies, and other co-operators for the families under its care.

To summarize the Society's past service and present position in the community it may be said that it has sought to take an appropriate part in every movement for the genuine welfare of the poor of New York City, whenever there was any reason to believe that such participation would be of service. It has endorsed and supported state and national measures for social advance, while standing consistently for the maintenance of that which has already been secured by individual initiative and normal growth.

THE IDLE RICH YOUNG MAN AND "PARLOR SOCIALISM."

Extracts from an Address by Sherburn M. Becker
Mayor of Milwaukee.

I FEEL like warning young men, whether rich or poor, against the dangers of the fantastic and the extreme tenets of Socialism. We have a government that was founded upon good principles largely by young men, and while it has often been threatened with destruction, it has weathered the storms of over a century.

I am not in sympathy with what the press has been pleased to call "Parlor Socialism," nor any other kind of Socialism which contemplates the utter overthrow of our present form of government.

There is great room for reform and we are growing better every day. Let us not be led astray by the more or less attractive pleadings and arguments of theorists who talk of revolutions. These things come to us principally through the agency of men who have made a failure of life in some country other than our own, and who would be dissatisfied, I believe, no matter what the conditions might be.

The idle rich young man, with proper training, has great opportunities in all the honorable professions—the church, medicine, the law, the newspaper office, literature, art. If he will identify himself with any one of these he will be producing something and will be a working man in every sense that the word implies. The man who shovels in the street is not the only producer and he is not the only man who toils. I could tell you, were I not too modest, of at least one mayor who works hard and who is known to have labored far into the night for days and weeks that he might fit himself for the laborious duties of his office.

HON. SHERBURN M. BECKER,
Mayor of Milwaukee.

A few weeks ago there came to Milwaukee a young "Parlor Socialist" who informed his hearers in a public address that he had been idle for years; that he produced nothing, and that he had no object in life except to spend the money earned by labor and which did not rightfully belong to him. When I read his address in a paper I felt like saying to him, "Go to work—you have the ability and you are needed—stop talking and do something. Get out of the parlors of the rich if you think you belong somewhere else." And it struck me that a desk in a bank or a newspaper office would be a good place for him. Now I am informed that he is to take a course in agriculture and raise cabbages and turnips, perhaps.

I believe that this young man, Joseph Medill Patterson, means well—that he is honest and sincere, but that he is not the kind of man who makes a success of farming. He has, I understand, the advantages of a college education and the good breeding that goes with it. He was trained in the school of journalism and is an able correspondent and reporter.

Then why should he go to the farm to milk cows or sow grain?

Why cannot he do good in the world with his pen? He can produce something with that as well as others can produce something with the plow or the corn planter. But he probably imagines that he must do manual labor, and toil with calloused hands. He is mistaken. We need intelligent young men in intellectual pursuits to help guide us in the right direction. We need brains as well as muscle, and we must have them. It is within the power of the rich young man to do his country great service. He is not handicapped with poverty and therefore is not tempted to be a grafter while in office. His ambition is not to make money, but to make a name for himself. There might be exceptions to this, but not many.

I do not mean to say that the rich young man is always honest or pure minded or that the poor young man is usually dishonest. What I am trying to do is to demonstrate that there is a place for the idle rich and educated young man, and to show you the things that recommend him. As a matter of fact more poor young men go to the front, I believe, in public affairs, than any other, because the former is forced to do something and in casting about for a calling he seeks public favor at the polls.

LABOR IN BRITISH POLITICS.

American Delegate to British Trades Congress
Discusses Labor's Political Future in England.

THE fraternal delegates sent this year by the American Federation of Labor to the British Trades Congress were Mr. Frank K. Foster, of Boston, and Mr. James Wilson, of New York. During his absence Mr. Foster wrote a series of letters, giving his observations on labor matters in Great Britain. One of the most interesting of these, which appeared in the *Boston Globe* of September 27, relates to the much-discussed status of trade unions in politics in the United Kingdom, and includes also an analysis of the real nature of socialist sentiment among British workingmen. In the course of his letter Mr. Foster says:

"Is the British political labor movement liable to continue in its present form? This question I have asked Englishmen of many classes, trade unionists, shopkeepers, lawyers, and at least one cabinet minister. The journalists are discussing it from all standpoints. The politicians are seeking to find its answer. British conservatism is puzzling over it and society as a whole is in a state of mind.

"It all depends. It appears more than likely that while the main policy of seeking labor representation will be followed, there will be a readjustment of the machinery so far used. The general consensus of opinion seems to be that many of the present labor members were elected by the revolt against the Chamberlain protective policy or by Liberal votes as well as by labor votes, and that the concessions which the present government is undoubtedly prepared to grant will greatly weaken the strength of the independent movement should another general election take place. It is nevertheless conceded that even should a satisfactory trades dispute bill be passed, the independent movement would still continue to possess a good deal of vitality.

"There is every indication that Keir Hardie will be supplanted from the recognized leadership of the labor group of M.P.'s when parliament reassembles, and that the extremist policy which he stands for will be likewise dropped. The place will be filled by D. J. Shackleton, M.P., a man of quite a different type—sane, solid, judicial—whose quality of mind and leadership is far more in accord with the British temperament than those of the fanatical and irreconcilable, though more brilliant, Hardie.

"Shackleton, by the way, is one of the fraternal delegates to the American Federation of Labor which meets in Minneapolis in November. He is a socialist, but of the genial and untheoretical type, inspired by temperamental altruism rather than by a vindictive and systematically-stimulated class hatred. This distinction, indeed, may be held to apply to by far the larger portion of the so-called socialists of England. A most eminent authority informed me that not five per cent. of those who called themselves socialists either knew or cared anything about the doctrine of 'the collective ownership of the tools and instruments of production and distribution.' Their creed is a purely opportunist one, demanding practicable reforms.

"Now this kind of socialism finds no great difficulty in fusing and obtaining recognition of all sorts from the old-line trade unionists who make up the rank and file of the British movement. But even here there is on all sides to be observed a suspicion that the trade-union funds are being used to carry on socialistic propaganda under the stimulus of the crisis which came in the last general election. It was felt that unity must be had at all cost, and so trade-union funds are now being paid in to support candidates submitted by the independent labor party elected mainly by trade-union votes, some of whom are not even members of organized labor or wage earners. The trade-union leaders recognize this incongruous state of affairs and meditate a change.

"Another force which the labor political movement will have to contend with is the middle class defense association, which is now rapidly organizing all over London and the provinces. The middle class is the great rate-paying class and is undoubtedly alarmed at the progress of municipalization and unionism.

"The ostensible object of the new movement is the protection of the ratepayer against schemes to raise taxation, and it may easily become directly hostile to the political labor movement. Measuring the various forces in opposition, then, I should be inclined to predict that labor representation in its present form has reached its zenith for some time to come.

"It will readjust itself and continue to be a force of profit, of stimulus, to the political parties. The chances are that the pressing legislative demands of organized labor, the rational demands, will be accorded recognition. If not, then more labor members will be sent to parliament."

Mr. Foster's impressions are confirmed, in part at least, by the following press dispatch, dated London, October 3:

"The labor movement in Great Britain is at present passing through an interesting phase, which is tending to decide the future dominance of one of the two sections of the Labor party in the House of Commons, the Liberal section, led by John Burns, and the Socialist section, led by James Keir Hardie. The Federation of Miners, at a meeting held this week at Swansea, took a ballot which, although official figures are not yet available, is understood to have decided against joining the Hardie section. On the other hand, a conference of the Amalgamated Society of Railway Servants, sitting simultaneously at Cardiff, passed a resolution, after a long and bitter debate, in favor of adhesion to the Hardie section in spite of the fact that their leader, Richard Bell, M. P., was strongly opposed to the railway men submitting themselves to Socialist dictation."

The most successful trade unions to-day are those who believe in trade agreements, and who furthermore believe in maintaining a discipline so effective that no member, or group of members, can violate them with impunity.—*Iron Moulders' Journal*.

When a union is conducted on conservative lines it always has the respect and good wishes of the public, but let the men who act too hastily obtain control and their administration will meet the disapproval of the real union men and bring condemnation upon the entire labor movement.—*Journal of Labor*.

The National Civic Federation Review

VOL. II. No. 12

NEW YORK, MARCH—APRIL, 1907

TEN CENTS

THE CHILD LABOR SESSION OF THE FEDERATION'S ANNUAL MEETING

The Sixth Annual Meeting of The National Civic Federation was held at the Park Avenue Hotel, New York City, the Five Sessions Being Devoted to Discussions of Government by Injunction, Child Labor, Distribution of Immigrants, the Income and Inheritance Taxes, and to a Review at the Annual Dinner of the Work of the Different Departments of The Federation

THE CIVIC FEDERATION'S SIXTH ANNUAL MEETING.

TRIBUTES TO ITS SERVICE TO SOCIETY—ELECTION OF OFFICERS—IMPORTANT PROBLEMS DISCUSSED—INVESTIGATING COMMISSIONS CREATED.

EVERY great public gathering for the purpose of discussing pressing questions of the time almost unconsciously develops a thought or idea around which all the proceedings of the meeting are centered. Sometimes this central idea lacks definite expression, but in the case of the remarkable annual meeting of The National Civic Federation held in New York City on December 12 and 13, it was emphasized more than once by different speakers. This central thought, around which all the discussions may be said to have centered and to which was attributed the unbounded enthusiasm which prevailed, was American Democracy. Reference was made to it at the various sessions during the discussion of such widely varying subjects as "Government by Injunction," "Child Labor," and the "Income and Inheritance Tax," as well as by the speakers at the annual dinner held on the evening of December 12.

If the animated discussions of these important subjects left any fear in the minds of the hearers as to the progress of the American Republic amid the whirlpool of dangers which seemed to engulf it on all sides, it is not mere literary effort to say that these fears were set at rest by the speakers at the annual dinner. Conspicuous among these was Archbishop Ireland, who stated that nowhere else in the world was such an organization as The National Civic Federation possible, and claimed that it was one of the powerful institutions at work to conserve and preserve democratic institutions. Referring particularly to the conflict between capital and labor, ex-Mayor Seth Low stated that "the great forces by which we are to settle all these industrial questions is the invisible force of public opinion, which this Federation and other agencies are generating, most fortunately, in all parts of this country." President Samuel Gompers, of the American Federation of Labor, stated his belief that "The National Civic Federation is a common ground upon which we may all meet to discuss the various differences upon which we are divided, and to try to find a middle ground so that the common good of all may be subserved. I believe that this Civic Federation, in its endeavor to work out our common policy and common polity, is the effort to make the principles of the Declaration of Independence the very living factors of our every-day lives. The Civic Federation presents itself as the conservator of peace and progress and of the wealth and belief of our common country." Rabbi Stephen S. Wise stated that he rejoiced in the work of The National Civic Federation, "because the aims of this body imply your faith in the American Democracy, not as an act, not as a process, not as an achievement or consummation, but as a development, as an evolving through education." Other speakers referred in a similar strain to the services which The National Civic Federation was performing in strengthening American institutions in conformity with the progress of American Democracy.

At the annual meeting the following officers were elected:

President—August Belmont, President of the Interborough Rapid Transit Company, New York.

Vice-Presidents—Samuel Gompers, President of the American Federation of Labor, Washington, D. C.; N. J. Bachelder, President of the National Grange, Concord, N. H.; Ellison A. Smyth, President of the South Carolina Cotton Manufacturers' Association, Greenville, S. C.; Benjamin Ide Wheeler, President of the University of California.

Treasurer—Isaac N. Seligman, of J. and W. Seligman & Company, New York.

Chairmen of Trade Agreement Department—John Mitchell, President of the United Mine Workers of America, and Francis L. Robbins, President of the Monongahela River Consolidated Coal and Coke Company, Pittsburgh.

Chairman of Public Ownership Department—Melville E. Ingalls, of the Cleveland, Cincinnati, Chicago and St. Louis Railroad Company.

Chairman of the Conciliation Department—Seth Low, ex-Mayor of New York.

Chairman of the Industrial Economics Department—Nicholas Murray Butler, President of Columbia University.

Chairman of the Immigration Department—Franklin MacVeagh, of Franklin MacVeagh & Company, Chicago, Ill.

Chairman of the Welfare Department—Charles A. Moore, of Manning, Maxwell & Moore, New York.

Chairman of the Taxation Department—E. R. A. Seligman, Professor of Political Economy in Columbia University.

Chairman of the Executive Council—Ralph M. Easley, of New York.

Secretary—Samuel B. Donnelly, 281 Fourth Avenue, New York.

The Committee on Nominations, of which Marcus M. Marks of New York was Chairman, in submitting its report, stated that Oscar S. Straus had felt it necessary to decline re-election as Vice-President on account of

his appointment by President Roosevelt as Secretary of the Department of Commerce and Labor. In presenting its nomination for a successor to Mr. Straus, the committee offered the following resolution, which was unanimously adopted: "That in the retirement of Mr. Straus we desire to express our appreciation and thanks for his very valuable services during the past five years of the Civic Federation." President Belmont stated that Mr. Straus's retirement simply meant that he was practically taking a vacation as "he promises to come back to us as soon as the duties which he is now about to fulfill shall have come to an end."

At the close of the discussion on child labor, a resolution was adopted providing for the appointment of a commission to make a thorough investigation of the whole subject of child labor in the United States, the commission to be composed of representatives of various organizations. Provision was also made for the appointment of a commission to investigate the situation resulting from the operation of the Sherman anti-trust law, one on Government by Injunction, and one on the Income and Inheritance Tax.

GOVERNMENT BY INJUNCTION IN ITS VARIOUS ASPECTS.

REPRESENTATIVES OF LABOR AND OF CAPITAL DISCUSS THE CONFLICTING ISSUES OF THE DAY.

AUGUST BELMONT, President of The National Civic Federation, called the annual meeting to order on Wednesday morning, December 12, and extended a welcome to those present. "At this momentous period of our great country's history," he said, "when so many important and perplexing social and industrial problems are pressing for a solution, I regard it as fortunate that there exists such an organization as The National Civic Federation to take a vigorous hand in helping that solution."

"It is timely again to remind you of the purposes of the Federation as stated in its by-laws; they are, to organize the best brains of the nation in an educational movement toward the solution of some of the great problems relating to social and industrial progress, to provide for study and discussion of questions of national import, to aid thus in the crystallization of the most enlightened public opinion and, when desirable, to promote legislation in accordance therewith. The Federation's membership is drawn from practical men of affairs, whose acknowledged leadership in thought and action makes them typical representatives of the various elements that voluntarily work together for the general good."

"Farmers, wage-earners, manufacturers, bankers, merchants, ministers, laymen, economists, and other distinct but interacting elements of society have formed themselves into many useful organizations for the discussion of affairs peculiar to their pursuits and callings, but the Civic Federation, in addition to its departments for the accomplishment of specific purposes, provides a forum where representatives of all these elements meet to discuss important problems in which they have a common interest. Six national conferences have thus far been held, one upon Primary Election and Ballot Reform, on Foreign Policy, on Trusts and Combinations, Conciliation and Arbitration, Taxation, Immigration, and one on Public Ownership. These conferences have, in most instances, been attended by delegates officially appointed by Governors of States, Mayors of cities, and by representatives selected by various commercial, industrial, educational, and religious bodies. The present activities of the Federation are being exercised through six active agencies: The Public Ownership Commission, the Immigration Department, the Conciliation Department, the Welfare Department, the Industrial Economics Department, and the Political Reform Department."

In speaking of the subjects for discussion at the annual meeting, President Belmont stated that the problems growing out of the accumulation of great fortunes were to be considered under the title of the Income and Inheritance Tax, and suggested the hope that the discussion was to result in the appointment of a committee to investigate thoroughly the whole subject and, possibly, to propose legislation, if it is found desirable. "No subject," he said, "can bring greater

good to this country, if correctly solved, and greater harm, if, for wise and just taxation, punitive spoliation and the destruction of our boundless spirit of enterprise be substituted through hampering regulations. In contemplating the future of the great and ever-growing needs of our institutions of learning and instruction, our charitable and religious establishments, into whose life and growth have flown a seemingly endless and increasing stream of bequests and donations from great estates and fortunes, such as no other country can boast of, one must pause at the thought of drying up those springs of life. I ask, would popular subscriptions take their place, or, failing that, must a paternal government, to provide them, be the alternative? That is one of the phases of the problem that cannot escape contemplation."

Taking up another subject selected for discussion at the annual meeting—Government by Injunction—President Belmont said: "Seemingly, organized labor and organized employers have come to a deadlock on this question. If I correctly understand it, organized labor does not, as is currently thought, oppose the injunction principle, but it is opposed to what it claims are certain abuses. Organized employers, while largely admitting these abuses, deny that the remedy lies in the direction pointed out by organized labor. When our workmen, however, become imbued with the idea that our courts are used by employers for partisan purposes, so to speak, it is a matter of great moment and worthy of the consideration of this body, and I hope some steps may be taken through the instrumentality of this organization to help solve this apparently insolvable problem."

"Another subject touching our national life, perhaps more closely than any other, because of the sentimental reasons attached to it, in addition to its vast importance as bearing upon our moral and physical development, will be discussed by you at these sessions. I refer to the child-labor problem, up to this time regulated only by the States, but now crystallizing into proposed national legislation. Bills have already been introduced into the United States Senate for its regulation."

"President Roosevelt in his recent message to Congress urges strongly the compulsory investigation of industrial disturbances. I am not sure that such a proposition is advisable in any general sense. In fact, I doubt the wisdom of attempting legislation which will provide governmental interference with every threatened industrial disturbance. If such a policy were to be adopted there would certainly be more justification for its use in the case of quasi public institutions. The public is not vitally affected nor inconvenienced by a strike in a shoe factory or a cotton factory, because there are so many other factories in the same industries that there is no scarcity created by such a strike. In the case of steam railroads, street railroads, electric light and gas plants, the conditions are wholly different. The public,

as a whole, is at once inconvenienced and has a direct interest in the controversy."

President Belmont also referred to that part of President Roosevelt's message having to do with amending the Sherman anti-trust and the Interstate Commerce acts in order to meet a certain fundamental conflict between those two laws at the present time. President Belmont said that the attempt to prevent or destroy all combinations, whether good or bad, is unsound in economics and disastrous in the domain of trade. He quoted with approval President Roosevelt's views on this point. President Belmont then introduced ex-Mayor Seth Low as the chairman of the morning session.

IN assuming the chairmanship of the meeting ex-Mayor Low said that it seemed to him to be one of the bright things in our American life that any question, no matter how strongly people feel about it, can be openly and frankly discussed. Continuing he said:

"It certainly is one of the best phases of The National Civic Federation that it offers a platform upon which men of such diverse points of view can meet to discuss every question of interest in the industrial world. I suppose there are very few, if any, questions upon which opinion is more sharply divided at the present moment in the United States than on this question of 'Government by Injunction' so-called. Very likely the feeling is strong, and the difference of opinion is especially marked because the question is not accurately defined, or at least is defined by some men in one way and by other men in another way. It is very much to be hoped that the result of the discussions here to-day will be to enlighten us all, so that we may determine accurately to what extent differences of opinion are based upon differences of definition, differences of interpretation of fact, and to what extent they really represent a diverse judgment upon the same state of facts and the same conditions."

T. CARL SPELLING, general attorney for the American Federation of Labor, was the first speaker on the question of "Government by Injunction." He represented that organization in the discussion before the committee of Congress. Mr. Spelling stated that what is meant by "Government by Injunction" is "that power which has been superadded by the courts of the country to their constitutional power, by which they rule, or are said to rule, despotically upon certain occasions in the matters brought before them in litigation; that is, they rule in excess of their jurisdiction."

"If there be such a thing in this country", he said, "as 'Government by Injunction,' as we believe there is, then it is a most despotic government; that is, it is a government without limitation, without check or restraint, and government exercised by one man without responsibility or liability to account to any other man or to any other power on earth. In our form of government, there is no way to reach a judge for his misdeeds except by impeachment, and that has long ago been demonstrated to be a worthless remedy against judicial usurpation."

Mr. Spelling reviewed briefly the judicial history of the country as affecting the subject under discussion, claiming in substance that the effect of "Government by Injunction" was special legislation by an authority other than the properly constituted law-making body. He claimed that the fundamental limitation imposed by the long course of judicial history and procedure was that an injunction shall never be granted except to protect property or property rights. He believed this to be the keynote of the whole issue under discussion. He said that authorities do not distinguish between property, that is, visible and tangible property, and property rights, as regards its bearing on this question. He claimed that the representatives of labor have never insisted that in the case of a trade dispute, if men should undertake to inflict any injury to any property or property rights, for instance, such as trespassing on land, attempting to set fire to buildings or wrecking machinery, anything to which any kind of violence could be offered,—he claimed that they never have insisted that in any such case a writ of injunction to prevent it would

not be available. Labor unions, he said, were not trying to abolish the remedy by injunction. "It is not correct to say that never can an injunction issue against strikers or against the working man or in a conflict between capital and labor, because an injunction is always available, and always ought to be used, when anybody, whether workmen or unionists, or men who do not belong to that class, attempt to inflict any kind of irreparable injury upon property or property rights. We are absolutely safe in assuming and adhering to that position."

Referring to an injunction in trade disputes, Mr. Spelling said: "No court in Christendom has any jurisdiction to restrain me or anybody else from advising any man not to work, not to keep a contract, not to obey the law; you cannot enjoin me in any court for going out and advising men to commit even arson, or murder, or anything else. Now, that sounds harsh, and that is where a great deal of our difficulty has arisen. When anybody proposes to check the usurpation and abuse and

except the tendency toward monopolization and combination, the suppression of trade; I think that can be remedied. I think that will work itself out; but, I tell you, if these vicious and far-reaching precedents are to be recognized as the law of the land, and the judges are to be encouraged or permitted to go on building more on top of these, that they will soon constitute and erect outside the regular organizations and branches of government a power as despotic as that which destroyed Rome, as that which was exercised in the days of Caligula, as that which was exercised by the notorious and infamous Star Chamber. The liberties of the people of this country are more endangered by that tendency and by that practice than by any other."

Referring to some of the injunctions issued by the courts, Mr. Spelling stated that "they have enjoined men from preventing, by persuasion, or by any means whatever, men from entering the employ of the complainant, that is, the party who went by his attorney before the judge and got out the writ of injunction."

They have enjoined men from marching on the public highway; they have enjoined them from meeting in places far from the premises of the employer against whom they struck and from having music and making speeches and presenting their cause to the public. They have done what I call most unwarranted and outrageous things. These things have been done by the courts, exercising all the powers and functions of government on one side in a trade dispute. And you don't hear of any strikers ever going to a court to get an injunction, it is always the other side. Now, the court in such a case palpably and flagrantly takes the side of one party in a litigation, and the stronger party at that despite the greater numbers of the other side. So long as this power is recognized as belonging to those judges, they will, on a pretense, on a claim and allegation that men are about to resort to violence, prevent them from doing innocent and legal things, and taking the proper steps for the preservation of their constitutional rights. We simply want these usurpations lopped off. If we had the law as it stood before these usurpations began—before a system of precedents was built up in contravention of the ancient and just rule on this subject—we would not demand any legislation. It is not to change the law; all we want is the recognition of our rights as they stood before these usurpations."

WALTER DREW, Commissioner of the National Iron Erectors' Association, stated as his belief that of all the questions involved under the phrase "Government by Injunction" and growing out of the different legislation proposed in Congress, he considered the most vital and the most important to be the restoration of confidence on the part of the rank-and-file of organized labor in our laws and in our courts. After a brief consideration of the theory in practice connected with the use of the writ of injunction, both temporary and permanent, he claimed that, separate from any question of defect in the law or in its administration, the demand that temporary injunctions should not issue in labor controversies becomes a demand that the practice of our courts shall be changed to grant special immunities and privileges to one particular class only and vitally engaged in warfare with another class. "No

reason other than this," he said, "exists for discontinuing the temporary injunction in labor cases which does not exist in any other case that might arise. Without its use in such cases, as in other cases, the relation of the parties may be placed in a condition where justice could never be done between them. The very subject matter of the controversy might be disputed or injured beyond remedy. Organized labor may be aggressive and meet with our approval. It may fight its war with capital if it will, but in that fight it not only must ask but give fair play and a square deal."

Mr. Drew next took up the Pearre bill, of which he said that either it seeks to do away with great and serious evils that exist in our law and its application to labor combinations, or it seeks special dispensations and privileges for labor combinations as a class for the conduct of their so-called war against capital. In this connection he next took up a discussion of conspiracy

OFFICERS OF THE NATIONAL CIVIC FEDERATION.

excesses of the courts, they say: 'You are advocating violence; you are in favor of disorder.' Now, I admit that it is deplorable that men can be advised to commit crime, to injure people, and to stir up trouble, and put the public to a great amount of inconvenience; but, I tell you, it is more deplorable, it is a thing that will lead to the most disastrous results, if irresponsible men on the bench for life are to be allowed to use their authority above the law and above all the departments of government, to become unrestrained despots, take one side in every trade dispute, become guardians of peace and order and morality in the community, decide ex-parte upon a one-sided showing, that hundreds and thousands of men are about to violate the law, and send forth these special decrees, these enactments of special legislation—for that is what they are—to paralyze and destroy the rights of all these men; I say that is the most dangerous tendency in our government. I do not

under the common law and quoted a number of cases as to the rights of labor in combination. He said: "What would be an unlawful purpose on the part of an individual would likewise be an unlawful purpose on the part of a combination. The converse of this statement, however, is not true and what would be an unlawful purpose on the part of a combination might be entirely lawful for an individual, and it is with this fact that the chief fault is found by those who are proposing to change the law. This difference in the law concerning the purposes of an individual and those of a combination is explained by one word—malice. Ordinarily it is of no moment in the eyes of the law whether an individual acts from motives of malice or not, as long as his conduct is confined within the limits of the law. In other words, a malicious motive on his part would not make unlawful that which would otherwise be lawful. A different rule, however, applies to combinations, and a combination, whether of working men or of any other class of citizens, that inflicts intentional injury upon others from malicious motives, while it may not be liable criminally, still it becomes liable civilly and its action is held to amount to a legal wrong. A combination may not wilfully inflict injury upon third persons without lawful justification or excuse, and if such justification or excuse be lacking, its conduct in the eye of the law is deemed malicious and unlawful." Mr. Drew claimed that every principle in the law of conspiracy is applied equally and impartially to all combinations and that in no particular is there any rule or principle enforced by our courts against combinations of labor which is not equally applied to and enforced against other combinations.

Referring to the Pearre bill, Mr. Drew said: "The effect of this measure would be to make lawful and substantiate every method now employed by organized labor except the commission of actual crime. Not only would combinations for the purpose of establishing monopolies, for the purpose of inflicting malicious injury and for other purposes now declared unlawful be legalized, but a systematic use of coercion and intimidation, which have their only strength and danger when used by many against the one, would be beyond the reach of the law. In providing that such combinations should not constitute a conspiracy, not only are they placed beyond the reach of courts of equity, but civil and criminal remedies also are taken away.

"The mere fact that injunctions have been used to a greater extent in recent years than formerly is no proof whatever, without further showing, that they have been misused, but is simply proof that there has been greater occasion for them. Neither is it to be supposed that courts of equity or of law could be infallible in one class of cases more than in others. Courts make mistakes like the rest of us, for the matters upon which they are called to decide must be determined in the light of the judgment, the knowledge and the limitations of the human mind, and it is human to err. But if the mistakes be honest, and if there be no greater number of them in any one class of cases than in any other, the fact that isolated cases might be presented in which the writ of injunction has been improvidently employed, would furnish no more reason for doing away with it altogether in labor cases than in doing away with the whole body of the law and the jurisdiction of all courts.

"With no case made out of discrimination or inequality, either in the law or its administration as to labor combinations, one conclusion only will remain, and that is that organized labor in proposing this legislation seeks special immunities and privileges before the law not enjoyed by other combinations or other classes of the people.

"I shall not enter into an extensive discussion as to the dangers of class legislation. It is not necessary. Not only the history of nations but the fundamental spirit of our institutions alike condemn it, and any class that persists in demanding it will find the face of the great American public solidly set against its efforts. In this case it would be more than class legislation in its results. It would lead to a state of anarchy in labor controversies, for the employing class, finding no protection in the law in their individual fights against combinations using legalized methods of coercion and intimidation against them, would, from the very instinct of self-preservation, seek their protection outside the law and we would have this whole great contest, this war, as it has been termed, between capital and labor, taken out of the pale of civilized methods and of civilized courts."

JOHN MITCHELL, President of the United Mine Workers of America, was the closing speaker on the subject of "Government by Injunction." Among other things he said:

"Do you know that in labor disputes, when the proposition to arbitrate is made, very often—indeed almost generally—the workingmen will make the reservation that the question to be arbitrated shall not be submitted to a Federal judge? I do not share fully in these apprehensions, but the very fact that workingmen do express a fear of the impartiality of the Federal Judiciary is in itself a matter of grave concern, not alone to those who have suffered from the injunction but to the entire people of this country. Men do not lose confidence without cause or at least without the belief that they

have cause. So many injunctions have been issued, so many laboring men have been incarcerated because of the violation or alleged violation of these injunctions—not because of the commission of crime, not because they have violated any law of the land, but because they have insisted upon doing those things which they have a legal and a constitutional right to do.

"I wish to say for myself—and I yield to no man living in loyalty to this country—that if a judge were to enjoin me from doing something that I had a legal, a constitutional, and a moral right to do, I should violate the injunction. I shall, as one American, preserve my liberty and the liberties of the people even against the usurpation of the Federal Judiciary, and in doing this I shall feel that I am best serving the interests of my country.

"It is indeed unfortunate that within recent years the courts have gone so far in the exercise of their equity power. It is presumed that injunctions shall be issued only in cases where there is no adequate remedy at law. It is presumed that they are issued in cases where

there is danger of the infliction of irreparable injury. In a coal strike in West Virginia, for instance, an injunction is issued; this injunction restrains the men from the commission of crimes and also from the performance of acts which are entirely legal within themselves. The men proceed under direction of their attorneys to do only those things that they have a legal right to do; and they are called into court—they are charged with no crime, they are simply asked, have they violated that injunction? They are permitted to make no defense. They, as truthful men, must plead that they have violated the injunction, that they have walked upon the highway, that they have spoken to the men who wanted to work; the consequence is that they are sentenced to prison, not for violating the law, not for the commission of any illegal act, but because they have done those things which they had a legal right to do; and they are sent to prison without a trial by a jury of their peers. It is to this phase of the injunction that we take exception."

THE EXTENT AND MENACE OF CHILD LABOR.

EMPLOYERS, EMPLOYEES AND STUDENTS OF INDUSTRIAL CONDITIONS SHARPLY DISAGREE AS TO THE FACTS AND FIGURES INVOLVED IN THIS PROBLEM.

AT the afternoon session of the first day's meeting the subject, "The Extent and Menace of Child Labor: Is Everything Possible Being Done to Eliminate It?" was discussed. Daniel J. Keefe, President of the International Longshoremen, Marine and Transport Workers' Association presided. He stated that as his organization in no way comes into competition with child labor, he had no desire to discuss the subject, but expressed the opinion that many of the public statements with reference to child labor are very much exaggerated.

SAMUEL McCUNE LINDSAY, Secretary of the National Child Labor Committee, in referring to the claim that gross exaggeration with respect to the statistical enumeration of child labor in this country had been made, said that he didn't think "there is any one who will deny the fact that there have been exaggerations and erroneous statements about child labor. I have seen all sorts of estimates in the papers and magazines, some of them specifying particularly the number of children in particular occupations, and others making mere guesses as to the total number of children employed. I think most persons who read these newspaper statements and have any knowledge of statistics at all, treat them with the indifference that they deserve. I want to say with respect to the measurement of the extent of child labor that I believe it is impossible to measure child labor statistically with any accuracy or with satisfactory results."

After referring to the United States Census as the official source of information, Dr. Lindsay analyzed its methods of securing the data and then referred to the charge of gross exaggeration which had been brought against those who claimed that "two million children are working in the factories, mines, mills, mercantile establishments, etc., under fourteen years of age." Continuing on this point he said: "I presume that such a claim has been made; I would not like to deny it although I don't know anyone who has made it and I don't recall at the present time having seen exactly that claim made anywhere. The National Child Labor Committee has never made such a statement. In a report made a little over a year ago, we said that a conservative estimate for 1905 showed that there were two million children under sixteen years of age engaged in gainful occupations in the United States. This estimate took account of the probable increase since 1900 and always referred to children ten to fifteen years of age on the same basis of calculation as the census itself. That statement was made upon the authority of the National Child Labor Committee. We have had no occasion, by reason of any argument that has been made on the employers' side anywhere since then, to question the accuracy of the statement. I believe it is as true to-day as it was in 1905. The general policy of the Committee has always been to state its case conservatively, to under-estimate rather than to over-state the facts brought out in its work. In other words, we have secured data from private reports, by investigations of our own field agents, from reports of State officials, factory inspectors, school officials, State committees and educational authorities in several of our States, and applying the usual statistical methods of estimating, based upon a proportion, we have come to the conclusion that that estimate of two million children ten to sixteen years of age, in all occupations in the year 1905, is an under-estimate rather than an over-estimate. We could very well make it a little stronger without any danger of going beyond the records that we have at hand.

"Then as to the kind of child labor that represents.

No one, so far as I know, has undertaken to say that all those children are the victims of abuse; not at all. No one has undertaken to say that all the kinds of labor represented in the employment of those two million children are necessarily harmful. We do say, that as a general principle, any child under sixteen years of age who is required to work for its living, required to contribute materially to the support of itself or its family, is in a perilous and hazardous condition; that such burdens in childhood are contrary to the spirit of our institutions. It is depriving children of opportunities and bringing about class distinctions that we should seek in this country to avoid. We will say that some forms of child labor represented by these two million children are extremely harmful for children under sixteen years of age and that the labor of many of these children under sixteen years of age should be absolutely prohibited, namely, the labor of all children under fourteen years of age—which represents some 180,000 of these in occupations other than agriculture; that the labor of all the others should be protected, restricted by legal enactment, so that at least all children under sixteen years of age would be prohibited from working in physically and morally dangerous occupations, especially in mines, underground and also at night work, which we believe to be particularly hazardous.

"Now, beyond these statements, and I have tried to make them as definite and as clear as possible, there is nothing in the reports of our National Child Labor Committee that will warrant any further assertions; as to the accuracy of those statements we are prepared to defend them, and to show that they are under-statements rather than over-statements.

"As to the question of the further classification of these two million children according to occupations, first of all we find that most of them are in agricultural pursuits. Understand, I am now taking the Census figures and correcting them as of the date 1905, which means, adding a quarter of a million to the 1,750,000, which gives us 2,000,000. Of this two million a large proportion are in agricultural pursuits. Of the 1,750,000 in the year 1900, 790,623 were under fourteen years of age, and of that number 604,265 were engaged in agricultural pursuits, leaving 186,000 under fourteen years of age engaged in the manufacturing and mechanical pursuits, trade, transportation, domestic and personal services and professional service.

"The point we have made in the use of these statistics has been chiefly this, that 1900 as compared with 1880 showed an increase in the volume of child labor. The Census itself shows, from these figures, that the proportion of working children of either sex engaged in agricultural pursuits and in domestic and professional services was smaller in 1900 than in 1880, while the proportion in trade, transportation and in manufacturing and mechanical pursuits was larger, the movement being rather more marked for female than for male children. That is the essential fact that has been brought out by the Census figures, examined for whatever they are worth. This fact has attracted our particular attention and merited our notice in the work that we are trying to do for the welfare of the children—that in those trades, in those lines of activity where the danger is greatest, the danger to the health, physical development, moral development and education, the increase has been greatest. The figures show some alarming changes in the increase between 1880 and 1900 in these particular trades and industries where the work of children is hazardous. In the next place, we believe that the increase since 1900 has been steady."

Referring to the remedy that is being applied to cure

the child labor evil, Dr. Lindsay detailed the efforts of the National Child Labor Committee in securing prohibitive legislation, both State and National, and endorsed the Beveridge-Parsons bill in Congress. He expressed the belief that in preventing child labor, "we shall remove a very large cause of all our social discontent and many of the causes of the political disturbances of our present day."

OWEN R. LOVEJOY, Assistant Secretary of the National Child Labor Committee, spoke on "The Extent of Child Labor in the Anthracite Coal Industry." He quoted from the 1905 report of Chief Roderick of the Pennsylvania Department of Mines in part as follows: "During the latter part of 1905 a man by the name of Lovejoy made a tour of the anthracite counties inquiring into the ages of boys employed at the mines. In blazing headlines, the daily papers published, on Mr. Lovejoy's authority, the statement that ten thousand boys were found at work in and about the breakers who were under the legal employment age of fourteen years." To this Mr. Lovejoy replied in part as follows: "It should first be observed that the statement 'in blazing headlines' was never made by my authority, or the authority of the National Child Labor Committee, that 'ten thousand boys were found at work in and about the breakers who were under the legal employment age of fourteen years.' It was said, discussing the estimate made by Dr. Peter Roberts, 'if the borough we are now studying were taken as a basis for such a generalization, the number of boys under fourteen years of age working in the anthracite coal industry would be 12,800.'"

Mr. Lovejoy referred to other statements as to the number of boys under age employed in the anthracite coal industry, and explained the method of computation by which the representatives of the National Child Labor Committee arrived at their conclusions. The source of much of this information was pointed out as being the public school superintendents. On this point Mr. Lovejoy said: "If the same proportion of child labor prevailed in the entire region which is estimated here by these school superintendents, the total number would be six times 2,460, or 14,760 boys working under age, with falsified certificates, in the mines and breakers of the region. It is not claimed and has never been claimed by this Committee that the number of boys under age in the breakers is six times the 2,460 estimated by the school superintendents of these seven boroughs. The nearest approach to such a claim has been that if the same percentage prevailed throughout the region as found in these boroughs for which estimates were given by the school superintendents, the number in the mines and breakers would be not less than ten or twelve thousand, but estimates of the number have been accompanied always by the contention that 'until some accurate method to determine the age of children has been applied, the exact number will never be known.' The school superintendents, the class of public officials most familiar with the children, complain of the difficulty in determining the age of the children in default of accurate vital statistics."

Mr. Lovejoy argued for the enactment of a law in Pennsylvania which would make sixteen years the minimum age limit for employment in or about any mine, on the ground that coal mining is an occupation dangerous to the life and limb of those employed therein. "If it were true," he said, "that 'if a uniform law, with fourteen years as the minimum, were passed, Pennsylvania would lead all other States and countries in practical and sensible protective legislation on this important question,' then we would be constrained to say that other States and countries where coal mines are operated would be sadly in need of reform. Fortunately, the assertion is erroneous; for Illinois, Montana and Missouri forbid the employment of children under sixteen in mines, while Arizona, Colorado, Montana, Missouri and Utah limit the employment of children in mines to eight hours in the twenty-four. Austria forbids the employment in mines under fifteen years, while both France and Germany, although not

having a higher age limit for employment, require that all children employed shall have completed the common school course of education."

W. J. RICHARDS, Second Vice-President and General Manager of the Philadelphia and Reading Coal and Iron Company, in his opening remarks stated that, "the cause of my appearance here to-day may be found in the unwarranted statements that have been appearing in the public press for the past six months regarding the employment of child labor in the anthracite fields of Pennsylvania."

"There is in Pennsylvania," he said, "covering the portion of the anthracite fields, a mine law, and in addition special laws have been enacted from time to time limiting the age at which boys can be employed in the breakers and the mines. In the agitation for these laws, the operators have always favored and advocated the highest age suggested. The law now standing on the statute books of Pennsylvania and the age limit fixed

officer is appointed in each school district, whose duty it is to compel the attendance at school of every child under fourteen years of age. This truant officer is a resident of the school district, a man who knows the people and children of his locality. Before the beginning of each school year, he or the district assessor visits from house to house making a complete census of all the children of school age, noting where they are attending school. If any child under the school age has gone to work at any breaker or factory, the truant officer compels the discharge of the child and requires that he be sent to school. Another check is thus provided to prevent the conditions represented by the recent articles of which we have complained.

"Anthracite mining is a large and important industry. We are in every way endeavoring to live up to the laws. We have always led in any effort to improve the advantages and educational opportunities of the boys of the region. There has been no attempt at evasion on the part of the operators. When one of

these laws was declared unconstitutional, the operators still continued to enforce the age limit of the law."

Mr. Richards then presented in detail the report of the Pennsylvania Department of Mines, giving the result of a special investigation made by its inspectors in 1905 as to the extent of child labor in the anthracite mines in reply to Mr. Lovejoy's assertion that "the boys working in the hard coal breakers of that State under fourteen years of age number not less than 12,000." Chief Roderick's letter of instruction to the inspectors requested them to "make a strict inquiry as to the ages of boys working in and about the breakers. See whether Section 1 of the Act of May 2, 1905, has been complied with. Insist upon all boys, wherever found, furnishing proper proof of age according to law. You are authorized to enter legal proceedings against all violators of this law, whether employer or employee. Make a report to this department of the total number of boys over fifteen and under sixteen years of age employed in and about each breaker; also give the names of boys of doubtful age, with the address of their parents or guardians." As a result of this investigation, Mr. Roderick stated that "the total number of boys ranging from fourteen to sixteen years of age, employed in and about the breakers, is 8,124. Of this number the inspectors had some doubt as to 760 of the boys having reached the legal employment age, although each of them had presented the certificate required by law, which was on file, showing that he was over fourteen years of age. The boys of doubtful age number a little over nine per cent of the total number employed. It is very probable, however, that many of the 760 classed as doubtful by the inspectors are over fourteen. The difficult thing is to get at the correct age of these 760 boys, as at least seventy-five per cent of them were born in foreign countries."

Mr. Richards stated in conclusion that the company with whose operations he is connected has had a careful examination and investigation made covering its employees between the ages of fourteen and sixteen, and the finding corresponds very closely to that of the State of Pennsylvania. "I am perfectly convinced," he said, "that cases where boys are working under age are very limited."

DR. ROLAND P. FALKNER, a well-known statistician, without attempting to minimize the necessity for eradicating the evil of child labor, at the same time claimed that "the menace to society does not exist unless such child workers are an appreciable factor in the life of the community or of the nation. Society counts with large aggregates; it deals with great masses. To it the question of the extent of the evil is of the utmost importance. It would know whether it has to deal with a sporadic, comparatively infrequent phenomenon, or whether the evil is widespread." He then proceeded to analyze the census results of 1900 in regard to child labor. He said: "They show that between the ages of ten and fifteen years inclusive there were 1,750,178 persons employed in gainful occupation; that they formed 18.2 per cent of the population between

CHAIRMEN OF THE FEDERATION'S SEVEN DEPARTMENTS.

thereby was enacted by the Legislature in 1903. That law fixes the age for the employment of boys in the breakers at fourteen years and the age for employment of boys in the mines at sixteen years. These ages have the full approval of all the operators and mining companies in the anthracite regions. The effort of the companies has always been to rigidly adhere to that law. The instructions to all the superintendents and foremen of collieries have been to give close attention to every boy coming to or at work to learn whether he is of the age he is represented to be in the certificate furnished by his parents or guardians.

"To further protect the child and to prevent the employment of any under the legal age the State of Pennsylvania has a compulsory education law requiring the attendance at school of all children under fourteen years of age. To fully enforce its provisions a truant

the ages of ten and fifteen inclusive, and that they were divided among the groups of occupations recognized by the census as follows: Agriculture, 1,061,971; professional service, 2,945; domestic and personal service, 279,031; trade and transportation, 122,362; manufacturing and mechanical, 283,869.

"Whatever may be our view of child labor, it is clear that not all of this labor would fall equally under condemnation. The labor upon the farm, where the child works generally in assisting the parent or guardian, certainly falls in a different category from that in factory, mine, or sweatshop. So little does public opinion condemn such labor that none of the laws designed to throw a protection around the child include it within their sphere. Some of it may be objectionable, but the great bulk of it is so little objectionable that we can throw it out of the reckoning. We have left, then, 688,207 workers in fields other than agriculture."

Dr. Falkner then presented statistics showing the sub-division in age groups, and of a total of 688,207, 310,825 were fifteen years of age and 191,023, fourteen years of age. As to children of these ages Dr. Falkner said that, "it may be in some cases a hardship for a boy or a girl of fourteen and fifteen years of age to earn his or her living, but it is nothing abnormal or unusual. Nor does legislation seek to restrict such labor except in particularly hazardous industries. At this age legal restriction of child labor is the exception rather than the rule. Eliminate the children of fourteen and fifteen years of age and we have 186,259 children at work in 1900 under the age of fourteen who are the proper objects of restrictive legislation. That the number of child workers is so much less than currently reported should not lessen our sympathy with these unfortunates or diminish our efforts to alleviate their condition."

"In face of the evidence presented, how can it be claimed that child labor is a menace to our civilization, a menace growing more threatening as time advances? We may recognize the evil, whether it exists in particular localities or in particular industries. We may and should put forth every effort to diminish it. We should save as many children as we can from the harm which may arise from their employment at an early age, but why should we malign our democracy with exaggerated pictures of the evil? Why should we condemn our modern industrial system as a whole for an evil which is by no means general? Why should we grow pessimistic over our whole industrial outlook, and looking it in the face see beams in its eyes where there is only a tiny mote?"

CHARLES P. NEILL, United States Commissioner of Labor, stated that there was one very important point that seems to have been entirely overlooked by Dr. Falkner. "If there are 200,000 children this year," he said, "they do not stay fourteen years of age for a lifetime. One-half of these, who are, say, 12½ this year, will be thirteen years old next year. Every year 100,000 go out of the twelve-year-old grade, and another 100,000 children come in; so that, as a matter of fact, it is only a few years before you have got a million citizens who are turned into the body politic with the unfit surroundings of their child labor. I want to submit that the question is not how many are at work this year, but how many children in a reasonable time, within a period of five or ten years, will be at work at the age of twelve or thirteen years. While on the subject, I would like to suggest one further question, that those 200,000 be given two years more of schooling and two years more of childhood, so that if the number is so small in any single year, it will not affect industry to any appreciable extent, but in a given period of ten years it will affect the citizenship of this country to a most material extent."

W. A. MAY, General Manager of the Pennsylvania Coal Company, premised his remarks with the statement that "in order that there may not be a misunderstanding on the part of the public or false conclusions drawn from the magazine articles and newspaper accounts of the conditions existing in the anthracite regions as they relate to the employment of boys in and about the mines," he thought it appropriate "to give facts, figures and arguments which will materially lighten the dark and somber pictures they have drawn. These articles and accounts dwell mainly on single and isolated cases, making them typical when in fact they are not so." Mr. May then told of the efforts made by the employers to get at the ages of the boys seeking employment, so as to comply with the child labor act, referred to the constantly lessening number employed; mentioned instances of money expended for their comfort when employed; discussed the doubtful wisdom of abolishing the boy; and presented several notable examples of what slate pickers, driver boys and car runners have become in after life. "Boys under fourteen," he said, "the age limit fixed by law at which they may be employed at the collieries, are never employed if we know it. We ask for and obtain a certificate, sworn to by their parents or guardian. This was the practice with our companies before the present law, which has for one of its conditions the provision that boys of doubtful age must file a certificate with the employer if given work. What more than this can you ask of us? The boy may be under age,

but having taken every precaution, we cannot be held responsible."

Following a presentation of statistics showing the lessening number of boys employed as slate pickers in the breakers of the Lackawanna and Wyoming valleys, where the larger portion of anthracite coal is produced, Mr. May referred to the improvement in slate picking machinery, which eliminated the boy, and stated that "if we could use machinery and clean the coal as the public demands that it must be cleaned we would do so; we would not use boys." He stated that the change as to the employment of boys as slate pickers was great and added "if the use of boys for this work is an evil, it is not a growing one." He referred to the expenditures of the companies in heating the breakers and removing the dust therefrom. He stated that men could not be employed to pick slate because of the lack of supply and because of the character of the work which permitted boys to do it much better than men.

"Is it wise to entirely abolish the boy from our work?" he continued. "One of the speakers referred to the fatalities in our mines. That is true; we have many of them and we shall have them so long as mining is carried on; but will they not be increased by banishing the boy? To avoid accident you must have experience. We need that which comes from training of the hands, the limbs, the eye and the ear. There is no way to get it but by actual work, and how can you get it more quickly, to the greater advantage of the boy when he becomes a man and to his fellow workers, than by putting him at work? I mean a boy fourteen years old and over, because we do not believe it best to employ boys under that age any more than you do. To set the boy at work is the only way, and if you would go into the mines with me, you would quickly see how a boy will get that agility, that alertness, that brightness, which prevent accident. True, boys are killed; and men also are slain; but many more would be sacrificed on the altar of trade and for the sake of public comforts and welfare if they went into the mines without the knowledge gained by actual practice. In other words, we must have apprentices and they must begin young. This is not a false position and it will appeal to any one of you having had experience in practical affairs and in the handling of labor."

JOHN MITCHELL, President of the United Mine Workers of America, said that he was surprised at the statement that men could not be secured to pick slate, because the companies were unable to secure a sufficient number of men to work in the mines. "I dare say," he said, "that with the close of this month and the close of this year the breakers and collieries in the anthracite region will not have operated two hundred days in the year 1906. There are not more than two years in the past twenty when the anthracite miners have been given opportunity of working more than two hundred days in any one year, and if they are permitted to work only two-thirds of the working days in the year, it isn't likely that men are not employed in the breakers because of the inability of the companies to secure men to work in the mines. I quite agree—and I want to be fair about this matter—that men are not as suitable, they are not as well equipped to pick slate as boys. Boys are employed because they are nimble; a man would not work in a breaker; it is work entirely unsuited to him; a boy will work there; and a very large number of the accidents are due to the fact that the boys do run about, that they won't sit constantly at their employment, that at every opportunity that offers itself they want to play, and why wouldn't they? That is why we want this age limit raised, so that the boys may play before they go to the breaker."

"There has been a decided improvement in the conditions of child labor in the anthracite coal fields. Whether that improvement has come about because of the high motives or humane promptings of the coal companies or not, I am not going to say, but I will make this statement: That prior to the advent of the miners' union, there was no effort made to regulate the employment of children; prior to the year 1900, when the coal miners in the anthracite fields first engaged in a strike, there were no adequate laws regulating the employment of these boys, and the men are legion in Pennsylvania who started to work in the breakers when they were eight years of age. There are hundreds of boys of eighteen and twenty years of age there now, who started to work at ten and twelve. The age limit has gradually been raised; it has raised because of increasing intelligence, because of the Americanization of these non-English speaking people, because of the promptings of humanity, but particularly because of the education and influence of the miners' union."

"In justice to the anthracite coal companies I want to say, and I do it gladly, that when the law enacted in 1903, I believe that was the year, which fixed the age limit at which boys might be employed at fourteen and sixteen, was declared to be unconstitutional, the coal companies through their presidents issued orders that the provisions of the law should be continued in force anyway, and they were in most instances continued in force until a new law was enacted. The new law provided that the boys might not be employed in the breakers at less than fourteen years of age, or down in the mines at less than sixteen years of age, but also

provided that they must have a certificate from the schools showing they had received a certain amount of education. The coal companies contested that feature of the law, however, and the section fixing an educational qualification was declared to be unconstitutional, so that, notwithstanding the high age limit, it seems to me that they might have left uncontested the law which provided for the educational qualification, because after all it is just as necessary to the future of our American citizenship that men shall be strong mentally as well as physically—that they shall have a reasonable education as well as a strong and robust physique."

"The men employed in the anthracite coal mines constitute only one-half of the miners in Pennsylvania. There are about 150,000 bituminous coal miners in that State, and I presume the children of the bituminous coal miners are about as numerous as are the children of the anthracite miners. The boys may enter the bituminous mines when they are twelve years of age. There is no law that prohibits the employment in the bituminous mine of children above the age of twelve. The only requirement, however, is that the boy of twelve must work with his parents or with a guardian, and inasmuch as there is no employment in the bituminous mines for a boy outside, as there is in the anthracite field, it means that all the boys in the bituminous districts must go down in the ground; they must spend their lives in the earth, not on it; and it seems to me that some law should be enacted for the protection of the sons of the bituminous miner."

ELLISON A. SMYTH, President of the South Carolina Cotton Manufacturers' Association, who has been engaged in the cotton mill industry in that State for the past twenty-five years, stated that "it has been a matter of surprise to those of us in South Carolina who have been trying for twenty years to better the conditions of the working people there, to be antagonized as we have been by the Child Labor Committee." He said that "the statements that they have made and published are so glaringly incorrect that they have excited ridicule and a feeling of antagonism that otherwise would not have existed." Referring to some of these statements Captain Smyth said:

"For instance, there is a statement published by the Child Labor Committee—a general advertisement—in *The Outlook* of November 17, 1906, which says: 'Sixty thousand little children toil in Southern cotton mills; little girls eight years old work through a twelve-hour night.' Now, there are nine million spindles in all the Southern States. The children work in the spinning room. The spinners are paid so much for each number of sides of a spinning frame they run, and every spinning frame has two sides, and a fair average would be one hundred spindles to the side. If you take these figures you will find that not over 15,000 people could be employed in the spinning rooms as spinners, as a spinner will attend anywhere from six to ten sides, and some as much as twelve sides. What I mean by the 'side' of the spinning frame is attending to the spindles arranged along one side of the spinning frame."

"In the census figures of 1905 the statement is given by the officials that in South Carolina there are employed under sixteen years of age—the advertisement referred to says fourteen years—there were employed 9,769 children in all gainful occupations, including those on farms. We have in South Carolina 3,500,000 spindles, over one-third of what are in the Southern States. If you multiply the 9,700, taking that as a figure, and granting that they are all in Southern cotton mills (whereas these figures include children in all gainful occupations, agricultural and otherwise), but assuming that they are all in the cotton mills, you cannot muster over 30,000 in all the Southern States, and yet here is an advertisement which goes out stating that there are 60,000 children working twelve hours a night."

"Now, I happen to be President of the Association of South Carolina Cotton Manufacturers, and we have 110 mills in that Association, representing 3,250,000 spindles, nearly the whole number of spindles in the State. There are only three mills of that 110 that work at night or have worked at night for years. The weaving mills do not work at night. There are only eight spinning mills in South Carolina, and three of them work at night; but the only rooms that they run are the twisting rooms where adult labor is employed and not children. They only work nine hours at night and receive pay for a full day's work."

"Now, Mr. Lovejoy says, in a statement here that was published in *The Independent*—'Child Labor and Family Disintegration'—he says there are Southern cotton mills in which parents sign contracts to send all their children to work upon reaching a certain age. Now, that happens to apply to me individually. Why wasn't he fair enough to make a further statement and give all the facts? What is the contract? 'I (the parent) agree that all children, members of my family between the ages five and twelve years shall enter the school maintained by the Pelzer Company and shall attend every school day during the school session unless prevented by sickness or other unavoidable causes, but all children, members of my family above twelve years of age shall work in the mill and shall not be excused from service therein without the consent of the superintendent for good cause.' Now, what are the conditions? That contract dates from 1892. South Carolina

to-day has no compulsory school law. South Carolina had no child labor law until 1902. The most of our help that have come into the Southern cotton mills have come from the North Carolina mountains, and the backwoods where they had no school facilities at all. The effect of that contract was to force a compulsory school education upon the children of our mill operatives and to limit the age at which they went to work at twelve years. That was done in 1892, and to-day there is no law in South Carolina affecting compulsory education, and there has been no child labor law until 1902 and which now applies to twelve years of age.

"A committee of South Carolina manufacturers took part in and prepared the labor law that is now in existence in South Carolina and was passed in 1892, and a similar committee of South Carolina manufacturers in 1902 prepared a child labor law that is now in existence in South Carolina and was passed by their advocacy. Now, the National Child Labor Committee took no notice of all those facts, and John Spargo tells us in his book, on the authority of Dr. McKelway, Assistant Secretary of the Child Labor Committee in the South, that Southern mills have adjustable legs or supports to the spinning frames, so that they can be lowered nearer the ground for little children. A more ridiculous and silly mis-statement was never thought of or suggested. The whole cotton mill machinery has to be as rigid as possible. Our floors are four inches thick, with a ceiling of seven-eighths of an inch below and upper floors an inch-and-a-quarter above, the idea being to make as stiff a floor as possible, so that those spinning frames that are running eight to ten thousand revolutions a minute should have a firm foundation and not affect the steadiness of the machinery. It would be absolutely impossible to have an adjustable spinning frame so that legs could be moved up and down; such a thing has never been done, never been seen, never been attempted, and yet that statement was made on the authority of a man who was in the South and is supposed to know and ought to know.

"There has been a great talk and cry about the number of children employed in Southern cotton mills, and when that law went into effect in 1902 in all the cotton mills in South Carolina there were only 53 children that were debarred from working on account of their age. In 1902 our committee of cotton mill manufacturers prepared a very careful statement of statistics as to the schools maintained by the cotton mill corporations. In South Carolina, our public school system does not permit—the money raised does not permit—of schools being maintained more than four months in the year. The reason of that is that the white man there has the black man to carry. There are more colored people in South Carolina than there are white. The taxes are paid by the white people and the school fund is divided equally and fairly in proportion to their attendance on the schools. The white man is educating the negro children and he is paying for it and as a result he is unable to give to his own children the full length of time that he would do if his money all went to educate the white children. Now, the cotton mills have their own schools. Those statistics were gathered in 65 corporations in South Carolina. They show that \$175,000 have been spent by those mills in school buildings and equipments and that there were 7,433 children in attendance on those mill schools. In some villages children are paid money to attend these schools, they get regular pay envelopes just as if they were working in the cotton mills every month if they do not miss a day at school. Those schools run from eight to nine months in the year and the cost of maintaining those schools amounts to between \$25,000 and \$30,000 a year, all paid by the cotton mill corporations in addition to special school tax of over \$40,000.

"We don't want the children in the mills; it is not economical labor; it is not desirable from any standpoint, apart from any humanitarian feeling on the subject, it does not pay. But our conditions down there are peculiar. We work entirely according to what is called the family system, family help. It is not like in New England where the individual is employed, but a man will agree to hire himself and his family, and if you are not willing to employ his family or give them employment, he will go where he can get it; and for the last three or four years labor has been so scarce, the development of the cotton mill industry has been so rapid, that labor has been very scarce, and no one knows that better than the cotton mill operative and that he can go where he can get employment. That very often forces you to employ a child that is twelve years of age, whom otherwise you would not want, because if you do not take the family they will go to another village where they can be employed.

"Now, our association—that is, the South Carolina Cotton Mill Manufacturers' Association—while in our State we had a law of sixty-six hours a week, we voluntarily reduced in the mills of that association—110 mills—last July the hours of labor to sixty-four and fixed the period when they are going to reduce it to sixty-two and then to sixty. We are doing that in the absence of any demand or request of our employees and in response to no supplication or application or notice from labor organizations, because in the cotton mills of South Carolina there are no labor organizations. This movement is being carried on entirely by

the mill managers, because they believe that they will get better results and that it will be better for their people, better for the employees, better for all concerned. It will not come at once, but it was thought it would be better and fairer for both sides that the movement should be gradual and a few months apart instead of being rapidly taken all at once."

J. G. SCHONFARBER, of the Maryland Bureau of Statistics and Information, stated that most of the capital invested in the South in the cotton industry is from the North. "You will remember," he said, "that the Eastern capitalists laid the foundation of great fortunes in the slave trade many years ago, and afterward became Abolitionists. You will also remember that the immense cotton industries of the New England States have been fostered very largely by the employment of cheap child labor. The quickening of the public conscience in the East has abolished the employment of children under fourteen years, and for this and various other reasons the same capitalists have now gone South to exploit that section and avail themselves of the profits to be derived from the employment of children where no laws as strict as those of the East are in existence. We should also remember, in discussing and legislating on this subject, that the South is just now awakening from its industrial inactivity, and that restrictive laws as drastic as those in the Eastern States will retard her progress."

ANNA B. BROWN, Vice-Chairman of the Child Labor Committee of the Tennessee Federation of Women's Clubs, told of her experiences in visiting a number of the cotton mills in the Southern States. From her observation she concluded that: "Unless the States I visited and their churches do more than they have done and are doing for the people in their borders, the educational, industrial and moral redemption of the 'poor whites' and the classes from which mill operatives are drawn will depend for the next twenty-five years, as it depends now, on the Southern cotton mills. Long before we club women, and unions, and labor leagues, and philanthropists plunged into the child labor question, the mill men were already settling it. They are emancipating the children, they are doing it slowly, but they are doing it surely."

D. A. TOMPKINS, formerly a member of the United States Industrial Commission and at present a prominent cotton mill owner, as well as manufacturer of cotton mill machinery, of North Carolina, spoke with special reference to that phase of the child labor subject which relates to the cotton mills of the South. He said in part:

"It is important that some of the antecedent conditions in the South should be understood in order that we may appreciate those in existence to-day. You all know that the end of the Civil War was a calamity for the South, although the most thoughtful Southern people do not believe that the calamity was unalloyed for it ended the institution of slavery, and if the poverty that came were a calamity, the abolition of slavery was in turn a sufficient benefit to balance it; but few realize that the subsequent period of so-called 'reconstruction' was a calamity such as never before was borne by a Christian people. During the twenty years succeeding the war, while the white people sacrificed all else in the fight for Christian civilization, there was absolute poverty for everybody. Every man, woman and child in the South was a veteran of the war.

"The beginning of the cotton mill construction was the end of that desperate poverty, and that beneficent work affected not only the owner, but the operative and the farmer. The cotton mills increased the price of cotton for the farmer and removed the competition of the 'croppers,' who are now operatives in the mills. Through the establishment of this industry came the amelioration of the conditions of all the people of the South. It was not a question of who shall work, but how 'hog and hominy' or 'bacon and greens' might be secured for all to live upon. The effort to help the operatives began at a time when everybody in the South was absolutely on the same level of poverty.

"Immediately after the reconstruction anarchy was ended, and the man on horseback who led, or the one who undertook to build the cotton factory, was simply put forward because he was the right man for the place, and frequently without his consent, to help do the most promising thing for the benefit of the people and the country. The warm ties of friendship generated during the period of reconstruction made every man desirous of doing as much for his operatives as for himself.

"In this work of real reconstruction there came help from unexpected sources. It is to the eternal credit of the New England machinery builders that they gave liberal and long credit to the South which enabled us to make a beginning which has resulted in an industrial development to be brought to a still larger growth for the infinite benefit of the humanity of the South and the Nation. The interest in each other's welfare which was generated during the period of dire distress led the new mill owners among their first undertakings to provide for the education of the operatives by the erection of schools in conjunction with the homes in the mill communities.

"Having established or extended schools, having worked year after year for a compulsory education law, having increased wages fifty to seventy-five per

cent, and having brought what to us in the South is great prosperity out of conditions of deepest poverty, through methods which have secured the black man an equal opportunity, we believe that every Southern cotton mill man is doing his utmost to bring about that condition which will enable the limitation of work for profit only for children to fifteen years of age at least. It is not believed that we should undertake to do it arbitrarily, but by continually building up the educational, social and financial forces.

"As long as there are greedy men we must protect children from overwork, but light work in my opinion is not bad for children. In Germany they take a child of ten years and determine its education with reference to the industrial pursuits to be followed; not at twelve, fourteen, or fifteen, but at ten years, and I believe the Germans are correct in their ideas about the proper way to educate children.

"I am engaged in cotton manufacture and machine business. In the latter I have adopted a system of apprenticeship where we particularly desire to have the boy begin at twelve years, for the purpose of education, not for profitable employment. Our apprenticeship contract requires that the boy shall go to school six months in the year, work in the machine shop four months, and we are considering placing in the contract the requirement that he must spend one month of the year in the country, the expense for his board to be borne by our company where the parents are unable to afford it.

"Whatever we do in the way of legislation against child labor for profit, let us not forget that we have a large duty to see that the child when legislated out of the mill shall not be left wholly idle and untrained, but be mindful to provide enough work in school and in some apprenticeship condition to develop a decently trained and educated man or woman. With these conditions I favor raising the age limit of labor for profit to fifteen or sixteen years, but work in the capacity of apprentice for industrial training should begin earlier. I have thought of a graded schedule of apprenticeship work and school attendance, which might well be authorized and controlled by law, for boys and girls in textile pursuits: From 11 to 12 years, three months work in a textile factory may be allowed, but only after an attendance at school of six months; from 12 to 13 years, four months work in a textile factory may be allowed, but only after an attendance at school of four months; from 13 to 14 years, five months work in a textile factory may be allowed, but only after an attendance at school of four months; from 14 to 15 years, seven months work in a textile factory may be allowed, but only after attendance at school three months; from 15 to 16 years, ten months work in a textile factory, but only after attendance at school for two months. This would include official inspection provided by law.

"Instead of enacting laws which totally expel children from that training so essential to their better development as men and women, let us leave the way open for both teaching and training. It is in the period of childhood, I think, that the faculty of mental and physical development may be made most fruitful of permanent results. Very frequently mothers appeal to me to take their boys into our shop when they are too old to make them of any value to us. It is the contact with the actual working conditions—daily elbow-tough with working humanity, in their early years which is of value in their training. The young apprentice's work in our shop consists in waiting upon the machinists—he gets waste for them, and takes their tools to the blacksmith shop for repair, and does other light work, which secures for him an education through practical contact such as could not otherwise be obtained.

"Weaving is an art and can be carried as high as any of the arts, and it is familiarity with the process of manufacture from very early years which makes the skilled artisan. Why, then, should we legislate in a way which is likely to become too sumptuary and interfere with the higher development of the art? It matters not that a picture has been published recently of a loom showing a bedraggled child operating it, when no child ever did work at a loom, either in this or any other country or period. From time immemorial it has been the custom in the family for the young unmarried women to spin, and the elders to weave—that is where some of you ladies got your name of 'spinster.' To-day, as of yore, the young people do the spinning, and the elders the weaving. The children cannot weave and, therefore, the picture is totally misleading.

"But the Southern cotton mill men want you to realize that we believe that we are doing right and our utmost to raise a totally poverty-stricken country to one of prosperity for all, through constructive efforts, and that we shall continue to work for the greater improvement of conditions in the South."

JOHN GOLDEN, President of the Textile Workers of Fall River, related some of his experiences on a visit to the Southern cotton mills some four years ago, commissioned by his organization and the American Federation of Labor to study conditions there. Speaking of certain portions of the South he said: "I went into the homes of the working people; I lived with them; I went through the mills; I saw their earnings, and when any man tells me that the earnings of the Southern cotton operative are equal to the earnings in

SOME OF THE SPEAKERS AT THE FEDERATION'S SIXTH ANNUAL MEETING.

the North, I am not going to believe it, because I know they are not. And the conditions are not equal; if they were, we would have more people going there during depressions; during some of our big stoppages in the East we would have more people going down South to work; we have had a few, but the only ones that stay are those that either cannot get away or are fortunate enough to become officials.

"I want to tell you in regard to this question of child labor, that I am frank enough to admit it isn't confined to the South alone. There is a lot of it down there. I think the question of whether it does exist has gone beyond the debating stage. We have some of it in the North and East. In spite of many of our humane and progressive labor laws, we have it in Massachusetts, my home State, because I have seen it there. That is mostly on account of the lack of efficient factory inspectorship, the appointing of men as factory inspectors who know nothing about mill conditions, and who are very often appointed to pay off some political debt. It is no use whatever in passing any kind of factory laws, no matter of what humane character they may be, if you do not put in men to enforce them after they are passed. Such is not the case, I regret to say, at the present time in many of our States."

SAMUEL GOMPERS, President of the American Federation of Labor, spoke briefly on child labor conditions with special reference to the South. He related instances concerning investigations of conditions in that section, stating that one of labor's representatives, who went into one of the towns of Mississippi to investigate conditions of the cotton mill operatives, was informed that unless he left the State summarily he would be escorted out by the police, and in fact, he was accompanied on his way beyond the borders of the State by a representative of the city government.

"I know, too," said Mr. Gompers, "that there was pending in the South Carolina Legislature a bill to limit the hours of labor and also to restrict the age of children in the cotton mills of that State, and I have been informed that the resolution of the Cotton Manufacturers' Association of South Carolina to 'voluntarily' limit the hours of labor of children to sixty-six per week was done as an offset to prevent the enactment by the Legislature of that State of a sixty-hour law. The people of Alabama secured the enactment of a law limiting the labor of children to sixty hours per week. In 1895, during a visit to the State, I learned that the Legislature just a day before I arrived in Alabama, repealed the law, and it was plainly stated that it was done for the purpose of inviting the capital of the North, of Massachusetts, to come into Alabama. It seems to me that the very reason given is a condemnation of that repeal. The idea that the State of Alabama, at the instance of its cotton manufacturers, should give them or the Northern capitalists, free play in the labor of the children of Alabama!

"This discussion will do good, and that is after all what we are trying to do. If progress is being made, and I think it is, let us accelerate it and save the children—even save a child—from exploitation and give it the opportunity of going to school and the playground and of becoming a worker, a man or a woman."

DR. J. M. WAINWRIGHT, of the Moses Taylor Hospital at Scranton, Pa., discussed "The Relation of Child Labor to Health," based upon professional experience of six years in the anthracite coal region. He expressed the belief that "our coal fields are just as healthy and happy a community as is any other industrial region in this country, and we very much resent the statement that we are behind any industrial people in the United States in anything that makes for good."

He said: "We have heard a great deal about the boys going into the mines and in a few years developing tuberculosis, dying from the Great White Plague. Now, the facts about that are well stated by Miss Lillian Brandt of the Tuberculosis Society here; she has gotten a table from the last United States Census and classifies fifty-three different occupations, and of these fifty-three, miners and quarrymen were classed together as third from the best in point of mortality from tuberculosis. The only people who have less tuberculosis among them are farmers, planters, and farm laborers, as one class; and bankers, brokers, and officials of companies in the other. There are a lot of such figures available; for instance, in the registration area of the United States, consumption causes 10.6 per cent of all deaths among miners and 16.2 per cent of all deaths among all the occupied males, so that miners are nearly one-third less than all the occupied males in point of view of mortality from consumption. In Scranton for the last ten years consumption caused only 3.37 per cent of all deaths among miners, while among all the occupied males in Scranton it has caused 9.99 per cent, or three times as much.

"Another statement that has been made is that the death rate among the children in the anthracite region is worse than it is in the slums of the cities. Now, I would have felt perfectly free to contradict that statement entirely from my own superficial observation, but the facts in the case as obtained from the United States Census, comparing infant mortality in Scranton

with that in other large cities, show deaths in early infancy for 100,000 to be 78.1 in New York, 94.5 in Boston, 78.94 in Philadelphia and only 56 for Scranton. Take children's diseases, measles, scarlet fever, whooping cough, diphtheria, etc.—in New York the average mortality for these diseases is 37, in Scranton 27. So that, coming down to facts, our anthracite center is not only not worse than the slums of New York, but it is much better than the slums, with Fifth Avenue, the bucolic regions of the Bronx and breezy Staten Island thrown in."

EDWIN MARKHAM, author of "The Man with the Hoe," and who has written many magazine articles of late on the subject of child labor, read extracts from a number of letters which he had received commenting upon his articles. Some of these letters, he said, are from persons who are not always heard from, that is, from the workers themselves. "I have also received a number of letters from manufacturers, from those who are employing children, and I am forced to say that the arguments which I have read in those letters are somewhat similar to the arguments that can be found in the books of record about 1820, and so on, when the great problem of child labor was a vivid fact in England. The arguments are about the same. I am told that children enjoy this work, in fact, one writer tells me that after working hours the children sometimes play leap-frog. One gentleman in Illinois has invited me to come out there and see the boys play leap-frog. Well, I am glad of that, because the boys ought to play leap-frog. That is one of their rights.

"Another point is that hardship is necessary for these boys to develop them; it brings out their best qualities. Well, there is some truth in that, and I have been pointed to the illustrious Lincoln as a type of a man who developed himself through hardship. Well, there is a great deal of truth in this hardship argument, but there is not all truth in it by any means. We need a small quantity of hardship, all of us, although we are all flying from it whenever it happens to confront us in the road. Now, we are not all Lincolns. Lincoln had that hardihood and strength of character that forced him through obstacles, but the ordinary child is not equipped with that fortitude that makes its way through obstacles. What the child needs is a proper equalization between work, play and school. No child should be idle. I have been asked whether I thought a child should be coddled and deprived of work. I think a small quantity of work for a small quantity of humanity is very good.

"I am also told that the use of child labor is necessary on account of the necessity, the hard necessity, of trade; that the competitive struggle demands the child, for without him many important industries would languish and possibly go to pieces. This certainly is a serious problem, and for that reason it seems necessary that there should be a national law established in order not to hinder and hamper our national progress.

"The children are the seed corn of the nation, and it was Jefferson Davis himself who announced to his compeers 'we must not grind the seed corn.' The State has a right in this matter because the interests of the State are concerned. Of course, you know that amongst the Greeks the idea of the State took the very first importance, in fact, among the Spartans that position, that the interests of the State were absolutely supreme, took such a definite and sovereign position that they assumed the right even to destroy defective children. In our democracy we do not take so radical a view, but still the same principle holds. It is the opinion of the best thinkers since the beginning of Government that the State has a right to perpetuate its own life, and in saving the children from undue work—work coming upon them at a time when they are simply developing to become citizens—the State is only taking that right which has been accorded to her by the best thinkers of the race."

JAMES H. TORREY, one of the representatives of the anthracite operators before the Coal Strike Commission of 1902, referred to "some statements with reference to child labor in the anthracite region just made by Mr. Mitchell" as being likely "to convey an erroneous impression." He stated that "Mr. Mitchell's claim that prior to the advent of the miners' union and the strike of 1900 there was no effort to regulate the employment of children, is very wide of the mark." Mr. Torrey then reviewed in some detail the various enactments by the Assembly of Pennsylvania since 1891 regarding the employment of children in the anthracite industry previous to the entrance into the region of the United Mine Workers of America. The act of 1891, known as the Mine Ventilation Act, forbade "the employment of any boy under fourteen years or any woman or girl of any age inside the mines, or of any boy under the age of twelve years, or any woman or girl in or about the outside structures or workings of the colliery."

Mr. Torrey referred to the testimony regarding child labor presented before the Anthracite Coal Strike Commission, stating that the gist of the testimony "was to the effect that there was no effort upon the part of the operators to evade the law and that so far as it was

not properly enforced and respected it was mainly due to the fact that parents themselves gave false certificates as to the ages of their children for the purpose of securing the benefit of their wages. The cases of the employment of children in the anthracite region which presented the greatest hardship and appealed most strongly to the commission were those where they were employed in silk mills, knitting mills, and other industries which have located in great numbers in the anthracite region for the purpose of securing the benefit of the abundant and cheap labor there to be found." As showing the attitude of the anthracite operators with reference to this matter Mr. Torrey made the following statement by their authority during the sitting of the commission in Philadelphia in January, 1903: "There has been some agitation of this child labor question. It has been up a good many times. There has been some consultation among the attorneys for the operators, and I am authorized to state for all the operators, so far as they could be consulted, and I think it includes them all, that we will heartily recommend and co-operate in any effort to have a law passed forbidding the employment of any children under sixteen years in the bituminous or anthracite coal regions of Pennsylvania." He stated further that through the efforts of the operators there was introduced in the legislature of 1903 a measure which carried out the spirit of this proposition.

"This act," he said, "was attacked in the bituminous regions, and was held to be unconstitutional because two acts of Assembly were amended by one enactment. Nevertheless, the anthracite operators continued, so far as was in their power, to enforce the act according to its letter and spirit."

The act of 1905 relating to child labor, which applied solely to the anthracite region, increased the age at which boys might be employed in the anthracite mines to sixteen years for those inside and fourteen for those outside. "Probably by an inadvertence," said Mr. Torrey, "this act required that every minor employed in or about the mines should be required to furnish an employment certificate and in order to secure an employment certificate certain educational qualifications were required. The effect of this provision, if it had been enforced, would have been to require the operators, under severe penalties, to turn out of their employ all boys between the ages of sixteen and twenty-one who had no education, and thereafter refuse to employ any such. The constitutionality of the act was successfully attacked in the anthracite regions because it required different degrees of educational qualifications for different classes of miners who were practically in the same position."

Replying to Mr. Mitchell's denial of the scarcity of labor in the anthracite region, and his allegation that the record of 1906 will show not more than two hundred days' work, Mr. Torrey stated it to be of such common knowledge and universal complaint, that it is practically impossible to secure men enough to fully operate the mines, that it would appear very strange to any one familiar with the situation that it should be seriously questioned. "There was a six weeks' suspension," he said, "decreed by the union in the spring, covering the period required for it to consent to a continuance of the conditions imposed by the strike commission's award, and the usual number of holidays have been observed by them; otherwise, work has been as continuous and uninterrupted as the conditions and transportation facilities would permit."

EDGAR T. DAVIES, Chief of the Illinois Department of Factory Inspectors, in a letter, stated that "there is very little child labor in the industrial field in Illinois at the present time; there was considerable under the old child labor law. We have in Illinois what is considered an excellent law. It is quite different from the laws of other States, and applies not only to manufacturing institutions but also to stores, offices, laundries, mercantile establishments, coal mines, concert halls, bowling alleys, theaters and places of amusement. The policy of prosecuting defendants under the law, which has succeeded one of moral suasion, has resulted in a wonderfully increased school attendance and has reduced child labor eighty per cent in three years."

J. C. DELANEY, Chief of the Pennsylvania Department of Factory Inspection, in a letter, stated that "so far as Pennsylvania is concerned, the evils of child labor are not now and I doubt if they ever were so bad as they have been painted." He presented statistics for Philadelphia and Berks counties, comparing 1906 with 1905 as regards minor employees under sixteen years of age, Philadelphia showing a decrease of 6,394, or 34 per cent, and Berks county a decrease of 906, or 30 per cent. "This decrease," he said, "is not to be charged against or credited to industrial decline, for such has not been the fact. It is a direct result of several things working together to the same good end. They are the raising of the minimum age from thirteen to fourteen years by the Legislature of 1905; the vigorous enforcement of the law by the Department of Factory Inspection, and the passing out of the class of 'under sixteen' to 'over sixteen' of a large percentage of minor employees."

VIEWS OF EXPERTS ON DISTRIBUTION OF IMMIGRANTS.

SOME CLAIM THE PROBLEM IS BEING SOLVED THROUGH ECONOMIC LAWS, WHILE OTHERS SUGGEST REMEDIES FOR THE IMPROVEMENT OF CONDITIONS.

FOLLOWING the afternoon session and preceding the dinner on December 12 a special meeting of the Executive Committee of the Immigration Department was held at the Park Avenue Hotel. The special topic for discussion was "Distribution of Immigrants," which many students, lecturers, writers, and practical men of affairs have been emphasizing the past several years as being the crucial question in a proper solution of the immigration problem. Dr. Leander T. Chamberlain, First Vice-President of the Department, presided.

THOMAS W. SLOCUM, Chairman of the Department's Committee on Supply and Demand, was the first speaker. Among other things, he stated that if by any possible way we can direct our immigrants into those sections of the country where they are most needed and away from the congested centers, it would be a step in the right direction. Continuing, he said:

"Within the last year 1,025,000 immigrants came to this country. Of that number, I think 788,000, or practically eight-tenths, came into the port of New York. The best way to settle the matter of having so many immigrants in New York is to do it in the Irish way; the best way to get immigrants out of New York City is not to bring them in; but how are you going to attract immigrants to some other port when eight-tenths of the immigrants last year came into this port because it was to their advantage to come here? The steamship lines made opportunities for them that no other port provided. So long as the immigrants can come here cheaper than they can go anywhere else, they are going to come here, and we have got the problem of distributing them down through the South and out through the West. When it comes to the Italian, who comes in here and can get \$2 or \$2.50 a day working in New York, there is not very much to tempt him to go down South or out West for less money, although the purchasing value of that money may be greater there than it is here.

"It has seemed to me that we might perhaps make some practical headway if we, representing the Civic Federation, or the Immigration branch of it, could have communication with the steamship lines with the idea of opening up ports through the South, perhaps New Orleans, Charleston, or Savannah, where we could get the immigrants into agricultural pursuits and in manufacturing towns throughout the South."

COMMISSIONER WATCHORN referred to the distribution of immigrants as being like Banquo's ghost, in that it would not down, and said that those who have discussed it in his hearing or whose writings he had read, have invariably taken the view that by delivering immigrants at a certain place and leaving them there, they have solved this problem. He did not agree with such a view. Continuing, he said:

"The thing that will distribute the immigrants on a sound and healthy basis is to establish sound and healthy industrial conditions over very much more widely extended areas. There is no use telling a man who can get \$2.50 a day in a crowded city that it would be very much better for him—and perhaps insure his peace of mind, health of body and enrichment of pocket, and all that sort of thing—if he would only go West or go down South where he would get perhaps only \$1.15 a day and live under his own vine and fig tree. The thing to do in the distant States in order to attract immigrants, is to offer them as good wages as they can get in New York and until that is done immigrants will continue to avoid such sections of our country. The evils must be corrected where they exist, and then the stream will naturally flow where it belongs. It is useless trying to correct an evil by indirect treatment. The evil of congestion is due to the fact that the immigrants settle where they are best off, as they think, and you will have to show them where they will be actually better off by distributing themselves, before you can induce them to seek pastures new.

"A delegation came from the South to Ellis Island a short time ago, and they told me that they wanted at least 50,000 men and women to go there; that all the industries were languishing for want of help. I said: 'Very well, there are 700 or 1,000 immigrants here now; turn yourselves loose among them and take as many as you can divert from their chosen destinations.' They spent the afternoon trying to coax them to go there, and they could not get one. Why? Because these men knew well enough from the letters they had received from their friends and relatives what they could expect to get when they arrived there. If the report can be truthfully made and duly circulated that conditions in North Carolina are as favorable as they are in Massachusetts, you will have no difficulty in getting immigrants to go to North Carolina;

and until conditions are as satisfactory it is no use asking them to go there, and the suggestion that by sending them to any specially selected port as a means of distributing them I think is purely artificial."

PROF. WALTER F. WILLCOX, of Cornell University, said that during the last fifteen years statements have been made frequently and with increasing emphasis that the immigrants are not properly distributed over the country. "My conclusion," he said, "is that the distribution of immigrants is not a serious problem calling for federal intervention and aid. On the contrary, the immigrants, according to the best statistical evidence, are distributing themselves adequately and satisfactorily. They are following the allurements of economic advantage presented to them and going where those advantages are greatest. If this distribution is to be changed, I agree thoroughly with Commissioner Watchorn that it should be changed by changing the conditions, and that there is no evidence that the immigrants are in serious need of additional information regarding the conditions which now exist.

"To these arguments, when presented at a recent meeting of this Department, the answer was made that there was little difference between a tendency to stagnate in cities and a tendency to be found there. To my thinking the difference is radical. If our tenement house quarters of New York and other cities are crowded with foreign born, who linger there indefinitely in a state of hopeless contentment with conditions as they are, the problem might well be deemed a serious one, but if it be true, as I contend, that the population of these sections is in a state of rapid change, the older arrivals passing on to something different, and in the majority of cases, we believe, to something better, almost or quite as fast as new arrivals crowd in, then the whole mental attitude and temper of the population is one of hope, of confidence, of courage. The difference between a stagnant slime-covered pool, the picture usually raised in one's mind by the word 'slum,' is totally unlike the picture of a lake fed at one end by a great stream but kept at the same level and sweet and fresh by the outflow of countless streams of various sizes and in various directions all around its borders. The latter, rather than the former, I believe, is the true picture of our tenement house sections."

S. A. HUGHES, of the St. Louis and San Francisco Railroad Company, speaking for his section of the country and for a solution of the distribution problem, said that in his opinion the agricultural districts offer the solution. He suggested that land propositions be placed before the immigrants before they embark, so that they may be distributed properly on the land to their best advantage and to the best interest of the community. He said further:

"I believe that the immigrants who are coming to this country, allowing you a fair quota for labor in the cities and in the industrial sections, should be attracted to the farm upon this side, and for that reason I had the pleasure of introducing last December in this convention a resolution providing that the Immigration Commissioners' hands should be so strengthened that they would increase the facilities at the South Atlantic and Gulf ports for diverting the business from Ellis Island to the unoccupied and undeveloped lands of the South and the Southwest. But this cannot be done until you have placed your representatives in foreign countries with suitable land propositions, and the question then will arise, Are we not stimulating immigration to this country? I believe that the doors of our country should be thrown open to any able-bodied man, no matter from whence he comes, so long as he is willing to live under our flag and under our constitution. Although he may be illiterate, we will educate him, barring of course Chinese coolie labor as against our American labor."

CHARLES P. NEILL, United States Commissioner of Labor, agreed with the views expressed by Commissioner Watchorn and Professor Willcox. He stated that he had recently been looking into the matter of the distribution of immigrants and that the results of his investigation thus far appeared to confirm Prof. Willcox's statements. Continuing Commissioner Neill said:

"Some good can undoubtedly be accomplished by bringing the resources and advantages of different sections of the country more directly to the attention of our immigrants who have settled on the Eastern seaboard, but we must not lose sight of the fact that the only law that can in any way influence the distribution of immigrants throughout the various parts of the

United States is a fundamental economic law and not a legislative enactment. The immigrants who have come to the United States have torn themselves away from their home surroundings and life-long associations, and many of them have crossed the whole continent of Europe in addition to the Atlantic Ocean. Their purpose is largely to better their economic condition, and they are going to settle on the Eastern seaboard or in the South or the West, according as these respective sections offer them the greatest economic advantage. On the whole, they are going where they earn the largest wages. There is, of course, a certain friction that retards their perfectly free movement, but, generally speaking, any considerable difference in wages will bring immigrants from the East to the South and the West. I think what is most needed is to prevent such a large percentage of the immigrants going into the industrial pursuits instead of going on the land and developing our agricultural possibilities. What prevents this, it seems to me, is that such a large percentage of our present immigrants is without the means necessary to take up land. They cannot maintain themselves until their farms are able to support them.

"In a word, I would like to suggest that it is useless to talk about any plan to distribute immigrants, other than the single plan of offering higher wages in the places that want them than they are getting in the places that they are now, or in offering them opportunities to take up land that make the opportunities actual and really within their reach."

REFERENCE was made by Thomas F. Parker, of the South Carolina Cotton Manufacturers' Association, to the practical solution recently attempted in the State of South Carolina with regard to the distribution of immigrants by the establishment of a new line of immigrant steamers to Charleston. Mr. Parker spoke in part as follows:

"In South Carolina our wage scale is just reaching a point where we can commence to bid successfully in the world's labor market. In the last five years the wages in our State, including our mills, have advanced fully 50 per cent. The immigrants to our State for cotton mills in the past have mostly come from the population of neighboring States. The question of immigration from abroad is very new to us.

"South Carolina is one of the first Southern States to have a Commissioner of Agriculture, Commerce and Immigration, with an appropriation from the Legislature, and his visit abroad and his return on board of the first immigration steamer, the Wittekind, to Charleston, S. C., with 475 immigrants, carefully selected abroad, has attracted considerable attention in the South. We are informed that the results so far have been thoroughly satisfactory to the North German Lloyd Line, and that the indications are that it will permanently establish a line of steamers between Hamburg and Charleston, which would be an important step, as we see it, towards the proper distribution of immigrants.

"We realize that immigrants after arriving in America will eventually drift to where wages and conditions of living are most inviting, but our State prefers selecting the immigrants abroad, and first showing them what inducements the State of South Carolina has to offer, before others talk to them, and we want to save the per capita expense of transportation charges from New York to South Carolina of from \$15 to \$20. Our idea is that South Carolina has a better chance of keeping permanently people landed in Charleston, than if they were landed in New York or other ports.

"There is no question in my mind that the future development of the South is dependent on immigration from abroad, and that it is time we learn how best to handle this question. Perhaps one of the principal inducements which we can offer is cheap and desirable land. Each family of foreigners that we settle and satisfy is a nucleus around which other foreigners will collect."

JAMES BRONSON REYNOLDS, as Chairman of the Department's Committee on Oriental Immigration, brought before the conference a resolution passed by his Committee authorizing an investigation regarding the economic, social and political conditions of the Chinese, Japanese and Koreans in this country. He said: "We desire to inquire what occupations the Chinese, Japanese and Koreans in this country are engaged in, what compensation they receive and what their hours of labor are. We desire in the second place to investigate their social and political relations where they are found, as is the rule, in communities by themselves. As we are probably all aware, comparatively few of them speak our language fluently, so that the laborers and trades-people of these races are limited to association with their own people. We desire to inquire into their condition under these circumstances and determine what are their actual relations to our own people. We have already inquired regarding the information now possessed on the subject, and find that little exact information is possessed by any one."

JAMES P. ARCHIBALD, Assistant Commissioner of Licenses of New York City, said that to his mind the question of distribution was the most complex phase of the entire immigration problem, and stated his belief that until some elucidation is afforded by

those most interested—the farmer, the manufacturer and the contractor—chaos will still prevail and but unsatisfactory results remain. He gave a number of cases of enforced labor in certain sections of the South, and called for measures to prevent a continuance of such conditions. Continuing he said in part:

"The cases I have here cited are absolutely true and are a fair sample of the treatment which not only illiterates receive in certain parts of the South, but men of more than ordinary intelligence are inveigled into taking these chances, and to them the suffering must be keen indeed. This state of affairs does not apply, as a rule if at all, to agricultural laborers, but does in all its baseness, brutality and deceit, to contractors in particular, to quite a number of unscrupulous manufacturers, who think that this kind of treatment is never heard of outside of the one State where it happens, and presuming upon this, in which they are grievously mistaken, they keep up those vicious practices until it not only gets into the local courts but to the Federal courts. Even President Roosevelt himself has taken notice and has appointed special com-

missions to stop this practice of peonage in the very localities referred to, many convictions for which have been recently obtained and salutary punishment of both imprisonment and fines has been justly inflicted.

"Thus it is necessary, if those who love the South would develop its great resources, to be satisfied for the time being with less profit on their commercial enterprises, and devise ways and means of bringing the alien closer to the land—the land at present out of use—to give the immigrants a reasonable chance to establish homes and enable them to look into the future and see something in it for them and their offspring. No man will pay from \$8.00 to \$15.00 for transportation to the sunny South, undergo estrangement from family and friends and be subjected to almost inhuman treatment for \$1.25 per diem while there are \$2.00 per day and over right here in New York City, where at present there is being spent over four hundred millions of dollars in enterprises of public and private utilities, and where a greater demand for unskilled labor than can be supplied has existed for the past two years."

A REVIEW OF THE CIVIC FEDERATION'S ACTIVITIES.

THE WORK OF THE DIFFERENT DEPARTMENTS SUMMARIZED AND ITS SERVICES COMMENDED BY DISTINGUISHED MEN AT THE ANNUAL DINNER.

VICE-PRESIDENT OSCAR STRAUS presided at the dinner held at the Park Avenue Hotel on the evening of December 12. He referred to the efforts preceding the organization of the Federation in New York City in November, 1901, explaining that the lines of work were undefined and the whole plan tentative when those invited met in the rooms of the Board of Trade, so much so that it was problematical whether there would be a meeting over which to preside. The event brought forth, however, the largest representation of important labor leaders and of capital that had ever assembled in the city. Continuing Mr. Straus said:

"I think that I am not claiming too much for this organization when I say that, since the beginning of its work, a better relationship from that existing hitherto has developed between the labor leaders and the important employers of labor throughout the country. I personally feel a great indebtedness to the Federation. It has been an education to me, and whatever qualifications I may possess for the position to which I have been summoned, I owe (so far as that branch of the department's work relating to labor is concerned) to having come in closer contact with the great leaders of the industrial forces of this country.

"This evening I had one of the most prominent labor leaders of this country say to me—and I repeat his remarks in order to give you an idea of what results the work of the Federation is producing—'When you occupy your position, we feel we can come before you because we have met often before, and that you understand us and that we understand you.' This is no compliment to me; it is a compliment and it is a tribute to the work of this organization.

"Nine-tenths of the troubles between capital and labor result from misunderstanding. I heard a gentleman say this evening: 'It is unfortunate that The National Civic Federation has not been able to prevent two or three of the important strikes that have taken place during the five years of its existence.' Yes, it is unfortunate, but it has been a most fortunate thing, by reason of the existence of this Civic Federation, that many misunderstandings and strikes have been prevented of which there is no public record, but of which the Conciliation Department of the Civic Federation has knowledge and information that would surprise and gratify the community. We have learned how to assemble about the council table and to thrash out differences, and to prepare the common ground to which each side can repair for the purpose of doing everything in its power to avoid a disagreement or a rupture.

"I was told the other day: 'Why, you never can satisfy labor; if you give them eight hours to-day, next year they will want seven; if you give them five dollars a day wages this year, pretty soon they will want seven dollars.' I said: 'Perfectly true, for, after all, a healthy dissatisfaction, as distinguished from envious discontent, is a stimulus to our civilization. Whenever the desire for improvement is dead, our civilization is dead. For five years I lived in a country where medieval conditions prevailed and there the people were satisfied; there was a stupor of satisfaction, and there was a paralysis of energy. The government had directed to itself every power and every influence, it controlled every business, it controlled every enterprise, and instead of individual energy accomplishing anything, it was through favoritism and fawning that rights were obtained. Yes, healthy dissatisfaction, as distinguished from covetousness, is the very basis of our progress.

"How important is the promotion of industrial peace has only yesterday been illustrated. The great dynamite inventor, Nobel, who died a few years ago and who appreciated peace as perhaps no other man could, for he knew what the destruction of war meant, left an annual prize of \$40,000, among a series of prizes, to be distributed to the foremost promoter of international peace; and recently that prize has been given, to the honor and credit of this country, to its chief magistrate, Theodore Roosevelt. The surest foundation for international peace is internal industrial peace, and I am sure that the example he has set in this respect, such as the examples he has set in the 'world's peace,' will have its influence in every civilized country, because in every civilized country they have the same question at issue, namely, the promotion of the good relations between the great industrial forces. And in this connection I can imagine no more important work in which any man could be engaged than the work that is embraced in the scope of The National Civic Federation."

CHARLES A. MOORE, Chairman of the Welfare Department, presented a report of the work done the past year. The Department is now composed of over two hundred and fifty employers in different industries throughout the United States. He explained that opportunities for presenting the subject of welfare work to employers and the public generally through different types of meetings have been taken advantage of the past year. One result of the plan for holding conferences of employers in the different sections of the country for the interchange of experiences to stimulate interest has been the formation in New York and Boston of local committees to promote the work in these places. The Workshop Improvement Committee of the New England Civic Federation has for its object the promotion of practical interest in the improvement of such working conditions as affect the health, comfort and convenience of employes in factories, stores and other places where labor is performed.

He said: "No coercive work will be undertaken by these local committees. The same methods as those adopted by the national Welfare Department are used. When the average employer learns of the improvements which are pertinent to his industry, he is ready to adopt such measures as will afford health and comfort to his employes. This is accomplished again through conferences and literature. Such local work will be promoted in Philadelphia, Cleveland, Pittsburg and Chicago as early as feasible."

Referring to the numerous conferences held the past year Mr. Moore said: "It is interesting to note the effect of the conferences upon our own members. I, for one, after a meeting in New York last February immediately installed proper ventilating devices for metal polishers, and I would defy anyone to-day to claim that our metal polishers are not protected from the dust attendant upon the trade. Mr. Underwood, after the conference with the Chinese Commissioners, at which conveniences for railroad men were displayed by use of the stereopticon, immediately consulted with our Department in reference to rest houses for the trainmen on his road, and he is erecting rest houses which will be far superior to any which have yet been constructed. And, again, Mr. Belmont and Mr. Vreeland, through association with us in the work, have just announced their intention of vestibuling the street-cars of New York City."

Mr. Moore referred to the special investigations carried on the past year by representatives of the Welfare

Department, including the charity institutions of New York City, the conditions in Panama, cotton mill operatives in the South, the tunnel workers in New York City, etc. He stated that at the request of labor leaders and others the Department was soon to take up investigations of the tobacco, glass, and paper industries. The methods of the Department in distributing literature, plans, photographs, and architectural designs concerning welfare work were described.

In concluding his report Chairman Moore said: "Questions of such great importance, affecting wage-earners and their families, are before the country to-day that I feel the necessity of recommending the appointment of special committees to investigate and recommend what should be done to meet the needs of workers along the following specific lines: Industrial training; industrial insurance, which includes savings banks, life and accident insurance, building and loan associations, and old-age pensions; public service employes; employers' liability; deleterious trades; eating and ventilation; architecture, and sanitation of work places.

DR. LEANDER T. CHAMBERLAIN, First Vice-Chairman of the Immigration Department, presented a report of its activities the past year. As this department was organized as recently as June 29, 1906, much of the report dealt with the events leading up to its organization, an announcement of its officers, and an analysis of the purposes of its seven investigating committees. Continuing, Dr. Chamberlain said: "One important feature of the work of the Immigration Department to which attention is called was the conference held on September 24. The discussion was participated in by prominent experts whose views and presentation of facts served, partly through the wide publicity given by the press, as an educational force of importance.

"Through the efforts of the Committee on Agencies for Advancing the Welfare of Immigrants, action has been taken resulting in greater protection being thrown around the newly landed immigrant at New York City. It is believed that an effective check has been put upon the increasing number of cases where immigrants have been defrauded. We also have to report that this committee has in preparation a hand-book for immigrants, and that it has also planned to secure from the New York legislature a bill authorizing the licensing of ticket sellers and bankers who have to do with steamship transportation and in the forwarding of immigrants' money.

"The Committee on Basal Statistics has in view the drawing up of a general scheme of statistical investigation.

"The Committee on Legislation and Its Enforcement has in prospect the preparation of a digest of existing laws, departmental regulations, court decisions and department rulings concerning immigration in the United States and foreign countries.

"The Committee on Oriental Immigration has received the sanction of the Department to undertake an investigation of the economic and politico-social conditions surrounding the Chinese, Japanese, and Koreans in this country, including their actual employments, wages received, hours of labor, and their industrial and social condition generally. It is also desired to ascertain their communal relations to people of their own race, or our race, and to public officials in this country. Inquiries also are to be made regarding the effect of civic disfranchisement and ignorance of our language, customs, and laws on their social and moral condition."

ARCHBISHOP IRELAND, in his opening remarks, referred to the pleasure it had given him to be identified with the work of the Civic Federation from its earliest days, and stated that each time he assisted at one of its annual meetings he had found occasion to rejoice at its growth and at its constantly increasing influence and usefulness.

"But never before as this evening," he said, "have I realized what a great institution it is. It is really a wonderful institution. As to the great and good work of the Federation, the reports of the chairmen of committees which you have just heard have given ample evidence. Think of it! Think of how much has been done by the Welfare Department, and think not only of the physical good but of the moral good done thereby. And again our work in the Immigration Department has gone all over the world. A few months ago I was in Europe, and throughout several countries I was asked: 'Tell us something of that great immigration meeting that you had in New York; do you know anything about it?' Well, I was quite proud to be able to say I knew a great deal about it, for I was one of those who took part in that great meeting.

"I believe it is only in America such an institution is possible. And because of the fact of the Civic Federation, I am proud of my country. This fact was told to me in England and France—it is all due to our American democracy, that you can find men of every social position, employers and employes, the rich and the comparatively poor, sitting together around the same table and feeling that we are all equal before the Almighty, all children of the same God, all brothers together.

"Another reason why the Civic Federation is truly an American institution is the fact that we are ac-

EXECUTIVE COMMITTEE

On the Part of the Public.

GROVER CLEVELAND, ex-President of the United States, Princeton, N. J.
ANDREW CARNEGIE, capitalist, New York City.
CORNELIUS N. BLISS, ex-Secretary of the Interior, New York City.
CHARLES W. ELIOT, President Harvard University, Cambridge, Mass.
NICHOLAS MURRAY BUTLER, President Columbia University, New York.
SETH LOW, Publicist, New York City.
ARCHBISHOP JOHN IRELAND, of the Roman Catholic Church, St. Paul, Minn.
BISHOP HENRY C. POTTER, of the Protestant Episcopal Church, New York City.
CHARLES J. BONAPARTE, Attorney-General of the United States, Washington, D. C.
DAVID R. FRANCIS, ex-Secretary of the Interior, St. Louis, Mo.
JAMES SPEYER, of Speyer & Co., New York City.
V. EVERITT MACY, capitalist, New York City.
RALPH M. EASLEY, Chairman Executive Council, New York City.

On the Part of Employers.

HENRY PHIPPS, Director United States Steel Corporation, New York City.
AUGUST BELMONT, President August Belmont & Co., New York City.
CLARENCE H. MACKAY, President Postal Telegraph Cable Company, New York City.
LUCIUS TUTTLE, President Boston & Maine Railroad, Boston.
W. A. CLARK, President United Verde Copper Company, Butte, Mont.
FREDERICK D. UNDERWOOD, President Erie Railroad Co., New York City.
FREDERICK P. FISH, President American Telephone and Telegraph Company, Boston.
FRANCIS L. ROBBINS, President Monongahela River Consolidated Coal & Coke Co., Pittsburgh.
H. H. VREELAND, President New York City Railway Company, New York City.
SAMUEL MATHER, of Pickands, Mather & Co., Cleveland.
CHARLES A. MOORE, of Manning, Maxwell & Moore, New York City.
FRANKLIN MACVEAGH, of Franklin MacVeagh & Co., Chicago.
CHARLES H. TAYLOR, JR., ex-President American Newspaper Publishers' Association, Boston.
DAN E. HANNA, of M. A. Hanna & Co., Cleveland.
MARCUS M. MARKS, President National Association of Clothing Manufacturers, New York City.
OTTO M. EIDLITZ, Chairman Board of Governors, Building Trades Employers' Association, New York City.
FRANK A. MUNSEY, Publisher, New York City.
ELLISON A. SMYTH, President South Carolina Cotton Manufacturers' Association, Pelzer, S. C.

On the Part of Wage Earners.

SAMUEL GOMPERS, President American Federation of Labor, Washington.
JOHN MITCHELL, President United Mine Workers of America, Indianapolis.
JAMES DUNCAN, General Secretary Granite Cutters' International Association of America, Quincy, Mass.
DANIEL J. KEEFE, President International Longshoremen, Marine and Transport Workers' Ass'n, Detroit, Mich.
WARREN S. STONE, Grand Chief International Brotherhood of Locomotive Engineers, Cleveland.
P. H. MORRISSEY, Grand Master Brotherhood Railroad Trainmen, Cleveland.
WILLIAM D. MAHON, President Amalgamated Association of Street Railway Employees of America, Detroit, Mich.
WILLIAM J. BOWEN, President Bricklayers' and Masons' International Union, Indianapolis, Ind.
J. J. HANNAHAN, Grand Master Brotherhood Locomotive Firemen, Peoria, Ill.
JAMES O'CONNELL, President International Association of Machinists, Washington, D. C.
JOHN F. TOBIN, General President Boot and Shoe Workers' Union, Boston.
JOSEPH F. VALENTINE, President Iron Molders' Union of North America, Cincinnati.
JAMES M. LYNCH, President International Typographical Union, Indianapolis.
DENIS A. HAYES, President Glass Bottle Blowers' Association of the United States and Canada, Philadelphia.
WILLIAM HUBER, President United Brotherhood of Carpenters and Joiners of America, Indianapolis.
TIMOTHY HEALY, President International Brotherhood of Stationary Firemen, New York City.

Activities of the National Civic Federation. This issue is appropriately given up to a bird's-eye view of the manifold activities of The National Civic Federation.

In it is presented a detailed account of the sixth annual meeting of the organization; a brief report of the second annual gathering of the New England Civic Federation; an account of the Federation's remarkable conference between representatives of capital and labor and the general public held in Chicago at the residence of Mrs. Potter Palmer; and reports of addresses and lectures by officials of the different departments of the Federation before a large number of organizations in various sections of the country.

The sixth annual meeting of the Federation, held in New York City December 12 and 13, was a most remarkable and stimulating gathering. All five of the sessions, as well as the dinner held on the evening of December 12, were largely attended by representative men and women, and marked interest was manifested in the subjects discussed by well-known speakers. These subjects comprised Government by Injunction, Child Labor, Distribution of Immigrants, The Work of The National Civic Federation, and The Income and Inheritance Taxes. In addition to the educational value of these discussions, one of the most conspicuous results was the provision for the appointment of four investigating commissions—one on Child Labor, one on Government by Injunction, one on Income and Inheritance Taxes, and one on the Anti-Trust Laws. The details as to the personnel of these commissions and the plans for their investigations are now being worked out.

The importance of a Commission to inquire into the operations of the Anti-Trust laws is indicated in the fact that those engaged in various governmental relations in enforcing the statutes against combinations in restraint of trade have repeatedly emphasized the need of certain changes of law and policy. The prosecutions and verdicts and judicial decisions of the past ten years, both State and Federal, have completely established the supremacy of law over such combinations and yet, notwithstanding, there is at present a very unsatisfactory situation resulting from a strict enforcement of these laws. This condition is stated by President Roosevelt in his last message to Congress, as follows: "The actual working of our laws has shown that the effort to prohibit all combinations, good or bad, is noxious where it is not effective. * * * It is unfortunate that our present laws should forbid all combinations, instead of sharply discriminating between those combinations which do good and those combinations which do evil. * * * It is a public evil to have on the statute books a law incapable of full enforcement because judges and juries realize that its full enforcement would destroy the business of the country."

No one who reads the conflicting statements and different interpretations of conditions as regards the extent and menace of child labor in the United States, presented in this issue of THE REVIEW, will question for a moment the necessity of an impartial and thorough investigation of the actual situation. This is what the Commission on Child Labor has for its object.

Statements as to the advisability of adopting the Income and Inheritance Taxes differ almost as widely as do those regarding the status of child labor. The speakers at the Federation's annual meeting who discussed this subject, and who have justified the public attaching importance to their statements, disagreed so radically as to the desirability of enacting such laws that an impartial study of conditions by experts specially chosen for that purpose because of their qualifications was provided for.

Another pressing problem of the present day upon which there are widely-varying views is that of Government by Injunction, and the necessity for discovering the exact situation in this connection is as important as in that of the other questions referred to. The close relation of this issue to the conflict between capital and labor makes its study of particular importance.

A comprehensive view of the work of The National Civic Federation the past year was secured for the first time by members and invited guests at the annual dinner in New York City on the evening of December 12. This was presented through brief reports by of-

ficials of the different departments, showing what had been accomplished and indicating some of the plans for the coming year. The work of the Conciliation Department, as reported by Ex-Mayor Seth Low, Chairman of that Department, was particularly surprising if not startling in the impression it left on the hearers as to the great value and importance of the efforts of the Federation in preventing what promised at their beginning to be widespread strikes and industrial disturbances. Mr. Low described some of the methods of the Conciliation Department and called attention to a few of the more important cases which had been settled. As the operation of this Department precludes any public announcement of the cases brought to its attention, the greater part of its work is unknown to the public. Attention was called to the other activities of the Federation, through the reports of its Commission on Public Ownership by Chairman Ingalls; of the Department of Immigration by Vice-Chairman Chamberlain, and of the Welfare Department by Chairman Moore. The broader aspects of the Federation's work in the direction of strengthening and preserving American institutions, and in its relation to the progress of American Democracy, were touched upon by many of the speakers, including Oscar S. Straus, now Secretary of the Department of Commerce and Labor; Samuel Gompers, President of the American Federation of Labor; Archbishop Ireland of St. Paul; and Rabbi Stephen S. Wise of New York City.

Two recent events may be referred to here as emphasizing the broader aspects of the Federation's service. One is the increasing success of the Civic Federation of New England, an account of whose annual meeting is presented elsewhere in this issue. The second event is the remarkable "capital and labor" meeting at the home of Mrs. Potter Palmer in Chicago under the auspices of the Federation. In view of the fact that Chicago has been the center of long-waged industrial conflicts between capital and labor the past decade and more, this gathering of representatives of both organized employers and organized employes in that section promises well for the future.

Another view of the Federation's activities, to which attention is called in this issue, comprises lectures and addresses given in various parts of the country by officials of the organization. These lectures have proven beyond question to be a strong educational force—they supplement much of the other work of the organization and are successful in spreading its principles throughout the country.

It is not without its appropriateness at this time and in this place to call attention to the publicity feature of the Federation's activities as represented in THE REVIEW itself. Through its columns great public questions are elucidated by recognized leaders of thought and action and by the publication of reports of special investigations carried on by experts through its various departments. In these and other ways the Federation has made for itself in American national life a place of power and influence.

A new feature of these activities is emphasized in the recent organization of the Public Lecture Bureau of The National Civic Federation. Its purpose is to present to the public different views on important national questions by the best writers and speakers available, including prominent employers, financiers, University presidents, publicists, economists, representatives of the church, bar, labor organizations, etc. Addresses on a number of social and industrial topics have already been given under the auspices of this Bureau in a number of the large cities, including, among others, New York, Boston, Chicago, Philadelphia, Providence, Cleveland, and leading cities of the South; and at the present time arrangements are being made to increase the scope of the work by having prominent speakers deliver addresses on live questions in practically every large city. With the co-operation of the press of the country, which has given considerable space to the lectures delivered so far, a most important educational work is being accomplished. Among the prominent speakers so far engaged by the Bureau is Mr. W. H. Mallock of England, who recently delivered a series of lectures at the leading universities of the country on "Socialism." The speakers who are to follow Mr. Mallock will appear before commercial, religious, labor and educational organizations and institutions.

CIVIC FEDERATION'S ACTIVITIES.

Continued from page 11

customed to listen to one another and to hear men come and state different opinions. Why, if this meeting that we have witnessed to-day had taken place in any country of Europe, there would have been riot before the meeting closed. And when one man would stand up and contradict another, the other would have at once challenged him to a duel. This comes from the fact that in America we are thrown together and that we recognize the manhood of one another. Is it not worthy of America and worthy of religion to hear us all to-day asking, 'What good can we do to the little boy that is away down in some mine of Pennsylvania?' and to hear fellow laborers of that little boy and employers of that little boy say, 'We shall do the best we can for him, for we recognize in him a little brother, a future citizen of this great country.' Is it not beautiful to hear that so wide and grand are the opportunities offered to us all that one who did work as a little boy in those mines died a millionaire?

"Let us not complain that some among us become rich and millionaires. Let us not complain that there are great fortunes. Why, it is all due to America. It is America that has given such opportunities, and if some among us have minds more far-seeing and wills better controlled and more steady to grasp that opportunity, it is to his credit, as it is to the credit of the country that afforded him that opportunity. I always feel proud when I hear that in America there are great fortunes, because the men who have these great fortunes were at one time poor as the poorest among us, and it is because they live in such a great country, the country of opportunity as no other country is, that they have been able to grasp the things that make up these great fortunes. Not that I would have fortunes exercise their power to despoil others of opportunity; not that I would have them absorb the life and liberty of the nation so as to be able to play unjustly with the things in their hands; no, fair play for ever, justice always. But then, if from time to time, out of the shrubs and trees of the forest some do lift themselves higher up in the skies, let us rejoice in the fertility of the soil that gave them the sap that produced these high branches and that rich foliage and let us all see what we may do for our own good; let us not have among us a spirit of jealousy; let us all feel that we are citizens of the same nation; let the rich remember that whatever has come from the opportunities of the country and their own energy, that they are trustees before heaven for what has been placed in their hands to make the best use of it. And let those who have less remember that in a country where all would be comparatively poor, no one could ever hope to lift himself above the small position into which he was born.

"Our workmen are ambitious, hopeful of better things, and consequently are somewhat dissatisfied. It's all the result of America. In other countries they say nothing about the weary, dreary work of every day, and they are satisfied; but every American, poor and hard working as he is, to-day looks up and sees the sun shining for him as for others. He sees, in the flag held ever before him, an invitation to come forward and claim the best. It is only in America that we see workingmen proud of their dignity. But what is best of all, as some become employers and richer than others, they still remember, when they sit side by side with the employees, that they are sitting with fellow citizens and with brothers.

SETH LOW, Chairman of the Conciliation Department, stated that the Civic Federation assumed that the employers of labor and the employees both wish to do what is honorable, and that each asks for himself only what he thinks is right. "Having that belief," he said, "we believe that we can secure conciliation almost always if we can only get the parties to the dispute together in time. That is really the simple method of the Conciliation Department.

"Scarcely a month ago we were fortunate enough to be the means of bringing together two parties to a dispute which affected the welfare of an entire section of this country. It was after the strike had actually taken place, and it is a matter for congratulation on the part of the Federation that its agency was availed of to bring together both sides, neither of whom quite knew how to get together or to make the first advance. When that had been done, the dispute was settled by the parties in interest. I was told, during my recent visit to the South, that the settlement of that dispute was of literally inestimable value to that whole section of the country.

"The Conciliation Department does not do its work through the newspapers. It settles a great many strikes that are never heard of. It prevents more strikes from taking place than it settles, and altogether it is constantly working to bring about a better state of feeling in industrial circles.

"Perhaps the settlement of one strike that was prevented last spring, the manner of it and the method of it, would interest you and will illustrate, as perfectly as possible, the character of the times in which we live, and the character of the country of which we are proud to be citizens. I was at my farm forty miles north of New York, in Westchester county, when the telephone bell

rang. I found myself talking to a banker in Philadelphia, who said that his firm were the representatives of a street railroad system, I think in Illinois, close to the Mississippi River; that a strike was threatened; that they were afraid the men would go out before any opportunity could be had to bring about an agreement. Could I, as chairman of the Civic Federation's Conciliation Committee, prevent that disaster? They wanted me to telegraph to the national president, who happened to live in Detroit. I said: 'What can I say? Can I say that you are ready to arbitrate?' 'Well,' he said, 'I don't know that I am quite prepared to say as much as that.' 'Well,' I said, 'may I say that I think I can bring about arbitration?' 'Yes,' he said, 'you may say that.' I called up immediately the office of the Civic Federation in New York City, and in fifteen minutes a telegram was on its way to Detroit to this national officer representing the street railway employees, somewhat to this effect: 'I learn that a strike is probable in such and such a place; I hope that it will not take place until the Civic Federation has had the chance to see whether it cannot bring about a settlement; I think arbitration will be accepted.' Instantly a dispatch in reply came back: 'You may be sure that no strike will take place until the Civic Federation has had a chance to see what it can do. If arbitration is offered on fair terms, it will be accepted.' I ask you to notice how frank, how straightforward, and how explicit, that reply was. Next morning I got my Philadelphia friend in New York City by telephone and told him of this dispatch, and I said: 'What shall I say now?' After a little discussion it was agreed that I should telegraph, as I did, that the parties in interest here would telegraph to their local representatives to meet the men and settle if possible; that, failing a settlement, they would accept arbitration; and I asked the international officer, in case of need, to communicate with me again. In three or four days the matter was settled by mutual agreement, without any reference to the Civic Federation. I never heard of it again until Mr. Easley received a letter from both sides expressing their gratitude to the Civic Federation for its good offices.

"I never saw a man in connection with the whole business. I talked to a hole in the wall in Bedford, N. Y. The electric current carried the message to Detroit, to the place where the strike was threatened, and the whole thing was actually settled by that method, simply because The National Civic Federation existed, and uses, as the previous speakers have said, such means of getting together both employers and employees. I think that was a splendid illustration of the sort of service this institution is doing all the time; also, as I said, of the character of the times in which we live."

MELVILLE E. INGALLS, Chairman of The Federation's Public Ownership Commission, reported on the work of that body. He said in part: "As chairman of the Municipal Ownership Commission I have been spending three or four months on its work, and the remarkable thing about it is that I got interested in the work. On the committee are twenty other people, the most delightful people, busy men, men of ability, who knew what they were about. They would not postpone the results that they found on a subject, but they would settle it all up before they went to bed, and start next day on something else.

"We have examined the cities in England; we have examined gas plants, street car systems, and electric plants. We have looked into the plants in this country in the same way; and I have to say to you that those twenty gentlemen on that committee have worked harder than you could get them to work for any salary. The only trouble I have had with them was that they worked so hard and they have gone into so many details, that God alone knows when they will be ready to report. But when they do, you will get the whole history of municipal ownership in the kingdom of Great Britain and in this country and will get some facts that will be invaluable, because they have employed experts on both sides; they have had the people in favor of municipal ownership pick their experts and the people against it have selected theirs, and we have prepared questions and tried the case with those experts. We have got the true situation, I think, of the different plants throughout the country, and then we are going to boil that down into the different reports.

"We have divided off the various subjects, so that each member of the committee can do his work, and when they get through, I promise you that they will have a report that will give you valuable information, that will repay the Civic Federation for the large sum of money that they raised for the expenses of this work, for it has been very expensive. We have had to employ the highest talent in the land and it has taken a great deal of money, but the money was put up by friends, as it would not be raised in any other way, a combination of capital which has furnished the money for us, and these gentlemen on this committee have furnished the brains and done the work. All I did was to keep them good-natured and see that they did not quarrel with each other in their anxiety to get ahead, because we have had people in favor of municipal ownership and people against it. It has been a bitter fight after facts, and I believe in the end when we get through, we are going to give you practically a unanimous report upon the general principles of municipal ownership, and when we do, I believe and I hope that

it will be a standard for the guidance of the municipalities of this country."

SAMUEL GOMPERS, President of the American Federation of Labor, referring to his membership in The National Civic Federation, claimed to be one of its earliest members, long before it was known as The National Civic Federation. He said:

"I had faith in the idea; I believed it was capable of accomplishing a great deal of good. It seemed to me that the Civic Federation, endeavoring to bring together men of divergent interests, could discuss the questions affecting them and the questions affecting those they represented. I would not take one laurel wreath, one bloom, one leaf from all the grandeur of the results of our united effort, but I would not have one believe that we can solve all problems of our economic life by our Civic Federation. I think that no man surrenders one jot of his opinions or of his rights in becoming attached to the Civic Federation that he holds without membership. I know of a large number of contests contemplated that the Civic Federation has avoided. I believe, though, that the greatest strength of our concerted movement lies in the fact that we strongly hold to the principles and convictions that we held before we became associated with the Civic Federation, and that our best and common interests are conserved by meeting in our Conciliation Department and by our endeavors to bring about a common understanding upon contested points.

"In my endeavor to understand the conditions of labor in the past as well as of to-day, I have come to this conclusion, that the best interests of the working people of America are subserved by their organization, and that through it they are best prepared to defend, protect, and promote the interests of the working people, recognizing at the same time the modern development of organizations of employers in their particular interests as well as in their general class interests. And further, that an organization such as this Civic Federation, composed of the militant representatives of those classes, as well as the representatives of those who are considered in that larger citizen class—those who are not interested in either the one or the other—in bringing them together has demonstrated, as the history of the Civic Federation has proven beyond cavil, that when we have met to discuss the very essence of the interests and the vital points at issue, we have usually been capable of arriving at a common ground.

"These efforts have redounded to the common welfare of all the men and women and children of labor. The industrial workers of our country make constantly increasing demands upon modern society for improved conditions, and these must be considered in the development of our economic and social life. The working people—the wage-earners of our country—are your fellow citizens and mine. They bear the responsibility of sovereignty with you and me. Upon us, as a whole, depends the future of the whole Republic. It is because of this, not only because of our desire to help the children of labor, to protect and promote the interests of the women who toil and of the men who labor, but also because of the common polity upon which the future of our Republic depends, that the organized labor movement of America bases its proposition to benefit all.

"I have an abiding faith in the people of our country and in the institutions of the United States. The Declaration of Independence and all its glowing words are not to me glittering generalities. They imbue me with all the hope I have for the future of my fellow men. They give me an impetus to all that I do and try to do. I believe that this Civic Federation, representing the great captains of industry and of commerce and of learning and of labor—and I do not mention labor last because of its least significance, but because it is the culmination of all—in its endeavor to work out our common policy and common polity is the effort to make the principles of the Declaration of Independence the very living factors of our everyday lives. And it is that hope, it is that desire founded upon experience, that has encouraged the men and women who have toiled long and hard in this work.

"I believe that as there are in the institutions of our country the great powers of energy and of initiative to conserve the common good, so the Civic Federation presents itself as the conservator of peace and progress and of the wealth and belief of our common country."

RABBI STEPHEN S. WISE expressed the hope that The National Civic Federation may become more truly national in its scope and outreaching from year to year. He argued for a standardization throughout the United States of such laws as make for the amelioration of the lot of the worker. Continuing, he said: "I rejoice in the work of The National Civic Federation because the aims of this body imply your faith in the American democracy, not as an act, not as a process, not as an achievement or consummation, but as a development, as an evolving through education.

"You, gentlemen of The National Civic Federation, are doing a great work insofar as you proclaim anew through the gospel of the Federation the message of an American prophet: 'Thy money perish, if it brutalize thy soul.' Alas! it is not the money of the land that will perish if the soul of America be brutalized; it is America itself that will perish. That money may per-

ish, that prosperity and material greatness may disappear were not the worst of events, but greatly to be feared is the passing of the spirit of Americanism. You, gentlemen of The National Civic Federation, appear to understand, and you are seeking to bring to the American people, the essential truth that bigness is not greatness, that 'size is not grandeur, that territory does not make a nation.' Judea was only a little land, not bigger than the Hudson or Connecticut Valley. Greece was a little land, not very much bigger than are some counties in Montana or Texas. But Judea gave us Moses, and Isaiah, and Jesus, and Hillel, and Amos, and Nathan, and Elijah. And Greece gave us Homer, and

Socrates, and Sophocles, and Plato, and a mighty multitude of such heroes of the spirit.

"May it be given to you further to develop and to confirm the teaching that the greatest thing in America is not its wealth, not its power, but the American spirit, the spirit of democracy, the spirit of brotherhood—that spirit of democracy which Henry Demarest Lloyd has pithily summed up in the saying: 'The development of all the resources of the land by all the faculties of man for the use of all the people.' May The National Civic Federation ever be privileged to carry this high message to every part of our land. This is a high hope, a noble mission, a great opportunity. May you be equal to it."

INCOME AND INHERITANCE TAXES DISCUSSED.

DISTINGUISHED SPEAKERS ADVOCATE AND OPPOSE THESE METHODS FOR THE DISTRIBUTION OF WEALTH.

IN opening the second day's session of the annual meeting for the discussion of the "Income and Inheritance Tax," President Belmont stated that these forms of taxation have been frequently alluded to as calculated to cure some of our existing and growing evils. "That we should have evils occurring with our national growth is natural," he said, "but it is highly important that we should not attempt to cure them with an improperly considered or wrong remedy. It must also be remembered that our people have been accustomed to and have grown up under a totally different form of taxation. The income tax and inheritance tax are both direct taxes. We are all of us accustomed to pay an unconscious tribute through the form of indirect taxation—our tariff. It is not a question as to whether the tariff is for revenue or for protection. The question is: What is our habit of thought on the subject? For that reason the sentiment with regard to direct taxation is governed frequently by a man's own feelings and habits, and not from the point of view of an economic question.

"As the short remarks I made on the subject seemed this morning in the newspaper to be more or less misinterpreted, I am saying this to you now in partial explanation of what I there intended to convey.

"No one likes the direct tax in this country, and, therefore, in speaking of it, one always refers to it as a form of taxation that for one reason or another is obnoxious. No one likes to have his private affairs made the subject of publication or discussion or inspection. The income tax naturally involves that, and must necessarily involve it, provided there is any difference of opinion as to whether the return is proper or not. We have experienced it. We had the income tax just after the war. We had an income tax within a few years and thought that one was declared unconstitutional, many returns were made prior to that, and I personally did make my return at the time, and felt it to be a wise and perfectly proper method of taxation and one which I would be only too glad to advocate and submit to. But since that the other form, which is also in existence in various States—the inheritance tax—has been discussed by many as a method of checking the growth of large fortunes, which threaten, in the minds of some, our institutions and our general economic condition. And when I said that a wise and just method of taxation, and the solution of that in a proper manner, would be of great good to this country, I meant that punitive spoliation must not be resorted to. In other words, that those who accumulate large fortunes cannot do it dishonestly and improperly; it cannot be done; a man will finally meet his fall if such be his method; there may be isolated cases, but that is not the way the accumulation of fortunes in this great country comes about. The existing laws are complete and searching enough; the methods of reaching wrong-doers are sufficient. But that these fortunes, which it is alleged are accumulated in an improper manner all over this country, must be reduced in a punitive spirit, was what I meant should not be done. I did not mean that a tax on inheritance should not be passed, but that it should be done from the point of view of just and wise taxation and on sound economic grounds. That was all I meant to convey."

MELVILLE E. INGALLS, Chairman of the Cleveland, Cincinnati, Chicago and St. Louis Railway Company, referred to three prolific sources of multi-millionaires which are open to criticism. These, he said, were (1) the tariff, (2) illegal favors and contracts given to shippers by the railways, and (3) the production and the securing by questionable means of contracts at nominal prices for the use of the streets of various cities for the purpose of transportation and lighting, and Mr. Ingalls discussed briefly each of these sources.

Mr. Ingalls expressed his belief that the income tax "is the best and fairest tax that can be levied—a tax not for the purpose of destroying property—that would be socialistic—but for the purpose of making property pay its fair share of the burdens of the people. They

will tell you that it is a tax difficult to collect, but no more than taxes on hidden or unseen property. I don't believe in a graduated income tax, for I think that would be putting a tax on thrift and energy, but each man should pay upon his income the same proportion—pay it as a tax for the protection of his property. I would tax all incomes of one thousand dollars or over and have a fixed percentage. Under a thousand dollars the income from the tax would not be enough to pay for the cost of collection.

"The inheritance tax has already been taken up by the different States, some of them with a graded tax and others with a straight tax. I am not in favor of a graded inheritance tax any more than I am of the graded income tax, but I am in favor of the inheritance tax as a tax for paying the expenses of the State like other taxes. The question is whether this is not more of a matter for each State to take up by itself and go on as they are now starting. If it cannot be managed in that way, then the national Government should take it up, and the money that is obtained from these sources will enable it to reduce the burden of taxation in places where it is advisable to do so, and will produce income which may be lost from the modification of the tariff.

"I would also enact legislation—or, if it cannot be done under the present constitution, I would get an amendment—that no man should have the right to dispose of his property by will, and that when he dies it shall be divided equally among heirs. I would take away from any citizen the right to tie up any property in trust for one life or two or more. It is simply a continuance of the old law of entail under another form and holds these immense fortunes together, when, if they were divided equally among the heirs, they would soon scatter and be harmless.

"I know that this will be criticised and people will say that if a man has children and some are weak and incompetent to handle the fortune coming to him or her, that the parents should have the right to put them in trust, but that is the very thing that perpetuates some of these large fortunes. Let them be distributed. If some of the heirs waste their inheritance, the public will gain. The property is not lost by distribution, and nothing, in my judgment, will so protect our future against large accumulations of wealth as this. It seems to be a craze with some men to perpetuate after their death the immense fortunes that they have built up, but it is not a thing that the State ought to allow.

"There is danger in the present condition of public opinion that we will drift into a hysteria that will enact legislation that will seriously hurt our business and produce disaster. Especially is this true in reference to the railways, and you must keep in mind that the railways constitute the largest business force in the country. One-fifth of all the population depends upon them for their existence, either as employees or in the business of manufacturing, or supplies, etc. And while we set our face like a stone wall against any of the illegal conditions of the past being continued, we should give them a fair chance to carry on their business in the future and thus prevent disaster to the community.

"The real menace to my mind is the Sherman anti-trust law, so-called. I happen to know that the distinguished author of this law, when it was passed, did not think it applied to the railways in their conduct of their business. In 1895 the joint traffic agreement among the trunk lines was made. I had the honor to prepare that, and it never occurred to me that there was any danger of violating the Sherman anti-trust law, and we drew the agreement so it would aid and maintain the interstate commerce law. But the Supreme Court thought otherwise, and when in 1897 they made their decision that that agreement was a conspiracy and violated the Sherman law, there was then left no power or right among the railways to contract among themselves—to agree upon rates—to sue and be sued. In other words, that decision had the effect of turning them into a sort of Pariah, with every man's hand against them, and no right to conduct their busi-

ness legitimately among themselves. To-day it is necessary that there should be stable and fixed rates between points—say, between New York and Chicago—and it is necessary that they should be able to enforce those rates among themselves, and they should be allowed to meet and agree what those rates shall be, and which under the present law should be published and maintained. And yet under the construction of the courts if they should so meet and agree, it would be a conspiracy in restraint of trade and subject to fine and imprisonment under the Sherman law.

"I don't believe it is the intention of the people that this situation should exist; I don't believe it is their idea that the greatest industry in the country, employing more than a million of men, could be conducted without regard to law or in defiance of it. There should be co-operation and agreement allowed, but no unfair competition, nor any conspiracy.

"The same reasoning in many cases applies to other classes of business. Almost everything now is construed to be a trust. A trust is nothing but a combination of people for doing business more cheaply and largely. It is the evolution of the corporation; just as the corporation was the evolution of the partnership; and partnership was the evolution of the days of the shepherd when each man tended his own flock. The trust properly conducted is not the enemy of the people, and in the fanaticism of the hour it should not be condemned if properly managed. The law should be taken up and amended to suit business conditions of the twentieth century."

W. D. GUTHRIE, for whom is claimed the credit of defeating the last income tax proposition before the United States Supreme Court, referred to the recent activities for securing graduated or progressive taxation of income and inheritance successions to the property of decedents. He said: "In discussing these principal measures, it should be appreciated that if they become laws, the result, by reason of existing conditions and the general distribution of property throughout the country, will be to exempt the majority of owners of property and the great bulk of property from this form of taxation and to cast the burden upon those who constitute a very small minority of the population. It should likewise be realized that this proposed legislation, particularly as to inheritance, is conceded only a first step, and that increase in the scale is intended and is certain to follow. Indeed the President declares that 'at first a permanent national inheritance tax need not approximate, either in amount or in the extent of the increase by graduation, to what such a taxation should ultimately be.' As the States also have full power to levy similar taxes on inheritances and incomes, it must be manifest that if the scale of graduation adopted by Congress be high, the resources of the States will be correspondingly curtailed and crippled, that they may be embarrassed in securing the necessary revenue for maintaining their governments and performing their functions, and that within a very short time the national Government could appropriate a great part of the property now owned by the residents of the several States.

"The practical questions which are before us as a nation, then, are the following: Is it wise or prudent in a Republic based on universal suffrage to introduce progressive or graduated taxes as a permanent basis for taxation by Congress? Is it a legitimate function of the national Government, or within the scope of any power delegated to Congress, to regulate inheritances or fortunes or to endeavor to force a redistribution of wealth, as a means of solving social problems or lessening supposed moral evils? Ought unapportioned income taxes be levied by Congress in view of the decision of the United States Supreme Court in the income tax cases without first obtaining an amendment to the constitution authorizing such a tax?

"A graduated or progressive tax is necessarily arbitrary, for there is no definite rule or principle to apply. The rate may be reasonable at first, but will ultimately become little short of confiscation. The appetite will grow. One act of spoliation will lead to another. If twenty-five per cent of large fortunes is but a beginning, where will it stop, and who is to determine what is or is not reasonable and the limit beyond which a temporary majority shall not go? There is no limit, no power to check abuses, and we are at the mercy of the irresponsible majority if we once depart from the only safe and consistent rule, that of approximate equality."

Mr. Guthrie held as fundamentally wrong and misleading the claim that the power of our legislatures over inheritances or successions is unlimited; that the right to inherit or to dispose of property on death is not a property right, and that our lawmakers may grant or withhold the privilege at their will and discretion—the grounds upon which progressive and unequal taxation on inheritance are sometimes sought to be upheld. He claimed that the regulation of a succession to the property of decedents, and of the amount of property which any one individual or partnership or corporation may hold, are matters solely within the jurisdiction of the State and not to be interfered with or encroached upon by Congress. He did not believe that the people will ever conscientiously approve and sanction a policy which might deprive the

States of their present source of revenue and the control of the property belonging to their own residents.

As to an income tax, Mr. Guthrie said there was no doubt that any State may levy an income tax. Nor is there any doubt that Congress may levy an income tax provided it be apportioned to population.

Mr. Guthrie did not believe that the cure for existing evils was to be found in any scheme of compulsory redistribution, but rather in the effective and impartial enforcement of the penal laws, in making it dangerous to be dishonest, in severely punishing corporate and individual breach of trust and unlawful discrimination in enacting new laws whenever necessary, in amending the constitution so as to increase the powers of the national Government, but not in assault upon accumulated property or in fomenting hatred, envy and distrust of the rich. In conclusion he said:

"Our malady is not wealth but morals, want of business honesty, brutality in the fierce strife of competition, breach of trust, proneness to corruption, non-enforcement of laws, abuse of office, lack of the sense of civic duty. The breaking up of fortunes will be no cure for these evils. What we want is a re-awakening of the moral sense and a steadfast and consistent determination to enforce the laws and root out dishonesty and criminality. We need incorruptible legislators and public officials. With wealth and honest public opinion permeating the whole fabric of our civilization and demanding constant and vigorous enforcement of laws against individual and corporate dishonesty, all our schemes of legislation will be futile. We cannot make men honest by statute. In the phrase of the Roman, What are laws without morals: *quid leges sine moribus?*"

ANDREW CARNEGIE began his remarks on "The Income and Inheritance Tax" with stating his belief in the saying of Mr. Gladstone that the income tax "made a nation of liars." "There is no tax so pernicious," he said, "not only from an economic but from a moral point of view, as a tax that requires the struggling young business man, doubtful whether the bank directors will pass his note for a thousand dollars to-morrow, to explain his private affairs to some man in the community who may himself be a bank director or who is or may soon be connected with banks. It penetrates business to the core. The nation will never regret anything so much as attempting to collect a tax upon men engaged in business—bees making money for the national hive—and trying to penetrate into all the minutia of their affairs, rendering them liable to have competitors and bank directors and all other classes made cognizant of their position."

"I have always opposed the income tax. I differ with the President strongly upon that, but I am in a very different position in regard to the inheritance tax and to graduated taxation." Mr. Carnegie referred to his position on these questions as stated in his "Gospel of Wealth," written seventeen years ago, in which he advocates graduated taxation and inheritance tax as the best means of getting a better redistribution of wealth than we can by any other means.

"The term 'equality' which my friend Mr. Guthrie uses—he wants equality in everything—is not equality. If a man, a struggling workingman, struggling along at a thousand or two thousand dollars a year, and another man has one hundred thousand dollars a year, and another one million, it is a wrong use of the word 'equality' to say that they should be taxed the same. Adam Smith, an authority which I commend to you, gives us the right solution: 'It should be the object of law makers to derive from every citizen taxation for the support of government in proportion to his ability to pay.' That is the true equality."

After stating that the subject of wealth distribution will not down, and that it is obviously unequal, strangely so, Mr. Carnegie gave some detailed illustrations as to how wealth arises. In one of these wealth came to the possessor of land near New York City through the increase of population, not through ability, foresight, industry, labor. Said Mr. Carnegie: "It grew while the man slept, and probably the best thing in the world that the man could have done about it was to forget he had it; it would have grown just the same, but he might have sold it too soon if he had been thinking of it." Mr. Carnegie answered his own question, Who made that wealth? as follows: "The community, the population, the people. Then you tell me that wealth is sacred. I say that the community was the leading partner who made that wealth. It was hundreds of people, thousands of people settling around there, and we see millions who have toiled not, neither have they spun, spring forth without effort, live idle lives, and die. I am not in favor of touching the bee when he is making honey. Let the bee work, but when he passes away, then I say the silent partner, the community that made the wealth, should receive its dividend—a large proportion."

Mr. Carnegie's comment upon another illustration was to the effect that society makes a huge mistake if it ever interferes with an organizing man in his lifetime. "Such men," he said, "get very little. As a rule, a millionaire is not extravagant. A man who has made money can usually be trusted to keep it. It is more difficult to keep sometimes than to acquire, but his children are not so constituted. They have never

known what it was to figure means to ends, to lead frugal lives, or to do any useful work. They are spenders, not producers of wealth."

Referring to the increase in wealth by means of the steel industry, Mr. Carnegie, mentioning one of his former partners, Mr. John Walker, who was in the audience, said: "Now, it was as plain as A, B, C that Pittsburg was the place where a ton of steel could be made cheaper than anywhere else in the world, and that young man and other young fellows—bright, intelligent fellows—took trips to Europe and saw what Britain was doing. Britain was always ahead, you know, in steel manufacture. And they copied her. They found a supply of raw materials essential. They bought up ore mines on Lake Superior. They bought up coke till they could not rest, all around them, forty thousand acres or more; gas territory by the thousand acres; everything conducive to the making of steel. This country's demands for steel increased. Well, now, who made that wealth? The growth of the American people; that's where that wealth came from, and the people are the partners in every enterprise where money is made honorably."

"And I say when these millionaires, as the time comes, lie down with their fathers, the community fails in its duty and our legislators fail in their duty if they do not exact a tremendous share, a progressive share—if he leaves little, little taken. There is no idea of ever making his children poor, nor interfering with an ordinary testamentary apportionment of his property, but these enormous sums of millions and hundreds of millions really should have a different name from what we used to call 'property.' When a man was a 'man of property,' it meant he had enough for himself and his family to live respectably upon, but now we are under changed conditions, and changed conditions require not radically different laws, but that we proceed to change our present laws to these conditions."

"It isn't the millionaire alone who creates wealth. A man who had mines in Montana and made an enormous fortune did not make the ore from which his fortune came. Who made it valuable? The community wished to use that ore, then it became worth while to take it out of the ground and he made a profit. Gentlemen, wealth is based upon the community. Where a nation does not increase in population and is not prosperous, where wealth does not accumulate you will find no millionaires, but where a nation is prosperous, as we are—a new nation, beyond precedent prosperous—there the millionaire and there only they develop."

After explaining the difference in conditions in the United States and England as to enforcing the income tax system, Mr. Carnegie concluded that in this country an income tax is impracticable and would be intensely unpopular.

"I am with the President," he continued, "in regard to a graduated tax, and a heavy graduated inheritance tax, for many reasons. One is that it belongs to the community that made most of the money, and it should come in and get its dues. The second is that excessive wealth left to children is, as a rule, injurious to the child. We don't want to grow up in this community a class whose members are not compelled to render some service to the community to justify that community in giving them all their privileges and their pleasures. There are exceptions every now and then, and here let me say that the millionaire's son who does spurn the coarse pleasures that we see so many of them indulge in and devote himself to the service of the community in any form is entitled to double honor. But we must legislate not for the exceptions, but for the general."

In concluding his remarks Mr. Carnegie said: "I stand opposed to an income tax as the most pernicious tax that a nation could enact, but I do stand, on the other hand, believing this, that the problem of wealth will never down. The people are becoming intelligent. They see what I tell you is true, that the community makes most of the wealth, and I hope they will persist and tax heavily, by graduated taxation, every man who dies leaving behind him his millions which it was his duty to administer for the public good in his lifetime, and that they will cease to honor any man who does not regard his surplus wealth only as a sacred trust to be administered for the good of the community from which it has arisen."

E. B. WHITNEY, who represented the United States Government before the Supreme Court when the last income tax law was in litigation, followed Mr. Carnegie. He reviewed the attempts by the Federal Government to levy an income tax, and summarized the decisions of the Supreme Court in two cases. Referring to the principle of the graduated tax at the time of our Civil War, Mr. Whitney said that they did not graduate it because they wanted to cut down the large incomes, but because they thought that that made the tax more equal and more uniform. In other words, instead of levying the tax on an absolute rule of so much percentage all the way up from the bottom to the top, they tried to levy it so that the burden as actually felt by the taxpayers should be the same in either case, and that they thought it required to be graduated. When the question of its constitutionality

came before the United States Supreme Court, being argued in as many as five different cases, it was decided unanimously that an income tax was constitutional, and that it should be laid on the principle of uniformity over the whole United States. But in 1894 a law, drawn exactly like that of the Civil War period, came before the Supreme Court, which held, by a majority of one, that the law that had been laid down in the first decision was bad constitutional law and that the tax was unconstitutional.

In view of the circumstances surrounding the earlier decisions of the Supreme Court on the income tax, Mr. Whitney stated that the decision in 1894 came as a surprise to the Government. He said: "Now the question is, what is the law? What will the law be if Congress shall pass an income tax statute in the future? That, of course, is going to be a very difficult question, one of the most difficult questions which the Supreme Court ever had to decide. Here are precedents in point, that were unanimous decisions of the Supreme Court, unanimous decisions under the income tax at the time of our Civil War. On the other hand there is a decision which, while not unanimous—a decision on a vote of five to four—is a more recent one. And there are circumstances connected with each that will require special consideration. There was undoubtedly an abler array of counsel in the more recent case. On the other hand, the more recent case was argued with the least opportunity for preparation, and under conditions that were the least conducive to getting the best law, and the best results. It is immensely important that the Supreme Court of the United States should not change its position on questions of constitutional law, because if it changes its position from time to time, then it is the Supreme Court that legislates and not Congress, and we no longer have the distinction between the legislative and the judicial branches of the Government."

In referring to the constitutional amendment as a remedy, Mr. Whitney said: "Do not pass a constitutional amendment like the one that has been proposed, just saying that the income tax shall be levied on the rule of uniformity or anything of that sort. The whole beauty and advantage of the United States constitution is that it deals with great principles and generalizations, and does not go into specific cases." He suggested the right way to amend the constitution is to provide that all taxes shall be uniform throughout the United States; that the present provision should be repealed, and that if there are any taxes to be levied by the States alone, and which the United States Government is not to compete in levying, those taxes should be specified.

PROFESSOR E. R. A. SELIGMAN, of Columbia University, spoke of the general position of income and inheritance taxes in a system of modern finance, and referred more particularly to some of the problems with which any creators of such a system must inevitably deal. Following the statement that "we notice everywhere in modern times, and more especially in democratic countries, an unmistakable tendency toward the adoption or further elaboration of both income and inheritance taxes," Professor Seligman referred to the experience of this and foreign countries in this direction. He believed the question with us is one of special moment because of the universal breakdown of our system of personal property tax.

He said it would be a serious mistake, in considering any question of either income or inheritance taxes, to base the argument on the proposition solely and simply that large fortunes are a menace to society. He conceived this great movement as being an attempt rather to make large wealth pay its equal share of taxation and to reach the fortunes which now virtually escape all taxation. "The only legitimate argument," he said, "on which you can base either income or inheritance taxation is that you are thereby pressing into the service of the treasury aggregations of capital which would otherwise entirely escape. From this point of view, some of the interesting questions which we must all face are these: First, ought an income or an inheritance tax be a federal tax, or should it be reserved to the States? And secondly, what are the particular dangers to be avoided in administration of each system?"

As to the income tax, Professor Seligman did not think it should be a local tax, like our general property tax, and that as far as possible it should apply to the whole country and thus render impossible much of the evasion which takes place under our local tax systems. The income tax might at least be a State tax, and preferably a national tax.

Claiming that the inheritance tax is not needed for national purposes, while in the case of the States it is needed, and needed very badly, he thought the retention by the State governments of the inheritance tax is a matter of very vital importance, and ought to be discussed in detail by any commission that might be appointed.

In referring briefly to some of the problems to be considered in connection with the income and the inheritance tax, Professor Seligman stated that if we ever have an income tax, we ought to frame it in the light of the income tax legislation in other Anglo-Saxon countries. If we are to have inheritance taxes,

he said, one of the important problems that confronts the legislature is as to whether the tax ought to be assessed upon the inheritance as a whole, upon the property as such, or whether it ought to be levied upon the recipient of the particular share. Another point, he said, in which the inheritance tax does not stand alone, is the general question of graduation or progression. He said: "The problem here is, does a progressive or graduated rate in the inheritance tax imply a derogation from equality, or is it really the very sum and substance of equal taxation? It will be found, I think, that when we come down into the details of this proposition, there are very interesting arguments and much interesting experience in all countries of the world, which will tend to throw a light upon this proposition and which will lead us sooner or later to the conclusion that graduation, if carefully devised and carefully limited, is not in opposition to the principle of equality, but is rather an embodiment of that principle." These are only a few, he said, of the multiplicity of subtle points of the large number of different problems, on each one of which there is an abundant literature and a manifold experience.

THE system and methods by which the revenues are raised in the Dominion of Canada with reference to the federal power and to the provincial powers, and the place occupied in them by the income and inheritance tax, were described by Hon. George E. Foster, Ex-Minister of Finance of Canada. He explained that the income tax has been tried by only two of the provinces, and these the smaller ones, and that the amount of money received through it is very small compared with the total revenues raised. "With reference, however, to the inheritance and succession taxes," he said, "that has been adopted gradually by all the provinces, so that each province now has a succession or inheritance tax, graded and graduated in a more or less scientific or common-sense way, the exemptions varying from three thousand to ten or twenty-five thousand dollars, and the rate of tax running from one and one-fourth per cent up to ten per cent. Out of these inheritance taxes a very considerable and constantly increasing part of the revenues of the different provinces has been derived. For instance, the Province of Ontario, the premier province in the Dominion of Canada, this year will get \$1,000,000 and a little more from this inheritance tax, which is a little more than one-fifth of all the revenues raised by that province outside of the Dominion's contribution."

Mr. Foster indicated the future probable course of development in Canada as regards securing revenue for the State. On this point he said in part: "There is in Canada to-day a live and growing interest in the matter of ownership, control and distribution of what we call public franchises. This has taken a more or less practical shape for the purpose of securing revenue in most of the provinces, and of late in a somewhat striking way. In Nova Scotia, for instance, with its large collieries, every ton of coal that comes to the surface pays a royalty into the provincial treasury. In British Columbia, where there are large mining areas of gold, silver, lead and copper, on the gross output of every mine there is a royalty or a tax which goes to the provincial legislature. In the Yukon district, a royalty is charged upon the output and goes to enrich the federal treasury. In the Cobalt district, the present Government of Ontario has reversed the policy of the preceding Government, which opened the whole district to the prospector and gave the claim to the individual or corporation who staked it, taxing him or it merely a nominal sum for the license and confirmation of title, and then let the possessor have all that he could make from it. The present Government has adopted the principle of reserving certain areas for competition, so that the man who wants to get it has to say to the Government in his offer what he will pay outright for the area or how much bonus he will give for it, and what royalty he will pay besides upon all that is taken out of the mine. Now, that is a radical change in policy, but a change generally approved, and it remains to be seen how it will work out. And then also, they have gone farther, and withdrawn from prospecting a certain amount of territory in which they will grant no individual license, which they are prospecting and propose to work for the benefit of the provincial treasury, either by the Government or under the control of the Government, the profits of which go to the Government."

"Now these are developments along the line of the distribution of franchises and taxation of franchises which set people thinking upon methods and possibilities still open to the State."

THE work of the State Tax Commission of Wisconsin was described by Nils P. Haugen, one of the members of that body. Among other things he said: "As a result of the recommendations of the Tax Commission, we have an inheritance tax law in Wisconsin, and we derive from it considerable revenue. It is not of very long standing, and it is impossible to say as yet what that revenue will average in the long run. We have been successful in securing for the State revenue enough to support the State government entirely independent of local taxation, which is something that has been recommended by economists as generally desirable. The revenues of the State are

derived from railroad taxes, which we collect, insurance company taxes, and taxes of other public service corporations of a general character and from the present inheritance tax. I believe that there will be opposition in the States—I am pretty sure there would be in Wisconsin—to the abolition of the inheritance tax for State purposes if the imposition of a federal inheritance tax means that the States will have to abandon it. I say that because I notice the speakers on the question of an inheritance tax have confined themselves largely to a federal inheritance tax."

"Now this inheritance tax question in Wisconsin has been before our Supreme Court. A law was enacted in 1899 which imposed a tax on the inheritance as a whole. Our constitution provides that the rate of taxation shall be uniform, and that taxes shall be levied upon State property as the legislature shall prescribe. The Supreme Court held that first act unconstitutional. It levied the tax upon the inheritance as an entirety. The court said that it was a discrimination between different recipients, although they might be in the same class. It was not uniform within the class. Later, another bill was introduced which is now upon the statute books, which imposed the tax, not upon the inheritance as a whole but upon the share of each recipient. That law has been before the Supreme Court and has been sustained, although it is a graduated tax. Long before this legislation was enacted, our Supreme Court had been somewhat liberal in construing this requirement that the rate of taxation shall be uniform. It had said that it was not necessary that all property in the State should be on a uniform basis, but that all property within a certain class must be taxed on a uniform basis, and it held in the later case of the inheritance tax law that the classification, although it was a graduated tax, was reasonable. The question before the court was whether the classification was reasonable, and the courts sustained the law. So that we now have permanently on our statute books this inheritance tax law."

In speaking briefly of the income tax, Mr. Haugen said he did not know that the income tax would be any more inquisitorial if it is to be enforced than is the personal property tax. "Of course if you shut your eyes to it and do not seek to enforce it, then any system is as bad as any other, but if you try to enforce it you have to be inquisitorial even as to the personal property tax. We have before the legislature this winter, on its second passage, a constitutional amendment authorizing the enactment of a graduated income tax; that is, an income tax law is authorized and the amendment says that it may be graduated. There was some question under our constitution whether such a law would stand the test of constitutionality without some direct provision authorizing it."

A PAPER on the English income tax and its operations prepared by Alfred Mosely was read by Guy Edward Snider of the College of the City of New York. He said in part: "It is intended to tax income derived from every source in the United Kingdom as well as income from abroad received by persons residing in the United Kingdom. It can be said to be, not a single tax but a system of taxes composed of two elements, (1) a tax on income from property, and (2) a tax on income from personal service. The principal strength of the system from a fiscal point of view is found in the stoppage of the revenue at its source, and in the elasticity of the amount of revenue through adjustment of the rate. The tax forms one of the most important sources of revenue for the United Kingdom. In 1903 its total yield was thirty-eight million pounds, or twenty-nine per cent of the total revenue from taxation."

After describing its administrative machinery, the process of assessment, and the operation of the law, Mr. Snider said that the statement that the English tax is not a graduated law, that a man pays on his income from each source, and that consequently his total income is unknown, needs modification on account of the exemptions and abatements. The tax is graduated but to the point where the abatement ceases, and when a man claims exemption or abatement, he must declare a total of his income from all sources. The paper concluded as follows: "The tax on the income of the individual as distinguished from the tax based on an income producing property forms a minor part in the so-called income tax in England. Even in the case of a tax on salaries and profits the tax is aimed at a source of income rather than at the ability of the individual. Only in the case of exemptions and abatements is there an attempt to regulate the contribution of the individual tax payer with reference to his ability to pay as indicated by the size of his income. The English income tax is based upon the sources of income; it levies on the results of industry at the source. The tax may or may not, according to the circumstances of the case, rest on the individual taxpayer. In effect it is not a tax on the income of the individual, as such; it does not select the individual as a source of revenue, measuring his burden by his ability."

M. W. MEAGHER expressed the belief that a system of graduated income and legacy tax should be adopted primarily for the purpose of preventing a few men from controlling all the wealth of the United States, and not so much for the purpose of deriving

revenue. He said that the graduated income tax has been opposed by the preceding speakers on two grounds: That it would induce to lie in order to escape it, and that it would be inquisitorial. "As to the first objection," he said, "it should be borne in mind that lying under oath—which it would be in making false returns on one's income—is perjury; and that as a result of such perjury, the whole community would be defrauded by the perjurer. Imprisonment and confiscation of the perjurer's property on which he made no return, or to the extent of concealment thereof by him, would effectually restrain his lying propensity." As to the second objection, that is, that the graduated income tax would be inquisitorial, Mr. Meagher said that is true of every system of taxation except the poll tax. As to the objection that the graduated income tax would remove the incentive to accumulate, Mr. Meagher said that not only should the incentive to such accumulation as is dangerous to our institutions be destroyed, but the power to do so as well. He proposed as a remedy for present conditions a maximum or limitation of wealth, fixed, established and enforced by law, coupled with a graduated income and legacy tax.

EX-GOVERNOR E. BRADFORD PRINCE of New Mexico referred briefly to the claim that the inquisitorial feature of an income tax was an almost insuperable objection. He said that the ability to aid in supporting the Government was the proper criterion for the amount of taxation and that this ability is better shown by the income which a man is receiving than in any other way. "He may have enormous quantities of property," he said, "which produce nothing and which give no present ability. It is the income which gives that immediate financial ability. And yet, while laying that down as a principle, Mr. Carnegie went on to denounce an income tax in general, on account of what he called the inquisitorial character of the information that had to be obtained in order to make an income tax effective." He said that at the present time the listing system for taxation, whereby every man has to produce a perfect list of all his personal property exists in at least thirty-five States, and that in some of the States a list of the man's real estate as well is required as a basis of his taxation.

The claim that it exposes a man's business to the risk of the community and thereby does him a sort of irreparable injury is one, Mr. Prince thought, the contemplation of which in the greater part of the United States, where they have a list system, would be found to be absolutely ridiculous and preposterous. He did not believe there was anything in the objection. He said that the inquisitorial feature was not found to be an insuperable object at the time of the old income tax in the days of the War of the Rebellion, and that no one ever heard of there being any difficulty with regard to a man's having his private matters betrayed to the general public when we really did have an income tax. He characterized this inquisitorial objection as not a practical matter, as entirely theoretical and chimerical; that it is simply a bugaboo, gives no rise to any such objection in the greater part of our country where more than half of the population lives and in seven-eighths of the area where we find that development under existing laws.

FACTS ON IMMIGRATION.

INTERESTING and valuable material on both "sides" of the much discussed question of immigration is contained in "Facts on Immigration," being a report of the proceedings of two conferences on various phases of the problem held in New York City under the auspices of The National Civic Federation.

The introduction is by Frank Julian Warne, who writes of the need for impartially investigated facts, and explains the objects and purposes of the Immigration Department of the Federation. Prescott F. Hall, Secretary of the Immigration Restriction League, discusses various phases of the legislation now pending in Congress. Nathan Bijur criticises many statistics usually accepted as representing the facts as regards immigration. Professor Walter F. Willcox, of Cornell University, analyses immigration statistics and states conclusions as regards our net gain in population through immigration which are strikingly different from those commonly accepted. John Mitchell, President of the United Mine Workers of America, presents a startling view as to the effects of immigration upon coal mine workers, and President O'Connell, of the International Association of Machinists, as vigorously outlines some of the effects among mechanics. Thomas F. Parker, President of the Monaghan Cotton Mills in South Carolina, gives a brief account of the recent experiment in that State in bringing immigrants direct to Charleston from Europe. Charles P. Neill, United States Commissioner of Labor, summarizes briefly some of the results of a recent Government investigation, and Robert Watchorn, Commissioner of Immigration at Ellis Island, gives a clear explanation of what he believes to be the best means for distributing immigrants. There are also other prominent contributors who speak authoritatively on the particular issues they discuss.

NEW ENGLAND CIVIC FEDERATION'S ANNUAL DINNER.

WORKINGMEN'S INSURANCE THE TOPIC DISCUSSED—REPORTS OF OFFICERS REVIEWING THE ACTIVITIES OF THE PAST YEAR.

OF the three general meetings held by the New England Civic Federation since its organization two years ago, that of January 10, marking its second anniversary, held at the Ford Building in Boston, was much the largest and in several respects the most significant. The spirit manifested throughout the proceedings, in which men representing all the different elements included in the Federation took an active part, led one of the guests to remark that if enthusiasm and good feeling mean more after two years of experience with a novel and peculiarly difficult experiment than at the beginning, as we all believe it does, then it is demonstrated that this movement has become a recognized and necessary factor in the industrial welfare of this section.

About three hundred members and guests were in attendance as compared with one hundred and seventy one year ago, and about one hundred and thirty-five at the opening meeting in April, 1905. Opportunity was afforded during the reception hour of meeting President Tuttle and the other officers and speakers of the evening, as well as Governor Curtis Guild, Jr., and Mayor Fitzgerald, who were the guests of honor.

PRESIDENT LUCIUS TUTTLE, in opening the regular program at eight o'clock in Ford Hall, said:

"The Civic Federation of New England appropriately marks by this large assemblage its second anniversary. Of its six hundred members, nearly two-thirds reside elsewhere than in Boston, and while the core of the movement and its main work are in Boston, this widely distributed membership gives satisfactory evidence that it has already become distinctly a New England organization with a constantly widening sphere of influence in that larger field.

"In passing, it may be of interest to note that next Saturday evening a Chicago Branch of the Civic Federation is to be organized under most favorable auspices to carry on in that city and section a work similar in character to that which you are carrying on here.

"In its every act your association has closely adhered to the principles upon which it was founded, by keeping aloof from everything in the nature of partisanship and by never attempting to interfere with the conduct of the business of any interest, whether individual or corporate; and, above all things, it has consistently and persistently refrained from attempting the arbitration of anybody's differences or contentions.

"Its work, which is always quiet and unostentatiously performed, most largely consists in bringing together the representatives of those who labor with their brains and of those who add to the work of their brains that of their hands, and thereby substituting for those wasteful and barbarous methods that are always incidents of the lockout and the strike, the more economical and humane practices of temperate discussion and peaceful negotiation.

"It proceeds upon the assumption that there is no such thing anywhere as an 'irrepressible conflict' between capital and labor, but that the differences and discords that sometimes arise between these two necessary adjuncts of the world's business and progress are nothing more or less than the upspringing of that desire, implanted from the earliest dawn of civilization in every human breast, for a betterment of his or her social and physical condition and environment; and that without this constant and unrelenting struggle for individual improvement, which pervades every class of humanity, human progress would cease and civilization lose its virility and become stagnant and senile.

"It does not, however, indulge in any Utopian dreams or theories upon this phase of the world's many-sided social and humanistic problems but, on the contrary, attempts to apply to its solution only the plainest and most common-sense idea that in every disagreement arising between two parties to a common interest, neither may be wholly right or wholly wrong, and that, if the opposing interests may somehow be induced to come together for dispassionate discussion of all the questions at issue between them, each will most likely be brought to a better understanding of the whole subject, and an adjustment become possible that shall make for harmonious action and mutual trustfulness instead of discord and friction, with the well-known troubles that always follow in their train.

"With these guiding theories, the Civic Federation began and has continued its work, and if its custom permitted, our painstaking and able secretary could give us a long list of many important instances in which his intervention for the Federation, at the crucial moment, has been potential in maintaining industrial peace, and has prevented the outbreak of contentions that would have disturbed, for periods of incalculable length, not only the dominant business of great indus-

trial communities, but would have disastrously interfered with the personal comfort of that great host of outsiders who, under such conditions, are powerless to aid in the adjustment either of the troubles or their causes, and whose only lot seems to be that of irreparable suffering.

"With what has been done in this way during the year I have had but little personal connection, but I know of the many splendid results accomplished by our

LUCIUS TUTTLE,
President New England Civic Federation

secretary, and by the members of our committees, particularly those from the side of labor. And I want to impress upon you the work done by the labor men. They have had the laboring oar, and the efforts in behalf of industrial peace have proved many times more effective than could possibly have been the case without their assistance. I know of these things, and out of the fullness of that knowledge I offer you one and all most hearty and sincere congratulations upon the rounding out of the second year of the Federation's useful existence."

JOHN MASON LITTLE, Treasurer of the Civic Federation of New England, followed President Tuttle. Mr. Little said:

"I suppose the reason that President Tuttle introduces me as the only officer to speak is that he wants you all to know me. I will tell you why I think so a little later on.

"With regard to our finances, the fiscal year ends in February, therefore all our funds are not in, possibly, but it is a great pleasure for me to say that our bills are paid to date and there is sufficient money in sight to run the association until the end of the year. The treasurer of an organization like this has to be a gentle beggar, and, while I have gone about hat in hand, I have not been unmindful of certain features connected with the work. While the work has been going steadily on, and increasing, the nature of it is so quiet and unobtrusive in many respects, there is not at present an entire understanding in the community, except among you gentlemen, members of the association, and a few others, as to what it is that is accomplished. But it is an interesting feature to call attention to, that while a year ago the former treasurer collected all the money that was collected from thirty-eight individuals, your present treasurer has collected this year's funds, no larger in total amount, from more than one hundred individuals; which is a very important showing because it indicates that our money is coming in smaller quantities from a larger number, and that proves, I apprehend, that we are beginning to be better known.

"Now, gentlemen, we want all the money we can get within reason, because, while it is necessary to meet the expenses of this association, still the work can be very much enlarged if there is more money in the treasury, enough so that we shall feel perfectly comfortable. I have felt perfectly comfortable in one sense because I believed we should raise enough money, but we shall need more money and I think it will come

in increasing quantities from more and more individuals as time goes on. That is the reason, perhaps, why the President introduced me—so that you will know me, and when you meet me in the street you will hand me a dollar, or five dollars, as the spirit moves. Because, as you remember, Dr. Holmes said: 'I only want a little more than I can spend.'

"I cannot sit down without saying that although the President declares this is a thankless job, I do not so regard it. I consider it a great honor and privilege to do my share toward what I look upon as one of the great works of the beginning of the century."

LOUIS D. BRANDEIS spoke on "Wage-Earners' Savings, Life Insurance and Old Age Annuities," a subject of growing importance among trade unions. Mr. Brandeis said:

"The cost of living, properly considered, involves not merely the expense of supplying adequate food, shelter, clothing, education and recreation, but also such pro rata daily contribution as may be essential to provide against the contingency in the future of diminished earnings or unavoidably increased expenses. The contingency that the future may bring in the wage-earner's family extraordinary expenses or to himself non-employment, sickness or accident, premature death or ultimate superannuation, are ever present facts which must be considered, if the amount of wages to be paid and the disposition of them shall be properly determined. The expense of making such a provision should be recognized by the employer, the employee, and the public, as a fixed charge in reckoning the workingman's cost of living, just as repair and depreciation accounts of machinery are now recognized as fixed charges in the cost of manufacturing.

"In Germany, where this principle is accepted, the workingmen's future is largely provided for through paternal and socialistic measures for compulsory insurance. Compulsory thrift is not in harmony with the American ideas of individual liberty. The American spirit demands that such a provision for the future of the workingman and his family be made voluntarily and be made primarily through his own efforts. Those efforts must be directed, first, to securing wages sufficiently high to leave applicable to such purpose a surplus over the day's obvious needs, and, second, to developing the intelligent self-denial which shall induce the workingmen so to apply that surplus.

"Temporary needs in case of sickness and accident of the wage-earner are now supplied to a considerable extent through the trade unions and other voluntary associations of employees; and in such efforts individual employers have shown a readiness to aid. But adequate provision for the future demands in addition: First, the setting apart of funds which shall be immediately available to meet the proverbial 'rainy day' as in the case of non-employment or extraordinary family expense; second, insurance on the life of the wage-earner to protect the family in case of his premature death; third, an old age annuity or like provision against superannuation.

"Trade unions and other voluntary associations, whether managed wholly by employees or jointly by employers and employees, are admirably adapted for supplying temporary relief in case of sickness or accident, but they cannot be safely used as institutions for savings or to provide life insurance or old age annuities. Their management and membership is necessarily shifting; their officers are generally without the business experience requisite for the safe investment of large amounts; and they are properly without governmental supervision. Institutions which shall receive and invest workingmen's savings and provide life insurance and old age annuities demand necessarily stability of organization, continuity in management, business experience on the part of the managers, publicity of accounts, and governmental supervision.

"The need of proper institutions for workingmen's savings, is now adequately supplied in New England, in New York, and in some other States by their system of incorporated savings banks, in which there are no stockholders, and which are managed wholly for the benefit of the depositors by trustees who serve without pay. The record of these savings banks, which are benevolent, quasi-public corporations, has been almost uniformly high. Huge aggregates of the small savings of millions are managed at an extraordinarily small cost. In Massachusetts, the \$707,728,733 of assets of 189 savings banks are managed at a yearly cost of 23/100 of one per cent. In New York, \$1,405,800,004 of assets are managed at a yearly cost of 28/100 of one per cent. The rate of interest earned on their investments has been such as to enable these banks to pay to depositors dividends of about 4 per cent per annum.

"The second need, proper institutions for providing workingmen with life insurance, does not exist. Prac-

HENRY ABRAHAMS, Vice-President

HAYES ROBBINS, Secretary

JOHN MASON LITTLE, Treasurer

tically the only means of obtaining life insurance open to workingmen are the industrial insurance companies, notably the Metropolitan, the Prudential, and the John Hancock companies, which issue policies in small amounts on which the premiums are collected weekly at the homes of the insured. A vast amount of such insurance has been placed. There were outstanding on January 1, 1906, 16,872,583 such policies, constituting nearly three-fourths of the level premium life insurance policies then outstanding in the United States.

"The result of this industrial insurance has been disastrous to the wage-earner. He is obliged to pay for his insurance at a rate at least double that charged to the holders of ordinary life insurance. For the early periods of the industrial policy, the rate rises to eight times that paid by the insured on ordinary life policies; since in most industrial policies, a provision is inserted that if death occurs within the first six months only one-fourth of the face of the policy will be paid, and if within the second six months after the date of the policy, only one-half of its face.

"The result to the policyholder of this system of life insurance may be illustrated from the following data, based upon the Massachusetts official reports:

"In the fifteen years ending December 31, 1905, the workingmen of Massachusetts paid to the so-called industrial life insurance companies an aggregate of \$61,294,887 in premiums, and received back an aggregate of only \$21,819,606. The insurance reserve arising from these premiums still held by the insurance companies does not exceed \$9,838,000. It thus appears that, in addition to all the interest on invested funds, about one-half of the principal paid by the workingmen in premiums has been absorbed in the expense of conducting the business, and in dividends to the insurance companies' stockholders.

"If this \$61,294,887, instead of being paid to the insurance companies, had been paid in to Massachusetts savings banks, and these depositors had withdrawn from the banks the \$21,819,606 which they received from the insurance companies during the fifteen years, the balance remaining in the savings banks December 31, 1905, with the accumulated interest, would have amounted to \$49,931,548.35; and this, although the savings banks would have been obliged to pay upon these increased deposits in taxes to the Commonwealth more than four times the amount which was actually paid by the insurance companies on account of this insurance.

"Perhaps the appalling sacrifice of workingmen's savings through this system of insurance can be made more clear by the following illustration:

"The average expectancy of life in the United States of a man 21 years old is, according to Meech's table of mortality, 40.25 years. In other words, take any large number of men who are 21 years old, and the average age which they will reach is 61¼ years.

"If a man, beginning with his twenty-first birthday, pays throughout life fifty cents a week into Massachusetts savings banks, and allows these deposits to accumulate for his family, the survivors will, in case of his death at this average age of 61¼ years, inherit \$2,265.90, if an interest rate of 3½ per cent a year is maintained.

"If this same man should, beginning at age 21, pay throughout his life the fifty cents a week to the Prudential Insurance Company as premiums on a so-called 'industrial' life policy for the benefit of his family, the survivors will be legally entitled to receive, upon his death at the age of 61¼ years, only \$820.

"If this same man, having made his weekly deposits in a savings bank for twenty years, should then conclude to discontinue his weekly payments and withdraw the money for his own benefit, he would receive \$746.20. If, on the other hand, having made for twenty years such weekly payments to the Prudential Insurance Company, he should then conclude to discontinue payments and surrender his policy, he would then be legally entitled to receive only \$165.

"So widely different is the probable result to the workingman if he selects the one or the other of the two classes of savings investment which are open to him.

"Obviously the present industrial insurance companies are not a proper medium through which the workingmen's need of life insurance can be provided.

"No institution whatsoever exists at present which undertakes to supply the third need of the wage-earners, to wit:—old age annuities, and yet a proper superannuation fund is being recognized as one of the greatest of his needs.

"Life insurance is but a form of saving, and life annuities but a form of insurance. The savings banks manage the aggregate funds made up of many small deposits, until such time as they shall be demanded by the depositor—the insurance company, ordinarily, until the depositor's death. The savings bank pays back to the depositor his deposit with interest, less the necessary expense of management. The insurance company in theory does the same, the difference being merely that the savings bank undertakes to repay to each individual depositor the whole of his deposit with interest; while the insurance company undertakes to pay to each member of a class the average amount (regarding the chances of life and death), so that those who do not reach the average age get more than they have deposited (including interest), and those who exceed the average age less than they have deposited (including interest).

"Savings banks, under the system prevailing in New England and New York, New Jersey and Pennsylvania, are admirably adapted for taking care, not only of savings subject to withdrawal, but for providing life insurance and old age annuities. By extending the functions of the savings banks to these new spheres of usefulness, a remedy will be supplied for the greatest of life insurance wrongs—the present system of industrial life insurance—and a solution will be found for the greatest of workingmen's problems, to wit:—the provision for old age.

"With most wage-earners, the need of life insurance ends at the time that the need for an annuity begins; workingmen require life insurance mainly when their children are young. When the children have become self-supporting, the need of life insurance ceases; and, soon after, the need of superannuation funds frequently arises.

"The savings banks have a goodwill which, if only the opportunity were afforded, would without the intervention of expensive and self-seeking solicitors quickly lead millions of their depositors to become policyholders and prospective annuitants. On the other hand, many of those seeking only insurance or annuities would be led on in the road of thrift, and open savings accounts also.

"If life insurance and old age annuities are furnished under the favorable conditions of low expense rate under which these savings banks operate, small

regular payments commenced early and persisted in would suffice to provide the workingman with life insurance during middle age and a reasonable annuity when old age overtakes him. For instance, payments of a little more than \$1 a month commenced at the age of eighteen, would be sufficient to provide life insurance to the amount of \$500 up to the age of sixty and an annuity of \$100 a year after the age of sixty is reached.

"Through no other means can life insurance and old age annuities be so advantageously supplied to the workingman as through savings banks. Neither any other corporations now existing or newly organized, nor the State could supply them advantageously.

"Any other corporation would lack the extensive goodwill which in the savings banks has been developed by nearly a century of noble service; would lack the established traditions of economy which pervade their organizations; and would necessarily be subject to the heavy expense entailed in organizing and establishing a new and independent business. A generation, at least, of efficient service would be required before any new Life Insurance and Annuity Corporation could develop the goodwill which is essential to securing the patronage of the working people and which the savings banks now possess and can utilize without expense.

"Nor could the functions of providing life insurance and annuities be advantageously committed to the Federal Government, the State, or to Municipalities, among many other reasons, because the insurance and annuities reserve could not be invested by any government on a basis higher than the interest it pays on its loans—perhaps 2 or 3 per cent; while the savings banks earn over 4 per cent on their investments.

"The demand for a better system of providing workingmen's life insurance and the demand for a proper system of old age annuities are imperative. These demands will be met by extending the functions of the savings banks to these new spheres of usefulness."

IN commenting upon Mr. Brandeis's address, Henry Abrahams told of the work which the Cigar Makers' Union had carried on in the way of industrial insurance, strike and sick benefits. To this he attributes largely the success of the Union, and endorsed Mr. Brandeis's plan as an extension of this work. Mr. Abrahams told of the rise and growth of the International Cigar Makers' Union, which was organized after the Civil war and which was regarded as the finest trades union in the United States. It was in 1877 that the union began to develop strength, when the various benefit funds were first instituted that have later made the union a tower of strength. In case of sickness the members of the union got \$5 a week; in case of death a sum varying from \$50 to \$500; when out of work \$3 a week; when on strike \$5 a week; when serving on committees \$5 a week; in case of the death of wife \$40; and the death of a widowed mother \$40. A man out of work and wishing to go to another city got his railroad fare and fifty cents. In twenty-six years and two months there had been paid out under this last head, \$991,777; for strike benefits, \$1,092,104; for sick benefits, \$2,201,266.43; for death benefits, \$1,514,525.99, and for out of work benefits, \$1,045,866.11, a total of \$6,845,540.66. In 1880 at the Chicago convention the questions of coolie labor, prison labor and tenement house work came up for consideration and were solved by the adoption of a union label, the first

union label ever adopted by a trade union body. Since then the eight-hour day had been established and a Saturday half-holiday, and the cigar makers were better paid and happier and there was less intoxication than when they worked twelve and fourteen hours a day under the old system. All the reforms in the trade, he said, had been brought about by the trade union movement.

PROFESSOR F. W. TAUSSIG of Harvard University qualified what had been said of the remarkable system of protection for the wage-earner in Germany. "It is true," he said, "that a lower rate of wages has made it necessary, but it is also true that it has accomplished wonders. It provides for the possibilities of injury, sickness and death, and if there were no other way of doing that except by the suggestion of compulsion which it carries, I should not shrink from something like a German system."

"It is also true that in this matter we must admit we Americans are singularly backward. We are a reckless race; we are a heedless race. Perhaps it goes with the optimism of the industrial strides of the country. The carelessness, both of employers and employees, is a disgrace. Furthermore, the position of ours which places the responsibility on the individual and not on the trade in general is, I think, unsound. We have done an immense amount of insurance in the classes of the well-to-do. We have done singularly little for the workingman, who must bear some fault himself in this matter. We may hope to reach a better solution than that which is given by compulsion in the older countries. Large companies should continue to increase their efforts to provide against old age and injury. The same thing is true of labor unions."

AN interesting contribution to the subject was contained in a letter from Stephen H. Rhodes, President of the John Hancock Mutual Life Insurance Company. He said: "The subject suggested as the topic of the evening is not one for controversy, since any practical movement for the protection and benefit of the wage-earner would meet with earnest sympathy from me and my associates. Any system understandingly inaugurated which would supplement my work of the last twenty-five years, which, with devotion to the interests of a purely mutual insurance company and with a previous intimate knowledge of the underlying principles of insurance, have been spent in the practical service of the wage-earner, would strongly appeal to me."

EDWARD A. MOFFETT, Secretary of the Public Ownership Commission of The National Civic Federation, stated that to his mind the subject under discussion, with the possible exception of the matter of wages and hours, was the most closely related to the welfare of the workingman. "How good, how useful it is to provide insurance upon a universal scale, as Mr. Brandeis's plan necessarily proposes, is indicated," he said, "by the great success which has attended the adoption of such ideas upon the other side of the Atlantic."

"But, as Mr. Brandeis has shown you, the plan of industrial insurance which obtains in this country today has invented itself, has proved itself unsatisfactory and unworthy; for insurance, after all, is nothing less than a social necessity. We must not only provide the means whereby we shall live, but by the same token and with the added scriptural injunction, we should always have in mind, we are also under obligation one to the other to bury our dead. In fact, I feel it would not be too much to say that in a civilized community there should be no poorhouse and no potter's field. But the plan of industrial insurance that prevails now is very much like the Indian's gun, it costs more than it

comes to. Until the late insurance developments in New York, the wage-earners were very glad to have the insurance agent come to the door. Now they regard him, although he personally may be an honest fellow, with something of suspicion and distrust."

"I have been asked to state what is the sentiment—the probable sentiment—of workmen towards this idea of life insurance by the savings banks or through them. For that part of the working class which is unorganized, certainly it would be pretty hard to speak. They hold no conventions, and mouthpiece they have not; but so far as it is my privilege to speak for organized labor, I need say no more than this: That at the Pittsburg convention of the American Federation of Labor a year ago a resolution was adopted to the effect that the United States government should provide insurance—some plan should be adopted whereby insurance should be furnished by the government and no longer by the private companies. This resolution bore no special significance, because at the time of its adoption the people of the country were at a white heat of indignation. Now, whether or not the organized workmen of the country would prefer to drop that idea and take hold of the one so lucidly and engagingly proposed to us here to-night, would depend, in my judgment, upon what merit Mr. Brandeis's plan would show upon further development."

"Another word in conclusion. I ought to say something about the old age pensions or annuity idea. In no country is there such crying need of relief of that particular kind. In other words, in no other country does a man so quickly reach the limit of the period of his usefulness. This fact is due to several causes, chief among which is, in this country, the fact that machinery has more than in any other way displaced the delicateness and finesse of hand labor. The great demand is rather for agility and youth than for mature age and its correlative skill. People will say: 'Oh, such things have the effect of placing a discouragement on thrift. It teaches men to lean too much on that for the support which in their heyday they should lay up for themselves.'"

"I will answer that in a very few words by saying to you that under our present system, in the absence of anything like an old age pension or old age annuity, workmen fear to grow old. Stating it as mildly as I can, the average workingman who does not lose sight of his social duty, who raises a family, is not in a position to lay up for what has been poetically called 'the winter of life.' I can only hope, as I draw to a close, that the very interesting exposition which you have listened to to-night from Mr. Brandeis, and the added words of the succeeding speakers, will result in giving to the masses of this country a form of insurance—let it include an old age pension if that is possible; I should rather insist on it—whereby the accumulated premiums and usufruct of the same on the part of the working class will find a more economical and beneficial repository than these funds have heretofore found."

HAYES ROBBINS, Secretary of the Civic Federation of New England, in his report of the work accomplished the past year, said:

"It is unnecessary to repeat the detailed statement, offered in last year's report, of the objects, methods and scope of the work; all of which may be summarized to-day as accurately as when the movement was started two years ago, under the head of 'promoting better relations between employers and employees.'"

"We have steadily endeavored to keep to that object, without intruding on the field of other worthy organizations or scattering our efforts and resources. We have continued in the belief that any association which be-

gins to fulfil its possibilities of useful service in this particular field can have no lack of work to do, or occasion to make many excursions outside."

"This is not to imply that the movement is a narrow one; to treat it as such would be to defeat its very purposes. On the contrary, one of the most important factors in bringing about this better relation between employers and employees is the promoting throughout the community of a broader understanding of the many-sided industrial problem, with special reference to labor conditions; anything but a narrow task. To this end we bring into one common association men of many diverse interests and view-points—employer, labor, professional, educational, religious, civic, governmental. The object in view is definite and specific, but the methods employed must be broad and co-operative."

"This unique idea of a widely-inclusive membership rests upon an express recognition of the personal equation, as a factor of tremendous importance, far too little appreciated. Personal acquaintance among men representing so many diverse elements in the community means freer interchange of ideas and experiences, larger respect for the 'other man's' position, and a readier disposition to act from motives of reason and fairness than of narrow exclusiveness or mistaken estimates of self-interest."

"During the year we have rendered service, in one way or another, in connection with about thirty trade disputes, many of them of considerable importance. The two most significant were the teamsters' controversy in March, and the longshoremen's in September, both of which involved unusually difficult and complicated negotiations, but thanks to the co-operation of several members of the Federation resulted in satisfactory settlements. Only those closely connected with these matters realized how near this city was, in both cases, to an experience like that of four years ago; and judging from that experience it is safe to say that these two settlements alone represented a very great saving to the commercial and to the labor interests of Boston."

"The other cases with which we had something to do were in connection with street railway service, textile manufacture, electrical work, carpenters, stationary engineers, newspaper mailing, bleachery and dye works, telephone men, carpet weaving, lathing, woodworking, lithographing, paper and pulp making, hat manufacture and metal workers. In the case of longshoremen, and certain other trades named, matters arose in which we were consulted or called upon several times."

"Our second general meeting (first annual) was held January 11, 1906, at the Revere House, taking the form of a reception and smoker, with discussion on the hours of labor. It was attended by about 170 members and guests, and was apparently regarded by those present as entirely successful. In the absence of President Tuttle, the First Vice-President, Frank H. McCarthy, former President of the Boston Central Labor Union, presided; Mr. Tuttle arriving late in the evening in time to make a few closing remarks. Governor Curtis Guild, Jr., extended the greetings of the Commonwealth, and ex-Governor William L. Douglas delivered an address on Fidelity to Agreements. The question of Hours of Labor was discussed by Mr. Alfred Mosely, of London, England; Mr. James P. Archibald, of the Brotherhood of Painters and Decorators, New York; Mr. Marcus M. Marks, President National Association of Clothing Manufacturers, New York; Mr. James Duncan, First Vice-President American Federation of Labor, Quincy, Mass., and Mr. Louis D. Brandeis, of Boston."

"There have been a number of evidences since, that this gathering had a good effect, not only in the educational value of the discussion, but in promoting more general personal acquaintance among men from widely

PROF. F. W. TAUSSIG

LOUIS D. BRANDEIS

EDWARD A. MOFFETT

different walks of life, who, without such acquaintance, often misjudge and misinterpret each other's objects, motives and methods. The indirect influence of these meetings is probably greater from the fact that they are not held often enough to become tiresome.

"The attitude of the Boston press has been cordially friendly to the movement throughout the past two years, and it need hardly be said that this is an important factor in helping the industrial results we have in view.

"The new members enrolled during the year, including those connected with the Workshop Improvement Committee only, number 210; the total now being a little under 600. Names of the new members, up to October 1, appear in Bulletin No. 6. About 225 of our members are in Boston, approximately the same number in Massachusetts outside of Boston, and the remaining 150 are divided among Rhode Island, New Hampshire, Connecticut, Maine and Vermont, in the order named.

"The Committee on Workshop Improvement, which was just being organized a year ago, has now fifty-one members. The chairman is Mr. Frederick P. Fish, president of the American Telephone and Telegraph Company; first vice-chairman, Mr. George W. Brown, treasurer United Shoe Machinery Company, Boston; second vice-chairman, Hon. Charles G. Washburn, Slater Mills, Worcester. Bulletin No. 6 contains the names of the other members, except two, who have been added since October—Mr. Horace S. Sears, of Wellington, Scars & Co., Boston, and Mr. Harry W. Smith, president Wachusett Mills, Worcester.

"Bulletin No. 5 (May), on Better Workshops, was devoted expressly to the work of this Committee, and is known to have exerted a considerable influence, direct and indirect, towards the introduction of improvements in sanitary and other working conditions such as affect the health, comfort, and convenience of employees.

"More specifically the services of the committee have been given, sometimes directly and sometimes in co-operation with the Welfare Department of The National Civic Federation, in a number of cases where employers have desired consultation as to the workings and practical value of various improvements of this character, needed or desirable in their own plants.

"Several of these instances are mentioned in Bulletin No. 6 (October), which also contains an account of

the work under way for prevention of tuberculosis in workshops. An illustrated pamphlet has been prepared under the auspices of the committee, and approved by five medical experts, on Sanitary Cuspidors for Factory Use, giving descriptions of types approved, care and cleaning, first cost and expense of maintenance, etc. This has been published, for general distribution, by the Welfare Department of The National Civic Federation. The card notices, described in the pamphlet, warning against the practice of spitting on the floor, and calling attention to the fact that cuspidors are provided, is being called for by manufacturers to an increasing extent. The Workshop Improvement Committee supplies these cards, for posting in workrooms, free of charge in limited quantities and at cost of printing in large quantities. Thus far about 1,500 of the cards have been furnished to forty-five employing establishments in New England, the number required ranging from 2 to 100, in one case 500. The list includes manufactories of shoes, cotton cloth, machinery, electrical apparatus, blank books, rubber hose, furnaces, silverware, thread, clothing, paper, chairs, and even ships; showing the wide range of industries in which this important sanitary feature is found necessary. Bearing upon the practical importance of this effort, it is significant that one of the largest shoe manufacturers in Massachusetts has learned, from a recent investigation, that one-third of all the deaths among employees in his factories during the last few years were due to tuberculosis. One large establishment, near Boston, has just arranged for the supplying of destructible paper cuspidors on a scale which will probably call for the use of more than 60,000 a year.

"We have a good Committee on Organization and Education, its forty-eight members being scattered all over New England. It would be well if the Secretary could visit some or all of the members of this committee and personally consult with them on ways and means of extending our ideas and methods in the various sections represented, but it has proved very difficult to get away from the immediate local demands except at considerable intervals. However, new names for membership are secured through this committee from time to time, and occasional information on local conditions, by correspondence.

"Three Bulletins have been issued this season: No. 4, reporting the annual meeting of last January; No.

5, already referred to, outlining details of the Workshop Improvement program; and No. 6, containing more or less detail information about several features of the work, including a history of the longshoremen's strike and settlement, in September; list of new members, etc.

"The State and national bureau reports, and current periodicals of twenty-five or thirty industrial crafts and commercial bodies, kept on file and indexed for quick reference, have been consulted more freely this year than last by people in search of special information. On six occasions speakers for meetings of other organizations have been suggested or arranged for.

"Mr. Frank K. Foster attended the State convention of the Maine Federation of Labor, in June, on our behalf, and addressed the delegates on the aims and work of the Civic Federation. The convention passed resolutions of endorsement, similar to those adopted in 1905 by the Boston Central Labor Union, and the State convention of the Massachusetts Branch, American Federation of Labor. On the other hand, a similar attitude on the part of leading commercial bodies is indicated by the fact that our membership includes the president and secretaries of the Boston Chamber of Commerce, Boston Merchants' Association, National Cotton Manufacturers, and one or more officers of several other trade associations, wool manufacturers, clothiers, hardware, etc.

"Recognition should here be given to a fact upon which a very large part of the success of this improvement rests, namely; that many who cannot give money to its support do give time, thought and personal attention. The relatively small amount required to run the machinery of the Federation gives no proper idea of the scope of its efforts or influence, much being done voluntarily by men of prominence and large responsibilities, in all three of the groups represented in the Federation. An active, efficient organization is necessary, both to propagate our distinctive ideas and to furnish a definite means whereby this co-operation and voluntary service of practical men of affairs can be enlisted and made available promptly at the times needed. But it is a significant and optimistic fact that the personal services so rendered multiply by many times the effectiveness of the funds expended for running expenses and general educational propaganda."

CAPITAL AND LABOR MEET IN CONFERENCE IN CHICAGO.

UNDER THE AUSPICES OF THE NATIONAL CIVIC FEDERATION A REMARKABLY SUCCESSFUL MEETING IS HELD AT THE RESIDENCE OF MRS. POTTER PALMER.

THE National Civic Federation held a meeting in Chicago January 12, at the residence of Mrs. Potter Palmer, for the purpose of presenting its work to employers, employees and publicists. It was distinctly an educational meeting, with the view of forming later a branch of the Federation in the central States, having headquarters at Chicago.

The National Civic Federation, which was organized by Ralph M. Easley, Chairman of the Executive Council, was an outgrowth of the Civic Federation of Chicago, of which he was the first Secretary. The Honorable Lyman J. Gage was the first President of the Civic Federation of Chicago, whose object was the promotion of municipal reform, and Mrs. Potter Palmer was the first Vice-President. She was interested in the organization of the National Civic Federation, and it was but natural that she should encourage the establishment of a branch of the organization by holding the initial meeting at her home.

Mrs. Palmer has been long identified with the interests of labor. She was chairman of the Board of Women Managers of the Chicago World's Fair, and through that position secured diplomas for the wage earners contributing toward the manufacture of products whose excellence was recognized by awarding medals to the manufacturers.

There were present over seven hundred prominent citizens, including members of great industrial establishments, financiers, professional men, labor leaders and representatives of philanthropic agencies.

FRANKLIN MACVEAGH, of Chicago, presided, and in his opening address referred to the fact that this meeting of The National Civic Federation was held under most charming surroundings in the most beautiful environments and under most delightful auspices. "That is due," he said, "to the interest which Mrs. Palmer has ever felt in the purposes and objects of the Federation, and to her well known broad and gracious public spirit.

"The object of this meeting is to explain to the people of Chicago the work and spirit of The National Civic Federation. It is necessary for me to say just a word in description of that organization. It is a central body with its offices in New York. It originated in Chicago, but like most things upon which New York prides itself it originated here as a matter of course.

But it went to New York when it grew suddenly prosperous; and while you can keep here our people who grow gradually rich, those who grow suddenly rich all go down to New York. In addition to being a general organization, The National Civic Federation is an organization with departments. It has also branches—one in Boston for New England, and it has in New York a local branch dealing with the local situation.

"You may understand it to be an organization dealing purely with labor questions, but that is only one branch of its work. It has an Industrial Department, and that is perhaps its most important single department. It has a Conciliation Department presided over by Mr. Seth Low, who is happily here this evening. The Welfare Department has as its western head our admirable citizen, Cyrus H. McCormick. It is impossible to give you a detailed impression of The National Civic Federation, therefore it was necessary to select some department which would be fairly well represented and they have chosen the Welfare Department, because it is well developed, and of great and general interest. Also because Miss Gertrude Becks is here, and she has learned, as the executive chief of that department, exactly how to present it to you so that you may understand it."

EX-MAYOR SETH LOW, of New York, Chairman of the Conciliation Department of the Federation, in referring to its work said:

"The Conciliation Department of The National Civic Federation, of which I am chairman, is composed in about equal number of large employers of labor, representative leaders of labor unions, and of citizens who, like myself, are neither one nor the other. So that in all the problems that it has to consider it gets the point of view of the employer, and of the workingman, and of the general public. The object of the Conciliation Department is to bring employers and employees together in such a state of friendship and mutual understanding as to make labor troubles and strikes infrequent; and, wherever possible, to avoid them. You will observe that it is not called the 'arbitration department.' That is not its object. Its object is to conciliate, to bring about good feeling, and to obviate both strikes and the necessity for arbitration.

"The Federation does all of its work in the profound belief that the American men, whether em-

ployer or workingman, want to do the fair thing. We know that each one emphasizes his point of view. That is natural. But, after all, we believe that if we can get fair-minded men together and discuss a definite question of disagreement, in ninety-nine cases out of one hundred both sides, with the light that the other can throw upon it, will find the middle path between the two extremes, which all will consider fair. If you really want conciliation it is wonderful to see how often it can be brought about, even when conditions seem to be pretty hopeless.

"Let me give you an illustration of this. Last spring I was called up by telephone at my farm in Westchester County, about forty miles from New York, by a banker in Philadelphia, who told me that he represented a street railway system in one of the southern towns which was threatened with a strike and asked me if I could not communicate with Mr. Mahon, in Detroit, the representative of the street railway employees, and see if, as the head of the Conciliation Department, I could not have this strike put off.

"He said, in answer to my question as to whether I might say that he was willing to arbitrate, that he did not wish to commit himself to that, but that I might say I thought I could bring about conciliation. I called up the office of the Civic Federation in New York by telephone, and in fifteen minutes a dispatch was on its way to Detroit, reading: 'Sorry to learn there is a strike threatened in such a city. I hope it won't be permitted to occur until the Civic Federation has an opportunity to see what it can do. I think we can bring about arbitration.' The reply we received was a model. It said: 'You may be sure no strike will take place until the Civic Federation has had a chance to show what it can do. If arbitration is offered on fair terms it will be accepted.' The result of that was that the trouble was settled without a strike, and both sides wrote to the Civic Federation thanking it for its action. I think that is particularly interesting from the fact that I never saw anybody.

"It is the policy of the Conciliation Department to do its work privately. People often never know the Federation has had a hand in settling disputes that are settled. In the case I am about to tell you of, however, the parties interested gave it to the papers. A strike was in progress on the Southern Railway. Neither side wanted to make the first approach to settlement,

because that would have been a sign of weakness. When the situation was brought to my attention I asked for a conference, which was granted. In the course of a conference lasting two days the question was settled honorably, and, I think, satisfactorily to both sides.

"Not so long before that the Department had been called upon by a large paper manufacturer to settle a jurisdictional dispute between two unions, which between them did all the work in his factory. It threatened to hang up the entire business. Through the agency of the Conciliation Department the two unions were brought together. They talked the thing over in good humor and the thing was settled and all trouble averted.

"In another instance a jurisdictional dispute affecting a railway not far from New York was involved. The two unions concerned were invited by the Federation to come to New York. They came to New York, to different hotels, and that was as close as we could get them together. They went home, and after a little while we got them to come back again, this time to the same hotel, and that was the end. When they met they settled the dispute.

"Now, these are illustrations of the sort of things the Conciliation Department is doing all the time. I hope you feel as we do, that it is the kind of work well worth doing. We think that the more widely it is known that there is such an agency, the more industrial disputes can be settled. And if, after hearing of it to-night, you will be led to avail yourselves of this agency, or of the local one here, which will do the same thing, I am sure you will have no cause to regret it.

"It gives me great pleasure to have had the opportunity to tell you this simple story, and to thank your hostess on behalf of the Conciliation Department for giving me this opportunity."

MISS GERTRUDE BEEKS, Secretary of the Welfare Department of The National Civic Federation, illustrated an address on the subject of its work with stereopticon views. She spoke of the scope of The National Civic Federation and referred briefly to the work of its various departments. Portraits of members of the Executive Committee were thrown upon the screen, among whom were August Belmont of New York, Henry Phipps of the United States Steel corporation, Samuel Gompers, John Mitchell, Andrew Carnegie, and former Secretary of the Interior Cornelius N. Bliss.

She stated that the Welfare Department is devoted to interesting employers in improving the conditions under which employes in all industries work and live, and that its activities cover the questions of sanitary work places, recreation, educational opportunities, homes, and provident funds.

After giving consideration to the first essentials to the welfare of the employes—steady work, an equitable wage, and reasonable hours, the employer's attention should be directed toward meeting the pressing necessities for their physical well-being in the work places.

In taking up the question of ventilation, she spoke especially of the conditions under which the stationary firemen work, and said: "Do we realize that these men, especially in our great buildings in the large cities, sometimes, and I am sorry to say, often work without any ventilation? These men," referring to a picture, "are in the second sub-basement in a large building in New York City, where there is no outlet whatever for the foul air except the door which leads into the next sub-basement, where the condition is exactly the same. The temperature reaches as high as 110 degrees in the summer, and it is almost—I might say it is quite—criminal. It is a simple matter, indeed, to provide ventilation for these firemen. Mr. Belmont heard Mr. Timothy Healy, of the International Stationary Firemen's Union, explain at one of our meetings these conditions. He had just finished a large building in New York City, and asked Mr. Healy to meet him the next day to determine whether or not the arrangements were satisfactory for the stationary firemen. Mr. Healy was amazed to find the system of ventilation so perfect in that great building and how well the stationary firemen were provided for by this busy man, who has something else to think about

besides the individual employes. When a man who is so busy can do this there is no excuse for any other man forgetting his employes.

"The glass factories also have, many of them, good arrangements for bringing cool air into the faces of the blowers. The metal polishers are also in many instances protected against accident from the breaking of the emery wheel, as well as from the injurious effects of the dust. But the death-rate from tuberculosis among metal polishers, where there is no contrivance for exhausting the dust, is tremendous, and greater attention should be given to the protection of those workers. Fans sometimes are provided for driving out the fumes of the acid used by the dippers in the silver trade and the brass trade, which otherwise would permeate the entire plant and cause a great percentage of illness.

"I have recently been through many of the mines in the anthracite coal fields, and visited the most remote recesses of some in order to find whether the miners get air where they are working, and in a remote corner of this particular mine shown in the picture I found

come so acute that its work in conciliation gave the impression that that was its only office.

"Its object, expressed in general terms, is to promote industrial peace, and there is not one of its departments, as you have been told, but assists in that work. The Conciliation Department finds its work where difficulty in securing an agreement exists. The other departments tend to educate both employer and employe that they may avoid differences.

"A year ago the Municipal Ownership League of New York polled a vote so large that it was apparent that the subject must be studied. The Civic Federation called together about 150 men, representing dissimilar opinions on municipal ownership—those who advocated it and those who opposed; those who had been writing upon the subject and also those interested in transportation and conversant with the operation of public utilities. Their deliberations resulted in the appointment of a committee of twenty-one, charged with the purpose of studying the operations of public utilities both in this country and in Great Britain. They conferred upon a

committee of five the preparation of a report on their findings. The Civic Federation did nothing but use its best effort to supply the means to carry out what this committee undertook. It exercised no influence as to the selection, and on that committee were some of the most ardent advocates of municipal ownership of public utilities that we have in this country. They have visited England and have studied the subject in this country. They engaged their own engineers, their own experts, and did their work just as they chose and in whatever manner they thought best, and I am given to understand that within a short time their report will be ready. I understand that it will cover something like 11,000 pages, so you will perceive that a pretty thorough piece of work has been done, and that the Civic Federation folks will furnish teachers and those who are to discuss this subject a proper and thoroughly non-partisan and unbiased text-book. That is only illustrative of how the Civic Federation works.

"I have seen it suggested that a branch of the Civic Federation was to be established here. Of course that must come entirely in a spontaneous manner from you here in Chicago, if you deem such a step wise. In Massachusetts a Civic Federation of New England was organized some two years ago and now is an active and successful organization. They do their work independently of us, but in harmony with us. They have a conference on Thursday to consider this welfare work which has been put before you and the question of old age pensions and insurance of wage-earners. We have taken up that subject in New York.

"I only hope that the suggestion that an active co-operation be started here in Chicago will take form and I am sure with the enormous interests you would have to care for in the Middle West you would soon gain an importance which you can hardly realize and which would tend greatly to solve this subject, so important to our peace and welfare."

WARREN S. STONE, Chief of the Brotherhood of Locomotive Engineers, stated that it was his belief that the question of wages and the labor conditions of our country are the prominent

questions of the day. Continuing, he said in part: "The Civic Federation has enabled capital and labor to sit down and discuss in a friendly way their differences. I am a firm believer in the face to face conference.

"Leaving all question of sentiment out of it, boiling it all down to the basis of dollars and cents—and that is the basis we figure on to-day largely—the Civic Federation has enabled the Board of Locomotive Engineers to make two or three of the best settlements it ever made, and in doing so it has been the means of making settlements that perhaps have brought to our individual members over \$300,000. The Civic Federation has done that for us, and I cannot speak in terms too high for the good work that it is doing. It is an educational work all the way through, and when you bring the laboring men together you find that all labor leaders are not demagogues, and that all capitalists are not what they are represented by some.

RESIDENCE OF MRS. POTTER PALMER IN WHICH THE CHICAGO MEETING WAS HELD.

the air better. I am thankful to say, than in many factories of the United States."

Examples of improvements which have been introduced by employers along different lines were contrasted with bad conditions. The many modern conveniences which have been supplied for the benefit of employes were a surprise to all, and as one labor man put it, "Any employer who saw the splendid arrangements which have been introduced by other practical employers would thus be induced to install such improvements, for he would be ashamed not to do so."

PRESIDENT AUGUST BELMONT, of The National Civic Federation, followed Miss Beeks' address. He said in part:

"In 1900, when the Civic Federation was definitely founded, it embraced in the scope of its work a number of subjects of national interest, but the Industrial Department became practically the conspicuous one, because at that time the industrial situation had be-

"I do not believe the time is ever coming when there will be no differences to settle between those who have labor to sell and those who have to buy labor, but I do believe this movement of the Civic Federation will bring us closer together and will enable us to do away with that last resort of the labor organization, the strike. It is a pleasure to me to stand before you to-night and testify to the work the Civic Federation has done."

WILLIAM MAHON, International President of the Amalgamated Street Railway Employees of America, referred to the opposition of certain Chicago labor unions to meeting representatives of capital at Mrs. Palmer's as corresponding to the radicals of the Harriman type in the capitalist class who refuse to go half-way or meet with their opponents. Referring to the trade union movement, Mr. Mahon said that it was here to stay. He said:

"There never has been such opposition against any institution or against any movement, yet the trade union, in spite of all this opposition, has lived. You could not crush it. The whole forces of capital turned against it could not crush it. It is a movement that will not be crushed. You might as well make up your mind to the fact that the trade union is going to live on and on. And to the capitalist and to the man upon the other side I say, you might as well make up your minds sooner or later, as did that distinguished man under whose roof we meet to-night, Potter Palmer, when he told of his struggles against the trade unions by concluding, 'I have changed my mind.' And he came to recognize and deal with the unions, and he found benefit in doing so, and he fearlessly told it to the world in the declarations he made before he died."

"The American workman, schooled in the free schools and taught the rights of American citizenship, realizes that some of the titles to your wealth are as spurious, if you please, as the titles of kings and lords. We recognize that we have the same right to the same conditions, and that as men we are going to have them. We all aspire to have homes like this one if we can."

"The unions have made their mistakes, yes, lots of them, just as you capitalists have made yours, lots of them, but we are going on. We might as well make up our minds to come together to deal with one another and work in harmony and to meet the conditions that are before us. For what is it? The battle of life, after all. What have we gained when we get through by the policy of hoarding and grasping all the wealth there may be? Let us be men, let us realize the battle of life, let us recognize the conditions. You will find the men representing trade unions ready to meet you around the conference board and to take a fair position with you, and they will go more than half-way every time to adjust and settle these disputes upon a broad and fair basis. Meet with them, and by the recognition of them meet the battle of life as it confronts us. Let us deal with it. Let us form our civic federations and our organizations of all kinds that will bring men together."

"When I see the good that the Civic Federation has done, the strikes that it has prevented, the men that it has brought together, and brought peace, I must give it credit for what it has done to assist us in a number of great questions. We have settled a number of strikes that would have been great strikes, that would have involved great cities, and those things no one knew anything about because through the different officers of the Civic Federation those matters have been brought about and settled unknown to the public. And so, when we look at the good it has done, my friends, we are proud of the record it has made along that line."

"Some people say the labor unions want to wipe out

the wealth of the world. We want to do nothing of the kind. We want to dynamite the hovels out of existence, if you please. We have no desire to rob you of your wealth. Give us the opportunity with our labor and we will duplicate all the wealth of the world in the next twenty years with our own efforts. I would sooner go down to my grave as poor old Bill Mahon without one dollar to leave my children, and leave a legacy behind of the improved conditions of the street railway men of the country, than to have all the wealth of the Rockefellers, all the wealth of the Morgans, all the wealth of my friend Belmont, rolled up in one pile and doubled ten thousand times."

AN interesting event of the meeting was the action of George A. Schilling, a member of the Coopers' International Union, in calling attention to the remarkable address delivered by Mrs. Potter Palmer at the Columbian Exposition at Chicago. Mr. Schilling stated that the late Governor Altgeld had found the address of so much interest to him that he had re-read it three times. So much of this address was applicable to present day conditions that Mr. Schilling said he was justified in making liberal extracts from it. Some of the quotations were as follows:

"Experience has brought many surprises, not the least of which is an impressive realization of the unity of human interests, notwithstanding differences of race, government, language, temperaments, and external conditions. The people of all civilized lands are studying the same problems. Each success and each failure in testing and developing new theories is valuable to the whole world. Social and industrial questions are paramount, and are receiving the thoughtful consideration of statesmen, students, political economists, humanitarians, employers and employed."

"The few forward steps which have been taken during our boasted nineteenth century—the so-called age of invention—have promoted the general use of machinery and economic motive powers with the result of cheapening manufactured articles, but have not afforded the relief to the masses which was expected. The struggle for bread is as fierce as of old. We find everywhere the same picture presented—overcrowded industrial centers, factories surrounded by dense populations of operatives, keen competition, many individuals forced to use such strenuous effort that vitality is drained in the struggle to maintain life under conditions so uninviting and discouraging that it scarcely seems worth living. It is a grave reproach to modern enlightenment that we seem no nearer the solution of many of these problems than during feudal days."

"It is not our province, however, to discuss these weighty questions, except insofar as they affect the compensation paid to wage-earners, and more especially that paid to women and children. Of all existing forms of injustice, there is none so cruel and inconsistent as is the position in which women are placed with regard to self-maintenance—the calm ignoring of their rights and responsibilities, which has gone on for centuries. If the economic conditions are hard for men to meet, subjected as they are to the constant weeding out of the less expert and steady hands, it is evident that women, thrown upon their own resources, have a frightful struggle to endure, especially as they have always to contend against a public sentiment which discounts their seeking industrial employment as a means of livelihood. The theory which exists among the conservative people, that the sphere of woman is her home—that it is unfeminine, even monstrous, for her to wish to take a place beside or to compete with men in the various lucrative industries—tells heavily against her,

for manufacturers and producers take advantage of it to disparage her work and obtain her services for a nominal price, thus profiting largely by the necessities and helplessness of their victims. That so many should cling to respectable occupations while starving in following them, and should refuse to yield to discouragement and despair, shows a high quality of steadfastness and principle."

"If we now look at the question from the economic standpoint and decide for good and logical reasons that women should be kept out of industrial fields in order that they may leave the harvest for men, whose duty it is to maintain women and children, then, by all the laws of justice and equity, these latter should be provided for by their natural protectors, and, if deprived of them, should become wards of the State, and be maintained in honor and comfort. The acceptance of even this doctrine of tardy justice would not, however, I feel sure, be welcomed by the woman of to-day who, having had a taste of independence, will never willingly relinquish it. They have no desire to be helpless and dependent. Having the full use of their faculties, they rejoice in exercising them. This is entirely in conformity with the trend of modern thought, which is in the direction of establishing proper respect for human individuality and the right of self-development."

"Our highest aim now is to train each individual to find happiness in the full and healthy exercise of the gifts bestowed by generous nature. Ignorance is too expensive and wasteful to be tolerated. We cannot afford to lose the reserve power of any individual. We advocate, therefore, the thorough education and training of women to fit her to meet whatever fate life may bring; not only to prepare her for the factory and workshop, for the professions and arts, but, more important than all else, to prepare her for presiding over the home. It is for this, the highest field of woman's effort, that the broadest training and greatest preparation are required."

MANY letters were received from those who were unable to attend the meeting, some of which are abstracted as follows:

James Duncan, International Secretary-Treasurer of the Granite Cutters' International Association of America—"It is a happy sign of the times that such meetings are being held in our great industrial centers, and the people from the different walks and positions of life and business are meeting on a common level to discuss subjects which make for national business and progress."

Mrs. J. Ellen Foster, special representative of the United States Department of Justice—"I regard The National Civic Federation as a noble exponent of the best thoughts of modern industrialism. I congratulate the representatives of the Federation in the West that so royal a woman as Mrs. Potter Palmer will be its hostess at the beginning of this year."

Homer D. Call, Secretary-Treasurer of the Amalgamated Meat Cutters and Butcher Workmen of North America—"I assure you that my hearty sympathy is with you in the movement, as I firmly believe that The National Civic Federation is accomplishing a great work in harmonizing labor and capital and the uplifting of humanity."

T. J. Dolan, General Secretary-Treasurer of the International Brotherhood of Steam Shovel and Dredge Men—"The organization which your committee represents is a great institution and has done great work in bringing employers and employees into closer relations. In behalf of our organization, I desire to extend the

WILLIAM D. MAHON

MISS GERTRUDE BEEKS

WARREN S. STONE

best wishes and entire support of our brotherhood throughout the country in its great work."

Michael Colbert, General Organizer of the International Typographical Union—"The question of good sanitary conditions is a very important one from an economic standpoint as well as from the point of view of the health and comfort of the workers. Good light, good ventilation and good toilet facilities mean that the health and comfort of workers are conserved and thereby greater efficiency in workmanship is secured. Less time is lost through sickness and more work is done. The printing offices to-day, from the sanitary point of view, are far superior to those twenty years ago, and I have noticed in offices where attention is paid to light, ventilation, etc., the printer of to-day is superior physically to the printer of other days. He is also more sober and works steadier. The shortening of working hours has had something to do with this, of course, especially in morning paper offices, but im-

proved sanitary conditions account for part of the improvement."

John Mitchell, President of the United Mine Workers of America—"I am so thoroughly acquainted with the splendid efforts that have been made by The National Civic Federation to bring into closer and better relationship the interests of workmen and employers, and indeed the workmen and employers themselves, that I dislike to absent myself from any conference that is held under the auspices of that organization."

"It seems to me that if the best judgment of the capitalists and laboring men would assert itself, assisted by the sympathetic sentiment of public-spirited citizens, much could be done to establish a relationship between these great forces of modern society, which would at least reduce to the minimum the number and severity of industrial disturbances. I believe that this desirable end would be more speedily attained, if there were a fuller recognition by each of the other's rights and responsibilities."

"The time has long passed when either side in the industrial field can say with impunity, 'this is my business.' The times has certainly arrived when industries should be regarded as our business. In other words, there must be co-operation and mutual helpfulness in the conduct of business and industry if we hope to have a satisfactory and honorable peace."

The Rt. Rev. Henry C. Potter, Episcopal Bishop of New York—"The Civic Federation began in a high purpose; and has gone forward, as I rejoice to believe, along lines of the utmost value and importance. It has certainly not always (there are some who believe) seen our great social and industrial problems with an infallible eye—but then, you and I don't know any human power that can do that. What it has done, however, has been to help men and women, divided by fragmentary and most imperfect views of their several interests, to see them in a larger light, and with fuller discernment."

RECENT ACTIVITIES OF CIVIC FEDERATION REPRESENTATIVES.

SOME OF THE ADDRESSES DELIVERED BY OFFICERS OF THE WELFARE, INDUSTRIAL ECONOMICS AND IMMIGRATION DEPARTMENTS.

MISS HELEN VARICK BOSWELL has delivered numerous lectures before women's clubs for the Federation's Welfare Department upon the subject of "Welfare Work." Illustrated lectures have been presented to:

A convention of twenty-five women's clubs of Troy, N. Y.

The Woman's Educational and Industrial League of Boston, an organization of large membership, in whose work the leading women of Boston participate.

Civitas Club of Newburgh, N. Y., with an audience of four hundred and fifty men and women; although it is a woman's club, there were present many manufacturers.

The College of Agriculture, Cornell University, Ithaca, N. Y.

The Pine Hills Fortnightly Club of Albany, N. Y., the leading organization of women. The meeting was held at the Urania Club House, the principal men's club, and was attended largely by both men and women interested in public affairs.

During January three lectures were given by Miss Boswell in Washington, D. C., attended by many prominent officials, government employes, and influential residents of that city. The improvements shown as adopted in many of the leading establishments of the country stimulated an interest in such facilities for Government employes as well as those of private enterprises.

The Industrial Session of the State Federation of Women's Clubs of the State of New York, held at Saratoga, was conducted by Miss Boswell. There were other speakers along the same line secured by her.

Lectures were also presented before the Woman's Legislative League, the Woman's West End Republican Association, National Society Daughters of Ohio, and Sorosis, in New York City; the Woman's Republican League of Brooklyn; and the Unity Club at Washington, D. C.

In speaking before the Pine Hills Fortnightly Club of Albany, N. Y., upon "Industrial Conditions of Women Wage-earners," Miss Boswell said in part:

"Every woman in this country is a part of the industrial life of the country, if not through her own efforts, then through those of the men in her family. She should acquaint herself with its conditions, and the fundamentals upon which industrial life is built. We are striving for a higher standard of living. How shall we start to build up that if not by improving the condition of the people who help to create the products of the world? The Welfare Department covers such subjects as apply to the health, the recreation, education, and housing of employes. Under its organization of co-operation employers get together to compare notes, and to plan such improved features as may be worked out. Progressive business men realize the economic strength of their position when they put time, thought and money into the highest development of the conditions surrounding their work-people. Many business men do this without other than their own prompting, but we all know that public sentiment is a great factor in bringing about any needed reform, and it is well that there should be brought before men and women the old and new methods under which work is done, so that we may see improvements, see bad conditions, and judge where judicious suggestions may be made for improvement. Just here is where the clubwomen of this State can, and often do, exert a powerful influence for good by personally looking after the degree of enforcement of laws and endeavor for improving factory and shop conditions. There will be found no greater antidote to the dangerous encroachments of socialism than such welfare work. The cry of the socialist is always that nothing has been done, nothing is being done, and nothing will be done for the

amelioration of the working man and woman. To show that much is constantly in progress to improve conditions is the best answer to the socialistic cry, and the way to prevent the making of socialists is to surround workers with such conditions as will make them comfortable in their work, happy in their homes, and appreciative of the form of government under which they live. The real laborers of the country have no socialistic trend. One of the best known leaders, Samuel Gompers, has said: 'I have kept close watch upon your socialistic doctrines and the work of your movement for thirty years, and I am entirely at variance with your philosophy. I am not only at variance with your doctrines, but believe economically you are unsound, socially you are wrong, industrially you are an impossibility.'

"The pessimists of the country have had so much to say of the horrors of our industrial life that I am glad to show some of its brighter sides and to bring before you by means of stereopticon pictures the many advances and improvements that are daily being made for the comfort and health of women workers especially."

MISS GERTRUDE BEEKS, Secretary of the Federation's Welfare Department, has given illustrated lectures on "What Employers in Different Industries are doing to Ameliorate the Conditions of their Employes" before the:

Turn-Verein Von Brooklyn, E. D., at Brooklyn, N. Y.

Institute of the Eighth District of the Pennsylvania Young Men's Christian Association in Philadelphia.

Georgia State Federation of Women's Clubs at Macon.

A meeting of the employers and employes in Chicago, held at the residence of Mrs. Potter Palmer.

The employers of Muncie, Indiana, and their wives, at the home of Mr. F. C. Ball, a prominent glass manufacturer of that city; and before the

City Secretaries of the Young Men's Christian Association at Brooklyn.

Other addresses were before the Massachusetts State Conference of Charities, at Worcester, Mass., on "Welfare Work, a Safeguard to Public Health," and a joint meeting of Women's Clubs under the auspices of the Alta Lita Club of East St. Louis, upon the subject "What Women's Clubs May Do to Prevent Child Labor."

E. STAGG WHITIN, Secretary of the New York Welfare Committee of the Federation, lectured on the topic "Movements for Social Service," before the Woman's Club of Whitinsville, Mass. Mr. Whitin said in part: "The primary institutions, such as the family, the church, the vocation and State, are ever being strengthened and vitalized by many lesser institutions. The industrial revolution brought about changes in these institutions, and created in America many of the more vital problems of our social life to-day. To their solution, religious agencies, such as missions and other organizations for the 'salvation of souls,' were the first to appear. Gradually, great relief societies have been organized, and the church itself has become socialized. The establishment of the church house and settlement has come as a development out of the earlier forms, and is tending to guide the movement from the religious or salvational to the broader social or educational; thus the extension of public school and other educational agencies to take up the work of social prophylaxis."

"The vocational side, despite its great needs, has been almost untouched by these more social movements. To-day, renewed interest in the introduction of welfare work into factories and in industrial education has tended to add a new breadth to the movement, and to point out additional possibilities of advance."

The speaker then showed the recent developments that have been made in this latter type of work; the part the Welfare Department of The National Civic Federation had played in it; how necessary was the work of improving the conditions existing in many factories, and the necessary industrial preparation of those who are to take up factory work now that the increased educational advantages in the schools are tending to bring about a better standard of living.

At the request of the chairman, the speaker answered many questions pertaining to the congested districts in New York City. He showed how exaggerated was the general thought in regard to the conditions existing on the East Side, on account of the many misleading articles which have been written in regard to it. He pointed out that the distribution of the Russian immigrants to other parts of the United States, and the extension of popular education, would very soon relieve the congestion, which is the result of the gathering together of a distinctly foreign population under the influence of Old World customs.

The club honored the speaker with a full attendance for the first time in its history.

J. W. SULLIVAN, of the Typographical Union and a member of the Federation's Public Ownership Commission, in addressing the Home Economics Club, Teachers' College, Columbia University, upon the trade union's attitude toward welfare work, said:

"The trades unionists are observing sympathetically The National Civic Federation's Welfare Department, and its work is upheld by those who understand it. They see that it is discriminatingly promoting certain specific betterments for the working classes, thereby supplementing trade union endeavors and carrying out the good intentions of the enlightened and fair-minded employers who are engaged in the work. It recognizes that the trade unions are chiefly engaged with wages and hours, and the labor laws, and the union regulations associated with wage scales or those laws; that they are busy pushing organization or that they hesitate to bring up with employers new points that may cause friction. Hence they welcome the pacific intervention of a third party. There is a set of betterments for labor in which the employer, seeking to do his full duty by his employes, may engage his energies. I have traveled much over the world in the interests of labor, having been sent out by trades unionists or others, and I am impressed with the general need of well considered forms of welfare work. These betterments, for one thing, result in doing away with shop nuisances, and those inconveniences and burdens of life which factory hands cannot very well take hold of themselves, but through attention to which the employer may make his employe comparatively happy. Working people, laboring separately, may not experience shop nuisances very much, but when brought together by tens and twenties and hundreds and even thousands they find that, in the case of perhaps only one nuisance there may be a menace even to life itself. For instance, drafts of cold air are frequently a source of serious discomfort. The question of whether the window shall be open or closed becomes a vital question in a factory, and factions 'for' and 'against' arise; those far from a window want it open; those near it want it closed. Welfare work suggests a different solution. It brings into play the knowledge of other forms of ventilation."

"Trade unions took part in the establishment of the bureaus of labor. The National Bureau of Labor was not established until the American Federation of Labor again and again passed resolutions in its favor. The State bureaus also came through the unions largely. These bureaus cover the question of factory inspection."

They are also charged to enforce laws as to fire escapes, protection from dangerous machinery, seats for women, weekly payment of wages, abolition of truck stores, the guaranteeing of wages by lien laws, and others. Trade unionists have also proceeded to get the Saturday half holiday, Labor Day, and other holidays. We hold that such reforms were in the main the results of union effort; in any State where the unions are not strong, you do not have them.

"But even after the rules of the unions and the labor laws of the State are in force, something else is needed to improve the conditions of employees.

"The National Civic Federation has gone to the trouble of sending agents about the country, to ascertain what is being done for the betterment of the every-day conditions of the workers without ulterior motive, and one little thing added to another brings up the sum of the betterments in evidence until we have a principle involved that can be recommended highly by union men, a principle that when observed serves to bring about a better spirit and a better relationship between employer and employee.

"Some employers are sincere. Some are self-denying. The most violent radical will concede that much. Employers do not always follow to the bitter end the law of competition. They will stand in the way of it on occasions. They do not even in the majority of cases quote to labor men, 'We can get men just as good as you are at a somewhat lower rate, and men that will never growl.' And on the other hand, union men give full recognition to the good work of considerate and honest-minded employers, and encourage an increase in their number. These two classes of men with hearts, whose pocketbooks destiny has unbalanced, seem to be getting together in the Civic Federation.

"The well-intentioned employer often has to be educated.

"A good man in Chicago said to me not long ago: 'My six hundred garment workers ought to have plenty of ventilation. The air was foul the other day, and I went in and threw up the windows. The next day there were twenty not at work, reporting they had cold.' This was an enlightened man in many ways, but he knew nothing about ventilation.

"Imagine working in a factory where you have not a clean towel except one you may bring yourself, and you have to hide that because some one else may steal it, no soap, no water running regularly, no toilet room, a factory in which you have bad light, poor heat, questionable drinking water, where you must eat your lunch on at your cluttered bench, and where the floors show lack of cuspidors, and the walls covered with clothes for the lack of lockers. It is there that the Welfare Department may aid by representing to the employer what has been done by other employers.

"Certain occupations are open to special forms of welfare work. In the building trades here in New York we have many thousands of men working a bad day like this in the open, with usually no place for storage of their street clothes, and none of the conveniences you would expect in a building. These trades ought to have portable houses for such purposes. Many of the workers are intelligent men, well educated; and there they are working under conditions that take from them their self-respect.

"Trainmen need bunk houses. Formerly, at the ends of railroad divisions, the men had usually no place to go for rest and food but to a cheap hotel. Now bunk houses and railroad club houses are becoming more and more common.

"For molders, gas workers and blacksmiths a necessity is a place for dry clothing.

"In the metal trades, we find this bad example: Sixty-five men in a room with only six windows; the whole force working in acids and amid great machines blowing off an immense quantity of dust. The first question here is not high wages, nor short hours; it is welfare sufficient to make life tolerable.

"My own trade of printing is unhealthy from several causes, yet printing office conditions, in general, continue bad. In a certain office, for example, a linotype machine was in a draft. The man operating the machine contracted a bad cold which ran into consumption. He left the employ of the company. The story was repeated with a second man and a third man. The matter was brought to the attention of the officials and the ventilation of the office improved. If that can happen among printers, what must be the situation as to sanitary conditions among the newly-arrived Russian Jewish garment workers, so much poorer and more helpless? As a fact, it is usually bad in the extreme.

"There is little care taken of teamsters. Many of them in bad weather go into a saloon and get a drink two or three times a day, which is not wise welfare work for themselves. There was once a place in Hudson Street where teamsters could get a cup of coffee for a cent or two while waiting to deliver goods at a near-by freight station—a good plan, which ought to be imitated.

"These examples indicate the room there is for reminders to employers of certain neglected duties in our developing civilization.

"We find as we look into welfare work that with relation to it there are classifications of industrial workers. In this country we have American white working people, the negroes, who are removed from the whites by a gulf, and the immigrants, who are in some cases

almost as far from the American whites as the negroes. Three different fields for welfare work.

"I would not say one word for welfare work if I thought the outcome would be to develop in the wage worker a feeling of helpless dependency, or to advertise employing class-charlatans, or to modify one worker's demands through the trade unions.

"Employees can occasionally do an acceptable piece of welfare work for the employer. They can make sure that their representatives tell him the truth when conditions are good, and do not ask impossibilities when they are bad. They can show appreciation when the employer really does well by them. They can mitigate in various ways the unpleasantness of the higgling in the labor market. They can put the employer in a frame of mind in which he will say, 'Well, if I have performed welfare work for you I acknowledge in turn that you are contributing to my happiness, too.'

"Welfare work for boys includes the establishing of athletic fields, bowling alleys, gymnasiums and technical and other schools; and for girls, recreation grounds, light athletics, dressmaking, millinery, and above all, cooking.

"If there is one supreme crying need throughout the world it is for better cooking, how to make food palatable and how to be sure of its wholesomeness. If you are studying all that, young ladies, you are on the way to sainthood. You are helping in a radical way to make people better. The roots of your labors run down to the stomach, the boiler of human machinery, and up to man's moral nature, the foundation of Society. If you can help the poorer girls of the hard-working classes to study personal health, household economy and be good housewives, you are engaged in a noble work."

FRANK JULIAN WARNE, Secretary of the Federation's Immigration Department, in addressing the South Carolina Cotton Manufacturers' Association at its recent annual meeting at Spartanburg, S. C., said in part:

"Among the impressions I take away after a most instructive two weeks' trip in various sections of your Southland, is that of the remarkable, almost wonderful industrial development or revolution through which you are passing.

"The unprecedented and rapid growth of your industries has already brought to you many vexatious problems new to this section. The building of your cotton mills, for illustration, has brought about within a period of ten or fifteen years a widespread movement of population from your rural districts to the villages and cities. This movement has been so rapid as to impose upon you with startling suddenness pressing issues of a most intricate nature. While it is true that such problems have already been developed through various stages in other sections of the country, yet it does not follow that the same outcome can be prophesied of your section. These problems, while of the same general character, differ radically because of the varying elements that go to make them up, and it is of these differences and the part they play that public opinion should be correctly informed.

"You have your views, and no doubt your own conception as to how these problems should be solved. But at the same time it is highly important that the public should know your views, and I am convinced that The National Civic Federation can be of incalculable service to you as manufacturers and to your section in the up-building of your industrial state, for I take it that in your progress public opinion, not only of the South but of the nation at large, is to be a determining factor. And as captains of industry who have fought to your present position over obstacles which to many seemed almost insurmountable, I am sure you recognize the value of a correctly informed public opinion. It is in this connection that The National Civic Federation has its greatest usefulness to you. This organization has 'a decent respect for the opinions of mankind,' be these opinions those of the industrial leaders of the South, or the North, or West. It is a forum where representatives of all interests and all sections can meet and present their views through their leaders. The means which the Federation uses for accomplishing this purpose are conferences for the discussion of questions of public moment. At these conferences all 'sides' are represented and each is given equal opportunity to present its aspect of the issue. As an illustration of this feature of the Federation's work, I call your attention to the recent conference in New York City in December at which the child labor problem, in which you are particularly interested, was one of the questions discussed. You sent able men there to present your views and opinions. I believe that what your representatives said came as a surprise to many who heretofore have not had the opportunity of considering all the phases of this problem.

"In order to give you a general idea of the Federation's work, I might say that the organization is composed of three elements; of employers, representing the larger and more important industries of the country; of employees, representing the great labor organizations, some of them international in their scope; and of representatives of the public, the latter including professional men and public-spirited men from all sections of the country.

"The efficiency and standing of the Federation can probably best be indicated by mentioning the names of

some of those who are actively identified in its work. The president of the organization is Mr. August Belmont; one of the vice-presidents is Mr. Samuel Gompers, President of the American Federation of Labor. Up to the time of his appointment by President Roosevelt as Secretary of the Department of Commerce and Labor, Mr. Oscar S. Straus was also a vice-president. Another vice-president is your own fellow-member, Captain Ellison A. Smyth, and another one of your members, Mr. Thomas F. Parker, is Vice-Chairman of the Immigration Department. The officials of the organization also include such public-spirited men as ex-President Grover Cleveland, Mr. Andrew Carnegie, Archbishop Ireland, Mr. John Mitchell, President Eliot of Harvard University, Hon. Seth Low, Mr. Henry Phipps of the United States Steel Corporation.

"In addition to the conference feature referred to, the Federation's work is also carried on through departments organized for the purpose of making special investigations along particular lines. These departments include Immigration, Welfare, Conciliation and Arbitration, Trade Agreements, Industrial Economics, Political Reform, and Public Ownership. The methods under which these departments carry on their work can best be illustrated perhaps by that of the Public Ownership Commission. This body of one hundred men representing public-spirited citizens in various walks of life in different sections of the country was organized more than a year ago to carry on a thorough investigation as to public ownership of such public utilities as water, gas, electric power and light, and street railways. This commission, composed of those who oppose as well as those who favor public ownership, selected a committee of twenty-one to make an impartial investigation and to examine into the conditions and results in this country and abroad of public ownership and operation, public ownership and private operation, and private ownership and operation. Each 'side' selected its own paid experts, and these and the committee of investigation have spent many months in the principal cities of the United States and Great Britain. Such was the attention given to the selection of this important body—every shade of opinion being represented—as to assure an impartial and fair investigation and report, and I believe that when it finally presents its report, it will have a widespread influence in directing public opinion on this pressing issue.

"The other departments of the Federation are selected with the same care and with the sole idea of securing facts that are basal and fundamental. The Immigration Department in which you leaders of the South are greatly interested at the present time is also composed of different elements."

A MOST SENSIBLE VIEW.

WE doubt the efficiency of pity to solve the problem of child labor. A certain value is derived from pictures of the bent shoulders, the contracted lungs, the tired limbs, the sallow faces, the vacant eyes and the dwarfed intellects of those we are banishing from home, playground and schoolroom to the weary tread of our sweatshops, factories and mines. But not all child laborers are "slaves." Those who denounce the evils of child labor in such generalizations as that "two million little, wan and dwarfed child toilers march in the wage-slave ranks of America's industrial army" are a menace to this reform. Intelligent people, seeing many of these two million children who are not "wan" or "dwarfed," and who bear no other visible marks of slavery, discount the whole cry against child labor as sentiment. Many of the two million working children in America are between fifteen and sixteen years of age and are in occupations and laboring under conditions not injurious to themselves or to society. Not all glass houses employ little boys at night. Not all coal breakers are dense with clouds of dry dust. Not all telegraph offices employ little children to carry messages at midnight to houses of vice. Not all children in Southern cotton mills work through a twelve-hour night. Some one tells of seeing a little girl in a Southern cotton mill rudely awakened at night by a dash of cold water in her face. Homilies on child labor followed this incident, abounding in graphic descriptions of numberless little girls cruelly awakened night after night by splashes of cold water.

Nothing is gained by exaggeration; much is lost. It is enough that some of the two million are toiling all night in glass houses; that some coal breakers compel little boys of ten years to work in clouds of dust so dense as to completely hide the light and fill the lungs; that some little girls of eight years toil through a twelve-hour night in Southern cotton mills; that some of the little children of New York are crushed in body and soul in the slavery of sweatshop labor. The truth is bad enough. Let the picture be drawn with simple accuracy, and we may hope to arouse, instead of sentiments of pity, the sense of social justice; an appreciation of the relation of this system to our social institutions. A demonstration of the loss to society, the injustice to the laborer, and the dwarfing of the progenitors of our coming generations, will be more effective than specific pictures of little children who suffer from the wrong.—Owen R. Lovejoy, Assistant Secretary of the National Child Labor Committee, in the *New York Independent*.
